AS the nature and kind of the fractured Clavicle shall be, so must the cure and restoring thereof be performed. But howsoever this bone shall be broken, alwayes the end fastned to the shoulder and shoulderblade, is lower than that which is joined to the chest; for that the arm drawes it downwards. The collar-bone, if broken athwart, is more easily restored and healed, than if it be cloven long-wayes. For, every bone broken athwart doth more easily return into its former state or seat, whiles you lift it up on this or that side with your fingers. But that which is broken *secundum longum*, or into splinters, or long-wayes, is more difficultly joined and united to the ends and fragments: for the peeces, which were set, will be plucked asunder, even by the least motion of the arms; and that which was knit with the shoulder, will fall down to the lower part of the breast. The reason of which is, the collar-bone is not moved of its self, but consents in motion with the arm. In restoring this or any other fracture, you must have a care that the bones ride not one over another, neither be drawn nor depart too farre in sunder: therefore it will be here convenient, that one servant draw the arm backwards, and another pull the shoulder towards him the contrary way, for so there will be made, as I may so term it, a counter-extension. While which is in doing, the Surgeon with his fingers shall restore the fracture, pressing down that which stood up too high, and lifting up that which is pressed down too low. Some, that they may more easily restore this kind of fracture, put a clew of yarn under the Patients arm-pit, so to fill up the cavity thereof: then they forcibly presse the elbow to the ribs, and then force the bone into its former seat. But if it happen, that the ends of the broken bones shall be so depress, that they cannot be drawn upwards by the forementioned means: then must the Patient be laid with his back, just between the shoulders, upon a pillow hard stuffed, or a tray turned with the bottome upwards, and covered with a rug or some such thing. Then the servant shall so long presse down the Patients shoulders with his hands, untill the ends of the bones, lying hid and pressed down, fly out and shew themselves. Which being done, the Surgeon may easily restore or set the fractured bone. But if the bone be broken so into splinters that it cannot be restored, and any of the splinters prick and wound the flesh, and so cause difficulty of breathing, you then must cut the skin even against them, and with your instrument lift up all the depressed splinters, and cut off their sharp points; so to prevent all deadly accidents, which thereupon may be feared. If there be any fragments, they, after they are set, shall be covered with a knitting medicin made of wheat flour, frankincense, bole armenick, *sanguis draconis*, *resina pini*, made into powder, and mixed with the whites of egs, putting upon it splints, covered with soft worn linnen rags; covered over likewise with the same medicin, and then three boulsters dipped in the same; two whereof shall be laid upon the sides, but the third and thickest upon the prominent fracture, so to represse it and hold it in. For thus the fragments shall not be able to stir or lift themselves up further than they should, either to the right side or left. Now these boulsters must be of a convenient thickness and breadth, sufficient to fill up the cavities which are above and below that bone. Then shall you make fit ligation with a rowler, having a double head out crosse-wise, of a hands breadth, and some two ells and a half long, more or less, according to the Patients body. Now he shall be so rowled up, as it may draw his arme somewhat backwards, and in the interim his arm-pits shall be filled with boulsters, especially that next the broken bone; for so the Patient may the easily suffer the binding. Also you shall wish the Patient, that he of himself bend his arm backwards, and set his hand upon his hip, as the Country Clownes use to do, when they play at leap-frog. But how great diligence soever you use in curing this sort of fracture, yet can it scarce be so performed, but that there will some deformity remain in the part: for that a ligature cannot be rowled about the collar-bone, as it may about a leg or an arme. A *Callus* oft-times growes on this bone, within the space of twenty dayes, because it is rare and spongious.

How to restore the fractured Clavicle. The first way.

The second way.

The third way.

How to bind up the fractured clavicle.

It is a difficult matter perfectly to restore a fractured clavicle.

CHAP. IX. *Of the fracture of the shoulder-blade.*

THe Greeks call that *Omoplata*, which the Latines terme *Scapula*, or *Scapula pectoris*, that is, the shoulder-blade. It is fastned on the back to the ribs, nowle, the *Vertebra* of the chest and neck, but not by articulation, but only by the interposition of muscles, of which we have spoken in our Anatomie. But on the fore part it is articulated after the manner of other bones with the collar-bone, the shoulder, or arm-bone: for with its processe, which representeth a prick or thorn, and by some, for that it is more long and prominent, is called *Acromion*, (that is, as you would say, the top or spire of the said shoulder-blade) it receives the collar-bone. Therefore some Anatomists, according to *Hippocrates*, as they suppose, call all this articulation of the collar-bone with the hollowed pro-

An anatomicall description of the shoulder-blade.

cesse

cess of the shoulder-blade, *Acromion*. There is another process of the said blade-bone, called *Cervix omoplatæ*, or the neck of the shoulder-blade; this truly is very short, but ending in a broad insinuated head, provided for the receiving of the shoulder or arm bone. Not far from this process is another, called *Coracoides*, for that the end thereof is crooked like a Crows beak. This keeps the shoulder bone in its place, and conduces to the strength of that part. The shoulder blade may be fractured in any part thereof, that is, either on the ridge, which runs like a hill, alongst the midst thereof for its safety, as we see in the *vertebræ* of the back. So also in the broader part thereof it may be thrust in and depress, and also in that articulation, whereby the top of the shoulder is knit to it. According to this variety of these fractured parts, the happening accidents are more grievous or gentle. How many wayes the shoulder blade may be broken.

We know the spine or ridge of the shoulder-blade to be broken, when a doloriscke inequality is perceived by touching or feeling it. But you may know, that the broader or thinner part thereof is depressed, if you feel a cavity, and a pricking paine molest the part, and if a numnesse trouble the arme, being stretched forth. The fragments, if they yet stick to their bones and do not prick the flesh, must be restored to their place and place, and there kept with agglutinative medicines, and such as generate a *Callus*, as also with boulsters and rowlers fitted to the place. But if they do not adhere to the bone, or pricke the flesh lying under them, then must you make incision in the flesh over against them, that so you may take them out with your Crows beak. But although they stir up and down, yet if they still adhere to the *periosteum* and ligaments, (if so be that they trouble not the muscles by pricking them) then must they not be taken forth: for I have oftner than once observed, that they have within some short time after grown to the adjacent bones. But if they, being wholly separated, do not so much as adhere to the *periosteum*, then must they necessarily be plucked away, otherwise within some short space after, they will be driven forth by the strength of nature, for that they participate not any more in life with the whole. For that which is quick, saith *Hippocrates*, uses to expell that which is dead far from it. The truth whereof was manifested in the Marquis of *Villars*, who at the battell of *Dreux* was wounded in his shoulder with a Pistoll bullet, certain splinters of the broken bone were plucked forth with the pieces of his harnesse, and of the leaden bullet; and within some short space after, the wound was cicatrized, and fully and perfectly healed. But more than seven years after, a defluxion and inflammation arising in that place by reason of his labour in arms, and the heavinesse of his armour at the battell of *Mons-Contour*, the wound broke open again, so that many shivers of the bone, with the residue of the leaden bullet, came forth of the flesh. But if the fracture shall happen in the neck of the shoulder-blade or dearticulation of the shoulder, there is scarce any hope of recovery, as I have observed in *Anthony* of *Burbon*, King of *Navarre*; *Francis* of *Lorgue*, Duke of *Guise*; the Count *Rhingrave Philibert*, and many other in these late civill Wars. For there are many large vessels about this dearticulation, to wit, the axillary vein and artery, the nerves arising from the *Vertebræ* of the neck, which are thence disseminated into all the muscles of the arm. Besides, all inflammations and putrefaction arising there are easily communicated by reason of their neighbour-hood to the heart and other principal parts, whence grievous symptoms, and oft-times death it self ensues. The cure. *Lib. de vulc. capitis.* A history. Nature of its own accord makes it self way to cast forth strange bodies and matters. Why a fracture in the joint of the shoulder is deadly.

CHAP. X. *Of the fracture and depression of the* Sternon, *or Breast-bone.*

THe *Sternum* is sometimes broken, other whiles only thrust in without a fracture. The inequality perceivable by your feeling, shewes a fracture, as also the going in with a thrust with your finger, and the sound or noise of the bones crackling under your fingers. But a manifest cavity in the part, a cough, spitting of blood, and difficulty of breathing by compression of the membrane investing the ribs and the lungs, argue the depression thereof. For the restoring of this bone, whether broken or depress, the Patient must be laid on his back with a cushion stuffed with cow or hay under the *vertebræ* of the back, as we let down in the setting of the collar bone. Then a servant shall lie strongly with both his hands on his shoulders, as if he would press them down, whilest the Surgeon, in the mean time pressing the ribs on each side, shall restore and set the bone with his hand; and then the formerly described medicines shall be applyed for to hinder inflammation, and allwage pain; boulsters shall be fitted thereto, and a ligature shall be made crosse wayes above the shoulders, but that not too straite, lest it hinder the Patients breathing. By these means, at the appointment of *Anthony* of *Burbon* King of *Navarre*, cured *Anthony Bernard* a Knight of the order, who had his breast-plate bended and driven in, with an iron bullet shot out of a Field-peece, as also his *Sternum* together therewith, and he fell down as dead with the blow; he did spit blood for three months after I had set the bone, yet for all this he lives at this day in perfect health. Signs that the *sternum* is broken. Signs that it is depress. The cure. A history.

CHAP. XI. *Of the fracture of the ribs.*

THe true ribs, for that they are bony, may be broken in any part of them. But the bastard ribs can not be truly broken unlesse at the back bone, because they are only bony in that part, but gristly on the foreside toward the breast bones; wherefore there they can only be folded or crooked in. Those ribs which are subject to fractures, may be broken inwards and outwards, but oft-times it comes to pass, that they are not absolutely broken, but cleft into splinters, and that sometimes inwards, but not outwards. Thus the fissure doth oft-times not exceed the middle substance of the rib, but sometimes it so inclines through it all, that the fragments and splinters do prick and wound the membrane, which invests and lines them on the inside, and then there is great danger. But when the fracture is simple without a wound, compression, puncture of the membrane, and lastly, without any other symptome; then the danger is less. Therefore *Hippocrates* wisheth, that those, who are thus affected, till their lives In what place the short ribs may be broken.

more

Sent. 56. sect. 3. de art.

more freely with meat; for that moderate repletion of the belly, is (as it were) a certain prop or ſtay for the ribs, keeping them well in their place and ſtate; which rule chiefly takes place in fractures of the baſtard ribs. For ſuch as have them broken, uſually feel themſelves better after, than before meat. For emptineſs of meat, or of the ſtomach, makes a ſuſpenſion of the ribs, as not underpropped by the meat. Now that fracture which is outwardly, is far more eaſie to heal, than that which is inwardly; for that this prickeſh the membrane or *Pleura*, and cauſeth inflammation, which may eaſily end in an *Empyema*. Adde hereunto, that this is not ſo eaſily to be handled or dealt withall, as the other: whereby it commeth to paſs, that it cannot be ſo eaſily reſtored; for that theſe things cannot be ſo fully and freely performed in this kinde of fracture, which are neceſſary to the ſetting of the bone, as to draw it out, hold it and join it together. It is therefore healed within twenty dayes, if nothing elſe hinder. The ſigns of fractured ribs are not obſcure; for by feeling the grieved part with your fingers, you may eaſily perceive the fracture by the inequality of the bones, and their noiſe or crackling, eſpecially if they be quite broke aſunder. But if a rib be broken on the inſide, a pricking pain, far more grievous then in a pluriſie, troubles the Patient; becauſe the ſharpe ſplinters prick the Coſtall membrane: whence great difficulty in breathing, a cough, and ſpitting of bloud enſue. For bloud, flowing from the veſſels broken by the violence of the thing cauſing the fracture, is (as it were) ſucked up by the lungs, and ſo by a dry cough carryed into the wound, and at length ſpit out of the mouth. Some, to pull up the bone that is quite broken and depreſt, apply a cupping glaſſe, and that is ill done; for there is cauſed greater attraction of humours, and exceſs of pain by the preſſure and contraction of the adjacent parts, by the cupping glaſs, wherefore *Hippocrates* alſo forbids it. Therefore it is better to endeavour to reſtore it after this following manner. Let the Patient lye upon his ſound ſide, and let there be laid upon the fractured ſide an emplaiſter made of Turpentine, Roſin, black Pitch, wheat flour, maſtick, and aloes, and ſpread upon a ſtrong and new cloth. When it hath ſtuck there ſome time, then pluck it ſuddenly with great violence from below upwards; for ſo the rib will follow together therewith, and be plucked and drawn upwards. It is not ſufficient to have done this once, but you muſt do it often, untill ſuch time as the Patient ſhall finde himſelfe better, and to breath more eaſily. There will be much more hope of reſtitution, if, whileſt the Surgeon do this diligently, the Patient forbeare coughing, and hold his breath. Otherwiſe if neceſſity urge, as if ſharp ſplinters with moſt bitter tormenting pain prick the Coſtall membrane overſpread with many nerves, veins, and arteries, which run under the ribs, whence difficulty of breathing, ſpitting of bloud, a cough and feaver enſue; then the only way to deliver the Patient from danger of imminent death, is to make inciſion on the part where the rib is broken, that ſo laying it bare, you may diſcern the pricking fragments, and take them out with your inſtrument, or elſe cut them off. And if you make a great wound by inciſion, then ſhall you ſew it up, and cure it according to the common rules of curing wounds. Now diet, phlebotomy, and purgation, which (as *Hippocrates* ſaith) are not very needfull in a ſimple fracture, for that there are no ſymptomes which may require ſuch remedies; yet they, by reaſon of the complicated ſymptomes, as a convulſion, feaver, *Empyema*, and the like, muſt here be preſcribed by the advice of the Phyſitian which overſees the cure. A Cerate, and other remedies fitting the occaſion, ſhall be applyed to the grieved part: no other ligatures can be uſed, than ſuch as are fit to hold faſt and ſtay the locall medicins. There is no other rule of fite and lying, than ſuch as is taken from the will and content of the Patient.

Sent. 15. ſect. 3. de art. Paulus lib. 6. cap. 96. Avicen. 4.

A ſimple fracture may be cured only by Surgery.

CHAP. XII. *Of certain preternaturall affects which enſue upon broken ribs.*

MAny ſymptomes enſue upon fractured and contuſed ribs, but amongſt the reſt, there are two which are not common, whereof we will treat in this place. The firſt is, the inflation, or riſing up of the contuſed fleſh, which alſo enſues upon light affects of the bone, which have been neglected at the beginning. But the fleſh is not meerly puffed up of it ſelfe, but alſo with a certain phlegmatick, glutinous and viſcous humour gathering thereinto. The cauſe hereof is, the weakneſs of the digeſtive faculty of the part, occaſioned by the ſtroak and diſtemper; which therefore cannot aſſimilate the nouriſhment flowing more plentifully than it was wont, either drawn thither by means of the pain, or ſent thither by a blinde violence of nature, ſtirred thereto by a deſire of its own preſervation. Wherefore this halfe crude humor remaining there, raiſeth much flatuling from its ſelfe, or elſe wrought upon by the weaker heat, it is reſolved into cloudy vapours; whence it cometh to paſs, that the fleſh is ſwoln up in that place, and the skin on the contrary grows ſoft, as if it were blown up with a quil. Therefore laying your hand thereon, you may hear the noiſe of the winde going forth thereof, and ſee a cavity left in the part, as it is uſually ſeen in œdematous tumors. Unleſs you remedy this inflation, there will enſue an inflammation, feaver, abſceſs, difficulty of breathing; and laſtly, that ſecond kind of affect whereof we have determined to treat in this chapter, to wit, the putrefaction, corruption, or blaſting of the ribs. An abſceſſe, and the ſeparation of the fleſh from the bone is the cauſe hereof: for hence it cometh to paſs that the bone, deſpoiled of its naturall and fleſhly cloathing wherewith it was cheriſhed, is eaſily offended by the touch of the entring air, which it never formerly felt, and ſo at length is becometh (as it were) blaſted: which when it happens, they ſpit up filth, and ſo fall into a conſumption, and at length die. To withſtand all theſe inconveniencies, you muſt as ſpeedily as you can, reſtore the fractured bones by the former delivered means. And then this mucous tumor muſt be reſolved by proper heating and diſcuſſing medicins, and kept down by boulſters and rowlers; that ſo the fleſh may touch the bone, and cover it as it uſually did. But the ligature ſhall not be made ſo ſtrait, as to hinder the ribs from their wonted motion in expiration and inſpiration. If the tumor degenerate into an abſceſs, it ſhall be ſpeedily opened, leſt the matter, kept in too long, corrupt the bone which lyes under it, by the contagion of its putrefaction. The ulcer being opened, the matter ſhall be evacuated by putting a pipe into the ulcer, the end whereof ſhall be bound about with a thred, leſt it fall into the capacity of the cheſt, and that it may be drawn forth at your pleaſure.

The cauſe.

The ſignes.

The cure.

CHAP.

CHAP. XIII. *Of the fracture of the Vertebræ, or back bones of the back, and of their processes.*

THe *vertebræ* are ſome whiles broken, other whiles bruiſed, or ſtrained on the inſide, whereby it cometh to paſs, that the membranes which inveſt the ſpinall marrow, as alſo the ſpinall marrow it ſelf, are compreſſed and ſtraitned, which cauſe many malign accidents; which, whether they be curable or not, may be certainly foretold by their magnitude. Amongſt theſe ſymptomes are the ſtupidity, or numneſs and palſie of the arms, legs, fundament, and bladder, which diminiſh, or elſe take away from them the faculty of ſenſe and motion; ſo that their urine and excrements come from them againſt their wills and knowledg, or elſe are wholly ſuppreſt. Which when they happen (ſaith *Hippocrates*) you may foretell that death is at hand, by reaſon that the ſpinall marrow is hurt. Having made ſuch a prognoſtick, you may make an inciſion, ſo to take forth the ſplinters of the broken *vertebræ*, which driven in, preſs the ſpinall marrow, and the nerves thereof. If you cannot do this, at leaſt you ſhall apply ſuch medicins as may aſſwage pain, and hinder inflammation; and then the broken bones ſhall be reſtored to their places, and contained therein by thoſe means which we ſhall mention when we come to treat of the luxation of the ſpine. But if that the proceſſes only of the *vertebræ* be broken, the fragments ſhall be put in their places, unleſs they be quite ſevered from their *periosteum*. But if they be ſevered, you ſhall open the skin and take them forth, and then dreſs the wounds as is fit. We underſtand that only the proceſſes of the *vertebræ* are broken, if in the abſence of the forementioned ſymptoms of numneſs and the palſie, you laying your finger upon the grieved part, feel ſomething, as a bony fragment, ſhaking and moving thereunder, with a certain crackling noiſe, and cavity, and depreſſion; and then, if when the Patient holds down his head, and bends his back, he feel far more pain, than when he ſtands up ſtreight upon his feet. For in ſtooping, the skin of the back is ſomewhat ſtretched forth, and extended, and alſo forced upon the ſharp ſplinters of the fragments, whence proceeds a dolorifick ſolution of continuity, and a pricking: in ſtanding ſtreight up, on the contrary, the ſtretched skin is relaxed, and conſequently leſs moleſted by the ſharp fragments. The fractured proceſſes of the *vertebræ* eaſily heal, unleſs they be aſſociated with ſome other more grievous ſymptome which may hinder, ſuch as is a certain great contuſion, and the like. For as we formerly ſaid out of *Hippocrates*, all rare and ſpongy bones are knit by a *Callus* within a few dayes.

The affects of the *vertebræ*.

Sect. 2. Prorh.

The cure of fractured *vertebræ*.

The cure of the proceſſes.

Signs that onely the proceſſes are fractured.

CHAP. XIV. *Of the fracture of the holy-bone.*

ALſo the holy bone in a certain part thereof, which may be eaſily healed, may be broken by the blow of bruiſing things, as by a bullet ſhot out of a muſket, as I have obſerved in many. But if the fracture violate, together with the *vertebræ* thereof, the ſpinall marrow contained therein, then the Patient can ſcarce ſcape death, for the reaſons ſhewed in the former chapter.

What fracture of the holy bone curable, and what not.

CHAP. XV. *Of the fracture of the rump.*

THe Rump is compoſed of four bones; the firſt whereof hath a cavity, wherein it receives the loweſt *vertebræ* of the holy bone, the other three are joined together by *Symphyſis* or Coalition; at the end of theſe hangs a certain ſmall griſtle. The fracture of theſe bones ſhall be cured by putting your finger into the Patients fundament, and ſo thruſting it even to the fractured place. For, thus you may thruſt the fragment forth, and fit and reſtore it to the reſt of the bones by your other hand lying upon the back. But that it may be the ſooner healed, it is fit the Patient keep his bed, during all the time of the cure. But if there be a neceſſity to riſe, he ſhall ſo ſit in a perforated ſeat, that there may be nothing which may preſs the broken part; and fitting remedies for healing fractures ſhall be applyed at occaſion ſhall offer it ſelfe.

The deſcription of the rump.

The cure.

CHAP. XVI. *Of the fracture of the Hip, or* Os Ilium.

THe Hip conſiſts of three bones: the firſt is named *Os Ilium*, the haunch bone, the other, *Os Iſchion*, the huckle bone, the third *Os pubis*, the ſhare bone. Theſe three bones in men of full growth are ſo faſt knit and joined together, that they can by no means be ſeparated, but in children they may be ſeparated without much a do. This bone may be broken in any part thereof, either by a ſtroak, or by a fall from high upon any hard body. You ſhall know the fracture by the ſame kind of ſigns, as you know others, to wit, pain, pricking, a depreſſed cavity, and inequality, and alſo a numneſs of the leg of the ſame ſide. The ſplinters of the bones (if quite broke off) muſt by making inciſion be taken away at the firſt dreſſing; in performance of which operation, you muſt have a care that you hurt not with your inſtrument the heads of the muſcles, nor any veſſels, eſpecially which are great; nor laſtly, that large nerve which is ſent into the muſcles of the thigh and leg. On the contrary, ſuch fragments as are not broken or ſevered from their *periosteum*, ſhall be ſmoothed and ſet in order with your fingers, as is fitting. Other things ſhall be done according as art and neceſſity ſhall perſwade and require.

The deſcription of the hip.

The ſignes. The cure.

CHAP. XVII. *Of a fracture of the ſhoulder, or arm bone.*

THe Arm bone is round, hollow, full of marrow, riſing up with an indifferent neck, and ending on the upper part into ſomewhat a thick head. On the lower part it hath two proceſſes, the one before, the other behinde, between which there is (as it were) an half circle, or the cavity of a pulley, each end whereof leads into its cavity, of which one is interior, another exterior; that by theſe (as it were) hollow ſtops, the bending and extenſion of the arm might be limited, leſt that the bone

The deſcription of the arm, or ſhoulder bone.

bone of the cubit, if the circle ſhould have been perfect, ſliding equally this way and that way, might, by its turning, have gone quite round, as a rope runs in a pulley; which thing would much have confuſed the motion of the cubit. For ſo the extenſion, or bending it back, would have been equall to the neceſſary bending it inwards. It is very expedient that a Surgeon know theſe things, that ſo he may the better know how to reſtore the fractures and luxations of this part. If one of the fragments of this broken bone ſhall lye much over the other, and the Patient have a good ſtrong body, then the arm ſhall be much extended, the Patient being ſo ſet upon a low ſeat, that he may not riſe, when the fracture ſhall be a ſetting, and ſo hinder the begun work; and alſo, that ſo the Surgeon may the more eaſily perform his operation upon the Patient ſeated under him; yet *Hippocrates* regarding another thing, would have the Patient to ſit higher. But you muſt have a care that the ſhoulderbone it ſelf be drawn directly downwards, and the cubit ſo bended as when you put it into a ſcarf. For if any one ſet this bone, lifting the arm upwards, or otherwiſe extending it, then muſt it be kept in that poſture; for otherwiſe, if the figure be changed, the ſetting will quickly be ſpoiled, when as you come to put the arm in a ſcarf. Wherefore the Surgeon muſt diligently and carefully obſerve that in ſetting a broken arm, he put it in ſuch a poſture, that reſting on the breaſt, it look down towards the girdle. You muſt have a care in laying the ſplints, and rowling your ligatures, that they hurt not, nor preſs too hard upon the joints. For, in the opinion of *Hippocrates*, by the preſſure of parts which are nervous, fleſhleſs, and conſequently endued with exquiſite ſenſe, by the ſplints there is danger of moſt grievous pain, inflammation, denudation both of the bone and nerve; but chiefly, if ſuch compreſſion hurt the inner part, towards which the arm is bended, wherefore the ſplints made for this place muſt be the ſhorter. Therefore after the arm-bone is ſet, the arm ſhall be laid upon the breaſt in a right angle, and there bound up in a ſcarf, leſt that the Patient, when he hath need to ſtir, ſpoil and undo the ſetting, and figure of the broken bone. But the arm muſt be kept in quiet, untill ſuch time as the fragments ſhall be confirmed with a *Callus*, which uſually is in forty dayes, ſooner or later, according to the different conſtitutions of bodies.

The cure.

How the arm muſt be placed when the bone is ſet.

Sect. 3. offic. ſect. 1. de fract.

In what time it will knit.

CHAP. XVIII. *Of the fracture of the Cubit, or the Ell and Wand.*

The differences.

IT ſometimes happeneth, that the cubit and wand are broken together and at once, and otherwhiles that but the one of them is fractured. Now they are broken either in their midſt or ends; their ends (I ſay) which are either towards the elbow, or elſe towards the wriſt. That fracture is worſt of all, wherein both the bones are broken, for then the member is made wholly impotent to perform any ſort of action, and the cure is alſo more difficult, for the member cannot ſo eaſily be contained in its ſtate: for that bone which remains whole, ſerves for a ſtay to the arm, and hinders the muſcles from being drawn back, which uſually draw back and ſhrink up themſelves, whenſoever both bones are broken. Hence it is, that that fracture is judged the worſt, wherein the cubit or ell bone is broken. But that is eaſieſt of all, wherein only the wand is broken, for ſo the fractured part is ſuſtained by the ell bone; when both the bones are broken, there muſt be made a ſtronger extenſion, for that the muſcles are the more contracted. Therefore, whenſoever either of them remains whole, it doth more ſervice in ſuſtaining the other, then any either ligatures or ſplints, for that it keeps the muſcles right in their places. Wherefore, after the bones ſhall be ſet and rowled up with ligatures and ſplints, the arm muſt be ſo carryed up in a ſcarf put about the neck, that the hand may not be much higher than the elbow, leſt the blood and other humours may fall down thereinto. But the hand ſhall be ſet in that poſture which is between prone and ſupine, for ſo the wand ſhall lye directly under the ell, as we have read it obſerved by *Hippocrates*. The reaſon is, for that by a ſupine figure or ſituation, both the bone and muſcles are perverted: for firſt, for the bone, the *Apophyſis, ſtyloides* and *Olecranum* of the cubit, ought to be in an equall plain, and to be ſeated each againſt others which is not ſo in a ſupine figure, as wherein the *Proceſſus ſtyloides* of the cubit is ſet againſt the inner proceſs of the arm bone. But in muſcles, for that, like as the inſertion and ſite of the head of a muſcle is, ſuch alſo is the ſite of the belly thereof, and laſtly, ſuch the inſertion of the tail thereof; but by a ſupine figure, the muſcles ariſing from the inner proceſs of the arm bone and bending the cubit, ſhall have the tail placed in an higher and more exteriour ſite. In the *interim*, you muſt not omit, but that the Patients arm may, with as little pain as poſſible you can, be bended and extended now and then, leſt by the too long reſt of the tyed up part, and the intermiſſion of its proper function, the bones of the joint may be ſowdred together by the interpoſition, and as it were glue of the defluxion which falls abundantly into the joint of the elbow, and neighbouring parts, whence the ſtifneſs and unmoveableneſs thereof, as if there were a *Callus* grown there: from whence it may happen that the arm thereafter may neither be bended, nor extended, which I have obſerved to have happened to many. Whereof alſo *Galen* makes mention, and calls this kind of vitiated conformation *Ancyle* and *Ancyloſis*. If a wound alſo aſſociate a fracture of the arm, then ſee that you put about it plates of Latin, or Paſt-bord, and make a convenient ligature, and that the fragments of the bones be kept in the ſame ſtate wherein they were ſet and reſtored. Moreover, let him lay his arm upon a ſoft pillow, or cuſhion, as the precedent figure ſhewes you.

CHAP.

CHAP. XIX. *Of the fracture of a Hand.*

THe bones of the Wrist, and After-wrist, may be broken but, in *Hippocrates* opinion, chiefly by that kind of fracture which is called a *Sedes*, now if they shall happen to be broken, this shall be the manner of restoring them. Let the Patient lay forth his hand upon some even and smooth table, then let your servant stretch forth the broken bones, and the workmaster restore them thus extended, and put them in their proper seats. But being restored, they must be kept in their places by such remedies as are used in other fractures; to wit, cerates, compresses, linnen cloths, and splints. Now the fractured fingers shall be tyed or bound to their neighbours, that so they may the more easily, as bound to a stake, be kept in that state wherein they have been put by the hand of the Workman. But these bones, seeing they are of a rare and spongie nature, are in a short time and easily strengthened, or knit by a *Callus*. These things being done, the hollowness or palm of the hand shall be filled with a Tennis ball, for thus the broken bones shall not only be more easily kept in their places, but also the fingers themselves shall be kept in a middle posture, that is, not wholly open, nor quite shut. If they be kept in any other figure, the ensuing *Callus* will either deprave or quite abolish that action of the hand, whereby we take hold of any thing. The case stands otherwise with the fractured Toes; for they shall be kept streight and even out, lest they should hinder our going or standing.

Sect. 2. de fract. sen. 9.

The cure.

To what purpose the carrying of a ball in a fractured hand serves.

CHAP. XX. *Of the fracture of the Thigh.*

IT is a hard thing to bring the fragments of the broken thigh together to be set, by reason of the large and strong muscles of that part, which whilest they are drawn back towards their originall, by a motion both naturall and convulsive, they carry together with them the fragment of the bone, whereinto they are inserted. Therefore, when as the fracture of this bone shall be restored, the Patient must lye upon his back with his leg stretched forth, and the Surgeon must strongly and with great force extend the thigh, but if he alone shall not be able sufficiently to extend it, he shall imploy two other strong attendants, by whose joint-help the fragments may be fitted and set each against other. For this purpose, when as the strength of the hand was not sufficient, the Ancients used an Instrument, called a *Glossocomium*, whereof this is the figure.

Why the bone of the thigh is more difficultly set.

The figure of a Glossocomium, *or Extender.*

In stead of this *Glossocomium*, you may make use of my Pulley, for *Hippocrates* in this bone when it is broken, doth approve of extension so great, that although by the greatness of the extension the ends of the fragments be somewhat distant asunder, an empty space being left between; yet notwithstanding would he have ligature made. For it is not here as it is in the extensions of other bones, whereas the casting about of Ligatures keeps the muscles unmoveable: but here, in the extended thighs, the deligation is not of such force, as that it may stay and keep the bones and muscles in that state, wherein the Surgeon hath placed them. For, seeing that the muscles of the thigh are large and strong, they overcome the ligation, and are not kept under by it. The Surgeon, in setting it, shall also consider, that the thigh-bone is hollowed on the inner side, but gibbous on the outside, therefore it must be set in its native figure. Otherwise, if any unmindfull of this consideration, would have it streight, he shall make his Patient halt all his life after: wherefore this inner and native hollowness must be filled up and preserved by putting in a compresse or boulster spread over with *unguentum rosatum*, or the like glutinous thing that it may not fall off: for thus also the ligation shall the more faithfully keep the fragments of the bone in their places. Moreover, Compresses shall be applyed to the more slender and less protuberating parts of the thigh, as those which are next the ham and knee, that so the whole ligation may be alike, and consequently the more firm. Now ligatures, as we formerly noted, are ordained for three things. The first is, that the bones may be kept in that state wherein they were set, till they be strengthened by a *Callus*. The second is, to hinder defluxion, which easily falls into the broken and luxated parts, both by reason of pain, as also by weakness. The third is, to stay and hold fast the splints and medicins which are applyed. Inflammation is hindred by repressing and hindring the blood and other humors, ready to flow down, from entring into the part, and by pressing those humors, which are peternaturally contained in the part, into the neighbouring parts above & below. Wherefore there must no small care be had of preparing ligatures, to wit, that they be made of choice and well woven cloth, yet not coursest or rough, and let them be of such length and breadth, as the Surgeon, perfected by an artificiall conjecture, shall judge to be fit for the thickness and length of the member, and greatness of the fracture: for ligatures ought to be of breadth to involve and cover all the fractured part, & a great part of that which is found. But seeing that in my Book of Bandages, I have fo-

The naturall and inaturall crookedness must be preserved in setting the bone.

The part to be bound up, must, be made plain either by nature or art.

most

med chiefly to ſet down and approve the manner of binding uſed by *Hippocrates*, now I thing good here in this place to deſcribe that which is in common uſe amongſt our Surgeons. Our Surgeons therefore at this day require three Ligatures for fractures, the firſt whereof they preſently caſt upon the hurt part, whether broken or diſlocated, or only ſtrained, making the firſt wrappings upon it ſo that they moſt and ſtraitlieſt bind it there, but leſſe and more looſly on both ſides thereof. Such circumvolutions, or wrappings, are drawn upwards, and there ended. They muſt be rowled thick, and not wide, for ſo if they preſently follow, and lye one upon another, they will hold the bones more firmly, and more far and wide preſſe forth and repreſſe the ſuperfluous blood from the ſound part. They preſently in like ſort caſt the ſecond ligature upon the very fracture, giving it two wraps, then going downwards; yet ſo, as that they are opener or wider, and farther diſtant each from other, and not ſo cloſe together, as the circumvolutions of the firſt ligature; that ſo they may preſs the humors the leſſe to the extremities of the part, as thoſe which cannot receive and bear, without inflammation and danger of a gangrene, ſuch abundance of humors, for that they are not ſufficiently ſpatious; as alſo more remote from the fountain of native heat, which is greater in the center than in the circumference. At the lower end of the hurt part the circumvolutions either end, or elſe are twined thence back again. They caſt on the third ligature in that lower end of the hurt part, and rowl it ſmoothly and gently upwards, the windings being made contrary to the windings of the firſt and ſecond ligatures; that they may ſo draw back into their naturall ſtate the muſcles, which peradventure have been drawn aſide by the force of the former wrappings. Theſe ligations finiſhed, they apply three ſplints of paſt-bord, or ſome ſuch matter; the firſt below the fracture, and that truely more broad, and of ſufficient length; and then two others, one on each ſide, diſtant each from other ſome fingers breadth, to the end to keep the bone that it do not ſtir to this ſide or that, being wrapped about with Tow or Cotton. Then they think of placing or laying the part, to which purpoſe they propound to themſelves three ſcopes. The firſt is, that the part may lye ſoft; the ſecond, ſmooth, or even; the third, ſomewhat high. The hurt part ought truely to lye ſoft, for that hard lying preſſes it, and cauſes pain and inflammation; which whiles the Patient cannot patiently endure, he is forced to change his place, whilſt he every way ſeeks eaſe for his pain: and thus he now and then moves the fractured part, which ought to be kept quiet without any motion. It muſt lye ſmooth or even, becauſe an unequall or uneven ſite diſtorts or draws awry the part, whilſt one portion of the hurt part is born up, and ſuſtained by that which lyes under it; but the other hanging down hath nothing thereunder, whereupon it may reſt. Therefore *Hippocrates* bids us diligently to take heed that the heel do not hang down, nor the foot remain without a pillow, for hence pain and a troubleſome defluxion of humors is to be feared. But the part ought to lye ſomewhat high, that the defluxion may be hindred, which is eaſily ſtirred up by a prone and declining ſite: for if the foot ſhal be placed in a lower figure, the blood which flowes thither from the leg, will cauſe inflammation. But on the contrary, if it be higher, nothing can flow down thereinto. Therefore abſolutely not only the foot, but alſo the thigh and leg, are to be placed higher than the reſt of the body: yet keeping ſuch a mean, that the part may not be too much diſtended, as *Hippocrates* admoniſheth us. In the mean time, this hurt leg or ſide, ought to be of equall length with the ſound; and for that purpoſe it muſt be ſtayed on both ſides with Junks, as we ſhall ſhew you hereafter, when we come to ſpeak of a broken leg. The bandage being performed as we have ſaid, the following night, and the next day the Patient feels the member more ſtraitly bound, than when it was firſt wrapped; yea, verily the knee is lifted up into a ſoft tumor by the expreſſion of the humor from the wounded part: but on the contrary, the enſuing day the ligation is ſlackned and relaxed, ſome portion of the humor contained in the part being digeſted. Alſo the next day all things are perceived more looſe, there being made a larger reſolution of the humor. Then therefore the bandages muſt be looſed, and that not only, leſt that the fragments of the bones ſhould fall forth of their place, but alſo that we may gratifie the Patient by that alteration or change of place, and beſides that we may avoid itching, which uſually happens to parts too long bound up, by reaſon of the ſuppreſſion of acrid and fuliginous excrements, which uſe to be gathered in great quantity in a part at reſt and bound up, both from the excrementitious humors, wherewith the part is moiſtened, and the alimentary humors, in a part which is idle and at quiet; by reaſon the diffliation and tranſpiration are hindred by want of exerciſe, and the pores of the ſkin ſhut up by the abundance of the ligatures: ſo that by the ſuppreſſion thereof, many have not only an itching, but alſo the ſkin being broke by the acrimony of theſe, as well vapours as humors, which are kept ſhut and pent up, have ulcers break forth. Therefore when ſuch accidents ſhall be feared, the part ſhall ſo long be fomented with warm water and oil, as you ſhall think fit: for, ſuch fomenting aſſwageth pain, relaxeth that which was too much ſtraitned by the binding, and amends the refrigeration of the part, cauſed by the repercuſſion and expreſſion of the blood and ſpirits, the native and internall heat being by this means revived. If, together with the tumor, there be a contuſion and fugillation, it muſt be the longer fomented, that the excrementitious humor reſiding in the part may be digeſted. But if this quantity of time ſhall not ſuffice, then muſt you uſe ſtronger digeſtives: yet have a care you uſe them not too long; for ſo you ſhould hinder the generation of a *Callus*. Therefore that ſaying of *Hippocrates* muſt here be remembred, which ſaith, That a weak fomentation, and the ſhort time of uſing one doth attract, but not diſcuſſe; but a longer and ſtronger waſts the fleſh. Beſides alſo, you muſt have regard to the temper and habit of the Patient; for fomentations, uſed to plethorick bodies, draw ſuperfluous humors to the part. The Ancients bid, that the ligatures be looſed every third day untill their ſeventh day: but after the ſeventh, on every ſeventh day: but hereof nothing can be certainly and perpetually decreed: for, according to the accidents the patients muſt be dreſſed ſooner or later, more often or ſeldome; ſeeing the ligatures, and the reſt of the dreſſing. Therefore, if no ſymptome urge, I would have none of theſe things, which are done to the Patient at the firſt dreſſing, to be moved, unleſſe at ſlowly and ſeldome as you may. For you hinder the knitting of the bone, if you never ſo little move the ends of the fragments thereof

for, as you see wood is joined together by glue, and pewter with sowder; so the fragments of bones are, by a providence of nature, glued and sowdred together by a *Callus*. Wherefore broken bones have very much need of rest, to the generating of a *Callus*; otherwise, the matter thereof flowing down, quickly flowes away, and nothing is done. You may much help forwards the generation of a *Callus*, which is begun about the thirteenth or fifteenth day, by applying an emplaister made with the white of an eg, having the powder of red rose leaves, and wheat flour mixed therewith, and other catagmatick plaisters, which shall hereafter be described in speaking of the fracture of a leg. Rest necessary for the knitting of set bones.

CHAP. XXI. *Of the fracture of the Thigh nigh to the joints, or the upper or lower head of the bone.*

A Fracture sometimes happens at the joint of the hip in the neck of the thigh bone, as I once observed in an honest matron. I being called to her, when I had observed the hurt thigh to be shorter than the whole, with the outward prominency of the *Ischium*, which at the first sight I supposed to proceed from the head of the thigh bone, I presently perswaded my self it was a dislocation and no fracture; I then therefore extended the bone, and forced (as I thought) the head thereof into its cavity. The equality of both the legs in bigness which followed upon this extension, encreased my perswasion that it was a dislocation. The next day I visited her the second time, and found her in great pain, her hurt leg the shorter, and her foot wrested inwards. Then I loosed all her ligatures, and perceived such a prominency as I did formerly. Wherefore I endeavoured again to force in the head of the bone, as I formerly did. But as I was busied therein, I heard a little crackling, and also I considered, that there was no cavity nor depression in the joint, by which signs I certainly perswaded my self, that the bone was broken, and not dislocated. Neither only such kind of fractures, but also the separation of the *appendix* or head of this bone from its place, may induce one to think it a dislocation, which thing hath sometimes deceived some heedless Surgeons, who have not dreamt of the divulsion or separation of the *appendix* from the top of the thigh bone, but have judged it only a dislocation. Then therefore (that I may return to my former narration) I set the bone, and joined the fragments together, laid thereupon splints with compresses, made ligations with a rowler, having two heads wrapped about the joint, and the body cross-wise, and I defended her foot with a case, that none of the cloths might press it. I fastned a rope to a post, and so let it come down into the midst of the bed, and tyed many knots thereon, for the better taking hold and lifting up her self; the which thing you must always do in fractures and dislocations of the thigh and leg, that so your Patient may have some stay, whereby they may succour themselves with their hands, as oft as they desire to rise, or lift themselves up in their beds, or go to stool; as also, that they may give perspiration, and as it were ventilation to the loins, buttocks, rump, and other parts, compressed and wearied with long lying, for want whereof they are molested with heat and pain, whence ulcers arise, which oft-times torment the Patient with such tormenting heat and pain, that he is even consumed by a feaver, watchings, and want of rest. This opportunity of raising the body out of the bed, is by so much the more needfull in this place, by how much the fracture is nearer the joint; for there it is more dangerous than in the midst of the thigh, and consequently more difficult to dress and heal, for that the part is bloodless, and by reason of the multitude of the nerves, tendons and ligaments, which are obnoxious to many malign symptomes. But the Surgeon must have diligent care in this kind of fracture, and must look often that the bone, which is set, do not fall forth again, which easily happens here by any light stirring of the body, and the like occasion, for that the thigh hath but one only bone. Therefore, as oft as the Bandages shall be loosed, and the fracture dressed, he shall attentively view the figure of the bone, and the magnitude of the affected part, comparing it with the sound, for the set and composed fragments of the broken bone, can scarce fall asunder, but that the one must lye upon the other. But before it be knit, the part must be extended and restored to its state, that so the Patient may not halt during the residue of his life. For I have read it written in *Avicen*, that scarce any do so well recover a fractured thigh, that they do not halt thereof; therefore the Patient must be carefull, that he move himself, or his body as little as he can. Many of the Ancients have set down the time of the consolidation of this bone to be fifty dayes: but (as I formerly said) there can be no certain or determinate time hereof. But in what time soever this bone shall be knit, the Patient must not stand or go thereon presently upon it; for that there remains a weakness in the part a long time after, so that the Patients are forced to use crutches to go withall, in the mean space while they recover more strength.

CHAP. XXII. *Of the fracture of the* Patella, *or whirle bone of the knee.*

The whirl bone of the knee is oft-times contused, but not so frequently broken; yet when that happens, it goes into two or three pieces, sometimes long-wise, sometimes thwart. Sometimes it is broken in the middle, and sometimes splintered into many splinters, and all these either with, or without a wound. The signs are the prominency [illegible] hollowness in that place, and a sensible separation of the fragments, the hurt [illegible] and the crackling of these parts under your hand. It is set after this manner, [illegible] keep it extended all the while, or till it be knit, and the [illegible] and it unequally, the hollowness of the hurt shall be filled with a boulster; for by bending of the knee the set fragments of the whirle bone would again fly in sunder. This being done, the [illegible] as is fitting, and be kept to set by the application of convenient remedies, making ligatures, and applying splints, as we said must be done in the fracture of the thigh bone. And lastly, you must observe and do in this as in the fracture of a leg. For the prognostick this I affirm, that I have seen none of those who have had this bone fractured, who have not halted during the rest of their lives. The cause hereof is, the knit-

ting by the concretion of a *Callus* hinders the free bending of the knee; going, especially on even ground, is more easie to the Patient, but an ascent is far more difficult, and absolutely painfull. The Patient must necessarily for this kinde of fracture lye or keep his bed, at the least for forty dayes.

CHAP. XXIII. *Of a broken leg.*

Sent. 65. sect. 2. de fract.

THis kind of fracture is cured after the same manner as that of the arm or cubit. *Hippocrates* admonisheth us, that the *Tibia*, or leg bone is more dangerous to be broken, and more difficult and slow to be healed than the *Fibula*, or shin bone; because that is the thicker, and as it were the upholder of the whole bulke of the body; but this other is but as it were a certain additament or assistant, provided for the staying or bearing up of the muscles of the leg by which the foot is moved. The leg bone being only broken, the signs thereof are perceived only in the inner part of the leg; for that the shin bone being whole, suffers it not to throw or cast forth it selfe. On the contrary, when the shin bone only is broken, the signs thereof appear only in the externall part of the leg, because the leg bone, being opposed thereto, doth not suffer it to cast in its self, and with its fragments to turn inwards. But when both the bones are broken, the signs of the fracture may equally appear both here and there. But when only one of these bones are broken, the fracture is far more easie to dresse and heal, because that which remains whole, is a much more firm stay to that which is hurt, than any splints can be. But that I may the better instruct and make ready the Surgeon for the restoring of this fracture, I will illustrate the matter by an example from my self. *John Nesbor*, Doctor of Physick, *Richard Hubert*, and I, went together to visit a Patient at the place of the Frier Minorites. Wherefore intending to pass over the Sein within sight of the place, I endeavoured to make my horse take boat, and therefore switched him over the buttocks. The Jade, madded herewith, so struck at me with his heels, that he brake both the bones of my left leg, some four fingers breadth above my ancle. Then I, fearing some worse mischief, and lest the Jade should double his blow, flew backs and as I fled back, the broken bones flew in sunder, and breaking through the flesh, stocking, and boot, shewed themselves, whereby I felt as much pain, as it is credible a man was able to endure. Wherefore I was presently carried into the boat, that so I might be carryed to the other side of the water to be dressed; but the stirring of the boat as they rowed, almost killed me with bitternes of pain, for that the sharp fragments of the bones were rubbed against the flesh which lay next them. Being ferried over, as I was conveyed into the next houses, my pain was much increased, whilest lifted by the hands of divers persons, one while up, another down, sometimes to the left side, other whiles to the right with my whole body, and all the parts thereof. When at the length I was laid upon a bed, I was somewhat freed from the bitternes of my pain, and had time to wipe off the sweat, which ran down over all my body. Then was I dressed with such a medicine, as the time and place would afford, we composed it of the white of an egge, wheat flour, soot of a chimny, and melted butter. For the rest, I entreated *Richard Hubert*, that he would handle me, as if he knew me not, neither that, moved for love of me, he should remit any thing of the severity of art, but chiefly, that he would stretch my foot straight out, and if the wound were not sufficiently wide, that he would enlarge it with his incision knife, that so he might the more easily set the broken bones in their due place; that he would with his fingers (whose judgment is far more certain than the best made instruments) search, whether the splinters which were in the wound were quite severed from the bone, and therefore to be taken forth; that he would with his hand press forth the blood, and the clods of blood which were in a great quantity concrete at the mouth of the wound; that he would bind up and place my leg in that site and manner, as he thought best: which is, that he should have three rowlers in a readiness, the first whereof he should cast directly upon the wound, so that he should begin his ligation at the wound: also he should put splints about it; some three, but others two fingers bredth, of the length of half a foot, somewhat depressed and hollowed, whereby they might be the more easily put about the leg, more straitly at their ends, and a fingers distance each from other, which at the last he should bind with fillets, like those wherewith women use to bind up their hair; yet so that the binding might be more strait upon the wound: and that he would fill the cavity of the ham, and of the ancles with boulsters made of flaxe wrapped in linnen clothes: that he would fortifie the sides of my leg with Junks made of bents or little sticks, and lined with linnen cloth, stretched from my heel to my groin, and bound over in four places; so that the strait figure of the leg might scarcely be perverted by any force: that he would gently, and smoothly, lift up my leg to an indifferent height: and lastly, that he should arm it from the violence of externall injuries, by putting it in a box or case. But you must note, that the fit placing or laying of the leg is a matter of such moment, that if any error be here committed, it will cause no less than lameness. For if it be lifted up higher than is fit, the *Callus* will be hollow on the forside; if lower than it will be gibbous or bunching forth. Neither also do they commit a small error, who do not fill up the cavities at the ancles after the aforementioned manner: for, hereupon the heel will be much afflicted, whilest it is forced to sustain a tedious and painfull compression, which at length brings a hard distemper, because the spirits cannot freely flow thereto; which I finding by experience, not knowing the cause, wished them ever now, and then to lift up my heel, whereby it might enjoy the benefit of perspiration, and the spirits have free entrance thereto, and

and the contained vapours passing forth. To conclude, my hurt leg was laid upon a cushion after the manner you see described in the page precedent.

CHAP. XXIV. *Of somethings to be observed in ligation, when a fracture is associated with a wound.*

THis, taken out of the doctrine of the Ancients, ought to be kept firm and ratified, that ligation must be made upon the wound; otherwise the wounded part will presently lift it self up into a great tumor, receiving the humors pressed thither by the force of the ligation made on this & that side, above and below, whence ensue many malign symptoms. You may make tryall hereof upon a sound fleshy part; for if you bind it above and below, not touching that which is in the midst, it will be lifted up into a great tumor, and change the flourishing and native colour, into a livid or blackish hue, by reason of the flowing and abundance of the humors pressed forth on every side from the neighbouring parts. Therefore such things will happen much the rather in a wounded or ulcerated part. But for this cause, the ulcer will remain unsuppurated and weeping, crude and liquid *sanies* flowing there-hence, like unto that which usually flowes from inflamed eyes. Such *sanies*, if it fall upon the bones, and make any stay there, it, with the touch thereof, burns and corrupts them, and so much the more, if they be rare and soft. These will be the signs of such corruption of the bones; if a greater quantity, and that more filthy *sanies*, flow from the ulcer, than was accustomed, or the nature of a simple ulcer requires; if the lips of the ulcer be inverted; if the flesh be more soft and flaccid about them; if a sorrowfull sense of a beating, and also deep pain torment the Patient by fits; if, by searching with your probe, you perceive the bone to be spoiled of its *periosteum*; and lastly, if you find it scaly and rough; or also if your probe be put down somewhat hard, it run into the substance of the bone. But we have treated sufficiently hereof in our particular Treatise of the rottenness of the bones. But certainly such rottenness will never happen to the bone, if the hurt part be bound up, as is fit, and according to art. Wherefore I judge it not amiss, again to admonish the Surgeon of this, that as far as the thing shall suffer, he make his rowlings upon the wound; unless by chance there be such excessive pain and great inflammation, that, through occasion of such symptomes and accidents, he be diverted from this proper and legitimate cure of the disease. Therefore then, because nothing more can be done, let him only do this, which may be done without offence, that is, let him supply the defect of ligation and rowlers, with a linnen cloth, not too weak, nor too much worn, being twice or thrice doubled, and which may serve to compass the wound and neighbouring parts once about: let him sew the edges thereof at the sides of the wound, lest he be forced to stir the fragments of the bones (which once set ought to be kept unmoved) as often as the wound comes to be dressed. For, broken bones do not require such frequent dressing, as wounds and ulcers do. By this it appears, that as want of binding, and too much loosness in absence of pain and a phlegmon, so also too strait ligation, when pain is present, brings a phlegmon and abscess to the wound. Therefore let all things here, according to the forementioned rules and circumstances, be indifferent. I have for this purpose thought good to reiterate these things, because you shall as yet find many, who follow the practise of *Paulus*, and make many circumvolutions here and there, above and below the wound, which presently they carry cross-wise. But this cross or lattice-like kind of ligation is wholly to be disliked, and that only to be used which we have described, according to the mind of *Hippocrates*. Now it is time that I returne to the former history of my mishap, and declare what was done to me after that first dressing, which I have formerly mentioned.

That the ligation must be most strait upon the wound.

What symptomes ensue the want of binding upon the wounded part.

Signs of the corruption of the bones.

When the wounded part must be omitted in ligation.

Lattice-like binding to be shunned.

CHAP. XXV. *What was used to the Authors leg after the first dressing.*

BEing brought home to mine own house in *Paris* in the afternoone, they took from me, out of the Basilica of the left arm, some six ounces of blood. And then at the second dressing the lips or edges of the wound and places thereabout were annointed with *unguentum rosatum*, which by a joint consent of the Ancients, is much commended in the beginnings of fractures: for it will asswage pain, and hinder inflammation, by repelling the humors far from the wounded part: for it is cold, astringent and repelling, as the composition thereof shewes; for it is made *ex oleo omphacino, aqua rosacea, pauco aceto, & cera alba*. Therefore I used this ointment for six dayes; I dipped the compresses and rowlers somewhiles in oxycrate, otherwhiles in thick and astringent red wine, for the strengthening of the part, and repressing the humors, which two things we must have a care of in *Hippocrates* opinion, in fractures especially with a wound. Wherefore if at any time the compresses or rowlers seemed to dry, I now and then moistned them with the oxycrate, or rose vineger: for, by their too much drinesse, pain and inflammation happen; and if they bind the part somewhat more strait, they hurt it also by their hardness. You shall see many Surgeons, who in this kind of affect, from the beginning to the end, use only astringent and emplastick medicins, wholly contrary to the method set down by *Hippocrates*, and commended by *Galen*. For, by the continued use of such things, the pores, and breathing places of the skin are shut up, whence the fuliginous excrement being suppresst, the externall heat is increased, and itching caused, and at length an ulcer by the fretting of the acrid and serous humour long suppresst. Whereby you may learn, that astringent and emplastick medicins must not be used above six dayes. In stead hereof you shall use the emplaisters, which I shall presently describe. In the beginning of my disease I used to spare a diet, that for nine dayes I ate nothing each day, but twelve stewed prunes, and six morsels of bread, and dranke a *Paris* pint of sugred water, of which water this was the composition. R. *succ. albis.* ℥xij. *aquæ font.* ℔xlj. *cinam.* ℥ij. *bullant simul secundum artem*: Otherwhiles I used syrup of maidens-hair with boiled water: Otherwhiles, the divine drink (as they term it) whereof this is the composition. R. *aquæ cottæ* ℔vj. *succ. albis.* ℥iv. *succ. lim.* ℥j. *agitentur & transvasentur sæpius in vasis vitreis*. I was purged when need required

Unguentum rosatum, wherefore] good in fractures.

You must have a care, that the compresses and rowlers grow not hard by drinesse.

The description of a sugred water.

with a bole of *Caſſia* with Rubarb. I uſed alſo ſuppoſitories of Caſtle ſoap to make me go to ſtoole, for, if at any time I wanted due evacuation, a preternaturall heat preſently ſeiled upon my kidnies. With this, though exquiſite manner of diet, I could not prevail, but that a fever took me upon the eleventh day of my diſeaſe, and a defluxion, which turned into an abſceſs, long flowing with much matter. I think the occaſion hereof was ſome portion of the humor ſuppreſt in the bottome of the wound, as alſo by too looſe binding, by reaſon that I could not endure juſt or more ſtrait binding; and laſtly, ſcales or ſhivers of bones quite broke off, and therefore unapt to be agglutinated: for theſe therefore putrefying, drew by conſent the proper nouriſhment of the part into putrefaction, and by the putredinous heat thence ariſing, did plentifully adminiſter the materiall and efficient cauſe to the defluxion and inflammation. I was moved to think they were ſcales ſevered from their bone, by the thin and crude *ſanies* flowing from the wound, the much ſwoln ſides of the wound, and the more looſe and ſpongy fleſh thereabouts. To theſe cauſes, this alſo did accrew, one night amongſt the reſt, as I ſlept, the muſcles ſo contracted themſelves by a violent motion, that they drew my whole leg upwards; ſo that the bones, by the vehemency of the convulſion, were diſplaced, & preſſed the ſides of the wound; neither could they be perfectly compoſed or ſet, unleſs by a new extenſion and impulſion, which was much more painfull to me than the former. My feaver when it had laſted with me ſeven dayes, at length enjoyed a *criſis* and end, partly by the eruption of matter, and partly by ſweat, flowing from me in a plenteous manner.

The cauſes of a fever and abſceſs, enſuing upon a fracture.

Signs of ſcales ſevered from their bones.

CHAP. XXVI. *What may be the cauſe of the convulſive twitching of broken members.*

WHy the extream parts are cold when we ſleep.

THis contraction, and (as it were) convulſive twitching, uſually happens to fractured members in the time of ſleep. I think the cauſe thereof is, for that the native heat withdraws its ſelf while we ſleep, into the center of the body; whereby it commeth to paſs, that the extream parts grow cold. In the mean while, nature, by its accuſtomed providence, ſends ſpirits to the ſupply of the hurt part. But becauſe they are not received of the part evill affected and unapt thereto, they betake themſelves together, and ſuddenly, according to their wonted celerity, thither from whence they came, the muſcles follow their motion: with the muſcles, the bones, whereinto they are inſerted, are together drawn; whereby it comes to paſs, that they are againe diſplaced, and with great torment of pain, fall from their former ſeat. This contraction of the muſcles is towards their originall.

CHAP. XXVII. *Certain documents concerning the parts, whereon the Patient muſt neceſſarily reſt, whileſt he lyes in his bed.*

The naturall faculties languiſh in the parts by idleneſs, but are ſtrengthened by action.

THoſe who have their leg or the like bone broken, becauſe they are hindered by the bitterneſs of pain, and alſo wiſh for their cure or conſolidation, are forced to keep themſelves without ſtirring, and upon their backs in their beds for a long time together. In the mean ſpace, the parts whereupon they muſt neceſſarily lye, as the heel, back, holy-bone, rump, the muſcles of the brocken thigh or leg, remain ſtretched forth and unmovable, ſet at liberty from their uſual functions. Whereby it comes to paſs, that all their ſtrength decaies, and grows dull by little and little. Moreover alſo, by the ſuppreſſion of the ſuliginous and acrid excrements, and want of perſpiration, they grow preternaturally hot; whence defluxion, an abſceſs and ulcer, happen to them, but principally to the holy bone, the rump, and heel: to the former, for that they are defended with ſmall ſtore of fleſh; to the latter, for that it is of more exquiſite ſenſe. Now the ulcers of theſe parts are difficultly healed, yea, and oft-times they cauſe a gangrene in the fleſh, and a rottenneſs and mortification in the bones there-under, and for the moſt part a continued feaver, *delirium*, convulſion, and (by that ſympathy which generally accompanies ſuch affects) a hicketing. For the heel and ſtomach are two very nervous parts, the latter in the whole body thereof, and by a large portion of the nerves of the ſixth conjugation; but the other by the great tendon paſſing under it, the which is produced by the meeting, and as it were growing together of the three muſcles of the calf of the leg. All which are deadly, both by diſſipation of the native heat by the feaverish, and that which is preternaturall; as alſo by the infection of the noble

noble parts, whose use the life cannot want, by carrion-like vapours. When as I considered all these things with my self, and (become more skilfull by the example of others) understood how dangerous they were, I wished them now and then to lift my heel up out of the bed; and taking hold of the rope which hung over my head, I heaved up my self, that so the parts, pressed with continuall lying, might transpire, and be ventilated. Moreover also I rested these parts upon a round cushion, being open in the middle, and stuffed with soft feathers, and laid under my rump and heel, that they might be refreshed by the benefit and gentle breathing of the air: and I did oft-times apply linnen clothes spred over with *unguentum rosatum*, for the asswaging of the pain and heat. Besides also, I devised a Casse of Lattin, wherein the broken leg being laid, is kept in its place, far more surely and certainly than by any Junks; and moreover also, it may all be moved to and again at the Patients pleasure. This Cass will also hinder the heel from lying with all its body and weight upon the bed, putting a soft and thick boulster under the calf, in that place where the Cass is hollow: besides also, it arms and defends it against the falling down and weight of the bed clothes, having a little arch made over and above of the same matter. All which shall be made manifest unto you by the precedent figure. Now it remains, that I tell you what remedies I applyed to the abscess which happened upon my wound. When therefore I perceived an abscess to breed, I composed a suppurative medicin of the yolks of egs, common oil, turpentine, and a little wheat flour, and I used it untill it was opened; then to cleanse it I used this following remedy. R. *Syrupi rosati & terebinth. venetæ, an.* ℥ij. *pulveris radicis iridis florentiæ, aloes, mastiches, farinæ hordei, an.* ℥ß. *incorporentur omnia simul & fiat mundificativum:* but I had a care, that the place, whereat I conjectured the quite severed scales of the bones must break forth, should be filled with tents made of sponge or flax, that so, by this means, I might keep the ulcer open at my pleasure. But I put into the bottome of the ulcer catagmatick and cephalick powders, with a little burnt alum, to procure the egress of the formerly mentioned scales. These at length cast forth, I cicatrized the ulcer with burnt alum. For, this having a drying and astringent faculty, confirms and hardens the flesh, which is loose and spongy, and flowing with liquid *sanies*, and helps forward natures endeavor in cicatrization. For, the fragments of the bones, they, by reason of their naturall drines and hardness, cannot be joined and knit together by themselves without a *medium*: but they need a certain substance, which, thickning and concreting at their ends, doth at length glue them together, and (as it were) fasten them with soder. This substance hath its matter of the proper substance and marrow of the bones, but the former from the native heat, and emplastick medicins, which moderately heat. For, on the contrary, these medicins, which, by their too much heat, do discuss and attenuate, do (as it were) melt and dissolve the matter of the *Callus*, and so hinder the knitting. Wherefore for this purpose, I would wish you to make use of the following emplasters, of whose efficacy I have had experience; for, hence they are called knitting or consolidating plaisters. R. *olei myrtill. & rosarum omphac. an.* lb. ß. *rad. althææ* lb. ij. *rad. fraxini, & fol. ejusdem, rad. consolidæ majoris & fol. ejusdem fol. salicis, an.* m. j. *fiat decoctio in sufficienti quantitate vini nigri, & aquæ fabrorum, ad medietatis consumptionem, adde in colatura pulveris myrrhæ & thuris an.* ℥ß. *adipis hirci,* lb. ß. *terebinth. lotæ* ℥iv. *mastiches* ℥ij. *litharg. auri & argenti, an.* ℥ij. *boli armeniæ, & terræ sigillatæ, an.* ℥j. ß. *minii* ℥vj *ceræ albæ quantum sufficit: fiat emplastrum, ut artis est.* In stead hereof you may use the black emplaister, whereof this is the description. R. *litharg. auri* lb. j. *olei & aceti* lb. ij *coquantur simul lente igne donec nigrum & splendens reddatur emplastrum, & non adhæreat digitis.* Or else, R. *olei rosat. & myrtill. an.* ℥ij. *nucum expressi, boli armen. sanguinis drac. pulverisatorum an.* ℥ß. *emplastri diachalcitheos* ℥iv. *liquefaciant simul, & fiat emplastrum secundum artem.* In defect of these, you may use a Cere-cloth, or *tela Gualteri*, whereof this is the description. R. *pulveris thuris, farinæ volatilis, mastiches, bolarm. resinæ pini, nucum expressi, rubiæ tinctorum, an.* ℥ij. *sevi arietini & ceræ albæ an.* lb. ß. *fiat emplastrum:* into which (whilest it is hot) dip a warm linnen cloth, for the forementioned use. *Emplastrum Diachalcitheos*, by the common consent of all the Ancients, is much commended for fractures; but it must undergo different preparations, according to the condition of the time; for in the summer it must be dissolved in the juice of plantain and night-shade, lest it should heat more than is fit. It is convenient, in the *interim*, to have regard to the temper of the affected bodies; for neither are the bodies of children to be so much dried as these of old men: otherwise if such drying medicins should be applyed to young bodies as to old, the matter of the *Callus* would be dissolved, it would be so far from concreting; wherefore the Surgeon must take great heed in the choice of his medicins. For, oftentimes remedies, good of themselves, are by use made not good, because they are used and applyed without judgement: which is the cause that oft-times pernicious accidents happen, or else the *Callus* becomes more soft, hard, slender, crooked, or lastly, concretes more slowly by the great error, and to the great shame of the Surgeon.

Medicins good of themselves, not good by event.

CHAP. XXVIII. *By what means we may know the Callus is a breeding.*

THen I knew that my leg begun to knit, when as less matter than was usuall came from the ulcer, when the pain slackened, and lastly, when as the convulsive twitchings ceased; which caused me to judge it fit to dress it seldomer than I was used to do. For, by the frequent detersion in dressing an ulcer, whilest a *Callus* is breeding, the matters whereof it is to be made, are drawn away and spent, which are (as they term them) *Rex, Combium*, and *Glutes*, which are the proper and genuine nourishments both of the bony, as also of the fleshy substance. I by other signs also conjectured the breeding of the *Callus*, to wit, by the sweating of a certain dewie blood out of the edges and pores of the wound, which gently dyed and bedewed the boulsters and ligatures, proceeding from the efflux of the subtler and gentler portion of that matter, which plenteously flowed down for the breeding of a *Callus*. As also, by a tickling and pleasing sense of a certain vapour, continually creeping, with a moderate and gentle heat, from the upper parts even to the place of the wound. Wherefore thenceforwards I somewhat loosened the ligation, lest, by keeping it too strait, I should hinder from

When the *Callus* is breeding the ulcer must be seldome dresst.

Hipp. sent. 43. sect. 1. & frast.

entring to the fragments of the bones, the matter of the *Callus*, which is a portion of the blood, temperate in quality, and moderate in quantity. Then therefore I thought good, to use nourishments fit to generate more gross, thick and tenacious blood, and sufficient for generating a *Callus*; such as are the extremities, tendinous, and gristly parts of beasts, as the heads, feet, legs, and ears of Hogs, Oxen, Sheep, Kids, all which I boiled with rice, French barley, and the like, using somewhiles one, somewhiles another, to please my stomach and palate. I also sometimes fed upon frumity, or wheat sodden in Capon broth with the yolks of egs; I drank red, thick and astringent wine, indifferently tempered with water. For my second course, I ate chesnuts and medlars: neither do I without some reason, thus particularize my diet: for that gross nourishments, especially if they be friable and fragil, as beef is, are alike hurtfull (for as much as pertains to the generating of a *Callus*) as light meats are For that makes the *Callus* too dry, these too tender. Wherefore *Galen* pronounces these meats only fit for generating a *Callus*, which are neither fragil, nor friable, neither serous and thin, nor too dry; but indifferent gross, and also viscid, fat and tough. These meats, digested by the stomach into *chylus*, are sent into the guts, and from hence, by the mesaraick veins, into the gate-vein, and the hollow part of the Liver, thence into the hollow vein, and so into the veins dispersed over all the body and the parts thereof. There are also some of these veins which carry blood into the bones; but in the large cavities of the bones is marrow contained, as in the small a certain marrowy substance, proportionable thereto, being their proper nourishment. The generation of marrow is from the grosser portion of the blood; which flowes into the greater cavities of the bones by larger veins and arteries, but into the less by lesser, which end in their pores and small passages. For, in large bones you may observe large and apparent passages, by which the veins and arteries enter for the forementioned use. By the same wayes the nerves also insinuate themselves, from whence proceeds a membrane which involves the marrow of the bones, the which by that means is endued with most exquisite sense, as experience teacheth; which is the cause that makes many beleeve, that the marrow hath sense of feeling, because the membranes thereof being hurt cause most bitter pain. Therefore out of the marrow and the proper substance of the bone, there sweats a certain gross and terrestriall juice, whereof, by the power of the assimilating faculty, which serves in stead of the formative, a *Callus* growes and knits. Simple fractures of the leg are usually knit in fifty daies; but through the occasion of the wound and the scale quite broke off, and other accidents which befell me, it was three whole months before the fragments of the bones were perfectly knit, and it was also another month, before I could go upon my leg without the help of a crutch. Going was painfull to me for some few dayes, because the *Callus* had taken up some place of the muscles: for, before my former freedome of motion could return again to the broken and knit part, it was necessary, that the tendons and membranes should separate themselves by little and little from the scar. In the performance of all these things, I had the diligent and faithfull assistance amongst the Surgeons, to omit Physitians, of *Anthony Portal* the Kings Surgeon.

Meats fit or generating a *Callus*

Why the marrow may seem to have sense of feeling.

In what space the leg is usually knit.

CHAP. XXIX. *Of those things which may hinder the generation of a* Callus, *and how to correct the faults thereof, if it be ill formed.*

HAving already spoken of the signs of a *Callus* beginning to concrete, of its generation and the manner thereof: it now remains, that we treat of those things which hinder the generation thereof; and what on the contrary help forwards the conformation and concretion thereof. Now these things which either wholly hinder, or else retard the generation of a *Callus*, have a strong and powerfull discussive and attenuating faculty; or else they are unctuous, oily, and moist. For by such, the juice, whereof the *Callus* ought to be, is either melted and consumed, or else growes soft, and is relaxed. But on the contrary, those things which help forwards a *Callus* must be drying, incrassating, thickening, hardning, and emplastick, moderately hot and astringent. But for moist and relaxing medicins, they ought to have no place here, unless when it happens that the *Callus* is ill formed, that is, too thick, or crooked, or otherwise ill shapen, whereby it may be wasted and broken, so to be restored again after a better manner. Yet notwithstanding, such things are not to be attempted, unless when the *Callus* is yet green, and so depraved, that the fault thereof doth very much pervert the native conformation of the part, and exceedingly offend the action. Then therefore in such a case, the place must be fomented with a decoction of a Sheeps head and guts, wherein shall be boiled the roots of Marshmallowes, of Briony, the seeds of Line, of Fænugreek, Pigeons dung, Bayberries, and the like. You shal also use this following ointment and plaister. ℞. *unguenti de Althæa* ℥iv. *olei liliorum, & axungiæ anserin. an.* ℥j. *aquæ vitæ parum, liquefiant simul, fiat linimentum quo liniatur pars.* Then apply this following emplaister. ℞. *emplast. de Vigo cum mercurio, cerati cæspati descriptione Physagrii, an.* ℥iij. *olei anethini & liliorum an.* ℥j. *liquefiant omnia simul, fiat emplastrum*; let it be spred upon leather for the aforesaid use. When by this means the *Callus* shall seem to be sufficiently mollified, it shall be broken, and the bones restored to their native state, and the cure of the fracture to be followed as at the beginning. If the *Callus* be become too hard through age, it is better not to break it, but to let it alone, lest some worse accident befall the Patient. For it may so fall out, that by your labouring to break it, the bone may break in some other part, before it break in that which is knit by the *Callus*. Therefore the discreet Patient had rather live lame, than for eschewing it, to undergo the hazzard of his life. If the *Callus* be too gross, it shall be diminished (if it be as yet fresh) with emollient, resolving, and powerfully astringent medicins, which have force to dissolve, dry and exhaust. It will also be good strongly to rub the *Callus* with oil of Bayes, wherein Salt-petre or some other kind of Salt hath been dissolved, then wrapped about with a rowler to bind it very straitly, putting a leaden plate thereon, whereby the flowing down of the nourishing humor into the part, may be forbidden; that thus by little and little the *Callus* may decay and diminish. If on the contrary, it any wayes happen that the *Callus* be more thin and slender, and grows more slowly, for that it is too straitly bound,

Discussing and unctuous medicins hinder the generation of a *Callus*.

What helps forward the generation thereof.

What *Callus* must not be broken, though distort, or otherwise ill conformed.

The causes of too slender a *Callus*

bound, or because the idle part is longer kept in quiet than is fit, without exercising of its proper function, (which cause is to be reckoned amongst the chief causes of the leanness, even for this reason, for that exercise stirs up the native heat of the part, the worker of digestion and nutrition) or else for that they feed upon such nourishments as offend in quality, or quantity, or both; or for that the ligature, used to the part, is too often loosed, or because the part is felt is too hastily and before the time put to undergo solid offices and motions. According to the variety of causes, medicins shall be applyed. For if the ligature of the part be too strait, it shall be loosed, yea verily the fractured place, the ligature being taken away, shall be quite freed from ligation, and a new kind of ligature must be made, which must be rowled down from the root of the vessels, that is, from the armpits, if the arm; or from the groin, if the leg be broken, to the fracture, yet so, as that you may leave it untouched or taken in, for thus the bloud is pressed from the fountain and spring, and forced into the affected part, by a way quite contrary to that whereby we have formerly taught, in fear of inflammation, to hinder it from entrance into the affected part. Also gentle frictions and fomentations with warm water may be profitably made, from which you must then desist when the part shall begin to grow hot and swell. If any too long continue these frictions and fomentations, he shall resolve that which he hath drawn thither. For this we have oftentimes observed, that frictions and fomentations have contrary effects, according to the shortness and continuance of time. Pications will also conduce to this purpose, and other things which customarily are used to members troubled with an *atrophia*, or want of nourishment.

Remedies therefore.

When we must desist from fomenting and frictions.

CHAP. XXX. *Of fomentations which be used to broken bones.*

DIvers fomentations are used to broken bones for severall causes. When we use warm water for a fomentation, we mean that, which is just between hot and cold, that is, which feels lukewarm to the hand of the Physitian and Patient. A fomentation of such water used for some short space doth moderately heat, attenuate and prepare for resolution, the humor which is in the surface of the body, it draws blood and an alimentary humor to the part labouring of an *atrophia*; it assuages pain, relaxes that which is too much extended, and moderately heats the member refrigerated through occasion of too strait binding, or by any other means. On the contrary, too hot fomenting cools by accident, digesting and dissolving the hot humor which was contained in the member. We mean a short time is spent in fomenting, when the part begins to grow red and swell, a just space, when the part is manifestly red and swoln: but we conjecture, that much or too much time is spent thereon, if the redness, which formerly appeared, go away, and the tumor, which lifted up the part, subside. Also in fomenting, you must have regard to the body whereto it is used. For if it be plethorick, an indifferent fomentation will distend the part with plenty of superfluous humors; but if it be lean and spare, it will make the part more fleshy and succulent. Now it remains, that we say somewhat of the fracture of the bones of the feet.

Warme water.

The effects thereof.

Notes of short, just, and too long fomenting.

Fomentations hurt plethotick bodies.

CHAP. XXXI. *Of the fractures of the bones of the feet.*

THe bones of the instep, back and toes of the feet, may be fractured as the bones of the hands may. Wherefore these shall be cured like them, but that the bones of the toes must not be kept in a crooked posture, as the bones of the fingers must, lest their action should perish or be depraved. For as we use our legs to walk, so we use our feet to stand. Besides also the Patient shall keep his bed untill they be knit.

Why the fractured bones of the foot must be kept in a streight posture.

The end of the fifteenth Book.

OF DISLOCATIONS, or LVXATIONS.

THE SIXTEENTH BOOK.

CHAP. I. *Of the kinds and manners of dislocations.*

A Dislocation is the departure or falling out of the head of a bone from its proper cavity, into an accustomed place besides nature, hindring voluntary motion. There is another kind of Luxation, which is caused by a violent distention, and as it were a certain dilacation, and dilatation, or extension into length and bredth of the ligaments, and all the nervous bodies, which contain, strengthen, and bind together the joints. Thus those who have been tormented and racked, have that thick ligament which is in the inner cavity of the huckle bone too violently extended. Those who have suffered the Strappado, have the ligament encompassing the articulation of the arm bone, with the shoulder blade, forcibly and violently distended. Such also is their affect, whose foot is strained by slipping. There is a third kinde of luxation, when as those bones which are joined contiguous, and one (as it were) bound to the sides of another, gape or fly asunder: as in the arm, when the ell parts from the wand, in the leg, when the one footle flyes from the other: yet this may be referred to the second sort of dislocations, because it happens not without dilatation;

What a Luxation properly so called is.

What a Luxation not properly so called is.

The third kind of dislocation.

The fourth. tion, or elſe the breaking of the ligaments. There is alſo a fourth added to theſe, as when the *Epiphyſes* and heads of bones are plucked from the bone whereon they were placed or faſtned: which unproperly called kind of Luxation, hath place chiefly in the bones of young people, and it is known by the impotency of the part, and by the noiſe and grating together of the crackling bones when they are handled. Now the bones of young folks are alſo incident to another caſualty: for as the bones of old people are broken by violence by reaſon of their drineſs and hardneſs, thus the bones of children are bended or crooked in by reaſon of their naturall ſoftneſs and humidity.

CHAP. II. *Of the differences of Diſlocations.*

What Luxations are ſimple. SOme Diſlocations are ſimple, others compound. We term them ſimple which have no other preternaturall affect joined with them; and ſuch compound, as are complicated with one or more preternaturall affects; as when a diſlocation is aſſociated with a wound, fracture, great pain, inflammation, and an abſceſs. For, through occaſion of theſe we are often compelled ſo long to let alone the luxation, until theſe be remitted of themſelves, or by our art. Some Diſlocations are complete and perfect, as when the bone wholly fals out of its cavity: otherſome are unperfect, as when it is only lightly moved, & not wholly fallen out; wherefore we only cal them ſubluxations or ſtrains. Differences of Luxations are alſo drawn from the place: for ſometimes the bone is wreſted forwards, otherwhiles backwards, upwards, downwards; ſomewhiles it may be wreſted, according to all theſe differences of ſite, and otherwhiles only according to ſome of them. Differences are alſo taken from the condition of the diſlocated Joint in greatneſſe and littleneſs, from the ſuperficiary or deep excavation of the *ſinus* or hollowneſs; and laſtly from the time, as if it be lately done, or of ſome long continuance. I have judged it fit to ſet down all theſe, for that there are ſeverall indications of curing, according to the varietie of each of theſe, as we ſhall teach hereafter.

What compound.

What a compleat Luxation is.

What a ſubluxation or ſtrain.

CHAP. III. *Of the cauſes of Diſlocations.*

Internall cauſes of diſlocations. THere are three generall cauſes of Luxations, internall, externall, and hereditarie. The internall are excrementitious humors and flatulencies, which, ſetling into the joints with great force and plentie, do ſo make ſlippery, ſoften and relax the ligaments which bind together the bones, that they eaſily fal out of their cavities, or elſe they ſo fil & diſtend theſe ligaments, and make them ſo ſhort, that being contracted, they alſo contract the *appendices* of the bones from whence they ariſe, and ſo pluck them from the bone whereon they are placed, or elſe draw the heads of the bones out of their cavities, chiefly if the violence of a noxious humor doth alſo concur, which poſſeſſing and filling up the cavities of the joints, puts them from their ſeats, as it oft-times happens to the joint of the hip by Sciaticaes, and to the *Vertebræ* of the ſpine, by whoſe Luxation people become gibbous, or otherwiſe crooked. But externall cauſes of Diſlocations are, fals from high, bruiſing and heavy blowes, the Rack, ſtrappado, ſlipping in going, and all ſuch like things, which may force the heads of the bones to fly out of their ſeats, or cavities, which alſo happens ſometimes to infants in their birth, when as they are too careleſly and violently drawn forth by the Midwife, ſo that either their arms or legs are put out of joint. Hereditarie cauſes are ſuch as the Parents tranſfuſe into their off-ſpring: hence it is, that crooked not neceſſarily, but oftentimes are generated by crooked, and lame by lame. The truth whereof is evident by daily experience. Beſides alſo *Hippocrates* himſelf avers, that infants in the very womb may have their Joints diſlocated by a fall, blow and compreſſion, and by the too much humidity and looſneſs of the Joints: whence alſo we ſee many crook legg'd and footed from their nativity; ſo that none need marvell or make any doubt hereof. We have read it obſerved by *Galen In librum de Artic.* that children may have impoſtumes in their mothers wombs, which may caſt forth quitture, the ulcers being opened of their own accord, and be cicatrized by the only benefit of nature. It alſo happens to many from their firſt conformation, that the cavities of their Joints are leſſe depreſt than they ſhould be, and that their verges are more dilated than they ought to be; whereby it happens that the heads of the bones can the leſſe enter into them. It falls out, that otherſome have the ligaments, appointed by nature for faſtning together the bones of the joint, whether inſerted or placed about, ſo weak, that from their firſt originall they are not of ſufficient ſtrength, or elſe abound with much Phlegm, either bred together with them, or flowing from ſome other place; ſo that by their too much ſlipperineſs they leſſe faithfully contain the knittings or articulations of the bones. In all theſe as the bones are eaſily diſlocated, ſo they may preſently be eaſily reſtored without the aſſiſtance of a Surgeon, as I have ſometimes obſerved in ſome.

Externall cauſes.

Hereditarie auſes.

Sect. 3. ſent. 88. & 94. ſect. 82. 4. ſent. 3. & 4. lib. de art.

Children may have Impoſtumes in their mothers wombs.

CHAP. IIII. *The ſigns of diſlocations.*

The common ſign of all diſlocations. SOme of the ſigns whereby we come to the knowledg of a luxated bone, are common to all diſlocations; others are proper only to ſeverall Luxations. It is a common ſign, that there is alwaies a tumor in that part whereto the bone runs, and a hollowneſs on that ſide from whence it is flown. Now the proper ſigns ſhall be ſhewed, when as we come to treat of the particular kindes of Luxations. We know a perfect Diſlocation by the loſt action of the part, that is to ſay, the loſt motion; pain alſo breeds a ſuſpicion of a diſlocation: for the head of the bone, which (moved out of its place) is forced into another, preſſes the fleſh, and diſtends the nerves alſo moved out of their place. Hereto alſo conduces the comparing of the ſound joint with that which is hurt, in which collation, it is fit the ſound part, which is compared with the hurt, be no waies, neither by nature nor any accident, wronged, nor defor-

deformed, nor withered or decayed, nor ſwoln above meaſure, otherwiſe it may cozen and deceive you, if you be leſſe warie. Labour and difficulty of action in moving, is a ſign of an uncomplete Luxation, or ſtrain. Now we thus know, that the ligaments, ſerving to the connexion of the articulations, are extended and relaxed, if the head of the bone, preſſed with your fingers, be eaſily driven unto the contrary part, and ſodainly fly thence back again; if thruſting your finger into the joint, it eaſily enter, nothing reſiſting it, as though all were empty within; if the motion be difficult, or none at all. Signs of an unperfect diſlocation.

CHAP. V. *Of Prognoſticks to be made upon luxations.*

ALl Joints may be perverted or luxated, but all of them cannot in like manner be reſtored. For the head may be diſlocated, but thereupon preſent death enſues, by reaſon of the compreſſion of the whole ſpinall marrow preſently at the originall thereof; ſuch alſo is the diſlocation of a *vertebra* of the ſpine, and of the Jaw-bone, which, ſlipped forth on both ſides, hath cauſed inflammation, and a great tumor before that it be ſet. The bones of other Joints, as they are more or leſſe diſlocated, and moved out of their ſeats, ſo may they be more eaſily or difficultly reſtored. For, by how much they are the leſſe moved out of their places, by ſo much they are the more quickly, and by how much they are the further, by ſo much they are the more ſlowly and difficultly ſet. Alſo an indication, taken from the figure of the luxated bone, gives a ſign of the eaſie or hard reſtoring of the diſlocation; as in the Arm, by how much the bones be the more eaſily diſlocated, by ſo much once luxated they are the more eaſily reſtored. Bones do not eaſily fall out of joint in fleſhy bodies; but when they chance to be put out, they are not eaſily got in again. For in ſuch, the articulation is ſtraitly on every ſide held in by the thickneſs of the muſcles, and the plenty of the fat lying thereabouts. On the contrarie, ſuch as are lean, eſpecially thoſe who formerly have been more fat, have their joints more lax, whereby it comes to paſſe, that their bones may eaſily be put forth of joint: beſides alſo, through the default of the digeſtive faculties, they have their joints replete with mucous humors, whence it is, that the heads of the bones, as ſtanding in a ſlippery place, are the leſſe ſtable, as it is recorded by *Hippocrates*. But ſlender bodies, which are naturally dry, compact and denſe, have their muſcles and ligaments more ſtrong and dry; wherefore their bones are the more difficultly diſplaced; and diſplaced, the more difficultly ſet. Some bones, joined amongſt themſelves, do ſometimes fly aſunder, as when the ſhoulder blade flyes from the collar-bone at the *Acromion*, and in the Arm the Ell from the Wand, and in the Leg the one ſocile from the other, and the Heel-bone from the Ancle. Bones thus ſeparated will never be joined together again, will never recover their former comely figure, never their ſtrength of action. For, then it moſt uſually happens, that the ligaments are either broke aſunder, or elſe reſolved and become lax. Thoſe whoſe bones are diſlocated by an externall cauſe, they, after they be ſet, may eaſily fall out again, for that the ligaments, moiſtened and bedewed with an excrementitious humor, cannot firmly hold them: oft-times the ligaments are not wholly broken, but only in ſome portion thereof, and hence the action of the part either periſhes, or is debilitated. Alſo that diſlocation is uncurable, when as the ligaments, ſteeped and ſwoln up with an excrementitious humidity, are ſo much ſhortened and contracted in their length, as they have acquired in their breadth: and thus they draw away and pluck off the *appendices* of the bones from whence they ariſe, and by reaſon the bone and the *appendix* do enter and receive each other by many cavities and prominencies, therefore they cannot, by how skilfull hand ſoever they be handled, be again fitly placed and put together. Old and inveterate diſlocations, wherein a tough humor poſſeſſing the cavity is concrete in ſtead of the head of the bone, are not to be reſtored; as neither when the heads of the luxated bones have by continuall attrition made themſelves a new cavity in the neighbouring bone: neither if they be reſtored, is the reſtitution firm and of continuance; becauſe the naturall cavity is poſſeſſed by another matter, and the new made near thereto cannot well and faithfully contain the received head of the bone. Thoſe who have their ſhoulder diſlocated, may uſe their hand for many actions, as well as the oppoſite ſound hand; for the weight of the body is not ſuſtained by the hands as it is by the legs. And by how much the hand is the more exerciſed, by ſo much the arm becomes the more corpulent. Contrarily, if the thigh-bone be diſlocated, eſpecially if it be wreſted inwards, the whole leg quickly decayes by an *atrophia*, becauſe the part doth abſolutely loſe all motion: for by the opinion of *Hippocrates*, the performance of the proper action encreaſes ſtrength, and makes the part in better plight; but idleneſs debilitates and makes it lean. If a great wound and fracture be joined with a luxation, there is danger, leſt while we uſe extention for reſtoring the part, we draw the nerves too violently; and ſo break the nerves, veins and arteries, whence would enſue fear of inflammation, convulſion, and other malign ſymptomes. Wherefore *Hippocrates* judges it better in ſuch a concourſe and complication of preternaturall affects, abſolutely not to meddle at all with the ſetting of the diſlocated bone: for, by attempting the reſtitution, certain death, but by omitting it only fatheneſs is to be feared. Every diſlocation muſt be reſtored before inflammation come, but if it be already preſent, you muſt preſently be careſull to take it away. For other things, let the Patient reſt, leſt if the affect be irritated, the increaſe and exceſſe of pain cauſe a convulſion, gangrene, and laſtly death, as I remember I have ſometimes obſerved. Therefore when inflammation, and other malign ſymptomes ſhall be mitigated and corrected, then may you endevour to reſtore the luxation, eſpecially if the habit of the body and member affected may admit it. For if the body be ſlender, delicate and tender, then the reſtitution will be more ſpeedy and facile. But on the contrary, more difficult, if it be groſſe and compact. And let thus much ſuffice for prognoſticks in Luxations.

VVhat luxations be uncurable.

VVhy thoſe bones which are hardly diſlocated, are hard to be ſet.

CHAP.

CHAP. VI. *Of the generall cure of Diſlocations.*

Five inventions in curing diſlocations.

FOr all that I have heretofore delivered the generall method of curing fractures and diſlocations, yet it ſhall not be unprofitable to repeat here in this place, thoſe things which may be accommodated to this Treatiſe of curing luxations. Now he that will cure diſlocations, muſt have regard to five intentions, which it will be fitting to perform in order. The firſt is, of holding; the ſecond, of drawing or extending; the third, of forcing in; the fourth, of placing in convenient figure and ſite; the fifth, of correcting the concomitant, or following ſymptomes.

The benefit of holding the member in diſlocations.

The firſt ſcope, which we ſaid was of holding, is meant either of the whole body, or elſe of ſome part thereof only. The whole body muſt be holden by the ſtrong embracement of your ſervant or attendant, when as the ſhoulder, the *vertebræ*, or the thigh bones are diſlocated. But in the diſlocation of the collar-bone, elbow, hand, knee, or foot and leg, it is ſufficient only to hold the part ſtraitly in your hands. There is neceſſity of holding either the body, or elſe ſome part thereof, leſt, while the diſlocated bone is extended, the whole body follow by continuance of parts, if there be nothing which may hinder: for if the body ſhould follow him that draws or extends, all the work-maſters labour and endeavour to reſtore it, is to no purpoſe. The uſe of the ſecond ſcope, that is, of drawing or extending, is, that there may be a free ſpace and diſtance between the luxated bones, by which diſtance the diſlocated bone may the more freely be forced into its cavity. But the manner of drawing or extending is different in quantity and manner, according to the various ſtrength of the muſcles and ligaments, and diſlocation of the bones to this or that part. Therefore this work is almoſt alwayes performed by the hands; which when they cannot ſuffice, we muſt uſe the aſſiſtance of inſtruments and engins, whoſe figures you ſhall ſee hereafter delineated. But that you may not do amiſs, you may ſo far uſe extenſion, untill the head of the bone be brought juſt againſt its cavity. When the Surgeon hath brought it to this paſs, then muſt he haſten to the third intention, which is, to put the head of the bone firſt moved and gently bended, into its cavity. For he muſt have a ſpeciall care, that he force it no other way, than into its proper cavity: for it would be dangerous, leſt he ſhould turn it from one extream into another, and the bone, for examples ſake, of the thigh, which was diſlocated into the fore-part by too violent forcing, by exceeding the middle cavity, may be driven and diſlocated into the hinder part. To ſhun this, the bone ſhall be put back the ſame way that it fell out, which may be eaſily done in freſh and late happening diſlocations. We underſtand that the bone is ſet by the noiſe, or as it were a popp, or ſound like that, which ſolid and ſounding bodies, being fully and forcibly thruſt into their cavities, do make; by the ſimilitude & conſent in figure, magnitude and all conformation of the affected part with the ſound, and laſtly, by the mitigation of the pain. The fourth ſcope, which is of the convenient ſite of the part, muſt be ſo fulfilled, that the bone after it is ſet may be kept in its cavity, and not fly forth again. Wherefore if the arm be diſlocated, it ſhall be carryed bound up in a ſcarf: if the thigh, knee, leg, or foot be luxated, they ſhall be fitly laid in a bed; but in the *interim* the Surgeon, preſently after he hath ſet them, ſhall have a care, that the affected joint be wrapped about with ſtoups and clothes, or compreſſes ſteeped in roſe vinegar, and ſpred with convenient medicins, then let it be bound with an artificiall deligation, rowling the ligatures unto the part contrary to that whereto the diſlocated bone flew. For the which purpoſe thicker boulſters ſhall be there applied whence the bone came out, otherwiſe there will be ſome danger, leſt it ſhould be again diſplaced: when theſe things are done, he ſhall for four or five daies ſpace meddle with nothing about the diſlocation, unleſs pain, or ſome ſuch like ſymptome happen. For then the fifth ſcope will call us from that ceſſation and reſt, which is, to correct the ſymptomes and complicate affections, as pain, inflammation, a wound, fracture, and others, whereof we have ſpoken abundantly in our Treatiſe of Fractures. Before we attempt to ſet inveterate diſlocations, we muſt endeavour to humect the ligaments, tendons and muſcles by fomentations, cataplaſms, emplaſters, liniments, and other remedies, that ſo theſe parts may be more obedient to the Surgeons hand; then muſt the diſlocated bones be moved with a gentle motion up and down, to and again, that by this means the excrementitious humour, which by continuance of time hath flowed down, may wax hot, be attenuated, reſolved or made ſlippery, and alſo the fibres of the muſcles, ligaments, and nervous bodies, placed about the joint for the defence thereof, may be looſed, that ſo they may preſently be more freely extended. But if a great ſwelling, pain, and inflammation urge, we muſt firſt think of aſſwaging and curing them, then of the reſtoring the diſlocation.

The manner of ſetting it, or putting it into its place.

Signs that the bone is ſet.

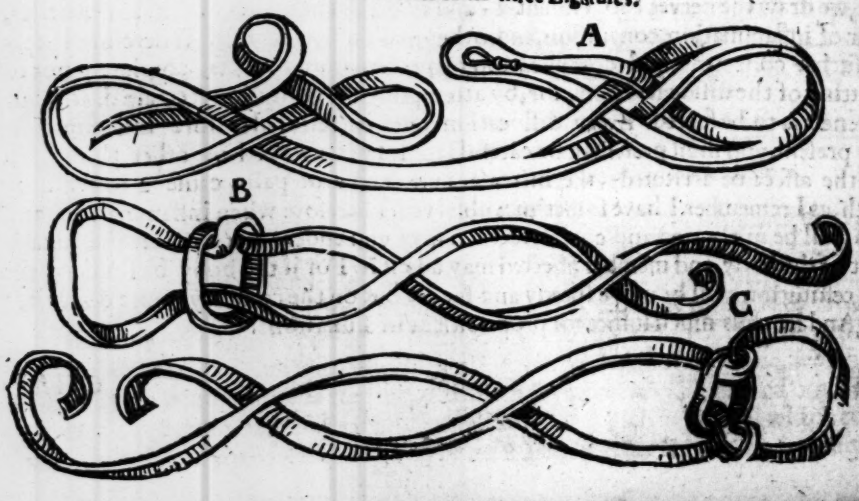
The benefit of fit placing the member.

The manner of binding up the ſet joint.

The cure of inveterate luxations.

CHAP. VII. *The deſcription of certain engines, ſerving for the reſtoring of Diſlocations.*

The delineation of the three Ligatures.

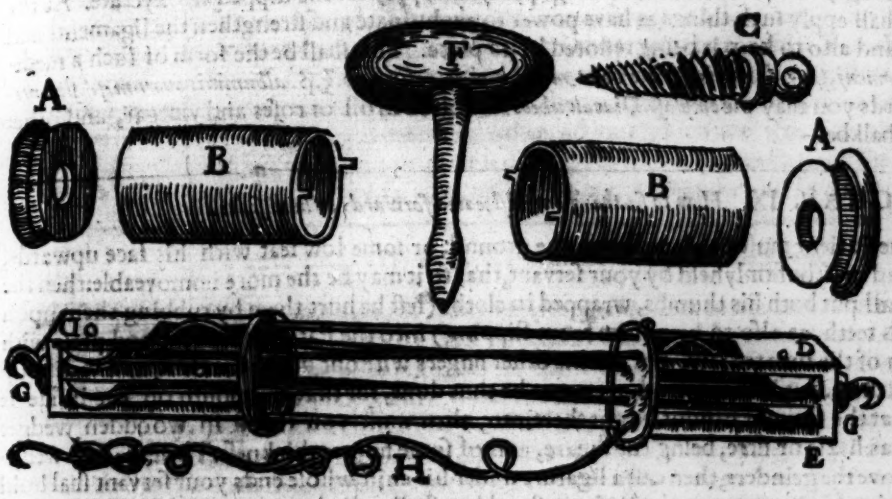


These ligatures are not for deligation, but extenſion.

BEfore I come to the particular kinds of diſlocations, I think it not amiſs to deſcribe three ſorts of bandages, and give you their figures, as thoſe which are moſt fit to hold and extend diſlocations. The firſt ligature, deſigned by this letter *A*, is made for holding the member. The ſecond, marked with the letter *B*, is fit for

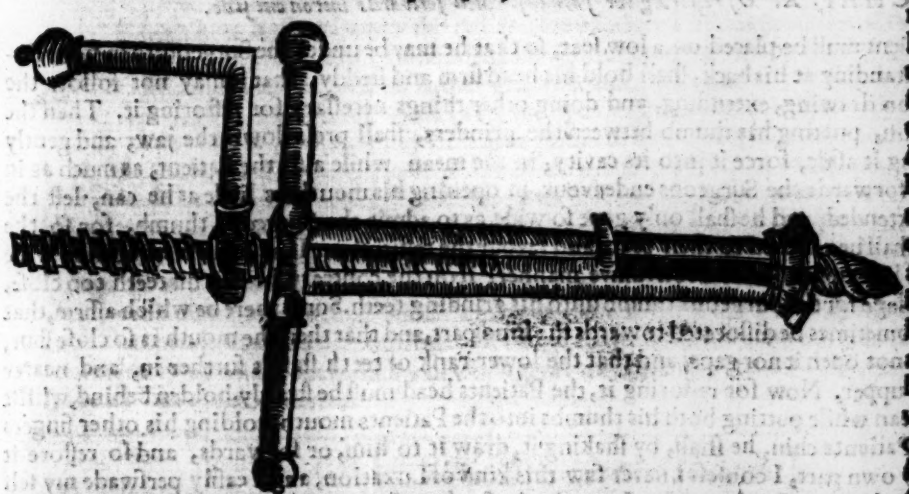
for drawing or extenſion, and conſiſts of one knot. The third, whereto the letter *C* is put, conſiſting of two knots, is to hold or bind more ſtraitly.

A Pulley.



I have thought good alſo to delineate the following Engine, made for to draw and extend more powerfully, when the hand will not ſerve. It is made like a Pulley, marked with theſe letters *DD*. Within this there lye hid 3. wheels, through whoſe furrowes runs the rope which is to be drawn, marked with this letter *H*. At the ends of the pulley are hooks faſtned, the one of which is to faſten the Pulley to a Poſt, the other is to draw the ligature faſtned to the part. The Boxes or Caſes wherein the Pulley is kept, is marked with *B B*. Their Covers are marked with *A A*. A ſcrew pin which may be twined, and ſo faſtned to a Poſt, that ſo one of the ends of the pulley may be hooked thereto, is figured with *C*. A Gimlet (marked by *F*.) to make a hole in a Poſt, ſo to let in the ſcrew pin. You may ſee all theſe things expreſt in the precedent figure.

Manubrium verſatile, or, *A Handvice.*



Some Practitioners in ſtead of this Pulley, make uſe of this deſcribed inſtrument, which they terme *Manubrium verſatile*, or a Handvice. The end thereof is faſhioned like a Gimblet, and is to be twined into a Poſt. Within that handle lies a ſcrew with a hooked end, whereto the ſtring or ligature muſt be faſtned. Now the ſcrew-rod or male ſcrew runs into the female by twining about of the handle, and thus the ligature is drawn as much as will ſuffice, for the ſetting the diſlocated bone. Having delivered theſe things thus in generall, now I come to treat of the Luxations of each part, from the jaw bone even to the toes of the feet.

CHAP. VIII. *Of the diſlocation of the Jaw bone.*

The cauſes, Differences, Signs that only one part is diſlocated.

THe Jaw bone is diſlocated by many occaſions, and not ſeldome by yawning, and other more ſtrong openings of the mouth. It is more frequently luxated into the fore, than into the hinder part, by reaſon of the mammillary additaments, which hinder it from falling backwards. The diſlocation is ſometimes but on one ſide, otherwhiles on both. If the one ſide only be luxated, it (together with the chin) is drawn awry unto the contrary ſide which is not diſlocated; the place is hollow from whence it is flown, but ſwoln whither it is gone, the Patient cannot ſhut his mouth, but is forc't to gape, ſo that he cannot eat; the Jaw, together with the teeth therein, hangs ſomewhat forwards, neither do the teeth anſwer fitly to one another, but the dog teeth are under the ſhearers. But if both ſides be diſlocated, all the jaw and chin hang forwards and towards the breaſt, beſides alſo, the temporall muſcles appear diſtended, ſpittle runs out of the Patients mouth againſt his will, the lower teeth ſtand further forth than the upper, which is the occaſion that the mouth cannot be ſhut, neither the tongue have free volubility to ſpeak, the Patient ſtammering in his ſpeech. When it is diſlocated on both ſides, it is more difficultly reſtored, and all the ſymptomes are more vehement; wherefore it muſt be ſet with all ſpeed, otherwiſe the Patient will preſently have grievous pain about his throat, inflammation, a feaver, whereupon oft times death enſues within ten dayes, by reaſon of the five branches of nerves, which, ariſing from the ſecond and fifth conjugation of the brain, are diſtributed into the moving muſcles thereof, which too violently extended, brings

Signs that both ſides are diſlocated.

Prognoſticks. Why death quickly enſues upon the diſlocation of both ſides of the jaw.

bring the forementioned ſymptomes. Practitioners affirm, that the Jaw twelve dayes after it is ſet, is free from the danger of relapſe. If it have been diſlocated ſome few dayes before you go about to reſtore it, you muſt uſe ſoftning and relaxing medicins to it; but when it is put in the joint, apply a medicine made of the whites of egs, and oil of roſes to aſſwage pain, and apply cloths dipped in oxycrate. At the ſecond dreſſing you ſhall apply ſuch things as have power to agglutinate and ſtrengthen the ligaments and other relaxed parts, and alſo to keep it being reſtored in its place. This ſhall be the form of ſuch a medicine. ℞. *Pulv. boli armeni, ſang. draconis, ſarcocollæ, maſtich. picis, reſinæ, an.* ʒ. ß. *albuminis ovorum q. ſ. fiat medicamentum*; afterwards you may uſe *emplaſt. Diacalcitheos* diſſolved in oil of roſes and vinegar, and other things, as occaſion ſhall be.

An aſtringent medicine.

CHAP. IX. *How to ſet the Jaw diſlocated forwards on both ſides.*

The firſt manner of ſetting a jaw bone.

FIrſt of all the Patient muſt be placed upon the ground, or ſome low ſeat with his face upwards, and his head muſt be firmly held by your ſervant, that ſo it may be the more immoveable: then the Surgeon ſhall put both his thumbs, wrapped in cloths (leſt he hurt them by rubbing them upon the Patients teeth, as alſo to keep them from ſlipping) into the Patients mouth, and place with them the larger teeth of the luxated jaw, but put his other fingers without under his chin, and ſo lift up the whole jaw with them. But if the operation cannot be thus done, for that the mouth on the inſide is ſo ſhut and cloſed that the thumbs cannot be put thereinto, then muſt you thruſt in woodden wedges made of ſoft wood, as hazle or firre, being cut ſquare, and of ſome fingers thickneſs. Theſe ſhall be wedged in on each ſide above the grinders; then caſt a ligature under his chin, whoſe ends your ſervant ſhal hold in his hands, and ſetting his knees upon the Patients ſhoulders, ſhall pull them upwards; then at the ſame time the Surgeon ſhall preſs downwards the woodden wedges. The jaw bones thus reſtored, ſhall be kept ſo by convenient ligation, and dreſſed with medicins, as it is fitting; and in the mean ſpace you muſt forbid the Patient to ſpeak, or needleſly to open his mouth. Wherefore he muſt abſtain from hard meats, and ſuch as require much chewing, untill his pain be quite paſſed, and uſe only ſpoon meats, as Barley-creams, ponadoes, jellies, cullaſſes, broths, and the like.

Another.

Diet.

CHAP. X. *Of reſtoring the Jaw diſlocated forwards but on one ſide.*

What the Surgeon.

THe Patient muſt be placed on a low ſeat, ſo that he may be under the Surgeon: then your ſervant, ſtanding at his back, ſhall hold his head firm and ſteddy, that it may not follow the Surgeon drawing, extending, and doing other things neceſſary for reſtoring it. Then the Surgeon, putting his thumb between the grinders, ſhall preſs down the jaw, and gently drawing it aſide, force it into its cavity; in the mean while alſo the Patient, as much as in him lyes, ſhall help forwards the Surgeons endeavour, in opening his mouth as little as he can, leſt the muſcles ſhould be extended; and he ſhall only gape ſo wide as to admit the Surgeons thumb, for ſo the temporall muſcles ſhall be reſtored to their place and favour the reſtitution. If he open his mouth as wide as he can, they will be extended after a convulſive manner; if on the contrary he ſhut his teeth too cloſe, there will be no paſſage for the Surgeons thumb unto his grinding teeth. Some there be which affirm, that the jaw bone may ſometimes be diſlocated towards the hind part, and that then the mouth is ſo cloſe ſhut, that the Patient cannot open it nor gape, and that the lower rank of teeth ſtands further in, and nearer the throat than the upper. Now for reſtoring it, the Patients head muſt be ſtraitly holden behind, whilſt the Surgeon, the mean while putting both his thumbs into the Patients mouth, holding his other fingers without under the Patients chin, he ſhall, by ſhaking it, draw it to him, or forwards, and ſo reſtore it to its place. For my own part, I confeſs I never ſaw this kind of Luxation, and I eaſily perſwade my ſelf that it can ſcarce ever happen, for the reaſon I gave in the former chapter. But nevertheleſs, if it by any means chance to happen, yet can it not be a perfect luxation, but an imperfect one, the jaw being only but a little thruſt back to the throat to thoſe mammillary additaments. And then it may eaſily be reſtored by lifting or drawing forth the jaw, and ſuddenly forcing it from below upwards.

What the Patient ought to do

Signs that the jaw is diſlocated backwards.

The cure.

CHAP. XI. *Of the Luxation of the Collar bone.*

Differences of the luxated collar bones.

AS the Collar bones may be broken, wreſted and crooked, ſo alſo they may be diſlocated. Now they are diſlocated, either againſt the *ſternum*, or againſt the ſhoulder-blade, or *acromion*: though yet both theſe kinds of diſlocations are very rare, by reaſon of the ſtrait and firm connexion which the collar-bone hath with the foreſaid parts, but chiefly where it is joined to the *ſternum*, it can ſcarce be depreſt, for that it is as it were underpropt with the firſt rib. But it may be diſlocated inwardly, outwardly, and ſide-wiſe, and according to this varlety there muſt be divers wayes to reſtore it; yet generally the collar bone is put into its place by moving or extending the arm. But if need require, the Patient ſhall be laid upon the ground with his face upwards, a Tray with the bottome upwards, a hard ſtuffed cuſhion, or the like thing being put under his ſhoulders; for thus it will ſo come to paſs, that the ſhoulder and cheſt will ſtand ſo forth, that preſently by lifting up, by preſſing down, or drawing forth the arm forwards or backwards, as the bone ſhall be flown out to this or that part, you may reſtore it; for thus the prominency may be forced into its cavity. But it will be requiſite to bind it up and lay bolſters thereon, and to give it reſt, as if it were fractured. *Galen* writes, that when he was five and thirty years old, whilſt he exerciſed himſelf in the place of exercile, his collar bone was ſo far ſeparated from the *Acromion*, that there was the ſpace of three fingers between them. And that this luxation was reſtored

The cure.

Com. ad ſent. 62. ſect. 1. de art.

in forty days space, by so much and more as the Patient shall neglect the motion of the beating arteries under the bone that is out of joint. For the kind of luxation is hard to be known, but so long, though it be easie to accustome, and bring it into joint again: but when it is of long continuance, far more difficult to be healed. I have known many Gentlemen deceived, who have taken the luxation of the collar bone for the dislocation of the shoulder. For then the Spinal process or top of the shoulder (which is the place from whence the collar bone is flown) is depressed with a manifest cavity, with vehement pain, indignation, and impotency of lifting up, or otherwise moving the arm, or performing other actions which are done by the help of the shoulder. Certainly, if this bone, when it is dislocated, be not set, the Patient shall be lame during his life, so that he shall not be able, neither to put his hand to his head nor mouth.

CHAP. XII. *Of the luxation of the Spine, or Back bone.*

An anatomicall description of the Spine.

THe Back bone consists of many bony vertebræ, like rowls or wheels (as they are called) set or knit together, by their flat sides, and circular forms consisting of a double use of moving or bending forwards. For if it should consist of one bone, it could not bend, but should stand continually with the trunk of one bodies bone inflexible, as through with a stake. The vertebræ have a hole passing through the midst of them, whereby the marrow, passing this way out from the brain as by a pipe, may serve for the generation of the sensitive and motive nerves, and their distribution into all parts beneath the head. For which purpose it is perforated with many holes on the sides through each whereof certain conjugations of the nerves pass forth into the cell of the belly, and veins and arteries pass in for the propagation of nourishment and life. The whole exterior face of the Spine is rough, and as it were armed with four sorts of apophyses, wherein some stand up, others down, some direct, others transverse. Wherefore from these things and from parallels the whole hath acquired the name of the Spine. The vertebræ of the lumbes, from the neck they are, the greater they grow, so that those which are the lowest are the largest, for it is agreeable to reason, that that which bears, should be bigger than that which is borne. Hence we see that the holy bone is placed under the os sacrum as a foundation. The fifth processus of the neck bones of the cheek, besides the benefit of distending the spinall marrow first up through the spine, manifest injuries, have also another, which is, they form and fashion the bones of the ears, by whose There lyes a gristle, and a tough, and (as it were) albuminous humour between the vertebræ which makes them, as also all the other joints of the body, slippery, and fit for motion. Since the spine is flexible with sensible agility forwards and backwards, from hence it is that there would be continuall danger of breaking the bones, unless they were fenced with strong ligaments, as look above. I have passed over in silence many things of the nature of the spine, because I seem to [illegible] lingly omit divers other things which are most copiously delivered by [illegible] adde this one thing, that there is nothing to be feared in the dislocation of the vertebræ, which more clearly manifests the industry of Gods great workmanship, than this composure of the spine and the muscles thereof.

The vertebræ of the breast.

Lib. 13. de usu partium.

CHAP. XIII. *Of the dislocation of the head.*

The connexion of the head with the first Rack bone from the neck.

THe head stands upon the neck bone by distinction to the first vertebræ [illegible] the interposition of two processes which [illegible] through which the marrow [illegible] down from the back bone, and they [illegible] full out of their cavities, and cause a dislocation behind, whereby the spinall marrow [illegible] violently and hastily compressed, bruised and extended. [illegible] is followed to the breast, [illegible] Patient can neither draw his own breath whereby death [illegible] upon this kind of [illegible] thing not through any fault of the Surgeon, but by the [illegible] disease, refusing all [illegible]

CHAP. XIV. *Of the* [illegible]

The danger hereof.

THe other accident of [illegible] whereby it comes to pass, [illegible] rest of the body lying [illegible] ficulty, or rather a [illegible] like calamity, by this the [illegible] or foreparts, that the [illegible] ling and breathing. Such [illegible] for upon a low seat, and then one shall [illegible]

Signs still [illegible] place of the [illegible] dislocation.

The cure.

Signs of their restitution.

and the mean while the Surgeon must take the Patients head, about his own breast, and so shake and move it to every part, untill the vertebra be restored to its place. We may know it is set by the sudden ceasing of the pain, which before grievously afflicted the Patient, and by the free turning and moving his head and neck every way. After the restoring of it, the head must be inclined to the part opposite to the Luxation, and the neck must be bound up about the dearticulation of the shoulder, but yet so, that the ligature be not too straite, lest by pressing the weazon and gullet, it straiten the passages of breathing and swallowing.

CHAP. XV. *Of the Dislocated Vertebræ of the Back.*

Differences and signes.

THe Back bones of the back may be dislocated inwards, outwards, to the right side and to the left. We know they are dislocated inwards, when as they leave a depressed cavity in the spine; outwardly, when they make a bunch on the back; and we know they are luxated to the right or left side, when as they evidently bunch forth to this or that side. The vertebræ are dislocated by a cause either internall, or externall, as is common to all other Luxations: the internall is either the defluxion of humours from the whole body, or any part to them and ligaments, or else a congestion proceeding from the proper and native weakness of these parts, or an attraction arising from pain and heat. The externall is a fall from high upon some hard body, a heavie and braising blow, much and often stooping, as in Drellers and Lookers to Vineyards, and Paviers, decrepit old men, and also lasts, as through an incurable dislocation of the thigh-bone, are forced in walking to stoop down, and hold their hand upon their thigh. But a vertebra cannot be forced or thrust inwards, unlesse by a great deal of violence; and if that any time happen, it is not but with the breaking of the eyes and ligaments, for they will break rather than suffer so great extension. Such a dislocation is deadly, for that the spinall marrow is exceedingly violated by too straite compression, whence proceeds dulnesse and losse of sense in the members lying thereunder. Neither is reflexion to be hoped for, because we cannot through the belly force it into its place: the urine is then suppressed, as also the excrements of the belly, sometimes on the contrary, both of them break forth against the Patients minde, the knees and legs grow cold, their sense and motion being lost. Such things happen more frequently, when the spine is luxated inwards, than when it is dislocated outwards, for that the nerves, thence arising, run and are carryed more inwardly into the body. Besides the prolled Spinall marrow becomes inflamed, and that being inflamed, the parts of the loins bind to them adjoined thereto, are also inflamed by consent, whence it happens, that the bladder cannot cast forth the urine. Now where the nerves are prolled, they can no more receive the imagination of the animall faculty. Hence follows the deprivation of the sense and motion in the parts whereto they are carryed, therefore the excrements do the more gravitate to expulsion by their troublesome sense, neither are prolled to keep them in, hence proceeds their suppression, and hence their breaking forth against their will. But the spine outwardly dislocated, scarce conserves any compression of the marrow or nerves.

The danger of a vertebra dislocated inwards.

Hipp. Sent. 51. sect. 3. de art. & Gal. in com.

CHAP. XVI. *How to restore the Spine outwardly dislocated.*

The cure.

THe vertebræ outwardly dislocated, when as they stand bunching forth, then is it fit to lay and stretch forth the Patient upon a table with his face downwards, and stoutly to bind him about with towels under the arm-pits, and about the flanks and thighs. And then to draw and extend, as much as may be, [illegible] without violence, for under such extension [illegible] to be hoped for, by some of the proceeded and bolder [illegible]

Another manner of cure.

four fingers long, and one thick, more or lesse, in linnen cloths, and so to apply one on each side of the dislocated *vertebræ*, and so with your hands to press them against the bunching forth *vertebræ*, untill you force them back into their seats, just after the manner you see it before delineated.

In the mean while have a care, that you touch not the processes which stand up in the ridg of the Spine, for they are easily broken. You may know that the *vertebræ* are restored by the equall smoothness of the whole Spine. It is fit, after you have restored it, to bind up the part, and lay splints or plates of Lead neatly made for that purpose upon it; but so, that they may not press the crists or middle processes of the *vertebræ*, which I formerly mentioned, but only the sides: then the Patient shall be laid upon his back in his bed, and the splints long kept on, lest the *vertebræ* should fall out again.

How to keep the restored *vertebræ* in their places.

CHAP. XVIII. *A more particular inquirie of the dislocation of the* Vertebræ, *proceeding from an internall cause.*

THe *vertebræ* are in like sort luxated by the antecedent cause, as we have formerly said, which is caused by the naturall imbecillitie of the parts, principally of the nervous ligament, by which all the *vertebræ* are bound each to other; this ligament comes not to the spinall marrow, but only bindes together the *vertebræ* on their outsides. For, besides the two membranes proceeding from the two *Meninges* of the Brain, wherewith the marrow is covered, there is a third strong and nervous coat put upon it, lest, whilst the spine is diversly bended, the bended marrow should be broken. This third coat arises from the *perieranium*, as soon as it arrives at the first *vertebra* of the neck. Now that ligament, wherewith we said the joints of the *vertebræ* were mutually knit and fastned, is encompassed with a tough and glutinous humor for the freer motion of the *vertebræ*. Sometimes another cold, crude, gross and viscid humor, confused and mixed herewith by great defluxions and catarrhs, begets a tumor, which doth not only distend the nerves proceeding forth of the holes of the *vertebræ*, but also distends the ligaments wherewith they are bound together: which so distended, and (as it were) drawn aside, do draw together with them the *vertebræ*, one while towards the right side, another while to the left, somewhiles inwards, otherwhiles outwards, and thus move them out of their seats, and dislocate them. A dislocated *vertebra*, standing forth and making a bunch, is termed in Greek *Cyphosis*, (Those thus affected we may call, *Bunch-backt*. But when it is depressed, it is named *Lordosis*, (Such we may term, *Saddle-backt*.) But when the same is luxated to the right or left side, it maketh a *Scoliosis* (or *Crooked-nesse*,) which wresting the spine, draws it into the similitude of this letter S. *Galen* adds a fourth default of the *vertebræ*, which is, when their joints are moved by reason of the looseness of their ligaments; the *vertebræ* yet remaining in their places, and he cals it a *Seisis* (or shaking.) They also note another defect peculiar to the spinall marrow, which is, when as it (the *vertebræ* being not moved whereto it adheres) is plucked and severed from them: this disease is occasioned by a fall from on high, by a great stroak, and by all occasions which may much shake, and consequently depresse the spinall marrow, or by any other means remove, or put it forth of its place. Scarce any recovers of this disease, for many reasons, which any exercised in the art, may easily think upon: But let us return to the internall cause of Luxations. Fluid and soft bodies, such as Childrens, usually are very subject to generate this internall cause of defluxion. If externall occasions shall concur with these internall causes, the *vertebræ* will sooner be dislocated. Thus Nurses, whilst they too straitly lace the breasts and sides of girles, so to make them slender, cause the breast-bone to cast its self in forwards or backwards, or else the one shoulder to be bigger or fuller, the other more spare and lean. The same error is committed, if they lay children more frequently and long upon their sides, than upon their backs; or if, taking them up when they wake, they take them only by the feet or legs, and never put their other hand under their backs, never so much as thinking that children grow most towards their heads.

Cyphosis.
Lordosis.
Scoliosis.
Com. ad sent. 2. sect. 3. lib. de art. Seisis.
The separation of the spinall marrow from the en compassing *vertebræ*.
The error of Nurses in binding and lacing of Children.

CHAP. XVIII. *Prognostick of the Dislocated* Vertebræ *of the back.*

IF in Infancy it happen that the *vertebræ* of the back shall be dislocated, the ribs will grow little or nothing in breadth, but run outwards before; therefore the chest loseth its naturall latitude, and stands out with a sharp point. Hence they become asthmatick, the lungs and muscles which serve for breathing, being pressed together and straitned; and that they may the easilier breath, they are forced to hold up their heads, whence also they seem to have great throats. Now because the weazen being thus pressed, the breath is carryed through a strait passage, therefore they wheaze as they breath, and snort in their sleep, for that their lungs, which receive and send forth the breath or air, be of lesse bignes; besides also, they are subject to great distillations upon their lungs, whereby it cometh to pass, that they are shorter lived. But such as are bunch-backed below the midriffe, are incident to diseases of the kidneys and bladder, and have smaller and slenderer thighs and legs, and they move slowly and sparingly cast forth hair and have beards; to conclude, they are lesse fruitfull, and more subject to barrenness, than such as have their crookedness above their midriffe. The Bunches which proceed from external causes are oft-times curable; but such as have their original from an inward cause, are absolutely uncurable, unless they be withstood at the first with great care

Hipp. sent. 6. sect. 3. de art.

VVhy, when the spine is luxated, the parts belonging to the chest are nourished and grow the lesse.

and industry. Wherefore such as have it by kind, never are helped. Such as, whilst they are yet children, before their bodies be come to perfect growth, have their spine crooked and bunching out, their bodies use not to grow at the spine, but their legs and arms come to their perfect and full growth; yet the parts belonging to their breasts and back, become more slender. Neither is it any wonder, for seeing the veins, arteries, and nerves are not in their places, the spirits do neither freely, nor the alimentary juices plenteously flow by these straitened passages, whence leanness must needs ensue: but the limbs shall thence have no wrong, for that not the whole body, but the neighbouring parts only are infected with the contagion of this evil. When divers *vertebræ*, following each other in order, are together and at one time dislocated, the dislocation is less dangerous, than if one alone were luxated. For, when one only *vertebra* is dislocated, it carries the spinall marrow so away with it, that it forces it almost into a sharp angle; wherefore being more straitly pressed, it must necessarily be either broken or hurt, which is absolutely deadly, for that it is the brains substitute. But when divers *vertebræ* are dislocated at once, it must of necessity be forced only into an obtuse angle, or rather a semicircle; by which compression it certainly suffers, but not so, as that death must necessarily ensue thereof. Hereto may seem to belong that which is pronounced by *Hippocrates*; a circular moving of the *vertebræ* out of their places is less dangerous than an angular.

VVhy the luxation of one *vertebra* is more dangerous than of many.

Sent. 51. *sect.* 3. *lib. de art.*

CHAP. XIX. *Of the dislocation of the rump.*

The signs.

THe rump oft-times is after a sort dislocated inwards by a violent fall upon the buttocks, or a great blow; in this affect the Patient cannot bring his heel to his buttocke, neither, unless with much force, bend his knee. Going to stool is painfull to him, neither can he sit unless in a hollow chair. That this (as it were) dislocation may be restored, you must thrust your finger in by the Fundament, even to the place affected,

The cure.

as we have said in a fracture; then must you strongly raise up the bone, and with your other hand at the same time join it rightly on the outside with the neighbouring parts; lastly, it must be strengthened with the formerly mentioned remedies, and kept in its place. Now it will be recovered about the twentieth day after it is set. During all which time the Patient must not go to stool, unless sitting upon a hollow seat, lest the bone, as yet scarce well recovered, should fall again out of its place.

CHAP. XX. *Of the luxation of the ribs.*

Causes.

THe ribs may by a great and bruising stroak be dislocated, and fall from the *vertebræ* whereto they are articulated, and they may be driven inwards, or sidewaies. Of which kind of luxation, though there be no particular mention made by the Ancients, yet they confess, that all the bones may fall, or be removed from their seats or cavities, wherein they are received and articulated. The sign of a rib dislocated and slipped on one side,

Signs.

is, a manifest inequality; which here makes a hollowness, and there a bunching forth; but it is a sign that it is driven in, when as there is only a depressed cavity where it is knit and fastned to the *vertebræ*. Such dislocations cause divers symptoms, as difficulty of breathing, the hurt rib hindring the free moving of the chest; a painfulness in bowing down, or lifting up the body, occasioned by a pain counterfeiting a pleurisie; the rising or puffing up of the muscalous flesh about the rib, by a mucous and flatulent humor there generated: the reasons whereof we formerly mentioned in our Treatise of Fractures. To withstand all these, the dislocation must be forthwith restored, then the puffing up of the flesh must be helped. Wherefore, if the dislocated rib shall fall upon

Cure.

the upper side of the *vertebra*, the Patient shall be set upright, hanging by his arms upon the top of some high door or window: then the head of the rib, where it stands forth, shall be pressed down untill it be put into its cavity. Again, if the rib shall fall out upon the lower side of the *vertebra*, it wil be requisite, that the Patient bend his face downwards, setting his hands upon his knees, then the dislocation may be restored by pressing or thrusting in the knot or bunch which stands forth.

But if the luxated rib fall inwards, it can no more be restored or drawn forth by the hand of the Surgeon, than a *vertebra* which is dislocated towards the inside, for the reasons formerly delivered.

Gal. com. ad sent. 3. *sect.* 1. *de art.*

CHAP. XXI. *Of a dislocated shoulder.*

THe shoulder is easily dislocated, because the ligaments of its dearticulation are soft and loose, as also for that the cavity of the shoulder blade is not very deep; and besides, it is every where smooth and polite, no otherwise than that of the shoulder bone, for that it is herein received. Adde hereunto, that there is no internall ligament from bone to bone, which may strengthen that dearticulation, as is in the leg and knee. Wherein notwithstanding, we must not think nature defective, but rather admire Gods providence in this thing; for that this articulation serves not only for extension and bending, as that of the Elbow, but besides, for a round or circular motion, as that which carries the arm round about, now up, then down, according to each difference of site. The shoulder bone, which *Hippocrates* cals the arm bone, may be dislocated four manner of wayes; upwards, downwards, or into the arm-pit, forwards and outwards, but never backwards, or to the hind part. For, seeing that there the cavity of the blade bone, which receives the head of the arm-bone, which *Hippocrates* cals a joint, lyes and stands against it; who is it that can but imagin any such dislocation? In like sort it is never dislocated inwardly

VVhy there is no internall ligament from the arm bone to the shoulder blade.

Differences of a luxated shoulder.

Sent. 1. *sect.* 1. *lib. de art.*

inwardly, for on this part it hath the flesh of a strong muscle, termed *Deltoides*, lying over it, besides also the back and *acromion* of the blade, and lastly, the anker-like, or beak-like process, all which four hinder this joint from slipping inwards. Now *Hippocrates* saith, that he hath only seen one kind of dislocation of this bone, to wit, that which is downwards or to the arm-pit: and certainly it is the most usuall and frequent; wherefore we intend to handle it in the first place. When the shoulder is dislocated downwards into the arm-pit, a depressed cavity may be perceived in the upper part of the joint; the *acromion* of the blade shewes more sharp and standing forth than ordinary, for that the head of the shoulder bone is slipt down, and hid under the arm-pit, causing a swelling forth in that place; the elbow also casts it self (as it were) outwards, and stands further off from the ribs; and though you force it, yet can you not make it to touch them; the Patient cannot lift up his hand to his ear on that side, neither to his mouth, nor shoulder. Which sign is not peculiar to the luxated shoulder, but common to it, affected with a contusion, fracture, inflammation, wound, abscess, *febirrus*, or any defluxion upon the nerves, arising out of the *vertebræ* of the neck, and sent into the arm: also this arm is longer than the other. Lastly, (which also is common to each difference of a luxated shoulder) the Patient can move his arm by no kind of motion without sense of pain, by reason of the extended and pressed muscles, some also of their fibres being broken. There are six wayes to restore the shoulder luxated downwards into the arm-pit. The first is, when it is performed with ones fist, or a towel; the second, with a clew of yarn, which put under the arm-pit, shall be thrust up with ones heel; the third, with ones shoulder put under the arm hole, which manner, together with the first, is most fit for new and easily to be restored luxations, as in those who have loose flesh, and effeminate persons, as children, eunuches, and women; the fourth, with a ball put under the arm pit, and then the arm cast over a piece of wood held upon two mens shoulders, or two standing posts; the fifth, with a ladder; the sixth, with an instrument, called an *Ambi*. We will describe these six waies, and present them to your view.

Signs of the shoulder dislocated downwards.

The wayes to restore it.

CHAP. XXII. *Of the first manner of setting a shoulder, which is with ones fist.*

FIrst, let one of sufficient strength, placed on the opposite side, firmly hold the Patient upon the joint of the shoulder, lest he move up and down with his whole body, at the necessary extension, working & putting it in: then let another, taking hold of his arm above the elbow, so draw and extend it downwards, that the head thereof may be set just against its cavity, hollowed in the blade bone. Then at last let the Surgeon lift and force up with his fist the head of the bone into its cavity. Here this is chiefly to be observed, that in fresh luxations, especially in a body soft, effeminate, moist, and not over corpulent, that it sometimes comes to pass, that by the only means of just extension, the head of the bone freed from the muscles and other particles wherewith it was, as it were, entangled, will betake it self into its proper cavity, the muscles being by this means restored to their place and figure, and drawing the bone with them, as they draw themselves towards their heads, as it were with a sudden gird or twitch: wherefore in many, whilst we thought no such thing, it sufficed for restitution only to have extended the arm. But if the luxation be inveterate, and the hand cannot serve, then must the Patients shoulder be fastned to a post with the forementioned ligature, or else committed to ones charge, who may stand at his back and hold him fast. Then the arm shall presently be tyed about, a little above the elbow, with a fillet, whereto a cord shall be fastned; which being put or fastned to the pulley, shal be drawn or stretched forth, as much as need shall require. Lastly the Surgeon, with a towel, or such like ligature, fastned about his neck and hanging down, and so put under the Patients arm-pit near to the luxation, shall, raising himself upon his feet with the whole strength of his neck, lift up the shoulder, and also at the same time bringing his arm to the Patients breast, shall set the head of the shoulder bone, forced with both his hands into its cavity, as you may see by the precedent figure. Then must you cover all the adjacent parts with a medicine made *ex farina volatili, bolo armenio, myrtillis, pice, resina & albumine*, beaten into powder, and mixed with the white

Gal. com. ad sent. 23. sect. 1. Aret.

An expression of the first manner of putting a shoulder into joint.

A perfect setting the luxated shoulder by extension only.

of an eg. Then muſt the hollowneſs under the arm be filled with a clew of woollen or cotten yarn, or a linnen cloth ſpred over with a little oil of Roſes or Myrtles, a little vinegar, and *unguentum roſatum*, or *infrigidans Galeni*, leſt it ſtick to the hairs, if there be any there. The part muſt afterwards be bound up with a ligature, conſiſting of two heads, of ſome five fingers breadth, and two els long; more or leſs, according as the body ſhall require. The midſt thereof ſhall be put immediately under the arm pit, and then croſſed over the lame ſhoulder, and ſo croſſing it as much as ſhall be fit, it ſhall be wrapped under the oppoſite arm. And laſtly, the arm ſhall be laid upon the breaſt, and put in a ſcarf, in a middle figure almoſt to right angles, ſo that by lifting up the hand he may almoſt touch his ſound ſhoulder, leſt the bone newly ſet, may fall out again, neither ſhall the firſt dreſſing be ſtirred, untill four or five dayes be paſt, unleſs the greatneſs of ſome happening ſymptome divert us from this our purpoſe.

CHAP. XII. *Of the ſecond manner of reſtoring a ſhoulder, that is, with the heel; when the Patient by reaſon of pain can neither ſit, nor ſtand.*

Hip. ſent. 12. ſect. 1. de art.

THE Patient muſt be laid with his back on the ground upon a cover-lid, or mat, and a clew of yarn or leathern ball, ſtuffed with tow or cotten, of ſuch bigneſs as may ſerve to fill up the cavity, muſt be put under his arm-pit, that ſo the bone may ſtraight waies the more eaſily be forced by the heel into its cavity. Then let the Surgeon ſit beſide him, even over againſt the luxated ſhoulder; and if his right ſhoulder be luxated, he ſhall put his right heel to the ball, which filled up the arm-pit; but if the left, then the left heel; then let him forthwith draw towards him the Patients arm, taking hold thereof with both his hands, and at the ſame inſtant of time ſtrongly preſs the arm-pit with his heel. Whilſt this is in doing, one ſhall ſtand at the Patients back, who ſhall liſt up his ſhoulder with a towel, or ſome ſuch thing fitted for that purpoſe, and alſo with his heel preſs down the top of the ſhoulder blade: another alſo ſhal ſit on the other ſide of the Patient, who, holding him, ſhal hinder him from ſtirring this way or that way at the neceſſary extenſion in ſetting it, as you may ſee it expreſt by the precedent figure.

The expreſſion of the ſecond manner of reſtoring a ſhoulder.

CHAP. XXIV. *Of the third manner of reſtoring a ſhoulder.*

SOme one who is of a competent height and ſtrength ſhall put the ſharp part of the top of his ſhoulder under the Patients arm-pit, and alſo at the ſame time ſhall ſomewhat violently draw his arme towards his owne breaſt, ſo that the Patients whole body may (as it were) hang thereby. In the mean time another, for the greater impreſſion, ſhall lay his weight on the luxated ſhoulder, ſhaking it with his whole body. Thus the ſhoulder, drawn downwards by the one which ſtands under the arm-hole, and moved and ſhaken by the other, who hangs upon it, may be reſtored into its ſeat, by the help of the Surgeon concurring therewith, and with his hand governing theſe violent motions, as this figure ſhewes.

The figure of the third manner of putting a ſhoulder into joint.

CHAP.

CHAP. XXV. *Of the fourth manner of restoring a distorted shoulder.*

The figure of the fourth manner of restoring the shoulder.

YOu must take a perch, or piece of wood (somewhat resembling that which the Water-bearers of *Paris* use to put on their shoulders) some two inches broad, and some six foot long, in the midst hereof let there be fastned a clew of yarn, or ball of sufficient bigness to fill up the cavity of the arm-hole. Let there be two pins put in, one on each side of the ball, each alike distant therefrom, with which, as with staies, the shoulder may be kept in, and upon the ball, that it slip not away from it. Let two strong men, taller than the Patient, either by nature or art, put this perch upon their shoulders; then let the Patient put his arm-pit upon that place where the ball stands up; the Surgeon must be ready to pull his hanging arm downwards. Thus the Patient shall (as it were) hang on the perch with his shoulder, and so the head of the bone shall be forced into its cavity, as this figure declares, wherein you may see the perch or pole, with the two woodden pins and ball fastned in the midst, delineated by its self.

CHAP. XXVI. *Of the fifth manner of putting the shoulder into joint, which is performed by a Ladder.*

The delineation of the fifth manner of restoring a shoulder.

YOu may also restore a shoulder dislocated into the arm-pit, by the help of a Ladder, after this manner. Let some round body, as a ball, or clew of yarn, which (as we formerly said) may serve to fill the arm-pit, be fastned upon one of the upper steps of a Ladder; at the foot of the Ladder set a low stool, whereupon let the Patient mount, then bind both his legs, and also his sound arm behind his back, lest, when you are about your operation, he hinder and spoil all you do, by laying his hand, or setting his foot upon the ladder. Then let his arm be presently put over the step of the Ladder, and his arm-pit put upon the there fastned ball, the Patient in the mean while being willed to come with his whole body as near unto the steps of the Ladder as he is able, for otherwise, besides that there is no other hope of restoring the luxation, there would be no small danger of breaking the shoulder bone. Also let him take heed, that he put not his head between the steps. Then his arm, bound above the Elbow with filleting, or some other ligature fit for that purpose, shall be drawn down by the hand of some that assist you, and at the same time let the stool be plucked from under his feet, so that he may hang upon the ladder. Thus by this means the head of the shoulder will be restored by its self, the endeavour of the Surgeon assisting, and pressing down the shoulder blade, and moving it to and again. The bone being

being ſet, the ſtool, which a little before was plucked from under the Patients feet, ſhall be put there again, that he may, with the more eaſe and leſs pain, pull back his arm from the ſtep of the Ladder. For if he ſhould liſt it high up to draw it over, there would be danger, leſt being newly ſet, and not well ſtaid, the head of the bone might fall out again. I have thought good to have all theſe things here expreſſed, that you may learn this operation, as if you ſee it done before you. I have not thought fit in this place to omit the induſtry of *Nicholas Picart*, the Duke of *Guiſe* his Surgeon; who being called to a certain Country-man to ſet his ſhoulder being out of joint, and finding none in the place beſides the Patient and his wife, who might aſſiſt him in this work, he put the Patient, bound after the forementioned manner, to a Ladder; then immediately he tyed a ſtaffe at the lower end of the Ligature, which was faſtned about the Patients arm above his elbow; then put it ſo tyed under one of the ſteps of the Ladder, as low as he could, and got aſtride thereupon, and ſate thereon with his whole weight, and at the ſame inſtant made his wife to pluck the ſtool from under his feet: which being done, the bone preſently came into its place, as you may ſee by the following figure.

Another figure expreſſing the fourth manner of reſtoring a diſlocated ſhoulder.

Another figure to the ſame purpoſe.

If you have never a Ladder, you may uſe a peece of Wood, laid acroſs upon two Poſts. Alſo you may uſe a door, as the other figure ſhewes, wherein you muſt obſerve a flat piece of wood or *ſpatula* with ſtrings thereat, whoſe uſe ſhall be ſhown in the following Chapter.

CHAP. XXVII. *The ſixth manner of reſtoring a ſhoulder, luxated into the arm-pit.*

Sect. 1. lib. 1. de art. ſent. 19.

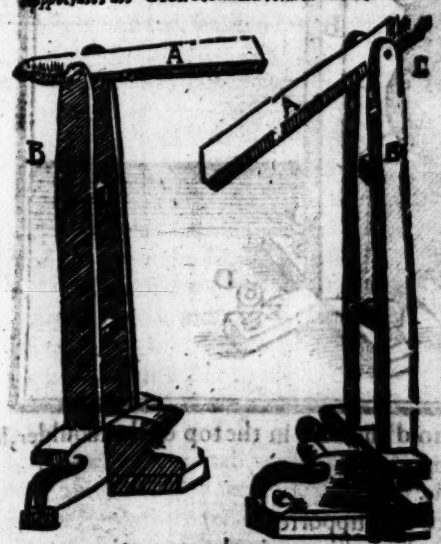
Hippocrates writes, that this is the beſt way of all to reſtore a diſlocated ſhoulder. You muſt take a woodden *ſpatula* of ſome four or five fingers bredth, and ſome two fingers thickneſs or leſs, but ſome yard or thereupon long; the one end thereof muſt be narrow and thin, with a round head ſtanding up and lightly hollowed, that put under the arm-pit, it may receive part of the head of the ſhoulder bone, the which for that purpoſe muſt not bend towards the ribs, but to the top of the ſhoulder. This upper part of the *ſpatula* muſt be wrapped about with a linnen or woollen rag, or ſome ſuch ſoft thing, that it may be the ſofter, and hurt the leſs; and then it muſt be ſo thruſt under the arm-pit, that it may throughly penetrate into the inner part between the ribs, and the head of the ſhoulder bone. There muſt, beſides in this *ſpatula*, be two holes in three ſeverall places, each alike diſtant from other, through which let ſoft ſtrings be put, whereby it may be tyed to the arm, ſtretched all the length thereof even to the fingers, in one place a little below the head of the ſhoulder bone, in another

The deſcription of the *Gloſſocomium*, termed *Ambi*.

another a little above the elbow, and the third at the wriſt, that ſo they may hold it firm. Therefore let the diſtances of the holes be fitted to this purpoſe; but principally you muſt have a care of this, that the upper part of the *ſpatula*, reaching beyond the head of the arm, enter even to the innermoſt Cavity of the arm-pit; then, a croſſe pin or piece of wood muſt be made faſt through two poſts or a frame, and well faſtned thereto, and thereupon the Arm with the *ſpatula* muſt be ſo put over, that the pin may be under the arm-pit, the body weighing one way, and the arm another: which being done, the arm muſt be drawn down one way, and the body another about the pin. Now this croſſe pin muſt be put on ſuch a height that the Patient may ſtand on tip-toes. Now this is the very beſt way of reſtoring a ſhoulder. In ſtead of two poſts or a frame, you may make ſhift with a ladder, doore, beds poſts, and ſuch like things as ſhall be there preſent. I have heard *Henry Arvet*, a very good Surgeon of *Orleans* ſay, that he never attempted this manner of putting into joint a ſhoulder diſlocated into the arm-pit without good ſucceſſe, unleſſe by chance (which alſo is noted by *Hippocrates*) that the fleſh is grown into the cavity, and the head of the bone hath made it ſelf another cavity in the place whereinto it is fallen; for in this caſe the bone will either not be reſtored, or elſe not remain in its place, but fall back notwithſtanding into the new hollowed cavity, which ſerves it in ſtead of its naturall ſocket or cavity. But I muſt here admoniſh young Surgeons, that if the bone be not reſtored at the firſt endeavour and aſſet, that they doe not deſpair and preſently deſiſt from their intended operation, but they muſt wind about, and gently move the joint: for ſo at the length it will be more eaſily moved, and enter into the naturall cavity. When it is in, it muſt be bound up with compreſſes and rowlers after the forementioned manner.

Sect. 1. de art. ſent. 21.

Hippocrates his Gloſſocomium *termed* Ambi.



To the former figures I have thought good to adde this, which expreſſeth the manner of reſtoring a ſhoulder luxated into the arm-pit with a *ſpatula* after the manner of *Hippocrates*. This *ſpatula* faſtned with an iron pin to the ſtanding frame may be turned, lifted up, and preſſed down at your pleaſure. A. ſhewes the wooden *ſpatula*. B. the frame or ſtanding poſts.

Hipp. ſent. 64. 4. de artic.

The figure of an Ambi *fitted to a diſlocated ſhoulder.*

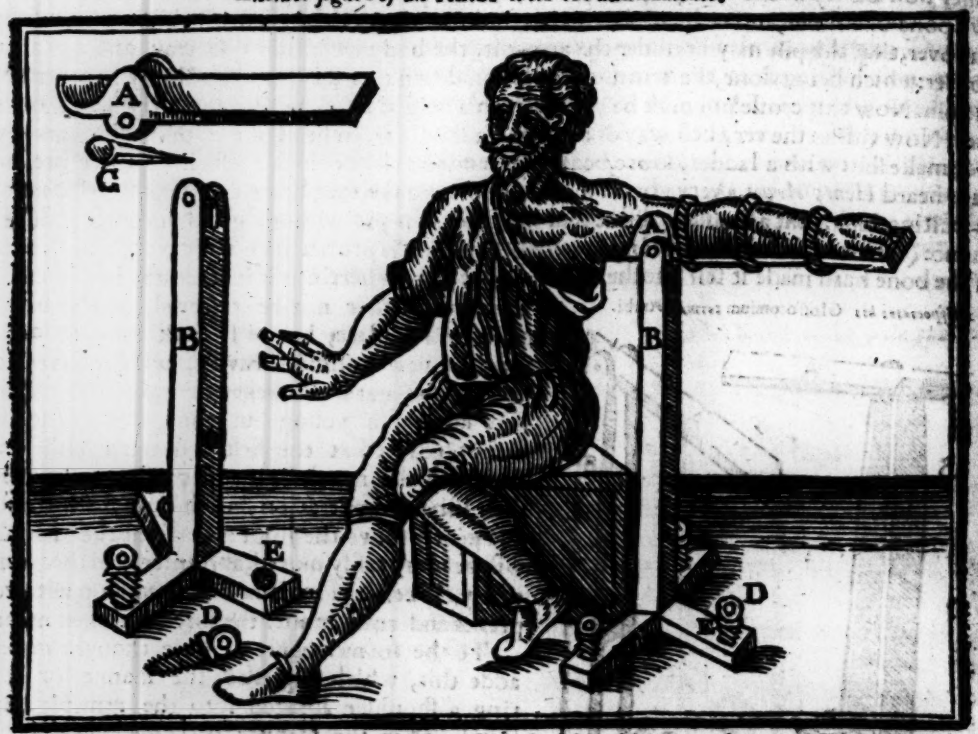
How to make uſe of the *Ambi*.

For the more certain uſe of this inſtrument the Patient muſt ſit upon a ſeat which muſt be ſomewhat lower than the ſtanding frame, that ſo the *ſpatula* which is thruſt into the arm-pit may be the more forcibly depreſſed, ſo to force in the head of the ſhoulder bone; the Patients feet muſt alſo be tyed, that he may not raiſe himſelf up whileſt the Surgeon endevours to reſtore it. Now he ſhall then endevour to reſtore it when he ſhall have bound the ſtretched forth arm of the diſlocated ſhoulder unto the *ſpatula*, and thruſt the one end thereof under the ſlipped forth head of the ſhoulder bone, as we have formerly ſhewed, for then by preſſing down the other end of the *ſpatula* which goes to the hand, the bone is forced into its cavity. You muſt diligently obſerve the wooden *ſpatula*, which therefore I have cauſed to be expreſſed by it ſelf, which *Hippocrates* calleth *Ambi*, whoſe head is a little hollowed where it is noted with this letter B. The whole *ſpatula* is marked with this letter A. with three ſtrings hanging thereat, provided for the binding of the arm, that it may be kept ſteddy, as you may perceive by the annexed figure.

There

There are other additions to this *Ambi*, whose figure I now exhibited to your view, by the invention of *Nicholas Picart* the Duke of *Lorrain's* Surgeon, the use and knowledg whereof, bestowed upon me by the inventor himself, I would not envie the studious reader.

Another figure of an Ambi *with the additaments.*



AA. Shew the two eares, as it were, stops made to hold and keep in the top of the shoulder, left it should slip out when it is put into the frame or supporter.
BB. The frame or supporter whereon the *Ambi* rests.
CC. The pin or axeltree which fastens the *Ambi* to the supporter.
DD. Screw-pins to fasten the foot of the supporter that it stir not in the operation.
EE. The holes in the foot of the supporter, whereby you may fasten the screw-pins to the floor.

CHAP. XXVIII. *How to restore a shoulder dislocated forwards.*

IT is seldome that the shoulder is luxated towards the forside; yet there is nothing so stable and firm in our bodies which may not be violated by a violent assault; so that those bones do also fall out of joint, whose articulations are strengthned for the firmer connexion with fleshly, nervous, gristly and bony stayes, or bars. This you may perceive by this kind of dislocated shoulder, strengthned as it were with a strong wall on every hand; to wit, the *Acromium* and the end of the collar-bone, seeming to hinder it, as also the great and strong muscles, *Epomis*, and *Biceps*. *Hippocrates*, shut up within the strait bounds of the lesser *Asia*, never saw this kind of dislocation, which was observed five times by *Galen*. I professe I have seen it but once, and that was in a certain Nun, which weary of the Nunnery, cast her self down out of a window, and bore the fall and weight of her body upon her elbow, so that her shoulder was dislocated forwards. This kind of dislocation is known by the depravation of the conformation or figure of the member, by the head of the shoulder wrested out towards the breast, as also the Patient cannot bend his elbow. It is restored by the same meanes as other luxations of other parts, to wit, by strait holding, extending, and forcing in. Therefore the Patient must be placed upon the ground with his face upwards, and then you must extend the shoulder otherwise than you do when it is luxated into the arm-pit. For when it falleth into the arm-hole, it is first drawn forwards, then forced upwards, untill it be brought just against the cavity whereinto it must enter. But in this kind of luxation, because the top of the shoulder is in the fore parts of the dearticulation shut up with muscles, opened both to the outer, as also to the inner part, you must worke to the contrary; to wit, to the hinde part. But first of all you must place a servant at the back of the Patient, who may draw back a strong & broad Bandage cast about the arm-pit (such as is the *Carchesium*, which consists of two contrary and continued strings) lest that when the arm shall be extended, the shoulder follow: also you must put a clew of yarn to fill up the arm-pit. Then must you extend the arm, casting another ligature a little above the elbow, and in the interim have a care that the head thereof fall not into the arm-pit, which may be done both by putting the forementioned clew under the arm, and drawing the head another way; then must you permit, by slacking your extension, the joint freed from the encompassing muscles, to be drawn and forced into its cavity by the muscles forcible recoiling, as with an unanimous consent, into themselves and their originals, for thus it will easily be restored, and such extension only is sufficient thereto.

CHAP.

CHAP. XXIX. *Of the shoulder luxated outwardly.*

THe dislocation also of the shoulder to the outward part doth sometimes happen, but yet, if it may at any time happen, the extension of the arm will be very difficult, but yet more difficult towards the outward part than towards the inward, there is a depressed cavity perceived towards the [illegible] from whence the head of the shoulder-bone is fled. For the restoring hereof, the Patient must be laid flat on his belly, and the elbow must be forcibly drawn contrary to that whereto it is fled, to wit, inwardly to the breast, and also the standing forth head of the arm-bone must be forced into its cavity, for thus it shall be easily restored. But into what part soever the shoulder bone is dislocated, the arm must be extended and drawn directly downwards. After the reduction setting medicins shall be put about the joint. Let there be somewhat put into the arm-pit which may fil it up, and let compresses or boulsters be applyed to that part to which the luxated bone fel; then all these things shall be strengthened and held fast with a strong and broad two headed ligature put under the arm-pit, and so brought six or eight times upon the joint of the shoulder, and thrown cryed unto the opposite arm-pit by so many windings as shall be judged requisite. Then the arm must be put and carried in a scarf to right angles, which figure must be observed not only in every luxation of the shoulder, but in each fracture of the arm also, for that it is less painfull, and consequently, such as the arm may stand the longer thereon without easing.

Signs.

The cure.

What to be done to hold in the shoulder after it is restored.

CHAP. XXX. *Of the shoulder dislocated upwards.*

THe head of the shoulder also may sometimes be turned into the upper part. Which when it happens, it is easily known by standing forth at the end of the collar bone, where the hollowness of the arm-pit is found larger than usuall, the elbow flyes further from the ribs than when it fell down inwards, nor the man is wholly unable to perform the usuall actions. It is fit for the reduction of such a luxation, that the Surgeon stoop down, and put his shoulder under the Patients arm, and there lead up as high as he can upon his feet, and therewithall press down the head of the shoulder bone into the cavity, or else make some other to do it. Otherwise it is fit to lay the Patient upon his back on the ground, and whilst some one extends the affected arm by drawing it downwards, the Surgeon with his own hand may force down the head of the bone into its cavity. The operation performed, the same things shall be done as in other luxations, compresses being applyed to that part whereto the bone flew, and it being also bound up with ligatures. Now you may understand in these four forementioned kinds of dislocations, that the bone which was luxated is restored, by the found which shall be found as you force it in, by the relaxation of the swollen [illegible] and lifting it up, by the mitigation of the pain, and lastly, by the collation and comparing of the affected arm with the found, and by its similitude and equality therewith.

Cure.

CHAP. XXXI. *Of the dislocation of the elbow.*

THe elbow may also be sometimes of three manner of ways dislocated, to wit, inwardly, outwardly, [illegible] by the bone which is luxated [illegible] to wit, in that manner of articulation which is called *Ginglymus*, and by the bone which is luxated in a naturall line, to wit, in that manner of articulation which is called *Enarthrosis*. I make the outward part, that which is [illegible] and more readily [illegible] that which is [illegible] the elbow is more difficultly dislocated outwardly, and more difficultly [illegible] and more readily [illegible] that manner of articulation which is called *Ginglymus*, as we have declared in our Anatomy, and by the Treatise of Fractures. [illegible] ceased, for that the [illegible] an absolute standing. [illegible] that the inner process [illegible] falleth out and is dislocated [illegible] ly, and forced against [illegible] forced thence, and [illegible] hereunto that the [illegible] other inner is the [illegible] their cubits. [illegible] made to the inner [illegible] bended, for the inner process [illegible] of the shoulder bone, which [illegible] makes the [illegible] it falleth out dislocated to the fore part, [illegible] shorter than the other. But if the elbow be fallen out of its place according to the other manner of dislocations, to wit, upwards to the shoulder, the naturall figure thereof is perverted, for the

The Author dissents not to agree with *Hip.* *Aphor. ult. sect. 3.* and *Celsus* in the setting down the kinds of a dislocated elbow.

The Author doth not agree with *Hippocr.* and *Celsus*, in setting down the notes of these dislocations: for those notes which are here attributed to an outward and forward luxation, these *Celsus* hath given to an elbow dislocated towards the fore and out part; and those which are here attributed to the elbow dislocated upwards and downwards; those *Celsus* hath attributed to a dislocation to the out and [illegible]

arm

Inflammation hinders repoſition.

arm is ſtretched forth, but little notwithſtanding bended towards that part from whence the bone went, that is, figured after a middle manner between bending and extending thereof. What kind ſoever of diſlocation ſhall befall it, the action of the elbow will either not be at all, or certainly not well untill that it be reſtored to its former place, there is a ſwelling in the part where into it is flown, and a cavity there from whence it is fled, which alſo happens in the diſlocations of all other parts. Furthermore, one diſlocation of the elbow is compleat and perfect, another imperfect. The latter as it eaſily happens, and through a ſmall occaſion, ſo it is eaſily reſtored; but on the contrary a perfect, as it hardly happens, and not unleſſe with great violence, ſo it is not ſo eaſily reſtored again, eſpecially if that you do not prevent inflammation, for being inflamed it makes the reſtitution either difficult, or wholly impoſſible, principally that which falleth outwards.

CHAP. XXXII. *How to reſtore the elbow, diſlocated outwardly.*

Signe,

Cure;

You may know that the elbow is diſlocated outwardly, if at any time you ſhall obſerve the arm to be diſtended, and not able to be bended. Wherefore you muſt forthwith undertake the reſtitution thereof, for fear of defluxion and inflammation which the bitterneſſe of pain uſually cauſeth, upon what part ſoever the luxation happen. There is one manner of reſtoring it, which is, you muſt cauſe one to hold hard and ſteddy the Patients arm a little under the joint of the ſhoulder, and in the mean while let the Surgeon draw the arm, taking hold thereof with his hand, and alſo force the ſhoulder bone outwards, and the eminency of the cubit inwards, but let him by little and little draw and extend the arm, wreſting it gently this way and that way, that he may bring back the bone which fell out into its cavity. I have thus expreſſly delivered this, that the young Surgeon may underſtand, that the arm muſt not be bended for the reſtoring of this kind of diſlocation, for reſtitution cannot ſo be hoped for, becauſe by this kind of bending the inner proceſſe of the cubit poſſeſſeth the place of the exteriour proceſſe in the cavity of the ſhoulder bone. Wherefore whilſt the arm is bended or crooked, the cubit is only lifted up, and not drawn into its ſeat. But if we cannot attain to the reſtitution thereof with our hands alone, you muſt cauſe the diſlocated arm lightly bended to embrace a poſt, then muſt the end of the cubit called *Olecranum* be tyed or bound about with a ſtrong ligature or line, and ſtrong wreathed into its cavity by putting a batoon or ſtaff into the ligature, as is demonſtrated by this following figure.

A Caution.

A figure which ſhews the way how to reſtore the elbow, by putting it about a poſt, with a batoon.

There is alſo another more exquiſite way of reſtoring it, which is expreſſed by the latter figure, wherein a line of ſome inch breadth is caſt about the *Olecranum* of the arm, embracing a poſt or pillar, and it is drawn ſo long, until the diſlocated bone be brought into its ſeat. Now we know that the bone is returned into its place, and reſtored, when the pain ceaſeth, and the figure and whole naturall conformation is reſtored to the arm, and the bending and extending thereof is eaſie, and not painfull.

CHAP.

CHAP. XXXIII.

Of the Dislocation of the Elbow to the inside, and of a compleat and uncompleat Luxation.

IF the Elbow be dislocated to the inner part, the arme must bee strongly and powerfully extended, then bended quickly and with sudden violence, so that his hand may smite upon his shoulder. Some put some round thing into the bought of the Elbow, and upon that do suddenly force the Elbow to the shoulder, as wee have formerly said. If the Cubit bone bee onely lightly moved out of its place into the upper or lower place, it is easily restored by drawing and forcing it into its cavity, after this following manner. Let two extend the arme, taking hold thereof at the shoulder and wrist, and each draw towards himselfe, and also the Surgeon (who shall there be present) shall force the bone which is dislocated from that part whereunto it is bended, unto the contrary: after he shall thus have restored it, hee shall lay the arme in a strait angle, and so binde it up, and apply fit medicins formerly mencioned, and so les him carry it in a scarfe put about his neck, as we said in the dislocation of the shoulder. *Hippocrates* bids, that the Patient, after it is set, shall often endeavour to bend his hands upwards and downwards, and also extend and bend his nayles, yea and also to attempt to lift up some heavy thing with his hand; for so it will come to passe, that the ligaments of this joint may become more soft, ready, and able to performe their accustomed functions; and also the bones of the cubit and shoulder shall be freed from the affect termed *Ankylosis*, whereto they are inclined by the luxation of this part. Now *Ankylosis* is a certaine preternaturall conglutination, or congunction, and as it were union of sundry and severall bones in the same joint, which doth hinder the bending and extension thereof. Now a Callus is generated in the elbow, (as in any other articulation) whether it remaineth out, or be put into joint, by reason that by rest and cessation from the accustomed actions, the viscide humors which flowed naturally to the joints, as also another watery part, grow cold, drawne thither by paine, flow downe, and be hardned, and glewed the bones together, and have obtained firmity by reason of the idlenesse and too long rest of this part. Wherefore, that we may withstand this affect, the whole ligation must be looked sooner and oftner than otherwise, that is to say, every third day, and then the Patients arme must be gently moved every way. Within the space of twenty, or twenty five dayes, these restored bones recover their strength, sooner or later, according to the happening accidents. It is necessary also that the Surgeon know that the *Radius*, or Wand, sometimes falleth out when the Cubit or Ell is wholly dislocated; wherefore hee must bee mindfull in setting the Cubit, that hee also restore the Wand to its place; in the upper part it hath a round processe lightly hollowed, wherein it receiveth the shoulder bone: it hath also an eminency which admitteth the two headed muscle.

Why the elbow is most subject to *Ancylosis*.

CHAP. XXXIV.

Of the Dislocation of the Styliformis, or bodkin-like processe of the cubit or ell.

THE processe of the Ell called *Sqbides*, being articulated to the wrist by *Diarthrosis*, that is, it is retained in a small cabity, is dislocated, and falleth out sometimes inwards, sometimes outwards. The cause usually is the falling of the body from high upon the hands. It is restored, if that you force it into its seat, diligently binde it, and apply thereto very astringent and drying medicines. But yet, though you shall diligently performe all things which may bee done in dislocations, yet you shall never so bring it to passe that this bone shall bee perfectly restored, and absolutely put to the place where hence it went: which thing wee have read, observed by *Hippocrates*; when (saith hee) the greater bone, to wit, the Ell, is removed from the other, that is, the wand, it is not easily restored to its owne nature againe; for that,

Differences and causes.

Cure.

Sent. 2. sect. 2. & sent. ult. sect. 3. de fract.

that, seeing that neither any other common connexion of two bones, which they call *Symphysis* or union, when it is drawne asunder and destroyed, may be reduced into its former nature, by reason these ligaments wherewith they were formerly contained, and as it were continued, are too violently distended and relaxed, whence it happens, that I have in these cases often observed, that the diligence and care of the Surgeon hath nothing availed.

CHAP. XXXV.

Of the dislocation of the Wrist.

Here, as before chap. 31. the Author dissents from *Celsus* and *Hippocrat.* in expressing the names and signs of these dislocations.

WE understand by the Wrist, a certaine bony body, consisting of a composure of eight bones knit to the whole Cubit by [illegible]. For the Wrist considered wholly in it selfe, is knit and articulated with the Ell and Ward; with that, against the little finger, with this, against the thumbe for thus as it were by two connections the joint is made more firme. Yet may it be dislocated inwardly, outwardly, and towards the sides. We say it is luxated inwardly when the hand stands upwards, but outwardly, when it is drawn in and cannot be extended. But if it chance to be dislocated sideways, it stands away either towards the little finger, or else towards the thumbe, as the humour pelts to this or that side. The cause hereof may seeme to depend upon the different articulation of the Ell and Ward with the Hand or Wrist: For the Ward, which is articulated on the lower part with the Wrist at the thumbe, by its upper part, whilst it rectives the outward swelling or condyle of the Ell in its cavity, performes the circular motions of the hands. But the Cubit or Ell, which in like sort is connected on the lower part by *Diarthrosis* at the little finger with the Wrist, being articulated on the upper part with the shoulder bone bends and extends, or stretches forth the hand. There is one way to restore the formerly mentioned dislocations. The arme on one side and the hand on another must be extended upon a hard resisting and smooth place, so that it may be fixed, and you must have a care that the part whence the dislocated bone fell, be the lowest in its first and place, and the part whither it is luxated higher. Then to conclude, the prominencies of the bones must be pressed downe by the hand of the Surgeon, untill by the force of compression and fit the luxated bones be thrust and forced into their place and cavities.

CHAP. XXXVI.

Of the dislocated bones of the Wrist.

Signe.

THE Wrist consists of eight bones, which cannot, unlesse by extraordinary violence, be put or fall out of their places. Yet if they shall at any time fall out, they will shew it by the tumour of the part whereto they are gone, and by the depression of that wherefrom they are fled. They may bee restored, if the diseased hand be extended upon a table, and if the bones shall be dislocated inwards, the hand shall bee placed with the palme upwards, then the Surgeon shall, with the palme of his hand, presse downe the eminencies of the bones, and force each bone into its place. But if the luxation bee outwards, hee shall lay the palme next to the table, and presse it after the same manner. To conclude, if the luxation shall be toward either side, the luxated bones shall be thrust towards the contrary, and the reduced bones shall be presently contained in their places with fit remedies, binding, rowling, and carrying the hand in a scarfe.

Cure.

Chap. XXXVII.

Of the dislocated bones of the After-wrest.

THere are four bones in the Palm or After-wrest, the two middlemost whereof cannot bee dislocated side-wales, becaus they are linisted and kept from falling aside by the opposition of the parts, as it were resisting. Neither can that which answereth to the little finger, nor that whereon the forefinger rest's, bee dislocated towards that side which is next the middle bones, whereof wee now spoke, but onely on the other side, free'd from the neighbor-hood of the boner: but all of them may bee dislocated inwardly and outwardly. They may bee restored as those of the Wrest.

Lib. 8. cap. 18.

Chap. XXXVIII.

Of the dislocated Finger.

ALso the bones of the fingers may bee four severel wales dislocated; inwardly, outwardly, and at each side. To restore them, they must bee laid straight upon a table, and so put into joint again. For thus they may bee easily restored, by reason their sockets are not deep, and their joints are shorter, and ligaments less strong. In twelv dales space they will recover their strength, as also those dislocations that happen to the Wrest and After-wrest.

Why the dislocated fingers may bee easily restored.

The breaking and relaxation of the internal ligament.

Of a dislocated Thigh, or Hip.

Chap. XXXIX.

THe Thigh or Hip may bee dislocated, and fall forth towards all the four parts of the world. But most frequently inwards, neere to that outwards; but verie seldom either forwards or backwards. A subluxation cannot happen in this joint, as neither in the shoulder, especially from an external cause, contrarie to which it usually happen's in the elbow, hand, knee, and foot. The cause hereof is, for that the heads of the thigh and shoulder-bone are exactly round, and the sockets which receiv them have curable borders and edges encompassing them: heerunto may bee added, that strong muscles encompass each dislocation, so that it cannot come to pass that part of the heads of such bones may bee couched in the cavitie, and other parts stand or fall forth, but that they will quickly bee restored to their places by the motion and wheeling about of the joint, and the strength of the encompassing muscles. But a subluxation may seem to happen in these parts from an internal cause. For then the ligaments and ties being softned and relaxed, do not draw and carrie back the head of the bone standing forth so far as the edges of the socket. If the Hip bee dislocated towards the inner part, that leg becom's longer and larger then the other, but the knee appear's somwhat lower, and look's outwardly with the whole foot, neither can the patient stand upon his leg. To conclude, the head of the Thigh-bone bewray's it self lying in the groin, with a swelling manifest both to the eie and hand; now the leg is longer then that which is sound, for that the head of the thigh is out of it's socket or cavitie, and situated lower, to wit, in the groin, therefore the leg is made by so much the larger. Now the knee stand's forth, becaus necessarily the lower head of the thigh-bone stand's contrarie to the socket. For this is common to all dislocated boner, that when as the dislocation happen's to the one side, the other end of the bone flie's out to the contrarie. Whence it is, that if the upper-head of the thigh-bone shall fall inwards, then the other head, which is at the knee, must necessarily look outwards. The like happen's in other dislocations. The leg cannot bee bended towards the groin, for that the dislocated bone hold's the extending muscles of the same part so finly stretched out, that they cannot yeeld, or applie themselvs to the benders. For flexion or bending ought to precede extention, and extention, flexion.

Hip sect. 68. sect. 3. de nat.

Gal. com. ad sect. 47. sect. 4. de nat.

A subluxation may befal the Thigh from an internal cause.

Ll/ CHAP.

CHAP. XL.

Prognoſticks belonging to a diſlocated Hip.

Why the thigh-bone diſlocated, is difficultly reſtored, or reſtored, eaſily fall's out again.

THere is this danger in the diſlocations of the Hip, that either the bone cannot bee put into the place again, at leaſt unleſs with very much trouble, or elſ being put in, that it may preſently fall out again. For if the tendons of the muſcles, the ligaments, and other nervous parts of the member bee hard and ſtiff, they, by reaſon of their contumacie and ſtiffneſs will hardly ſuffer the bone to return to its place. If that they bee ſoft, loos, effeminate and weak, they will not contain the reſtored bone in its place. Neither will it bee any better contained, if that ſhort, but yet ſtrong and round ligament, which faſten's the head of the Thigh-bone on the inſide in the Socket or Cavitie of the huckle-bone, bee broken or relaxed. Now it may bee broken by ſom violent ſhock or accident, it may bee relaxed by the congeſtion and long ſtay of ſom excrementitious, tough and viſcuous humor lying about the joint, through which means it waxeth ſoft. But if it bee broken, how often ſoever the bone bee reſtored, it will preſently fall out again. If it bee relaxed, there is onely this hope to contain the reſtored bone, that is, To conſume and draw away the heaped up humiditie by application of Medicines and Cauteries of both kindes, for which purpoſe thoſe are more effectual which do actually burn, for that they drie and ſtrengthen more powerfully. Leanneſs of the bodie, and the want of *Aponeuroſes*, that is, of broad tendont and external ligaments, whereof many encompaſs the knee, encreaſe's the difficultie of containing it in the place. But the parts adjoining to the diſlocated and not-ſet-bone fall away by little and little, and conſume with an *Atrophia* or want of nouriſhment; both becauſ the part it ſelf is forced to deſiſt from the accuſtomed actions and functions, as alſo for that the veins, arteries and nerv's beeing more ſtraitned and put out of their places, hinder the ſpirits and nouriſhment from flowing ſo freely as they ought, to the part: whence it com's to paſs, that the part it ſelf is made more weak, the native heat beeing debilitated through idleneſs, it can neither attract the alimentarie juice, neither can it digeſt and aſſimilate that little thereof which flow's and falleth thereto. Verily the Thigh-bone, as long as it is forth of the cavitie, grow's no more after the manner as the other bones of the bodie do, and therefore in ſom ſpace of time you may perceiv it to bee ſhorter then the ſound bone. Notwithſtanding the bones of the leg and foot are not hindered of their growth, for that they are not out of their proper places. Now for that the whole leg appear's more ſlender, you muſt think that happen's onely by the extenuation and leanneſs of the proper muſcles thereof. The ſame thing happen's to the whole hand, in the largeſt acception, when as the ſhoulder is out of joint, unleſs that the calamitie and loſs hereof is the leſs. For the ſhoulder beeing forth of joint you may do ſomthing with your hand, whereby it will com to paſs that no ſmal portion of nouriſhent may flow down into thoſe parts. But the Thigh-bone beeing diſlocated, eſpecially inwards in a childe unborn, or an infant, much leſs alimentarie nouriſhment flow's to that part, becauſ it can much leſs uſe the foot and leg, by reaſon of the diſlocation of the Hip, then it can do the hand by a luxation of the ſhoulder. But now wee muſt thus underſtand that which is ſaid by *Hippocrates*, That diſlocated bones and not reſtored do decreaſ or are hindered from their juſt growth, to bee onely in thoſe who have not yet attained to their full and naturally-appointed growth in every dimenſion. For in men of full growth, the bones which are not reſtored, becom more ſlender, but yet no ſhorter, as appear's by that which hee hath delivered of the ſhoulder.

The breaking and relaxation of the internal ligament.

Gal. com. ad ſent. 42. ſect. 4. de art.

Hippocrates explained *ſect. 1. & 3. lib. de art.*

CHAP. XLI.

Of the ſigns of the Hip diſlocated outwardly or inwardly.

THe Thigh-bone or Hip when it is diſlocated outwardly, and not reſtored, after ſom time the pain is aſſwaged, and fleſh grow's about it, the head of the bone wear's it ſelf a new cavitie in the adjoining Hip, whereinto it betake's it ſelf, ſo that at the length the patients may go without a ſtaff, neither ſo deformed a leanneſs will waſte their leg. But if the luxation happen inwards, a greater leanneſs will befal them, by reaſon that the veſſels naturally run more inwardly, as *Galen* obſerv's in the diſlocation of the *Vertebræ* to the inſide; therefore it com's to paſs that they are more grievouſly oppreſſed: beſides the thigh-bone cannot wag or once ſtir againſt the ſhare-bone: wherefore if the bone thus diſlocated bee not reſtored to its joint again, then they muſt caſt their leg about as they walk, juſt as wee ſee oxen do. Wherefore the ſound leg whil'ſt they go, take's much leſs ſpace then the lame, becauſ this, whil'ſt it ſtirreth or mooveth, muſt neceſſarily fetch a compaſs about, but that performeth its motion in a right line. Beſides, whil'ſt the patients ſtand upon their lame leg to put forwards the ſound, they are forced to ſtand crooked, whereupon they are forced to ſtay themſelv's with a ſtaff that they fall not.

Ad ſent. 51. ſect. 3. de art.

Further-

Furthermore thoſe who have this bone diſlocated either backwards or outwards, ſo that it cannot bee reſtored, have the part it ſelf grow ſtiff and hard; which is the cauſ why the ham may bee bended without great pain, and they may ſtand, and go upon the tops of their toes; beſides alſo, when they deſire to go faſter, they are forced to ſtoop, and ſtrengthen themſelvs by laying their hand on their lame thigh at every ſtep, both for that their lame leg is the ſhorter, as alſo becauſ the whole weight of the bodie ſhould not lie wholly or perpendicularly upon the joint or head of the thigh-bone. Yet in continuance of time, when they are uſed to it, they may go without any ſtaff in their hands. Yet in the interim, the ſound leg becom's more deformed in the compoſure and figure, becauſ, whilſt it ſuccor's the oppoſite and lame leg by the firm ſtanding on the ground, it bear's the weight of the whole bodie, in performance whereof the ham muſt neceſſarily now and then bend. But on the contrarie, when as the head of the thigh beeing diſlocated inwards is not put into the joint, if the patient bee arrived at his full growth, after that the head of the bone hath made it ſelf a cavitie in the neighboring bone wherein it may reſt, hee may bee able to walk without a ſtaff, becauſ the diſlocated leg cannot eaſily bee bended toward the groin or ham, and hee will ſooner reſt upon his heel then upon his toes. This kinde of diſlocation if it bee inveterate, can never bee reſtored. And theſe things happen, when as the thigh-bone is diſlocated inwards, or when the internal ligament which faſten's the dearticulation ſhall bee broken or relaxed. But the contrarie ſhall plainly appear if the diſlocation ſhall happen to bee outwards; for then the lame leg becom's the ſhorter, becauſ the head of the thigh flie's into a place higher then its cavitie, and the muſcles of that part are contracted towards their original, and convulſively draw the bone upward together with them. The whole leg, together with the knee and foot looketh inwards, they cannot go upon their heels, but upon the ſetting on of the toes. The leg may bee bended, which it cannot bee in a diſlocation of the thigh inwards, as *Paulus* ſhew's. Therfore wee muſt diligently obſerv that ſentence of *Hippocrates* which is read with a negative, in theſe words: *Sed neque conflectere quemadmodum ſanum crus poſſunt*, that they ought to bee read with an affirmative after this manner: *Sed conflectere &c. quin & crus ipſum &c.* But now the lame leg will better ſuſtain the weight of the bodie in an external, then in an internal diſlocation; for then the head of the thigh is more perpendicularly ſubject to the whole weight of the bodie. Therefore when in the ſucceſs of time it ſhall by wearing have made it ſelf a cavitie in the neighboring bone, which in time will bee confirmed, ſo that there will remain no hope of reſtoring the diſlocation, nevertheleſs the patient ſhall bee able to go without a ſtaff, for that then no ſenſ of pain will trouble him; whence it follow's, that the whole leg alſo will becom leſs lean, for that going is leſs painful, neither are the veſſels ſo much preſſed as in that diſlocation which is made inwardly.

Signs of the thigh-bone diſlocated outwards.

Paul. Æg. lib. 6. c. 8. Hip. ſent. 91 ſect. 3. lib. de artic.

CHAP XLII.

Of the thigh-bone diſlocated forewards.

IT ſeldom happeneth that the thigh is diſlocated forwards; yet when as it ſhall happen, it is by theſe ſigns. The head of the thigh lieth towards the ſhare; whence the groins ſwell up, and the buttock on the contrarie is wrinkled and extenuated by reaſon of the contraction of the muſcles; the patient cannot extend his leg without pain, no verily, not ſo much as bend it towards the groin, for the fore-muſcle which ariſeth from the hanch-bone is ſo preſſed by the head of the thigh, that it cannot bee diſtended; neither can the ham bee bended with out very much paine. But the ſame leg is equall at the heel with the other leg, yet the patient cannot ſtand upon the ſetting on of the toes; therefore when hee is forced to go, hee toucheth the ground with his heel only, yea verily the ſole of his foot is leſs inclined to the fore ſide, neither doth it ſeldom happen, that the urine, by this accident, is ſuppreſt; becauſe the head of the thigh oppreſſe's the greater nerves from whence thoſe ariſe which are carried to the bladder, which through the occaſion of this compreſſion is pained and inflamed by conſent: now when inflammation ſhall ſeiz upon the *Sphinct*-muſcle, the urine can ſcarcely flow out, for that it is hindered by the ſwelling.

Stopping of urine by reaſon of an internal diſlocation of the thigh-bone.

CHAP. XLIII.

Of the Thigh-bone diſlocated backwards.

SEldom alſo is the thighbone diſlocated backwards, becauſ the hind-part of the cavitie of the huckle-bone is deeper and more depreſſed than the fore; whence it is that the diſlocation of the thigh to the inner part is more frequent then the reſt. The patient can neither extend nor bend his leg by reaſon of the much compreſſion and tenſion of the muſcles which encompaſs the head of the thigh by this kind

Signs.

of luxation. But the paín is encreaſed when hee would bend his ham, for that then the muſcles are more ſtrongly extended. The lame leg is ſhorter than the ſound: when the Buttocks are preſſed, the head of the thigh is perceived hid amongſt the muſcles of that part, but the oppoſite groin is lax, ſoft, and depre'ſt with a manifeſt cavitie. The heel touche's not the ground, for that the head of the thigh is plucked back again by the muſcles of the buttocks amongſt which it lieth hid, but principally by that which is the larger, and which is ſaid to make as it were the pillow or cuſhion of the buttocks; for this is much more preſſed in this kinde of diſlocation then the reſt: whence it is, that the patient cannot bend his knee, becauſ the extenſion of the nervous production or large tendon which covers's the knee is ſo great. But if the patiente will ſtand upon the foot of his luxated leg without a ſtaff, hee ſhall fall down backwards, for that the bodie is inclined to that part, the head of the thigh being not directly underneath for the propping or bearing up of the bodie; wherefore hee is forced to ſuſtain himſelf upon a crutch on his lame ſide. Haveing premiſed theſe things of the differences, ſigns, ſymptoms and prognoſticks, it now remaineth, that wee briefly deſcribe the different waies of reſtoreing them, according to the difference of the parts whither it is fallen. First, you muſt place the patient upon a bench or table, groveling, or with his face upwards, or upon one ſide, laying ſom ſoft quilt or coverlid under him, that hee may lie the eaſier. Now you muſt place him ſo, that the part unto which the bone is flown, may be higher, but from whence it is fled, the lower. For if the thigh-bone bee diſlocated outwards or backwards, then muſt the patient bee laid groveling; if inwardly, upon his back; if forwards, then upon his ſide. Then muſt extenſion and impulſion bee made towards the cavitie, that ſo it may bee forced thereinto: but if the diſlocation bee freſh, and in a ſoft bodie, as a woman, childe, and ſuch like, whoſe joints are more lax, it ſhall not bee any waies needful to make great extenſion with ſtrong ligatures for the reſtoreing it; the Surgeon's hand ſhall ſuffice, or a liſt or towel caſt about it. In the interim the bone ſhall bee kep't faſt with compreſſes applied about the joint: then the Surgeon ſhall extend the thigh, takeing hold thereof above the knee, in a ſtraight line, and ſo ſet it directly againſt the cavitie, and then preſently thruſt it thereinto. For thus ſhall hee reſtore it, if ſo bee that in thruſtingit hee liſt up the head thereof ſomwhat higher, leſt the lips of the cavitie force it back, and hinder it from entring. Now becauſ unleſs there bee juſt extenſion, there can bee no reſtitution hoped for, it is far better in that part, that is, to extend it ſomwhat more than is neceſſarie, yet ſo, that you do not endanger the breaking of any muſcles, tendon or other nervous bodie. For that as *Hippocrates* write's, when as the muſcles are ſtrong and large, you may ſafely extend them, if ſo bee that you diſplace nothing by the force of the extenſion. If your hand will not ſuffice to make juſt extenſion, you muſt uſe the help of an Engine, ſuch as is our Pulley, faſtned to two poſts, ſo much of the rope beeing let forth, and drawn up again as ſhall ſuffice for the buſineſs in hand; in the performance whereof, it is fit that the patients friends abſent themſevs from this ſad ſpectacle, and that the Surgeon bee reſolute, and not deterred from his buſineſs by the lamentation, neither of the patient nor his friends. But for that wee write theſe things chiefly for the benefit of young practicioners, it ſeemeth meet, that haveing delivered theſe things in general, of reſtoring the thigh-bone, that wee run over theſe generalities in each particular, begining with that diſlocation which is made inwardly.

The general cure.

Sect. 2. lib. de fract.

CHAP. XLIV.

Of reſtoreing the Thigh-bone diſlocated inwards.

IT is fit to place the patient after the foreſaid manner, upon a table or bench, in the mid'ſt whereof ſhall ſtand faſtned a woodden pin of a foot's length, and as thick as the handle of a ſpade uſeth to bee; but it muſt bee wrapped about with ſom ſoft cloth, leſt the hardneſs hurt the buttocks, betwixt which it muſt ſtand, as wee read that *Hippocrates* did in the extenſion of a broken leg. The wooden pin hath this uſe, to hold the bodie that it may not follow him that draweth or extendeth it; and that the extenſion beeing made as much as is requiſite, it may go between the *peritoneum* and the head of the diſlocated thigh. For thus there is no great need of counter-extenſion towards the upper parts; and beſides it helpeth to force back the bone into its cavitie, the help of the Surgeon concurring, who twining ſomwhiles to this, and otherwhiles to that ſide, doth direct the whole work. But when the extenſion hath need of counter-extenſion, then it is needful you have ſuch ligatures at hand, as wee have mentioned in the reſtoreing of a diſlocated ſhoulder, to bee drawn above the ſhoulder. One of theſe ſhall bee faſtned above the joint of the hip, and extended by a ſtrong man; another ſhall bee caſt above the knee by another with the like force. But if you cannot have a woodden pin, another ſtrong and like ligature ſhall bee put upon the joint directly as the hip, and held ſtiff by the hands of a ſtrong man, yet ſo that it my not touch the head of the thigh by preſſing it, for ſo it would

Sect. 2. lib. de fract.

How to make extenſion and counter-extenſion in this kinde of fracture.

would hinder the reſtoring thereof. This manner of extenſion is common to four kindes of luxation of the thigh-bone. But the manner of forcing the bone into its cavitie muſt bee varied in each, according to the different condition of the parts whereunto the head inclineth; to wit it muſt bee forced outwards if it bee fallen inwards, and contrarie in the reſt, as the kinde of the diſlocation ſhall bee. Som too clowniſh and ignorant knot-knitters faſten the lower ligature below the ankle, and thus the joints of the foot and knee are more extended then that of hip or huckle-bone, for they are neerer to the ligature, and conſequently to the active force: but they ought to do otherwiſe; therefore in a diſlocated ſhoulder you ſhall not faſten the ligatures to the hand or wreſt, but above the elbow. But if the hands ſhall not bee ſufficient for this work, then muſt you make uſe of engines. Wherefore then the patient being placed as is fit, and affected part firmly held, ſom roundthing ſhall bee put into the groin, and the patient's knee, together with his whole leg ſhall bee drawn violently inwards, towards the other leg. And in the mean while the head of the thigh ſhall bee ſtrongly forced towards the cavitie of the huckle-bone, and ſo at length reſtored, as the following figure ſhew's.

Ligatures made for extenſion muſt bee faſtned neer the part to bee extended.

A figure which manifeſteth the way of reſtoring the Thigh-bone diſlocated inwards.

When the head of the Thigh by juſt extenſion is freed from the muſcles wherewith it was infolded, and the muſcles alſo extended that they may give way and yeeld themſelvs more pliant, then muſt the rope bee ſomwhat ſlacked, and then you muſt alſo deſiſt from extending, otherwiſe the reſtitution cannot bee performed, for that the ſtronger extenſion of the engine will reſiſt the hand of the Surgeon, thruſting and forceing it into the cavitie. This precept muſt bee obſerved in the reſtoring of this and other diſlocations. You ſhall know that the thigh is reſtored by the equalitie of the legs, by the free and painleſs extenſion and inflection of the lame leg. Laſtly, by the application of agglutinative medicines (whereof wee have formerly ſpoken) the reſtored bone ſhall bee confirmed in its place; to which purpoſe ligation ſhall bee made, the ligature beeing firſt caſt upon the place whereinto the head of the thigh fell, and thence brought to the oppoſite or ſound ſide by the belly and loins. In the mean while the cavitie of the groin muſt bee filled with ſomwhat a thick bolſter which may keep the head of the bone in the cavitie. Neither muſt you omit janks ſtretched down even to the ankles, as wee have obſerved in the fracture of the thigh. Then muſt both the thighs bee bound together, whereby the diſlocated member may bee unmoovable, and more and more ſtrengthned. Neither muſt this dreſſing bee looſed, untill four or five daies bee paſſed, unleſs peradventure the ſudden happening of ſom other more grievous ſymptom ſhall perſwade otherwiſe. To conclude, the patient muſt bee kept in his bed for the ſpace of a month, that the relaxed muſcles, nervs, and ligaments may have ſpace to recover their former ſtrength, otherwiſe, there is danger leſt the bone may again fall out by the too forward and ſpeedy walking upon it. For the ſite of the thigh it muſt be placed and kept in a middle figure, yet this middle figure conſiſt's in the extenſion, not in the flexion, as it is demonſtrated by *Hippocrates*, for that ſuch a figure is accuſtomable to the leg.

A general precept.

Sect. 2. lib. de fract.

CHAP. XLV.

Of reſtoreing the Thigh diſlocated outwardly.

THe patient muſt bee placed groveling upon a table in this kinde of diſlocation alſo, and ligatures as before, caſt upon the hip and lower part of the thigh, then extenſion muſt

bee made downwards, and counter-extenſion upwards; then preſently the head of the bone muſt bee forced by the hand of the Surgeon into its place. If the hand bee not ſufficient for this purpoſe, our pulley muſt bee uſed, as the following figure ſheweth.

A figure which expreſſeth the manner of reſtoreing the thigh luxated outwards.

When it is that onely extenon ſervs for the reſtoring the diſlocated Thigh.

This kinde of diſlocation is the eaſilieſt reſtored of all theſe which happen in the thigh or hip, ſo that I have diverſ times obſerved the head of the thigh to have been drawn back into its cavitie by the onely regreſs of the extended muſcles into themſelvs towards their originals, ſomwhiles with a noiſ or pop, otherwhiles without, which beeing don, laying a compreſs upon the joint, you ſhall perform all other circumſtances as before in an internal diſlocation.

CHAP. XLVI.

Of reſtoreing the Thigh diſlocated forwards.

When the Thigh is luxated forwards, the patient muſt bee laid upon his ſound ſide, and tied as wee have formerly delivered. Then the Surgeon ſhall lay a bolſter upon the prominent head of the bone, and have a care that his ſervant firmly hold it: then immediately juſt extenſion beeing made, hee ſhall with his hand force the bone into the cavitie; but if his hand will not ſerv, hee ſhall attempt it with his knee. Then to conclude, hee ſhall uſe the reſt of the things formerly mentioned to contain the reſtored bone.

CHAP. XLVII.

Of reſtoreing the Thigh diſlocated backwards.

The patient ſhall bee placed groveling upon a table or bench, and the member extended, as in the reſt, one ligature ſtretched from the groin, another from the knee; then the Surgeon ſhall endeavor to force back with his hand that which ſtand's up, and alſo to draw away the knee from the ſound leg. The bone thus placed and reſtored, the cure require's nothing elſ than to bee bound up and kept long in bed, leſt that the Thigh, if it ſhould bee moved, the nervs beeing yet more looſ, might again fall out. For the thigh is in great danger of relapſ, for that the cavitie of the huckle-bone is onely depreſt, as far as it goe's in, and the burden of the hanging or adjoining thigh is heavie.

CHAP. XLVIII.

Of the diſlocation of the Whirl-bone of the knee.

The Whirl-bone of the knee may fall forth into the inner, outer, upper and lower part; but never to the hind-part, becauſ the bones which it cover's do not ſuffer it. To reſtore it, the patient muſt ſtand with his foot firmly upon ſom even place, and then the Surgeon muſt force and reduce it with his hands from the part into which it is preternaturally

naturally ſlidden. When it ſhall bee reſtored, the cavitie of the ham ſhall bee filled up with bolſters ſo that hee may not bend his leg, for if it bee bended, there is no ſmal danger of the falling back of the whirl-bone. Then a caſe or box ſhall bee put about it, on the ſide eſpecially whereto it fell, beeing made ſomwhat flat and round reſembling the whirl-bone it ſelf, and it ſhall bee bound on with ligatures, and medicines ſo faſt that it may not ſtir a jot. After the part ſhall ſeem to have had ſufficient reſt, it is fit that the patient trie and accuſtom by little and little to bend his knee, until at length hee ſhall finde that hee may eaſily and ſafely moov that joint.

CHAP. XLIX.

Of the diſlocated Knee.

THe Knee alſo may bee diſlocated three manner of waies, that is, into the inner, outer, and hind-part, but very ſeldom towards the fore-ſide, and that not without ſom grievous and forcible violence; for the whirl-bone lying upon it, hinder's it from ſlipping out, and hold's it in. The other waies are eaſie, becauſ the cavitie of the leg-bone is ſuperficiarie and very ſmooth, but the cavitie of the lower end of the thigh-bone is made in the manner of a ſpout or gutter, and beſides the head thereof is verie ſmooth and ſlipperie; but the whole joint is much more lax than the joint of the Elbow: ſo that as it may bee the more eaſily diſlocated, ſo may it the beter bee reſtored; and as it may bee the more eaſily, ſo may it bee the more ſafely diſlocated, for that inflammation is leſs to bee feared here, as it is obſerved by *Hippocrates*. Falls from high, leaping, and too violent runing are the cauſes of this diſlocation. The ſign thereof is the diſabilitie of bending or lifting up the leg to the thigh, ſo that the patient cannot touch his buttock with his heel. The diſlocation of the knee which is inwardly and outwardly, is reſtored with indifferent extenſion and forceing of the bones into their ſeats from thoſe parts whereunto they have fallen. But to reſtore a diſlocation made backwards, the patient ſhall bee placed upon a bench of an indifferent height, ſo that the Surgeon may bee behinde him who may bend with both his hands and bring to his buttocks the patients leg put between his legs. But if the reſtitution do not thus ſucceed, you muſt make a clew of yarn, and faſten it upon the mid'ſt of a ſtaff, let one put this into the cavitie of his ham, upon the place whereas the bone ſtand's out, and ſo force it forwards; then let another caſt a ligature of ſom three fingers bredth upon his knee, & draw it upwards with his hands, then preſently & at once they ſhal ſo bend & crook the lame leg that the heel thereof may touch his buttocks.

The differences.

Ad finem ſect. 3. de fract.

How to reſtore a knee diſlocated backwards.

CHAP. L.

Of a Knee diſlocatyd forwards.

BUt if the Knee bee diſlocated forwards (which ſeldom happen's) the patient ſhall bee placed upon a table and a convenient ligation made aboov, and another cloſe beneath the knee. Then the Surgeon ſhall ſo long preſs down with both his hands the bone which is out of joint, until it ſhall return to its place again. To which purpoſe if the ſtrength of the hand wil not ſerv to make juſt extenſion each way you may make uſe of our engine, as you may perceiv by this following figure.

The cure.

A figure ſhewing the manner of reſtoreing a Knee diſlocated forwards.

You ſhall know that the bone is reſtored by the free and painleſs extenſion of the leg; then

then will there bee place for medicines, bolſters and ſtrengthening ligatures. In the mean ſpace the patient ſhall forbear going ſo long as the part ſhall ſeem to require.

CHAP. LI.

Of the ſeparation of the greater and leſſer Focile.

The joining of the leg and ſhin-bones.

THe *Fibula* or leſſer Focile is faſtned and adhere's to the *Tibia*, leg-bone, or greater Focile without any cavitie, above at the knee and below at the ankle. But it may bee pluck't or drawn aſide three manner of waies, that is, forwards, and to each ſide: this chance happen's when in going wee take no ſure footing, ſo that wee ſlip with our feet this way and that way as in a ſlipperie place, and ſo wreſt it inwards or outwards; for then the weight of our bodie lying open upon it, draw's the leg, as it were, in ſunder, ſo that the one Focile is diſlocated or ſeparated from the other. The ſame may happen by a fall from an high place, or ſom grievous and bruiſing blow: beſides alſo, their appendices are ſomtimes ſeparated from them. For the reſtoreing of all theſe into their proper places, it is fit they bee drawn and forced by the hand of the Surgeon into their ſeats: then ſhall they bee ſtraitly bound up, putting compreſſes to that part unto which the *Fibula* flew; beginning alſo your ligation at the very luxation, for the fore-mentioned reaſons. The patient ſhall reſt fortie daies, to wit, as long as ſhall bee ſufficient for the ſtrengthening of the ligaments.

The cure.

CHAP. LII.

Of the Leg-bone or greater Focile diſlocated and divided from the Paſtern-bone.

Differences and ſigns.

ALſo the Leg-bone is ſomtimes diſlocated and divided from the Paſtern-bone, as wel inwardly, as outwardly; which may bee known by the ſwelling out of the bone to this or that part; if it bee onely a ſubluxation or ſtrain, it may bee eaſily reſtored, by gently forceing it into the place again. After the bone ſhal bee reſtored, it ſhall bee kept ſo by compreſſes and fit deligation, by croſs and contrarie bindeing to the ſide oppoſite to that towards which the bone fell, that ſo alſo in ſom meaſure it may bee more and more forced into its place. In the mean time you muſt have a care that you do not too ſtraitly preſs the great and large tendon which is at the heel. This kinde of diſlocation is reſtored in fortie daies, unleſs ſom accident happen which may hinder it.

CHAP. LIII.

Of the diſlocation of the Heel.

Cauſes and differences.

WHoſoever leaping from an high place have fallen very heavie upon their heel, have their heel diſlocated and divided from the paſtern-bone. This diſlocation happen's more frequently inwardly than outwardly, becauſ the prominencie of the leſſer Focile embrace's the paſtern-bone; whence it is, that there it is more ſtraitly and firmly knit. It is reſtored by extenſion and forceing it in, which will bee no very difficult matter, unleſs ſom great defluxion or inflammation hinder it. For the bindeing up, it muſt beee ſtraiteſt in the part affected, that ſo the blood may bee preſſed from thence iuto the neighboring parts; yet uſing ſuch a moderation, that it may not bee painful, nor preſs more ſtraitly than is fit, the nervs and groſs tendon which run's to the heel. This diſlocation is not confirmed before the fortieth day, though nothing happen which may hinder it. Yet uſually it happeneth that many ſymptoms enſue by the vehemencie of the contuſion. Wherefore it will not be amiſs to handle them in a particular chapter.

The cure.

CHAP. LIV.

Of the Symptoms which follow upon the contuſion of the Heel.

Why bloodletting neceſſarie in the fracture of a heel.

Hip. ſect. 3. de fracturis.

IT happeneth by the vehemencie of this contuſion, that the veins and arteries do as it were vomit up blood both through the ſecret paſſages of their coats, as alſo by their ends or orifices, whence an *Ecchymoſis* or blackneſs over all the heel, pain, ſwelling, aud other the like enſue, which implore remedies and the Surgeon's help, to wit, convenient diet, and drawing of blood by opening a vein, (of which though *Hippocrates* make's no mention, yet it is here requiſite by reaſon of the Feaver and inflammation) and if need require, purgation; principally ſuch as may divert the matter by cauſing vomit, and laſtly, the

the application of local medicines, chiefly ſuch as may ſoften and rarifie the skin under the heel, otherwiſe uſually hard and thick (ſuch as are fomentations of warm water and oil) ſo that divers times wee are forced to ſcarifie it with a lancet, ſhunning the quick fleſh. For ſo at length the blood poured forth into the part, and there heaped up, is more eaſily attenuated, and at length reſolved. But theſe things muſt all be performed before the inflammation ſeiz upon the part, otherwiſe there will be danger of a convulſion. For the blood, when it fall's out of the veſſels, readily putrefies, by reaſon the denſitie of this part hinder's it from ventilation & diſperſing to the adjacent parts. Hereto may be added, that the large and great tendon which cover's the heel, is endued with exquiſite ſenſe, & alſo the part it ſelf is on everie ſide ſpred over with many nervs. Beſides alſo there is further danger of inflammation by lying upon the back and heel, as wee before admoniſhed you in the Fracture of a leg. Therefore I would have the Surgeon to bee heer moſt attentive and diligent to perform theſe things which we have mentioned, leſt by inflammation a Gangrene and Mortification (for heer the ſanious fleſh preſently fall's upon the bone) happen together with a continued and ſharp Fever, with trembling, hicketting and raveing. For the corruption of this part firſt by contagion aſſail's the next, and thence a Fever aſſail's the heart by the arteries preſſed and growing hot by the putrid heat, and by the nervs and that great and notable tendon made by the concourſ of the three muſcles of the calf of the leg, the muſcles, brain and ſtomach are evilly affected and drawn into conſent, and ſo cauſ convulſions, raveling and a deadlie hicketting.

Why the heel is ſubject to inflammation.

Gal. ad ſent. 23. ſect. 2. lib. de fract.

CHAP. LV.

Of the diſlocated Paſtern, or Ancle-bone.

THe *Aſtragalus* or Paſtern bone may bee diſlocated and fall out of its place to everie ſide. Wherefore when it fall's out towards the inner part, the ſole of the foot is turned outwards, when it flie's out to the contrarie, the ſign is alſo contrarie; if it bee diſlocated to the foreſide, on the hinde ſide the broad tendon coming under the heel is hardened and diſtended, but if bee luxated backwards, the whole heel is as it were hid in the foot: neither doth this kinde of diſlocation happen without much violence. It is reſtored by extending it with the hands, and forcing it into the contrary part to that from whence it fell. Beeing reſtored it is kept ſo by application of medicines and fit ligation. The patient muſt keep his bed long in this caſe, leſt that bone which ſuſtain's and bear's up the whole bodie, may again ſink under the burden, and break out, the ſinews beeing not well knit and ſtrengthened.

Sign.

Cure.

CHAP. LVI.

Of the diſlocation of the In-ſtep and back of the foot.

THe bones alſo of the In-ſtep and back of the foot may bee luxated, and that either upwards or downwards, or to one ſide, though ſeldom ſidewiſe, for the reaſon formerly rendred, ſpeaking of the diſlocation of the like bones of the hand. If that they ſtand upwards, then muſt the patient tread hard upon ſom plain or even place, and then the Surgeon by preſſing them with his hand ſhall force them into their places; on the contrary, if they ſtand out of the ſole of the foot, then muſt you preſs them thence upwards, and reſtore each bone to its place. They may bee reſtored after the ſame manner if they bee flown out to either ſide. But you muſt note, that although the Ligatures conſiſt but of one head in other diſlocations, yet heer *Hippocrates* would have ſuch uſed as have two heads, for that the diſlocation happen's more from below upwards, or from above downwards, then ſidewiſe.

Cure.

Sect. 14. ſect. 2. lib. de fract.

CHAP. LVII.

Of the diſlocation of the Toes.

NOw the Toes may bee four waies diſlocated, even as the fingers of the hand; and they may bee reſtored juſt after the ſame manner, that is, extend them directly forth, and then force each joint into its place, and laſtly, binde them up as is fitting. The reſtitution of all them is eaſie, for that they cannot far tranſgreſs their bounds. To conclude, the bones of the feet are diſlocated and reſtored by the ſame means as thoſe of the hands, but that when as any thing is diſlocated in the foot, the patient muſt keep his bed; but when any thing is amiſs in the hand, hee muſt carrie it in a ſcarf. The patient muſt reſt twenty daies, that is, until hee can firmly ſtand upon his feet.

The differences.

Cure.

CHAP.

CHAP. LVIII.

Of the ſymptoms, and other accidents which may befal a broken or diſlocated member.

Remedies for a contuſion.

MAnie things may befal broken or diſlocated members by the means of the fracture or diſlocation; ſuch as are bruiſes, great pain, inflammation, a fever, impoſtume, gangrene, mortification, ulcer, *fiſtula*, and *atrophia*, all which require a skilfull and diligent Surgeon for their cure. A contuſion happen's by the fall of ſom heavie thing upon the part, or by a fall from high, whence follow's the effuſion of blood poured out under the skin: which if it bee poured forth in great plentie, muſt bee ſpeedily evacuated by ſcarification, and the part eaſed of that burthen, leſt it ſhould thence gangrenate. And by how much the blood ſhall appear more thick, and the skin more denſ, by ſo much the ſcarification ſhall be made more deep. You may alſo for the ſame purpoſe applie Leeches.

What may happen by pain.

Concerning pain wee formerly ſaid, that it uſually happen's by reaſon that the bones are mooved out of their places, whence it happeneth that they becom troubleſom to the muſcles and nervs, by pricking and preſſing them. Hence enſue inflammations, as alſo impoſtumation and a fever, oft times a gangrene, and in concluſion a mortification corrupting and rotting the bones; otherwhiles a ſinuous ulcer or *fiſtula*. But an *atrophia* and leanneſs ariſeth by the ſloth and idleneſs of the member decaying all the ſtrength thereof, and by too ſtraight ligation intercepting the paſſages of the blood, otherwiſe readie to fall and flow thither.

Remedies for the leanneſs or *Atrophia* of any member.

Now the leanneſs which is occaſioned by too ſtraight ligation receive's cure by the ſlackning of the ligatures wherewith the member was bound. That which proceed's from idleneſs, is helped by moderate exerciſe, by extending, bending, lifting up, and depreſſing the member, if ſo bee that hee can away with exerciſe. Otherwiſe hee ſhall uſe frictions and fomentations with warm water. The frictions muſt be moderate in hardneſs and gentleneſs, in

What meaſure to bee uſed in fomenting.

length and ſhortneſs. The ſame moderation ſhall be obſerved in the warmneſs of the water, and in the time of fomenting. For too long fomenting reſolv's the blood that is drawn. But that which is too little or ſhort a ſpace draw's little or nothing at all: after the fomentation, hot and emplaſtick medicines made of pitch, turpentine, *euphorbium*, pellitorie of Spain, ſulphur, and the like, ſhall bee applied. They ſhall bee renued everie day more often or ſeldom, as the thing it ſelf ſhall ſeem to require.

A *dropax*.

Theſe medicines are termed *Dropaces*, whoſe form is thus: ℞ *picis nigræ, ammoniaci, bdelii, gummi elemi in aquâ vitæ diſſolutorum an.* ℥ii. *olei laurini* ℥i. *pulveris piperis, zinziberis, granorum paradiſi, baccarum lauri & juniperi, an.* ℥ii. *fiat emplaſtrum ſecundùm artem, extendatur ſuper alutam.*

Bindeing of the ſound part oppoſite to the emaciated.

It is alſo good to binde about the oppoſite ſound part with a ligature, yet without pain; as if the right arm ſhall decay for want of nouriſhment, the left ſhall bee bound, beginning your ligation at the hand, and continuing it to the arm-pit. If this miſchance ſhall ſeiz upon the right leg, then the left ſhall bee ſwathed up from the ſole of the foot to the groin. For thus a great portion of the blood is forced back into the *vena cava*, or hollow vein, and from this being diſtended and over full, into the part affected and gapeing with the veſſels almoſt emptie; beſide alſo it is convenient to keep the ſound part in reſt, that ſo it may draw the leſs nouriſhment, and by that means there will bee more ſtore to refreſh the weak part.

How to binde up the emaciated part.

Som wiſh alſo to binde up the decaying member with moderate ligation; for thus, ſay they, the blood is drawn thither: for when as wee intend to let blood by opening a vein with a lancet, wee binde the arm. Alſo it is good to dip it into water ſomwhat more then warm, and hold it there until it grow red, and ſwell; for thus blood is drawn into the veins, as they finde, which uſe to draw blood of the *ſapbena* and *ſalvatella*. Now, if when as theſe things and the like bee don, the lame part grow's hot, red and ſwollen, then know that health is to bee hoped for; but if the contrarie happen, the caſe is deſperate: wherefore you need attempt nothing further.

Signs that an *Atrophia* is cureable.

Furthermore, there is ſomtimes hardneſs left in the joints, after fractures and diſlocations are reſtored. It is fit to ſoften this, by reſolving the contained humor by fomentations, liniments, cataplaſms, emplaſters made of the roots of marſh-mallows, brionie, lillies, line ſeed, fenugreek ſeed, and the like, and alſo of gums diſſolved in ſtrong vineger, as *ammoniacum, bdelium, opopanax, labdanum, ſagapenum, ſtyrax liquida*, and *adeps anſerinus, gallinaceus, humanus, oleum liliorum*, and the like. Alſo you muſt wiſh the patient to moov the part now and then, everie day, yet ſo, that it bee not painful to him, that ſo the pent up humor may grow hot, bee attenuated, and at length diſcuſſed, and laſtly, the part it ſelf reſtored as far as art can perform it; for oft-times it cannot bee helped any thing at all. For if the member bee weak and lame, by reaſon that the fracture happened neer the joint, for the reſidue of his life the motion thereof uſeth to bee painful and difficult, and oft-times none at all, eſpecially if the *callus*, which grow's there, bee ſomwhat thick and great; and laſtly, if the joint it ſelf ſhall bee contuſed and broken by the ſtroke, as it oft-times happen's in wounds made by gun-ſhot.

OF

Of divers other PRETER-NATURAL AFFECTS, whose cure is commonly performed by Surgerie.

The Seventeenth Book.

CHAP. I.

Of an Alopecia, *or the falling away of the hairs of the head.*

AN *Alopecia* is the falling away of the hair of the head, and somtimes also of the eie-brows, chin and other parts; the French commonly call it the *Pelade*: Physicians term it the *Alopecia*, for old Foxes (subject, by reason of their age to have the scab) are troubled oft-times with this disease. This affect is caused either through defect of nourishment fit to nourish the hairs, as in old age through want of the radical humiditie, or by the corruption of the alimentarie matter of the same, as after long Fevers, in the *Lues venerea*, Leprosie, the corruption of the whole bodie and all the humors, whence follow's a corruption of the vapors and suliginous excrements; or elss by the vitious constitution of pores in the skin in raritie, and constriction or densitie, as by the too much use of hot ointments made for coloring the hair, or such as are used to take off hair, therefore called *Depilatoria*, or by the burning of the skin, or loss thereof, haveing a scar in stead thereof; by reason of whose densitie the hair cannot spring out; as by too much laxitie the suliginous matter of the hair staie's not, but presently vanisheth away. The *Alopecia* which com's by old age, a consumption, burn-baldness, leprosie, a scald head, is incureable: that which admit's of cure, the caus being taken away, is helped. Wherefore if is proceed from the corruption of humors, let a Physician bee called, who, as hee shall think it fit, shall appoint diet, purgeing and phlebotomie. Then the Surgeon shall shave off the hair which is remaining, and shall first use resolving fomentations, applie Leeches and Horns to digest the vitious humor which is under the skin, then shall hee wash the head to take away the filth with a Lee wherein the roots of Orris and Aloes have been boiled. Lastly, hee shall use both attractive fomentations and medicines for to draw forth the humor which is becom laudable in the whole bodie by the benefit of diet fitly appointed. But if the *Alopecia* shall happen through defect of nourishment, the part shall bee rubbed so long with a court linnen cloth, or a fig-leaf, or onions until it wax red; besides also the skin shall bee pricked in many places with a needle, and then ointments applied made of *Labdanum*, pigeons dung, staves-acre, oyl of bayes, turpentine and wax, to draw the blood and matter of the hairs. If the hair bee lost by the *Lues venerea*, the patient shall bee anointed with quick-silver to sufficient salivation. To conclude, as the causes of this disease shall bee, so must the remedies bee fitted which are used.

What *Alopecia* uncureable.

What cureable, and how.

" σφὶς ὑγεια

CHAP. II.

Of the Tinea, *or Scald-head.*

THe *Tinea* (let mee so term it in Latine, whil'st a fitter word may bee found) or a Scald-head, is a disease possessing the musculous skin of the head or the hairie scalp, and eating thereinto like a moth. There are three differences thereof; the first is called by *Galen scalie or bran-like*, for that whil'st it is scratched it cast's manie bran-like scales: som Practitioners term it *a drie scall*, becaus of the great adustion of the humor causing it. Another is called *Ficosa*, *a fig-like scall*, becaus when it is despoiled of the cruft or scab which is yellow, there appear's grains of quick and red flesh, like to the inner seeds or grains of figs, and calling out a bloodie matter. *Galen* name's the third *Achor*, and it is also vulgarly termed the *corrosive or ulcerous scall*, for that the many ulcers

Lib. 1. de comp. med. secund. locos.

cers where with it abound's are open with manie ſmall holes flowing with liquid *ſanies* like the waſhing of fleſh, ſtinking, corrupt and carrion-like, ſomwhiles livid, ſomwhiles yellowiſh. Theſe holes, if they bee ſomwhat larger, make another difference which is called *Cerion* or *Favoſa*, (that is, like a honie-comb) becauſ as *Galen* think's, the matter which floweth from theſe, reſembleth honie in color and conſiſtence. They all proceed of an humore which is more or leſs vitious, for a leſs corrupt humor cauſeth a ſcalie, a more corrupt; the fig-like, but the moſt corrupt produceth the ulcerous. If it ſhall happen to an infant by reaſon of the fault and contagion of the nurſ, or elſ preſently after it is born, it ſcarce admit's of cure; neither muſt wee attempt that, before the childe com to that age that hee may bee able to endure the cure and medicines. But you may in the mean while applie the leavs of Colworts or Beets beſmeared with freſh butter, or other gentle medicine haveing a facultie to mollifie and open the paſſage for the ſhut-up matter. Thoſe who are of ſufficient age to away with medicine, may bleed, purge, bathe, according to art by the advice of a Phyſician. For local medicines in a ſcalie ſcall, ſoftening and diſcuſſing fomentations ſhall bee appointed, made of the roots of marſh-Mallows, Lillies, Docks, Sorrel boiled in lee with a little vineger added thereto. The head ſhall bee twice in a day fomented with ſuch a decoction, and on the ſixth day the hair beeing ſhaven off, it ſhall bee ſcarified, and then leeches & horns put to it ſo ſcarified. Then it ſhal bee forthwith anointed with oyl of ſtaves-acre mixed with black ſope, both to draw and repreſs the malignitie of the humor impa'ct in the part. You may alſo uſe the following medicine even to the perfect cure of the diſeaſ, as that which is much commended in this kinde of diſeaſ by *Vigo*, *Gordonius* and *Guido*; it is thus made. ℞ *elleb. albi & nigri, atrament. auripigmenti, litbargyri auri, calcis vivæ, vitriol. alum. galla. fulig. ciner. fæcis vini uſti, an* ℥ ß. *argenti vivi extincti,* ʒiii. *æruginis æris* ʒii. *fiat pulvis qui incorporetur cum ſucco boraginis, ſcabioſæ, fumariæ, oxylapathi, aceti, an. quart. i. olei antiqui lib. i. bulliant uſque ad conſumpt. ſuccorum, in fine decoctionis cineres ponantur, addendo picis liquidæ* ℥ ß. *ceræ quantum ſufficit, fiat unguentum:* Theſe autors teſtifie that this will heal any kinde of ſcall. Certainly none can diſ-allow of it who well conſidereth the ingredients and compoſure thereof.

The cure. For a ſcalie ſcall. An ointment for a ſcolled head.

A cruſtie alſo or fig-like ſcall ſhall bee ſo long fomented with the preſcribed fomentation, until the cruſts or ſcabs fall off, yet there is nothing ſo good and effectual as Creſſes beaten or fried with hog's ſuet. For it will make it fall off in the ſpace of four and twentie hours, beſides, if it bee continued it will heal them throughly, as I have known by experience, and reaſon alſo ſtand's therewith; for according to *Galen*, Creſſes are hot and drie. When the cruſts ſhall bee fallen away, the parts affected ſhall bee anointed with the formerly preſcribed ointment. I have cured manie with a little oyl of vitriol, and ſomtimes alſo with *Ægyptiacum* made ſomwhat more ſtrong then ordinarie. But if the root of the hairs appear rotten, they ſhall bee plucked out one by one; yet if ſuch putrefaction ſhall poſſeſs the whole hairie ſcalp, and trouble all the roots of the hair, that you may pluck them out the more readily, and with leſs pain, you may beſmear a cotten-cloth on the rougher ſide with this following medicine. ℞ *picis nigræ* ʒvi. *picis ref.* ʒii. *pul. viridis æris, & vitriol. rom. an.* ʒi. *vel* ℥ ß *ſulphur. viv.* ℥ ß. *coquantur omnia ſimul in aceti acerrimi quantitate ſufficiente, fiat medicamentum ad uſum:* let it bee applied to the head, and remain on for two daies; then let it bee quickly and forcibly plucked away againſt the hair, that ſo the hairs ſticking to the plaiſter may by that means bee plucked away therewith: you ſhall uſe this medicine ſo long as need ſhall ſeem to require.

The cure of a cruſtie ſcall. A poultis of Creſſes. *Lib. 7. ſimpl.* A plaiſter to pluck away the hair at once.

For the third kinde of Scall which is termed a Corroſive or Ulcerous, the firſt indication is to cleanſ the ulcers with this following ointment. ℞ *unguenti enulati cum mercurio duplicato, ægyptiaci, an.* ʒiii. *vitriol. albi in pulverem redacti* ʒi. *incorporentur ſimul, fiat unguentum ad uſum*; alſo you may uſe the formerly deſcribed ointment. But if any pain or other accident fall out, you muſt withſtand it by the aſſiſtance and direction of ſom good Phyſician; verily theſe following medicines againſt all kindes of Scalls have been found out by reaſon, and approoved by uſe. ℞ *Camphur.* ℥ ß. *alum. rocb. vitriol. vir. æris, ſulph. vivi, fulig. forn. an.* ʒvi. *olei amygd. dulcium & axungiæ porci, an.* ʒii. *incorporentur ſimul in mortario, fiat unguentum.* Som take the dung which lieth rotting in a ſheep-fold; they uſe that which is liquid, and rub it upon the ulcerated places, and lay a double cloth dipped in that liquor upon it. But if the patient cannot bee cured with all theſe medicines, and that you finde his bodie in ſom parts thereof troubled in like ſort with cruſtie ulcers, I would wiſh that his head might bee anointed with an ointment made of *Axungia, argentum vivum*, and a little *Sulphur*, and then fit ſom *emplaſtrum Vigonis cum mercurio* into the faſhion of a cap; alſo ſom plaiſters of the ſame may bee applied to the ſhoulders, thighs and legs, and ſo let him bee kept in a verie warm chamber, and all things don as if hee had the *Lues venerea*. This kinde of cure was firſt (that I know of) attempted by *Simon Blanch* the King's Surgeon, upon a certain young man, when as hee in vain had diligently tried all other uſual medicines. A ſcalled head oft-times appeareth verie loathſom to the eie, caſting forth virulent and ſtinking *ſanies*; at the firſt it is hardly cured, but being old, far more difficultly. For diverſ times it breaketh out afreſh, when you think it kill'd, by reaſon of the impreſſion of the malign putrefaction remaining in the part, which wholly corrupt's the temper thereof. Moreover, oft-times beeing healed, it hath left an

The cure of an ulcerous ſcall. A contumacious ſcall muſt bee cured as wee cure the *Lues venerea*.

Alopecia

Alopecia behinde it, a great shame to the Surgeons. Which is the reason, that most of them judg it best to leav the cure thereof to Empericks and women.

CHAP. III.

Of the Vertigo, *or giddiness.*

THe *Vertigo* is a sudden darkning of the eies and sight by a vaporous and hot spirit which assendeth to the head by the sleepie arteries, and fil's the brain, disturbing the humors and spirits which are contained there, and tossing them unequally, as if one ran round, or had drunk too much wine. This hot spirit oft-times riseth from the heart upwards by the internal sleepie arteries to the *Rete mirabile*, or wonderful net; otherwhiles it is generated in the brain it self, being more hot then is fitting; also it oft-times ariseth from the stomack, spleen, liver and other entrals being too hot. The sign of this disease is the sudden darkning of the sight, and the closing up as it were of the eies, the bodie being lightly turned about, or by looking upon wheels runing round, or whirle-pits in waters, or by looking down anie deep or steep places. If the original of the disease proceed from the brain, the patients are troubled with the head-ach, heavines of the head, and noise in the ears, and oft-times they lose their smell. *Paulus Ægineta* for the cure bid's us to open the arteries of the temples. But if the matter of the disease arise from som other place, as from som of the lower entrals, such opening of an arterie little availeth. Wherefore then som skilful Physitian must bee consulted with, who may give directions for phlebotomie, if the original of the disease proceed from the heat of the entrals; by purging, if occasioned by the foulnes of the stomack. But if such a *Vertigo* bee a critical symptom of som acute disease affecting the *Crisis* by vomit or bleeding, then the whole business of freeing the patient thereof must bee committed to nature.

What the *Vertigo* is, and the causes thereof.

The Signs.

Lib. 6.

A critical *Vertigo.*

CHAP. IV.

Of the Hemicrania, *or Megrim.*

THe *Megrim* is properly a disease affecting the one side of the head, right, or left. It somtimes passeth no higher then the temporal muscles, otherwhiles it reacheth to the top of the crown. The cause of such pain proceedeth either from the veins and external arteries, or from the *meninges*, or from the verie substance of the brain or from the *pericranium*, or the hairie scalp covering the *pericranium*, or lastly, from putrid vapors arising to the head from the ventricle, womb, or other inferior member. Yet an external cause may bring this affect, to wit, the too hot or cold constitution of the encompassing air, drunkennes, gluttonie, the use of hot and vaporous meats, som noisom vapor or smoak, as of Antimonie, quick-silver, or the like, drawn up by the nose, which is the reason that gold-smiths, and such as guild metals are commonly troubled with this disease. But whencesoever the cause of the evil proceedeth, it is either a simple distemper, or with matter: with matter, I say, which again is either simple or compound. Now, this affect is either alone, or accompanied with other affects, as inflammation and tension. The heavines of head argue's plentie of humor; pricking, beating and tension shew's that there is a plentie of vapors mixed with the humors, and shut up in the nervous, arterious, or membranous bodie of the head. If the pain proceed from the inflamed *meninges*, a fever followeth thereon, especially, if the humor causing pain do putrefie. If the pain bee superficiarie, it is seated in the *pericranium*. If profound, deep and piercing to the bottom of the eies, it is an argument that the *meninges* are affected, and a feaver ensue's, if there bee inflammation, and the matter putrefie; and then oft-times the tormenting pain is so great and grievous, that the patient is afraid to have his head touched, if it bee but with your finger, neither can hee away with anie noise, or small murmuring, nor light, nor smels however sweet, no nor the fume of Wine. The pain is somtimes continual, otherwhiles by fits. If the cause of the pain proceed from hot, thin and vaporous blood, which will yeeld to no medicines, a verie necessarie, profitable and speedie remedie may bee had by opening an arterie in the temples, whether the disease proceed from the internal or external vessels. For, hence alwaies ensueth an evacuation of the conjunct matter, blood and spirits. I have experimented this in manie, but especially in the Prince de la *Roche-sur-yon*. His Physicians, when hee was troubled with this grievous Megrim, were *Chaplain*, the King's, and *Castellane* the Queen's chief Physicians, and *Louis Duret*, who notwithstanding could help him nothing by blood-letting, cupping, bathes, frictions, diet or anie other kinde of remedie either taken inwardly or applied outwardly. I beeing called, said, that there was onely hope one way to recover his health, which was to open the arterie of the temple in the same side that the pain was; for I thought it probable, that the cause of his pain was not contained in the veins, but in the arteries, in

The differences.

In what kinde of *Megrim* the opening of an Arterie is good.

A Historie.

which caſe by the teſtimonie of the antients, there was nothing better then the opening or bleeding of an arterie, whereof I have made trial upon my ſelf to my great good. When as the Phyſicians had approoved of this my advice, I preſently betake my ſelf to the work, and chooſ out the arterie in the pained temple, which was both the more ſwoln and beat more vehemently then the reſt. I open this, as wee uſe to do in the bleeding of a vein, with one inciſion, and take more then two ſawcers of blood flying out with great violence, and leaping; the pain preſently ceaſed, neither did it ever moleſt him again. Yet this opening of an Arterie is ſuſpected by manie, for that it is troubleſom to ſtay the guſhing forth blood, and cicatrize the place, by reaſon of the denſitie, hardneſs and continual pulſation of the arterie; and laſtly, for that when it is cicatrized there may bee danger of an *Aneuriſma*. Wherefore they think it better firſt to divide the skin, then to ſeparate the arterie from all the adjacent particles, and then to binde it in two places; and laſtly divide it, as wee have formerly told you muſt beee don in *Varices*. But this is the opinion of men who fear all things where there is no cauſ; for I have learn't by frequent experience that the apertion of an arterie, which is performed with a Lancet, as wee do in opening a vein, is not at all dangerous; and the conſolidation or healing is ſomhat ſlower then in a vein, but yet will bee don at length, but that no flux of blood will happen, if ſo bee that the ligation be fitly performed, and remain ſo for four daies with fitting pledgets.

No danger in opening an arterie.

CHAP. V.

Of certain affects of the Eies, and firſt of ſtaying up the upper eie-lid when it is too lax.

OF the diſeaſes which befal the eies, ſom poſſeſs the whole ſubſtance thereof, as the *Ophtbalmia*, a *Phlegmon* thereof: others are proper and peculiar to ſom parts thereof, as that which is termed *Gutta ſerena* to the optick nerv. Whence *Galen* made a threefold difference of the diſeaſes of the eies, as that ſom happened to the eie by hurting or offending the chief organ thereof; that is the cryſtalline humor; others by hindering the animal facultie, the chief cauſer of ſight, from entring into them; and laſtly, other ſom by offending the parts ſubſervient to the prime organ or inſtrument. Now of all theſe diſeaſes, the eie hath ſom of them common with the other parts of the bodie, ſuch as are an ulcer, wound, *Phlegmon*, contuſion and the like: other ſom are peculiar and proper to the eie, ſuch as are the *Egilops*, *Cataracta*, *Glaucoma*, and diverſ others of this kinde. Som have their upper eie-lid fall down, by reaſon that the upper skin thereof is relaxed more then is ſufficient to cover the eie, the griſtle in the mean while not relaxing it ſelf together therewith. Hence proceed's a double trouble; the firſt, for that the eie cannot bee eaſily opened; the other, becauſ the hairs of the relaxed eie-lid run in towards the eie, and becom troubleſom thereto by pricking it. The cauſ of ſuch relaxation is either a particular palſie of that part, which is frequent in old people, or the defluxion or falling down of a wateriſh humor, and that not acrid or biteing; which appear's by this, that thoſe who are thus affected have a rank of hairs growing under the natural rank, by reaſon of abound-dance of heaped-up humor, as it is moſt probable. For thus a wet and mariſh ground hath the greateſt plenty of graſs. Now if this ſame humor were acrid, it would cauſ an itching, and conſequetly becom troubleſom to the patient, and it would alſo fret in ſunder and deſtroy the roots of the other hairs, ſo farre it is from yeelding matter for the preternatural generation of new. It is fit before you do any thing for the cure, that you mark with ink the portion there of which is ſuperfluous, and therefore to bee cut away, leaſt if you ſhould cut off more then is requiſite, the eye-lid ſhould remain turned up, and ſo cauſ another kinde of affect, which the antients have called *Ectropion*. Then the eie beeing covered, take and liſt up with your fingers the middle part of the skin of the eie-lid, not taking hold of the griſtle beneath it, and then cut it athwart, takeing away juſt ſo much as ſhall bee neceſſarie to make it as it were natural; laſtly, join the lips of the wound together with a ſimple ſuture of three or four ſtitches, that ſo it may bee cicatrized; for the cicatrization reſtrain's the eie-lid from falling down ſo looſly, at leaſt ſom part thereof beeing taken away. There ought to bee ſom meaſure and heed taken in the amputation, otherwiſe you muſt neceſſarily run into the one or other inconvenience, as if too much bee cut away, then the eie will not bee covered; if too little: then you have don nothing, and the patient is troubled to no purpoſe. If there ſhall bee manie hairs grown preternaturally, you ſhall pluck them away with an inſtrument made for the ſame purpoſe; then their roots ſhall bee burned with a gentle cauterie, the eie beeing leſt untouch't, for a ſcar preſently ariſeing will hinder them from growing again.

Differences.

Paul. Ægin. lib. 8. cap. 6.

The cauſ.

The cure.

CHAP. VI.

Of Lagophthalmus, *or the Hare-eie.*

SUch as have their eie-lids too short, sleep with their eies open, for that they cannot bee covered by the too short skin of the eie-lids. the Greeks term this affect, Λαγόφθαλμος. The cause is either internal or external: internal, as by a Carbuncle, Impostume, or Ulcer; external, as by a wound made by a sword, burn, fall, and the like. If this mishap proceed by reason of a cicatrization, it is cureable, if so that the short eie-lid bee of an indifferent thickness. But if it have been from the first conformation, or by som other means, whereby much of the substance is lost, as that which happen's by burning, and a carbuncle, then it is uncureable. For the cure, you shall use relaxing and amollient fomentations, then the skin shall bee divided above the whole scar, in figure of an half moon, with the horns looking downwards. Then the edges of the incision shall bee opened, and lint put into the middle thereof, that so it may hinder the lips from joyning together again. Then shall you apply a plaster upon the lint, and so binde up the part with a fitting ligature, that may somwhat press upon the whole eie, lest it should lift it self somwhat upwards again, and so return into its ancient, but not natural figure. But in cutting the skin, you must take care that your incision harm not the gristle; for if it bee cut, the eie-lid fall's down, neither can it bee afterwards lifted up. But now for the lower eie-lid: it is subject to sundrie diseases, amongst which there is one which answereth in proportion to that, which wee late mentioned, which is, when as it is lifted upwards little or nothing, but hang's and gape's, and cannot bee joyned with the upper, and therefore it doth not cover the eie, which affect is familiar to old people; it is called *Ectropion*, and it may bee helped by means formerly delivered.

Paulus Ægin. lib. 6. cap. 10.

The cure.

Ectropion, or the turning up, or out of the eie-lid.

CHAP. VII.

Of the Chalazion, *or Hail-stone, and the* Hordeolum, *or Barly-corn of the eie-lids.*

THe *Chalazion* is a round and cleer pimple, which grow's upon the upper eie-lid; it is also moovable, and may bee stirred this way and that way with your fingers. The Latines call it *Grando*, for that it resemble's a hail-stone. Another pimple not much like this grow's somtimes upon the verges of the eie-lids above the place of the hairs. It is termed *Hordeolum*, by reason of the similitude it hath with a barlie-corn. The matter of these is contained in its proper cist or skin, and therefore is hardly brought to suppuration. At the first begining it may bee resolved and discussed. But when as it is once grown and concrete into a plaster or stone-like hardness, it is scarce cureable. Wherefore it is best to perform the cure by opening them, that so the contained matter may flow, or bee pressed forth. If the pimple or swelling bee small, then thrust it through with a needle and thread, and leav the thread therein of such length, that you may fasten the ends thereof with a little of the emplaster called *Gratia Dei*, like glue to the fore-head, if it be on the upper eie-lid; or to the cheeks, if on the lower. You must draw through a fresh one every second daie, as is usually done in chirurgicall setons. For thus at length the swelling will bee destroied, and made plain.

Paul. cap. 6. lib. 6.

The cure.

CHAP. VIII.

Of the Hydatis, *or fatness of the eie-lids.*

THe *Hydatis* is a certain fattie substance, like a piece of fat seated and lying under the skin of the upper eie-lid. It is a disease incident to children, who are of a more humid nature: wherefore it is a soft and loose tumor, making the whole eie-lid, which it possesseth, œdematous; so that as if depressed with a weight, it cannot bee lifted up. It hath its name, for that it hath as it were a bladder distended with a whayish humor, which kinde of fault is observed by *Galen* in the liver. Those, who are thus affected, have their eies look red, and flow with tears, neither can they behold the sun, or endure the light. The cure is performed by cutting off the superfluous substance, not hurting the neighbouring parts; and then presently put som salt into the place whence it was taken out (unless the vehemencie of pain hinder) that so the place may bee dried and strengthened, and the rest of the matter (if anie such bee) may bee consumed, and hindred from growing again. Lastly, you shall cover the whole eie with the white of an egg dissolved in rose-water, or som other repercussive.

What *Hydatis* is.

Com. ad aphor. 55. sect. 7.

The cure.

CHAP. IX.

Of the eie-lids faſtened or glewed together.

Paulus cap. 15. lib. 6.

SOmtimes it cometh to paſs that the upper eie-lid is glewed or faſtened to the under, ſo that the eie cannot bee opened, or ſo that the one of them may ſtick or bee faſtened to the white coat of the eie, or to the hornie. This fault is ſomtimes drawn from the firſt originall, that is, by the default of the forming facultie in the womb (for thus manie infants are born with their fingers faſtened together, with their fundaments, privities and ears unperforated) the eie in all other reſpects beeing well compoſed. The cauſ of this affect ſomtimes proceed's from a wound, otherwhiles from a burn, ſcald or impoſtumation, as the breaking of the ſmall pox. It is cured by putting in a fit inſtrument, and ſo opening them; but with ſuch moderation, that you touch not the hornie coat, for otherwiſe it would fall out. Therefore you muſt put the end or point of your *probe* under the eie-lids, and ſo lifting them up (that you hurt not the ſubſtance of the eie) divide them with a crooked inciſion-knife.

The cauſ.

The cure.

The inciſion made, let the white of an egg beaten with ſom roſe-water bee put into the eie, let the eie-lids bee kept open; yea let the patient himſelf bee careful that hee often turn it upwards, and lift it up with his fingers, not onely that the medicine may bee applied to the ulcer, but alſo that they may not grow together again. In the night time let a little pledget dipped in water, and that either ſimple, or wherein ſom vitriol hath been diſſolved, bee laid thereon. For thus you ſhall hinder the eie-lids from joyning together again. Then on the third daie the parts or edges of the eie-lids ſhall bee touched with waters drying without biting or acrimonie, that ſo they may be cicatrized. But if the eie-lid adhere to the hornie coat at the *pupilla* or apple of the eie, the patient will either bee quite blinde, or verie ill of ſight. For the ſcar which enſue's will hinder the ſhapes of things from entring to the chryſtaline humor, and the viſive ſpirits from paſſing forth to the objects. For prognoſticks, you may learn out of *Celſus*, that this cure is ſubject to a relapſ, ſo that it may bee ſhunned neither by diligence nor induſtrie, but that the eie-lid will alwaies adhere and cleav to the eie.

A diſeaſ ſubject to relapſ.

CHAP. X.

Of the itching of the eie-lids.

MAnie have their eie-lids itch vehemently by reaſon of ſalt phlegm, which oftentimes excoriating and exulcerating the parts themſelvs, yeeld's a *ſanies*, which joyn's together the eie-lids in the night time as if they were glewed together, and make's them watrie and bleared. This affect doth ſo torment the patients, that it oft-times make's them require the Phyſicians help. Wherefore general medicines beeing premiſed, the ulcers ſhall bee waſhed with the following *Collyrium*. ℞. *aquæ mellis in balneo mariæ diſtillatæ* ℥iii. *ſaccarii candi* ʒi. *aloës lotæ & in pollinem redactæ* ʒß. *fiat collyrium*. Which if it do no good, you may uſe this which follow's. ℞. *Ung. Ægyptiac.* ʒi. *diſſolve in aquæ plantaginis quantitate ſufficienti*. Let the ulcerated eie-lids bee touched with a ſoft linnen rag dipped therein, but with care that none thereof fall upon the eie. But when the patient goe's to bed, let him cauſ them to bee anointed with the following ointment, verie effectual in this caſe. ℞. *axungiæ porci & butyri recentis, an.* ℥ß. *tuth. præpar.* ʒß. *antimon. in aqua euphraſiæ præparati,* ℈ii. *camphoræ gra.* iiii. *miſce, & in mortario plumbeo ducantur per tres horas, conflatum indè unguentum, ſervetur in pyxide plumbeâ*. Som commend and uſe certain waters fit to cleanſ, drie, binde, ſtrengthen, and abſolutely free the eie-lids from itching and redneſs; of which this is one.

A detergent *Collyrium*.

℞. *aquæ euphrag. fœniculi, chelidon. an.* ℥ß. *ſarcocal. nutritæ* ℈ii. *vitriol. rom.* ʒi. *miſceantur ſimul, & bulliant unicâ ebullitione; poſtea coletur liquor, & ſervetur ad uſum dictum*. Or elſ, ℞. *aquæ roſ. & vini alb. boni an.* ℥iiii. *tuth. præpar. aloës an.* ʒi. *flor. æni* ℈ii. *camphor. gra.* ii. Let them bee boiled according to art, and kept in a glaſs to waſh the eie-lids. Or elſ, ℞. *vini albi* ℔ß. *ſalis com.* ʒi. let them bee put into a clean Barbar's baſon and covered, and kept there five or ſix daies, and bee ſtirred once a daie, and let the eie-lids bee touched with this liquor. Som wiſh that the patients urine bee kept all night in a Barbar's baſon, and ſo the patients eie-lids bee waſhed therewith. Verely in this affect wee muſt not fear the uſe of acrid medicines, for I once ſaw a woman of fiftie years of age, who waſhed her eie-lids when they itched with the ſharpeſt vinegar ſhee could get, and affirmed that ſhee found better ſucceſs of this then of anie other medicine. *Vigo* preſcribe's a water, whoſe efficacie above other medicines in this affect, hee ſaith, hath been proved; and that it is to bee eſteemed more worth then gold, the deſcription thereof is thus: ℞. *aq. roſ. vini albi odoriferi mediocris vinoſitatis an.* ℥iiii. *myrobalan. citrini trit.* ʒiß. *thuris* ʒii. *bulliant omnia ſimul uſque ad conſumptionem tertiæ partis; deinde immediatè addantur flores æris* ℈ii. *camph. gr.* ii. Let the liquor be kept in a glaſs well ſtopped for the fore-ſaid uſe.

You need not fear to uſe acrid medicines in the itching of the eie-lids. *Lib. 2. cap. 9. tract. 3.*

CHAP.

CHAP. XI.

Of Lippitudo, *or Blear-eies.*

THere are manie whose eies are never drie, but alwaies flow with a thin, acrid, and hot humor, which causeth roughnes, and upon final occasions, inflammations, blear or blood-shot eies, and at length also *Strabismus* or squinting. *Lippitudo* is nothing elſ but a certain white filth flowing from the eies, which oftetimes agglutinate's or join's together the eie-lids. This diſeaſ often trouble's all the lifetime, and is to bee cured by no remedie; in ſom it is cureable. Such as have this diſeaſ from their infancie, are not to bee cured, for it remain's with them till their dying day. For large heads, and ſuch as are repleat with acrid or much excrementitious phlegm, ſcarce yeeld to medicines. There is much difference whether the phlegm flow down by the internal veſſels under the ſkull, or by the external which are betweeen the skull and the skin, or by both. For if the internal veins caſt forth this matter, it will bee difficultly cured; if it bee cured at all. But if the external veſſels caſt forth, that cure is not unprofitable, which haveing uſed medicines reſpecting the whole bodie, applie's aſtringent medicines to the ſhaved crown, as *Empl. contra rupturam*, which may ſtreighten the veins, and as it were ſuſpend the phlegm, uſeth cupping, and command's frictions to bee made towards the hinde part of the head, and laſtly, maketh a Seton in the neck. There are ſom who cauterize the top of the crown with an hot iron, even to the bone, ſo that it may caſt a ſeale, thus to divert and ſtaie the defluxion. For local medicines, a *Collyrium* made with a good quantitie of roſe-water, with a little vitriol diſſolved therein, may ſerv for all.

What *Lippitudo* is.

A *Collyrium* of vitriol to ſtay the defluxions of the eies.

CHAP. XII.

Of the Opthalmia, *or inflammation of the Eies.*

AN *Opthalmia* is an inflammation of the coat *Adnata* and conſequently of the whole eie, beeing troubleſom by the heat, redneſs, beating, renitencie, and laſtly pain. It hath its original either by ſom primitive cauſ or occaſion, as a fall, ſtroke, duſt, or ſmall ſand flying into the eies. For the eie is a ſmooth part, ſo that it is eaſily offended by rough things, as ſaith *Hippocrates*, *lib. de carnibus.* Or by an antecedent cauſ, as a defluxion falling upon the eies. The ſigns follow the nature of the material cauſ, for from blood eſpecially cholerick and thin, it is full of heat, redneſs and pain; from the ſame allaied with phlegm all of them are more remiſs. But if a heavineſs poſſeſs the whole head, the original of the diſeaſ proceed's therefrom. But if a hot pain trouble the forehead, the diſeaſ may bee thought to proceed from ſom hot diſtemper of the *Dura mater*, or the *pericranium*; but if in the verie time of the rageing of the diſeaſ the patient vomit, the matter of the diſeaſ proceed's from the ſtomack. But from whence ſoever it cometh there is ſcarce that pain of any part of the bodie, which may bee compared to the pain of the inflamed eies. Verily the greatneſs of the inflammation hath forced the eies out of their orb, and broken them aſunder in diverſ. Therefore there is no part of Phyſick more blazed abroad then for ſore eies. For the cure, the Surgeon ſhall conſider and intend three things; diet, the evacuation of the antecedent and conjunct cauſ, and the overcoming it by topick remedies. The diet ſhall bee moderate, eſchewing all things that may fill the head with vapors; and thoſe things uſed that by aſtriction may ſtrengthen the orifice of the ventricle, and prohibit the vapors from flying up to the head; the patient ſhall bee forbidden the uſe of wines, unleſs peradventure the diſeaſ may proceed from a groſs and viſcid humor, as *Galen* deliver's it. The evacuation of the matter flowing into the eie, ſhall bee performed by purgeing medicines, phlebotomie in the arm, cupping the ſhoulders and neck with ſcarification, and without: and laſtly, by frictions, as the Phyſician that hath undertaken the cure ſhall think fit. *Galen* after univerſal remedies for old inflammations of the eies, commend's the opening of the veins and arteries in the forehead and temples, becauſ for the moſt part the veſſels thereabouts diſtended with acrid, hot and vaporous blood, cauſ great and vehement pains in the eie.

What *Opthalmia* is, and the cauſes thereof.

Signs.

The cure.

Com. ad aphor. 31 ſect. 6.

Lib. 13. meth. cap. ult.

For the impugning of the conjunct cauſ, diverſ topick medicines ſhall bee applied, according to the four ſundrie times or ſeaſons that everie phlegmon uſually hath. For in the begining when as the acrid matter flow's down with much violence, repercuſſives do much conduce: and tempred with reſolving medicines, are good alſo in the encreaſ. R. *aq. roſ. & plantag. an.* ℥ß. *mucagin. gum. Tragacanth.* ʒii. *album. ovi quod ſufficit, fiat collyrium*, let it bee dropped warm into the eie, and let a double cloth dipped in the ſame *collyrium* bee put upon it. Or, R. *mucag. ſem. pſil. & cydon. extractæ in aq. plant. an.* ℥ß. *aq. ſolan. & lactis muliebris, an.* ʒi. *trochiſc. alb. rha.* ℈. *fiat collyrium*, uſe this like the former. The veins of the temples may bee ſtreightned by the following medicine. R. *bol. arm. ſang. drac. et maſt. an.* ʒ.ß. *alb. ovi, aquæ roſ. et acet. an.* ʒi. *tereb. lot. et ol. cidon. an.* ʒi.ß. *fiat defenſivum.* You may alſo uſe *Ung.*

A repercuſſive medicine.

Aſtringent emplaſters.

Ung. de Bolo, empl. diacal. or *contra rupturam* diſſolved in oyl of myrtles, and a little vineger. But if the bitterneſs of pain bee intolerable, the following cataplaſm ſhall bee applied. An anodine cataplaſm. ℞ *medul. pomor. ſub. ciner. coctorum* ℥iii. *lacti muliebris* ℥ ß. let it bee applied to the eie, the formerly preſcribed *collyrium* beeing firſt dropped in. Or, ℞ *mucag. ſem. pſil. & cidon. an.* ℥ß. *micæ panis alb. in lacte infuſi.* ℥ii. *aquæ roſ.* ℥ß. *fiat cataplaſma.* The blood of a Turtle-Dove, pigeon or Hen drawn by opening a vein under the wings, dropped into the eie, aſſwageth pain. The efficacie of Baths in pains of the eies. Baths are not onely anodine, but alſo alſo ſtay the defluxion by diverting the matter thereof by ſweats; therefore *Galen* much commend's them in ſuch defluxions of the eies as com by fits. *Ad aphor. ſect. 7.* In the ſtate when as the pain is either quite taken away or aſſwaged, you may uſe the following medicines. ℞ *ſarcocol. in lacte muliebri nutritæ,* ℥i *aloes lotæ in aq. roſar.* ℥ii. *trochiſ. alb. rha.* ℥ß. *ſaccbar. cand.* ℥ii. *aquæ roſ.* ℥iii. *fiat collyrium.* Or, ℞ *ſem. fœniculi, & fœnug. an.* ℥ii. *flo. chamæ. & melil. an.* m. ß. *coquantur in aq. coin. ad* ℥iii. *colaturæ adde tutbiæ præp. & ſacroc. nutritæ in lacte muliebri. an* ℥i. ß. *ſaccbari cand.* ℥ß. *fiat collyrium ut artis eſt.* Detergent *Collyria.* In the declination the eie ſhall bee fomented with a carminative decoction, and then this *collyrium* dropped thereinto. ℞ *ſacroc. nutritæ* ℥ii. *aloës & myrrh. an.* ℥i. *aq. roſ. & cup bnag. an.* ℥ii. *fiat collyrium, ut artis eſt.*

CHAP. XIII.

Of the Proptôſis, *that is the falling or ſtarting forth of the eie, and of the* Phthiſis *and* Chemôſis *of the ſame.*

THe Geerks call that affect *Proptôſis*, the Latines *Procidentia* or *Exitus oculi*, when as the eie ſtand's, and is caſt out of the orb, by the occaſion of a matter filling and lifting up the eie into a great bigneſs, and largeneſs of ſubſtance. The cauſ. The cauſ of this diſeaſ is ſomtimes external, as by too violent ſtraining to vomit, by hard labor in child-birth, by exceſſive and wondrous violent ſhouting, or crying out. It ſomtimes happeneth that a great and cruel pain of the head, or the too ſtrait bindeing of the forehead and temples for the eaſing thereof, or the palſie of the muſcles of the eie, give beginning to this diſeaſ. Certainly ſomtimes the eie is ſo much diſtended by the defluxion of humors, that it break's in ſunder, and the humors thereof are ſhed, and blindeneſs enſue's thereof, as I remember befel the ſiſter of *Lewis de Billy* merchant, dwelling at Paris neer S. *Michäel's* bridg. The cure. The cure ſhall bee diverſified according to the cauſes. Therefore univerſal medicines beeing premiſed, cupping-glaſſes ſhall be applied to the original of the ſpinal marrow, and the ſhoulders; as alſo Cauteries, or Setons: the eie ſhall bee preſſed or held down with cloths doubled and ſteeped in an aſtringent decoction made of the juice of *Acacia*, red roſes, the leaves of poppie, henbane, roſes and pomgranat pills: of which things poultiſſes may bee made by addition of barlie-meal and the like.

The *Atrophiæ* of the eie. There is ſomtimes to bee ſeen in the eie an affect contrarie to this, and it is termed *Atrophia*. By this the whole ſubſtance of the eie grow's lank and decay's, and the apple it ſelf becom's much leſs. The *Phthiſis* thereof. But if the conſumption and emaciation take hold of the pupil onely, the Greeks, by a peculiar name and different from the general, term it a *Phthiſis*, as *Paulus* teacheth. *Lib. 3. cap. 22.* Contrarie cauſes ſhall bee oppoſed to each affect; hot and attractive fomentations ſhall bee applied; frictions ſhall bee uſed in the neighboring parts, and laſtly all things ſhall bee applied which may without danger be uſed to attract the blood and ſpirits into the parts.

The *Chemôſis*. *Paulus l. 3. c. 2.* There is another affect of the eie, of affinitie to the *Proptôſis*, which by the Greeks is termed *Chemôſis*. Now this is nothing elſ then when when both the eie-lids are turned up by a great inflammation, ſo that they can ſcarce cover the eies, and the white of the eie is lifted much higher up then the black. Somtimes the *Adnata* changeing his wont, looketh red; beſides alſo, this affect may take its original from external cauſes, as a wound, contuſion and the like. But according to the varietie of the cauſes, and the condition of the preſent affect fixed and remaining in the part, diverſ remedies ſhall bee appointed.

CHAP. XIV.

Of the Ungula, or Web.

THe *Ungula, Pterygion* or Web is the growth of a certain fibrous and membranous fleſh upon the upper coat of the eie called *Adnata*, ariſeing more frequently in the bigger, but ſomtimes in the leſſer corner towards the temples. When it is neglected, it cover's not onely the *Adnata*, but alſo ſom portion of the *Cornea*, and coming to the pupil it ſelf hurt's the ſight thereof. Such a Web ſomtimes adhere's not at all to the *Adnata*, but is onely ſtretched over it from the corners of the eie, ſo that you may thruſt a *probe* between it and the *Adnata*: it is of ſeveral colors, ſomwhiles red, ſomwhiles yellow, ſomwhiles duskiſh, and otherwhiles white. It hath its original either from

from external causes, as a blow, fall, and the like; or from internal, as the defluxion of humors into the eies. The *Vngula* which is inveterate, and that hath acquired much thickneſs and bredth, and beſides doth difficultly adhere to the *Adnata*, is difficultly taken away, neither may it bee helped by medicines whereby ſcars in the eies are extenuated. But that which covereth the whole pupil muſt not bee touched by the Surgeon, for being cut away, the ſcar which is left by its denſitie hindereth the entrance of objects to the cryſtalline humor, and the egreſs of the animal ſpirit to them. But oftentimes it is accompanied with an inflammation of the eies, a burning, itching, weeping defluxion, and ſwelling of the eie-lids. That the cure may rightly and happily proceed, hee muſt firſt uſe a ſpare diet, purgeing medicines ſhall bee given, and blood taken away by opening a vein, eſpecially, if there bee great inflammation. For particular remedies, this excreſcence ſhall bee eaten away, or at leaſt kept from growth, by dropping into the eie *collyrium* of vitriol deſcribed in wounds of the eies. But if that wee profit nothing by this means, it remaineth, that wee take it away with the hand after the following manner.

What Web curable, and what incurable.

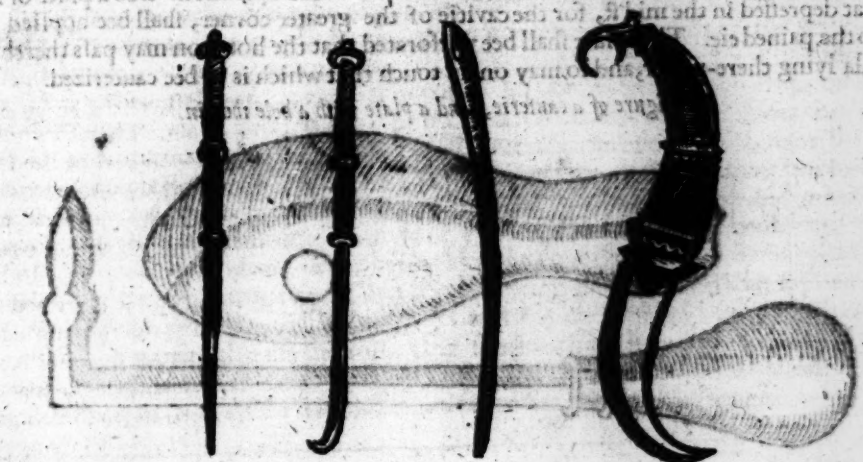
The cure.

You ſhall ſet the patient upon a fourm or ſtool, and make him lean much back, and bee ſo held firmly, that hee may not fall nor ſtir, then muſt you open his ſore eie, putting therein a *ſpeculum oculi* formerly deſcribed in treating of the wounds of this part, and then muſt you lift up the Web it ſelf with a ſharp little hook, with the point turned a little in, and put under the mid'ſt of the Web when you have lifted it a little up, thruſt a needle threded with a ſmooth thred between it and the *Adnata*, then taking hold of the hook, and the two ends of the thred drawn through with the needle, and lifting up the Web by them, you ſhall gently begin to ſeparate it from the ſubſtance of the eie lying there-under, beginning at the original thereof with a crooked inciſion-knife, and ſo proſecute it even to the end, yet ſo as you hurt no part of the *Adnata*, nor *Cornea*.

The cutting of the Web.

The figures of little books, a needle, and crooked inciſion-knife.

Little books. *A needle.* *A crooked inciſion-knife.*



Then muſt it bee cut off with a pair of ſciſſers, and the white of an egg beaten with ſom Roſe-water laid thereon, and often renewed. Afterwards the eie muſt everie day bee opened, leaſt coming to cicatrization, the eie-lids ſhall bee glewed together in that part whereas the Web is taken away, which alſo ſhall bee hindered by putting of common ſalt, ſage and cummin-ſeeds into the eie, beeing firſt champed and chawed in the mouth. There are ſom who inſtead of the crooked knife ſeparate the Web from the *Adnata* with a horſe's hair, others do it with a gooſ quil made readie for the ſame purpoſe, takeing heed that they hurt not the caruncle at the corner by the noſe, for it will follow if that you draw the Web away too violently; and if it bee cut, there will remain a hole, through which dureing the reſt of the life a weeping humor will continually flow, a diſeaſ by the Greeks termed *Rhyas*. If after the cutting there bee fear of inflammation, linnen rags moiſtned in repelling medicines formerly preſcribed in wounds of the eie, ſhall bee laid thereupon.

CHAP. XV.

Of the Egilops, Fiſtula lacrymoſa, *or weeping Fiſtula of the Eie.*

The uſe of the glandule at the greater corner of the eie.

AT the greater corner of the eie there is a glandule, made for the receiving and containing the moiſture which ſerveth for the lubricating and humecting the eye, leaſt it ſhould

The differences.

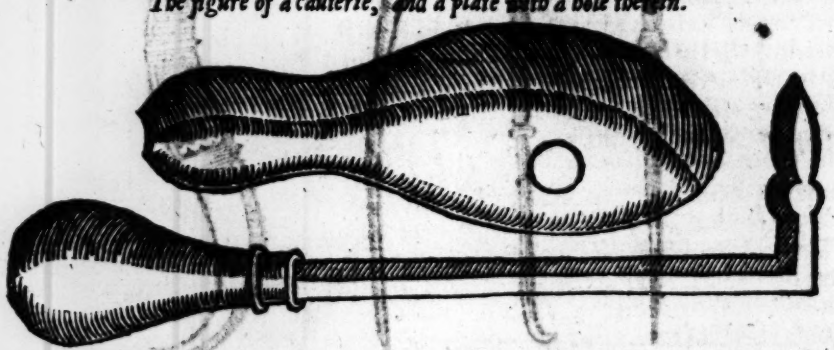
ſhould drie by continual motion. This glandule ſomtimes by a ſanguin or pituitous defluxion falling violenrly from the brain, ſwel's, impoſtumate's and ulcerate's with an ulcer, not ſeldom degenerateing into a fiſtula, ſo that in ſucceſs of time it rotteth the bone that lieth under it: of ſuch fiſtulae's, ſom are open outwardly, and theſe uſually have their original from a phlegmon; other ſom are inwardly, and thoſe are ſuch as at firſt ſwelled by the defluxion or congeſtion of a phlegmatick matter, ſo that there appeareth no hole outwardly, but onely a tumor of the bigneſs of a peaſ, this tumor beeing preſſed, floweth with a ſanious, ſerous and red or otherwiſe with a white and viſcid matter, and that either by the corner of the eie, or by the inſide of the noſe. Som have this matter flowing continually, others have it onely monethly, which is proper alſo to ſom fiſtulae's. Such weeping fiſtulae's if they becom old, cauſ an *Atrophia* of the eie, and ſomtimes blindeneſs and a ſtinking breath. Therefore wee muſt diligently and ſpeedily by phyſical and chirurgical means reſiſt the breeding diſeaſ. Wherefore, haveing uſed general medicines, wee muſt com to particulars. Therefore if the ulcer bee not ſufficiently wide, it ſhall bee enlarged by putting tents of ſponge therein. The fleſh of the Glandule encreaſing more then is fit, ſhall bee corrected by putting therein the catheretick pouders of Mercurie, calcined vitriol, or ſom *aqua fortis*, or oil of vitriol, and laſtly, by a potential cauterie. If you cannot prevail by theſe means, and that the bone begin's to rot, and the patient bee ſtout hearted, then uſe an actual cauterie whoſe uſe is far more effectual, readie, certain and excellent, then a potential cauterie, as I have tried in manie with happie ſucceſs. In my opinion it make's no matter, whether the cauterie bee of gold, ſilver or iron; for the efficacie it hath, proceedeth not from the matter, but from the fire. Yet if wee muſt religiouſly obſerv and make choice of metals, I had rather have it of Iron, as that which hath a far more drying and aſtringent facultie then gold, for that the element of earth beareth the chief ſway therein, as appeareth by the waters which flow through iron-mines. Wherefore you ſhall cauſ to bee made a triangular Iron, ſharp at the end, that it may the more ſpeedily penetrate. And then the ſound eie and adjacent parts being well covered and defended, and the patien'ts head firmly holden in one's hand, leaſt the patient beeing frighted, ſtir himſelf in the verie inſtant of the operation. But a plate of iron ſomwhat depreſſed in the mid'ſt, for the cavitie of the greater corner, ſhall bee applied and fitted to the pained eie. This plate ſhall bee perforated that the hot Iron may paſs thereby to the fiſtula lying there-under, and ſo may onely touch that which is to bee cauterized.

Periodical and Typical Fiſtulaes.

The cure.

The efficacie of an actual cauterie.

The figure of a cauterie, and a plate with a hole therein.



Things to bee don after the cauterizing.

After the bone is burnt with the cauterie, a *collyrium* made of the whites of eggs beaten in plantain and night-ſhade waters muſt bee poured into the hole it ſelf, the eie and all the neighboring parts; but the patient ſhall bee laid in bed, with his head ſomwhat high, and the *collyrium* ſhall bee renued as often and as ſoon as you ſhall perceiv it to grow drie. Then the fall of the Eſchar ſhall bee procured by anointing it with freſh butter; when it is fallen away, the ulcer ſhall bee cleanſed, filled with fleſh, and laſtly cicatrized.

CHAP. XVI.

Of the Staphyloma, *or grape-like ſwelling.*

Whar a *Staphyloma* is, and the cauſes thereof.

Staphyloma is the ſwelling of the hornie and grape-like coat, bred through the occaſion of an humor flowing down upon the eie, or by an ulcer, the hornie coat beeing relaxed, or thru'ſt forth by the violence of the puſtule generated beneath. It in ſhape reſembleth a grape, whence the Greeks ſtyle it *Staphyloma*. This tumor is ſomtimes blackiſh, otherwhiles whitiſh. For if the hornie coat bee ulcerated and fretted in ſunder, ſo that the grapie coat ſhew it ſelf, and fall through the ulcer, then the *Staphyloma* will look black like a ripe grape, for the utter part of the *Uvea* is blackiſh. But if the *Cornea* bee onely relaxed and not broken, then the ſwelling appear's of a whitiſh color like an unripe grape. The Antients have made manie kindes or differences thereof. For if it bee but a ſmall hole of the broken *Cornea* by which the *Uvea* ſheweth or thruſteth forth its ſelf, they then termed it *Myocephalon*, that is, like the

Paulus and *Aetius.*

the head of a flie. But if the hole were large, and alſo callous, they called it *Clavus*, or a nail; if it were yet larger, then they termed it *Acinus*, or a grape. But in what ſhape or figure ſoever this diſeaſ ſhall happen, it bringeth two diſcommodities, the one of blindeneſs, the other of deformitie. Wherefore here is no place for Surgerie to reſtore the ſight, which is already loſt, but onely to amend the deformitie of the eie; which is by cutting off that which is prominent. But you muſt take heed that you cut away no more then is fit, for ſo there would bee danger of pouring out the humors of the eie. Everie *Staphiloma* inferr's incureable blindneſs.

CHAP. XVII.

Of the Hypopyon, *that is the ſuppurate or putrefied eie.*

PUS, or Quitture is ſomtimes gathered between the hornie and grapie coat from an internal or external cauſ: From an internal, as by a great defluxion, and oftentimes after an inflammation; but externally, by a ſtroke, through which occaſion, a vein beeing opened hath poured forth blood thither, which may preſently bee turned into Quitture. For the cure, univerſal remedies beeing premiſed, cupping-glaſſes ſhall bee applied, with ſcarifications and frictions uſed. Anodine and digeſtive *collyria* ſhall bee poured from above downwards. *Galen* write's that hee hath ſomtimes evacuated this matter, the *Cornea* beeing opened at the *Iris*, in which place all the coats meet, concur and are terminated. I have don the like, and that with good ſucceſs, *James Guillemeau* the Kings Surgeon beeing preſent, the Quitture beeing expreſſed and evacuated after the apertion. The Ulcer ſhall bee claenſed with *Hydromel*, or ſom other other ſuch like medicine. The cauſ. *Lib. 14. method. cap. ult.*

CHAP. XVIII.

Oo the Mydriaſis, *or dilatation of the Pupil of the Eie.*

Mydriaſis is the ditatation of the pupil of the eie, and this happeneth either by nature or chance: the former proceedeth from the default of the firſt conformation, neither is it cureable; but the other is of ſorts; for it is either from an internal cauſ, the off-ſpring of an humor flowing down from the brain, wherefore Phyſical means muſt bee uſed for the cure thereof. Now that which cometh by anie external occaſion, as a blow, fall, or contuſion upon the eie, muſt bee cured by preſently applying repercuſſive and anodine medicines, the defluxion muſt bee hindered by diet skilfully appointed, phlebolomie, cupping, ſcarification, frictions and other remedies which may ſeem convenient. Then muſt you com to reſolving medicines, as the blood of a Turtle-dove, Pigeon, or chicken reeking-hot out of the vein, beeing poured upon the eie and the neighboring parts. Then this following cataplaſm ſhall bee applied thereto ℞. *farinæ fabar. & hordei an.* ℥iii. *ol. roſar. & myrtillor. an* ℥i. ß. *pul. ireos flor.* ℥ii. *cum ſapa fiat cataplaſma.* You may alſo uſe the following fomentation. ℞. *roſar. rub. & myrtyl. an* m.i. *florum melil. & chamæm. an.* p.i. *nucum cupreſſ.* ℥i. *vini auſteri* ℔.ß. *aq. roſar. & plantag. an.* ℥iii. make a decoction of them all for a fomementation to bee uſed with a ſponge. The Cauſ. The Cure. A digeſting Cataplaſm.

CHAP. XIX.

Of a Cataract.

A Cataract is called alſo by the Greeks *Hypochima*, by the Latines *ſuffuſio*. Howſoever you term it, it is nothing elſ but the concretion of an humor into a certain thin skin under the hornie coat, juſt againſt the apple or pupil, and as it were ſwimming upon the waterie humor; and whereas the place ought to bee emptie, oppoſing it ſelf to the internal facultie of ſeeing, whereby it differeth from ſpots and ſcars growing upon the hornie coat and *Adnata*. It ſomtimes covereth the whole pupil, otherwhiles but the one half thereof, and ſomwhiles but a ſmal portion thereof. According to this varietie the ſight is either quite loſt, weak, or ſomwhat depraved, becauſ the animal viſive ſpirit cannot in its entire ſubſtance paſs through the denſitie thereof. The defluxion of the humor whence it proceed's, is either cauſed by an external occaſion, as a ſtroke, fall, or by the heat or coldneſs of the encompaſſing air, troubleſom both to the head and eies; or elſ it is by an internal means; as the multitude, or elſ the acrid hot and thin qualitie of the humors. This diſeaſ alſo ſomtimes taketh its original from groſs and fumid humors ſent from a crude ſtomack, or from vaporous meats or drinks, up to the brain, and ſo it falleth into the eies; where, by the coldneſs, ſtraitneſs and tarrying in the place, they turn into moiſture, and at length into that concretion or film which wee ſee: The ſigns may bee eaſily drawn, from that wee have alreadie delivered. For when the cataract is formed and ripe, it reſembleth a certain thin membrane ſpred over the pupil, and A Cataract. The differences. Cauſes. Signes.

and appeareth of a different color, according to the varietie of the humor whereof it conſiſteth, one while white, another while black, blue, aſh-colored, livid, citrine, green. It ſomtimes reſembleth quick-ſilver, which is verie trembling and fugitive, more then the reſt. At the firſt when it beginneth to breed, they ſeem to ſee manie things, as flies flying up and down, hares, nets, and the like, as if they were careleſly toſſed up and down before their eies: ſomtimes everie thing appeareth two, and ſomwhiles leſs then they are; becauſ the viſive ſpirit is hindered from paſſing to the objects by the denſitie of the skin, like as a cloud ſhadowing the light of the Sun. Whence it is that the patients are duller ſighted about noon, and ſurer and quicker ſighted in the morning and evening, for that the little viſive ſpirit diffuſed through the air, is diſperſed by the greater light, but contracted by the leſs. Now if this film cover half the pupil, then all things ſhew but by halfs; but if the mid'ſt thereof bee covered, and as it were the centre of the chryſtaline humor, then they ſeem as if they had holes or windows: but if it cover it all, then can hee ſee nothing at all, but onely the ſhadows of viſible bodies, and of the Sun, Moon, Stars, lighted candles, and the like luminous things, and that but confuſedly, and as by conjecture.

CHAP. XX.

Of the phyſical cure of a beginning Cataract.

Diet for ſuch as are troubled with a Cataract.

A Begining Cataract is hindered from growing and concretion by diet conveniently and artificially preſcribed, by the abſtinence from wine, eſpecially more ſtrong and vaporous, and forbearing the uſe of meats, which yeeld a phlegmatick juice and vaporous: as peaſ, beans, turneps, cheſnuts, and, laſtly, all ſuch things as have the facultie of ſtirring up the humors, and cauſing defluxion in the bodie, ſuch as are all ſalt and ſpiced meats, as alſo garlike, onions, muſtard. The immoderate uſe of Venerie hurts more then all the reſt, for that it more violently exagitate's the whole bodie, weaken's the brain and head, and beget's crude humors. Let his bread bee ſeaſoned with ſom fennel ſeeds, for it is thought to have a facultie of helping the ſight, and clearing the eies, and diſſipating the miſtie vapors in the ſtomack before they can aſcend to the brain. Wherefore by the ſame reaſon it is good to uſe marmelade of quinces, conſerv of roſes, and common drige powder, or anie ſuch like compoſed of things good to break winde, or corroborate the ventricle. Phlebotomie and purging, if they bee requiſite, ſhall bee fitly appointed: Ventoſes ſhall bee applied to the ſhoulders and neck; and phlegmatick matter ſhall bee diverted and evacuated by the mouth with uſing maſticatories in the morning. There bee ſom which beleev, that a begining Cataract may bee diſſipated and diſcuſſed by often rubbing the eie-lids with his fingers, and in like ſort by the often and earneſt beholding of the Stars, and the Moon when it is at the full, looking-glaſſes, diamonds, and all other ſuch like bright ſhining things. I beleev, that by beams plentifully and ſuddenly brought and diffuſed over the eie, directly oppoſite againſt ſome bright ſhining thing, it may ſeem to have a penetrating, dividing, diſſolving, as alſo a conſuming and drying facultie. Beſides, alſo the hot breath of him who holdeth in his mouth, and chaweth fennel ſeeds, aniſ-ſeeds, coriander ſeeds, nutmeg, cinnamon, cloves, and the like, hath a great facultie, the eies beeing firſt gently rubbed with the finger, it beeing breathed in neer at hand, and often received, to heat, attenuate, reſolv, digeſt and diffuſe the humor which is readie to concrete. Moreover, this *collyrium* of *John Vigo* is thought verie powerful to clear the eies, ſtrengthen the ſight, hinder ſuffuſions, and diſcuſs them, if at anie time they concrete, and begin to gather. ℞. *hepatis bircini ſani & recentis* ℔ii. *calomi aromatici & mellis an.* ℥ß. *ſucci rutæ,* ʒiii. *aquæ chelidoniæ, fœniculi, verbeniæ euphoſiæ, an.* ℥iii. *piperis longi, nucis moſchatæ, caryophyllorum an.* ʒii. *croci* ℈i. *floris roriſmarini aliquantum contriti,* m.ß. *ſarcocollæ, aloës hepaticæ, an.* ʒiii. *fellis ratæ, leporis & perdicis, an.* ℥i. *terantur omnia, tritiſque adde ſacchari albi* ℥ii. *mellis roſati* ʒvi. *conjiciantur in alembicum vitreum, & diſtillentur in balneo Mariæ:* Let this diſtilled liquor bee often dropped into the eies. But if you prevail nothing by all theſe medicines, and that the cloudie and heaped up humor doth daily increaſ and thicken, then muſt you abſtain from remedies, and expect until it bee no more heaped up, but thickned, yea until it ſeem to bee grown ſomwhat hard. For ſo it may bee couched with a needle; otherwiſe, if this ſame skin ſhall not bee ripe, but more tender then is fitting, when you ſhall com to the operation, it will bee broken and thruſt through with the needle, and not couched. On the contrarie, if it bee too hard, it will reſiſt the needle, neither will it ſuffer it ſelf to bee eaſily couched. Wherefore it is requiſite that the Surgeon know when it is ripe, and hee muſt diligently obſerv the ſigns whereby hee may diſcern a ripe Cataract from an unripe; and that which is cureable, from that which is uncureable. For that onely which is ripe and cureable is to bee couched; that which is unripe, that is, ſuch an one as is more tender, and as it were crude, and that which is more hard and denſ, and laſtly, that is uncureable muſt not bee attempted at all.

How bright ſhining things may diſſipate a begining Cataract.

A *Collyrium* diſſipating a begining Cataract.

A Cataract muſt not bee couched, unleſs it bee ripe.

CHAP.

CHAP. XXI.

By what signs ripe and cureable Cataracts may bee discerned from unripe and uncureable ones.

IF the sound eie beeing shut, the pupil of the sore or suffused eie, after it shall bee rubbed with your thumb, bee presently dilated & diffused, and with the like celeritie return into the place, figure, color and state, it is thought by som to shew a ripe and confirmed Cataract. But an unripe, and not to bee couched, if the pupil remain dilated and diffused for a long while after. But it is a common sign of a ripe, as also more dens, and consequently uncureable suffusion, to bee able to see nor distinguish no visible thing beside light and brightness; for to discern other objects showeth that it is not yet ripe: Therefore the sound eie beeing shut and pressed, the pupil of the other rubbed with your thumb, is dilated, enlarged, swelleth, and is more diffused; the visive spirits by this compression beeing as it were forced from the sound into the sore eie. But these following Cataracts are judged uncureable, that is, such as are great, such as when the eie-lid is rubbed are nothing dilated or diffused, whose pupil becometh no broader by this rubbing: for hence you may gather, that the slopping or obstruction is in the optick nerv, so that how cunningly and well soever the Cataract bee couched, yet will the patient continue blinde; you shall do no more good in couching a Cataract, which is in an eie consumed and wasted with a *Phthisis*. Also that Cataract is uncureable, which is occasioned by a most grievous disease, to wit, by most bitter and cruel pains of the head, or by a violent blow. Such as are of a plaister-like, green, black, livid, citrine and quick-silver-like color, are usually uncureable. On the contrarie, such as are of a Chesnut color, or of a skie or sea-water color, with som little whiteness, yeeld great hope of a happie and successful cure.

Uncureable Cataracts.

Cureable Cataracts.

CHAP. XXII.

Of the couching a Cataract.

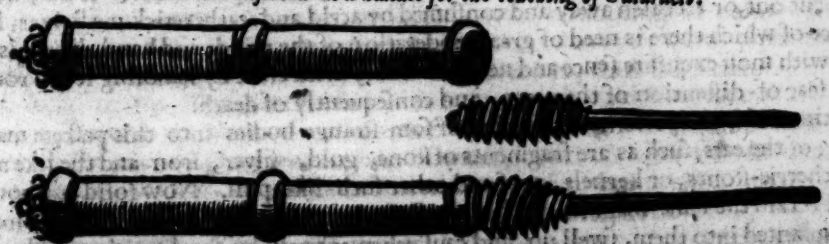
AFter you shall know by the fore-mentioned signs that the Cataract is cureable, it remains that you attempt the couching thereof, but so, that there bee nothing which may hinder. For if the pain of the head, cough, nauseousness or vomiting at that time trouble the patient, you shall then bestow your labor in vain: Wherefore you must expect until these symptoms be gon. Then make choice of a season fitting for that purpose, that is, in the decreas of the moon, when the air is not troubled with thunder nor lightning, and when as the Sun is not in Aries, becaus that sign hath dominion over the head. Then let the Surgeon consult a Physician whether purging or blood-letting bee convenient for the patient, so to resist plethorick symptoms, otherwaies readie to yeeld matter for relaps. Two daies after you must make choice of a place furnished with indifferent or competent light, and the Patient being fasting shall bee placed in a straight chair, so that the light may not fall with the beams directly upon him, but sidewise. The eie which shall bee cured must bee made more steddie, by laying and bindeing wooll upon the other: Then the Surgeon shall seat and place himself directly against the patient upon a seat somwhat higher, and bidding the patient put his hands down to his girdle, hee shall hold the patient's legs between his knees. One shall stand at the patient's back, who shall hold his head, and keep it from stirring; for by a little stirring hee may lose his sight for ever. Then must you prepare and make readie your needle, and thrust it often into som strong thick cloth, that it may bee as it were smooth by this motion, and for the performance of the work in hand with the less pain somwhat warmed. It must bee made of iron or steel, and not of gold or silver, it must bee also flatted on the sides, and sharp-pointed, that so it may the better pierce into the eie, and wholly couch the Cataract once taken hold of; and least it should slip in the Surgeon's hand, and bee less steddie, it shall bee put into a handle, as you may see by the following figure.

When to couch a Cataract.

The place.

The needle.

A needle inserted in a handle for the couching of Cataracts.



All things beeing thus in a readiness, you must bid the patient to turn the sight of his eie towards his nose, & the needle must bee boldly thrust (for it is received in a place that is void, & onely filled with spirits) directly by the coat *Adnata*, in the middle space between the lesser corner

corner and the hornie coat, juſt againſt the midſt of the Cataract, yet ſo, as that you hurt no vein of the *Adnata*, and then by ſtirring it as it were diverſly until it com to the midſt of the pupil and ſuffuſion. When it is com thither, the needle muſt bee inclined from above downwards to the ſuffuſion, and there to bee ſtirred gently until by little and little it couch or bring down the Cataract as whole as may bee beneath the compaſs of the pupil; let him ſtill follow it though couched with his needle, and ſomwhat violently depreſs and keep it down for ſom ſhort ſpace, that ſo it may reſt and ſtay in that lower place whether it is depreſſed. The Surgeon ſhall trie whether it firmly remain there or no, bidding the patient preſently to move his eie; for if it remain conſtantly ſo, and do not return again, the cure is perfect. Then muſt the needle bee lifted up by little and little, neither muſt it preſently bee taken forth, that if the Cataract ſhould bear up, or riſe again, that it might again, and ſo often (whil'ſt the work is yet hot, and all things in a readineſs) bee couched towards the leſſer corner, until it bee fully and ſurely hid. Then muſt you draw back the needle gently, and after the ſame manner as you put it in; leſt if you uſe not moderation, you bring back the Cataract from whence you couched it, or grievouſly offend the cryſtalline humor, the prime inſtrument of ſight, or the pupil with danger of diſtoning thereof. Som as ſoon as the work is don, give the patient ſomthing in his hand to look upon: but *Paulus* approov's not thereof, for hee fear's leſt his endeavoring or ſtriveing to ſee, may draw back the Cataract. Wherefore it is more wiſedom and better, preſently after the drawing forth of the needle, to put on a ſoft rag the white of an egg beaten in roſe-water with a little choice alum, and ſo applie it to the eie and neighboring parts for to binde and hinder the inflammation; then alſo you muſt together therewith binde up the ſound eie, leſt by ſtirring to ſee, it might together therewith draw and move the ſore eie, by reaſon of the ſympathie and conſent they mutually have by the optick nerv's. After all things are thus performed, the patient ſhall bee laid in a ſoft bed, and ſo placed, that his head may lie ſomwhat high; let him bee laid far from noiſ, let him not ſpeak, nor eat anie hard thing that may trouble his jaws, wherefore let him feed upon liquid meats, as panado, barly cream, culliſſes, gellies, rear-eggs, and other meats of the like nature. At the end of eight daies the ligature that binde's up the eies ſhall bee looſed, and his eies waſhed with roſe-water, and putting on ſpectacles, or ſom taffatie, the patient ſhall by little and little accuſtom himſelf to the light, leſt hee ſhould bee offended by the ſudden meeting w^th^ light. But if the ſuffuſion, after ſom ſhort while after, lift it ſelf up again, it muſt bee couched again, but through a new hole, for the eie is pained and tender in the former place. It ſomtimes happen's by the touch of the needle that the Cataract is not couched whole, but is broken into manie pieces; then therefore each of them muſt bee followed, and couched ſeverally: if there bee anie verie ſmall particle which ſcape's the needle, it muſt bee let alone, for there is no doubt but that in proceſs of time it may bee diſſolved by the force of the native heat. There are alſo ſom Cataracts which at the firſt touch of the needle are diffuſed and turn into a ſubſtance like to milk or troubled water, for that are not throghly ripe, yet theſe put us in good hope of recoverie, and it bee but for this, that they can never afterwards concrete into one bodie as before. Wherefore at the length they are alſo diſcuſſed by the ſtrength of the native heat, and then the eie recover's its former ſplendor. If that anie other ſymptoms com unlooked for, they ſhall bee helped by new counſels and remedies.

What to bee don after the couching of a Cataract.

Of a Cataract which is broken to peeces.

CHAP. XXIII.

Of the ſtopping of the paſſage of the Ears, and the falling of things thereinto.

The cauſ.

IT ſomtimes happeneth that children are born without anie holes in their ears, a certain fleſhly or membranous ſubſtance growing in their bottom or firſt entrance. The ſame may alſo happen afterwards by accident, they beeing ulcerated by ſom impoſtume or wound, and the ear ſhut up by ſom fleſhly excreſcence or ſcar. When as the ſtopping is in the bottom of the cavitie, the cure is more difficult then if it were in the firſt entrance, But there is a double way of cure; for this ſubſtance, whatſoever it bee, muſt either bee cut out, or elſ eaten away and conſumed by acrid and catheretick medicines; in performance of which there is need of great moderation of the minde and hand. For it is a part endued with moſt exquiſite ſence and near the brain, wherefore by handling it too roughly, there is fear of diſtention of the nerve, and conſequently of death.

The cure.

Somtimes alſo the preternatual falling of ſom ſtrange bodies into this paſſage maketh a ſtopping of the ears, ſuch as are fragments of ſtone, gold, ſilver, iron and the like metals, pearls, cherrie-ſtones, or kernels, peaſ and other ſuch like pulſ. Now ſolid and bonie bodies ſtill retain the ſame magnitude; but peaſ, ſeeds and kernels, by drawing the moiſture there implanted into them, ſwell up, and cauſ vehement pain by the diſtention of the neighboring parts, wherefore the ſooner they are drawn forth, the better it is for the patient. This ſhall bee don with ſmall pincers and inſtruments made in the ſhape of ear-picks. But if you profit nothing thus, then muſt you uſe ſuch gimblets as are made for the drawing forth

of

of bullets shot deep into the bodie. Little stones and bodies of the like stonie hardnes shall bee forced forth by the bodie, provoked to concussion by sneesing, and by dropping som oil of almonds first into the passage of the ear, that the way may bee the more slipperie, for it will com to pass by this sneesing, or violence of the internal air forcibly seeking passage out, that at length they may bee cast forth, the mouth and nostrils beeing stopped with the hand. But if wee cannot thus prevail, it remain's, that wee cut open the passage with an incision-knife, so much as shall bee sufficient for the putting in and using of an instrument for to extract them. If anie creeping things of little creatures, as fleas, ticks, pismires, gnats and the like, which sometimes happeneth, shall get therein, you may kill them by dropping in a little oil and vinegar. There is a certain little creeping thing, which for piercing and greeing into the ears, the French call *Perse-oreille* (wee an ear-wig.) This, if it chance to get into the ear, may bee killed by the foresaid means, you may also catch it, or draw it forth by laying half an apple to your ear, as a bait for it.

The concussive force of sneesing.

CHAP. XXIV.

Of getting of little bones and such like things out of the jaws and throat.

Sometimes little bones and such like things in eating greedily use to stick, or as it were fasten themselves in the jaws or throat. Such bodies if you can com to the sight of them, shall bee taken out with long, slender and crooked mallets made like a Cranel-beak. If they do not appear, nor there bee no means to take them forth, they shall bee cast forth by causing vomit, or with swallowing a crust of bread, or a drie fig gently chawed, and so swallowed; or elf they shall bee thrust down into the stomack, or plucked back with a leek, or som other such long and stiff crooked bodie anointed with oil, and thrust down the throat. If anie such like thing shall get into the weazon, you must caus coughing, by taking sharp things, or elf sneesing, so to cast forth whatsoever is there troublesom.

The cure different according to the places where they stick.

CHAP. XXV.

Of the Tooth-ache.

Of all pains, there is none which more cruelly tormenteth the patients then the Tooth-ache. For wee see them oft-times after the manner of other bones to suffer inflammation, which will quickly suppurate, and they becom rotten, and at length fall away piece-meal; for wee see them by daily experience to bee eaten and hollowed, and to breed worms, som portion of them putrefying. The caus of such pain is either internal, or external and primitive. The internal is a hot or cold defluxion of humors upon them, filling their sockets, and thence consequently driving out the teeth; which is the reason that they stand sometimes so far forth, that the patient neither dare's, nor can make use of them to chaw for fear of pain: for that they are loos in their sockets by the relaxation of the gums, caused by the falling down of the defluxion. When as they are rotten and perforated even to the roots, if anie portion of the liquor in drinking, fall into them, they are pained as if you thrust in a pin or bodkin, the bitternes of the pain is such. The signs of a hot defluxion are sharp and pricking pain, as if needles were thrust into them, a great pulsation in the root of the pained tooth and the temples, and som eas by the use of cold things. Now the signs of a cold defluxion are a great heavines of the head, much and frequent spitting, som mitigation by the use of hot remedies. In the bitternes of pain wee must not presently run to Tooth-drawers, or caus them presently to go in hand to pluck them out. First consult a Physician, who may prescribe remedies according to the varietie of the causes Now heer are three intentions of cureing. The first is concerning diet; the other for the evacuation of the defluxion or antecedent caus; the third for the application of proper remedies for the asswageing of pain. The two former scopes, to wit, of diet, and diverting the defluxion by purgeing, phlebotomie, application of cupping-glasses to the neck and shoulders, and scarification, do absolutely belong to the Physician. Now, for proper and topick medicines they shall bee chosen contrarie to the caus. Wherefore in a hot caus, it is good washing the mouth with the juice of pomgranats, plantain-water, a little vinegar wherein roses, *balaustie* and *sumach* have been boiled. But such things as shall bee applied for the mitigating of the pain of the teeth, ought to bee things of verie subtile parts, for that the teeth are parts of dens consistence. Therefore the ancients have alwaies mixed vinegar in such kind of remedies. *Recipe ser. rub. stomach. hordei, an. m. ß. seminis byoscyami conquassati ʒiß. fantalorum an. ʒß. lactucæ summitatum rubi, solani, plantaginis, an. m. ß. bulliant omnia in aquæ ℔ viii. & pasco*

The Tooth-ach a most cruel pain.

The caus thereof.

The signs of this or that defluxion.

Three scopes of cureing.

A cold and repercussive lotion for the mouth.

& pauco aceto ad bordei crepaturam. Wash the mouth with such a decoction being warm. You may also make Trochises for the same purpose after this manner. Rx. *semin. hyoscyami, sandaracha, coriandri, opii an. 3ß. teranjur & cum aceto incorporentur, formentque trochisci ad dentibus dolentibus.* Trochisers for a hot defluxion. Or else, Rx. *seminis portulacæ, hyoscyami, coriandri, lentium, corticis seminali citrini, roſar. rub. pyrethri, camphoræ, an. 3ß.* let them all be beaten together with strong niger, and made into trochises, with which being dissolved in rose-water, let the gums and whole mouth bee washed when need requireth. But if the pain bee not assuaged with these, you shall com to narcoticks, which may stupefie the nerv: as, Rx. *seminis hyoscyami albi, opii, camphoræ, papaveris albi, an. quantum sufficit, coquantur cum aq. & denti applicetur.* Narcoticks. Besides, you must also put this following medicine into the ear of the pained side. Rx. *opii & castorei, an. 3i. misceantur cum oleo roſato:* It hath somtimes availed in swoln, and distended gums, beeing first lightly scarified, to have applied leeches, for the evacuation of the conjunct matter, as also to have opened the veins under the tongue, or these which are behinde the ears. For I remember that I, by these three kindes of remedies, asswaged great pains of the teeth. Yet there bee som who in this affect open not these veins which are behinde the ears, but those which are conspicuous in the hole of the ear in the upper part thereof.

Pain of the teeth arising from a cold cause and defluxion, may bee helped by these remedies; boil rosemarie, sage, and pellitorie of Spain in wine and vineger, and add thereto a little *aqua vitæ*, in this liquor dissolv a little treacle, and wash your teeth therewith. Others mingle gum *ammoniacum* dissolved in *aqua vitæ* with a little *sandarecha* and myrrh, and lay it to the pained tooth, after *Vigoe's* counsel. *Mesne* think's that beaten garlick carried in the right or left hand, asswage's the pain, as the teeth ake upon the right or left side. But I beeing once troubled with grievous pain in this Kinde, followed the counsel of a certain old woman, and laid garlick rosted under the embers to my pained tooth, and the pain forthwith ceased. The same remedie used to others troubled with the like affect, had like success. Moreover, som think it available if it bee put into the auditorie passage. Others drop into the ears oil of *castoreum*, or of cloves, or som such other chymical oil. It is good also to wash the teeth with the following decoction. Rx. *rad. pyrethri* 3ß. *menthæ & rutæ an.* p.i. *bulliant in aceto*, and with this decoction beeing warm, wash the teeth. Hot fumes. Som like fumes better, and they make them of the seeds of *Colloquintida* and mustard, and other like; they take the smoak by holding their mouths over a funnel. Other som boil pellitorie of Spain, ginger cinnamon, alum, common salt, nutmegs, cypress-nuts, anis and mustard seeds, and *euphorbium* in oxycrate, and in the end of the decoction add a little *aqua vitæ*, and receiv the vapor thereof through a funnel; as also they wash their teeth with the decoction, and put cotton dipped therein into the ear, first dropping in a little thereof. Som there are which affirm, that to wash the teeth with a decoction of Spurge is a verie good and anodine medicine in the tooth-ach. Vesicatories. I have oft-times asswaged intolerable pains of the teeth, by applying vesicatories under the ear, to wit, in that cavitie whereas the lower jaw is articulated with the upper: for the vein, arterie and sinew which are distributed to the roots of the teeth, lie thereunder. Wherefore the blisters beeing opened, a thin liquor run's out, which doth not onely cure, but also nourish or feed the disease. But if the tooth bee hollowed, and that the patient will not have it pull'd out, there is no speedier remedie, then to put in caustick medicines, as oil of vitriol, *aqua fortis*, and also a hot iron; for thus the nerv is burn't in sunder, and loseth it's sense. Causticks. Yet som affirm that the milkie juice that flow's from Spurge made into a paste with *olibanum* and *amylum*, and put into the hollowed tooth, will make it presently to fall away in pieces. When the gums and cheeks are swoln with a manifest tumor, then the patient begin's to bee somwhat better and more at ease. For so by the strength of nature, the tumor causing the pain is carried from within outwards. But of what nature soever the matter which causeth the pain bee, it is convenient to intercept the cours thereof with *Emplastrum contra rupturam*, made with pitch and mastick, and applied to the temple on that side where the tooth asketh.

CHAP. XXVI.

Of other affects of the Teeth.

THe teeth are also troubled with other preternatural affects. For somtimes they shake by relaxation of the gums, or else beecom corrupt and rotten, or have worms in them, or else are set on edg. For the first, the gums are relaxed either by an external or primitive cause, as a fall or blow: or else by an internal or antecedent, as by the defluxion of acrid or waterish humors from the brain, or through want of nourishment in old bodies. Causes of loosness of the teeth. If the teeth grow loos by the means of the decaying gums, the disease is then incureable; but you may withstand the other causes by the use of such things as fasten the teeth, shunning on the contrarie such as may loosen them.

There-

Therefore the patient must not speak too earnestly, neither chaw hard things. If they become loos by a fall or blow, they must not bee taken forth, but restored and fastened to the neck that remain firm, for in time they will bee confirmed in their sockets, as I tried in *Antonii de la Rue* a Tailor, who had his jaw broken with the pommel of a dagger, and three of his teeth lost thereby, and almost shaken out of their sockets; the jaw being restored, the teeth were also put in their places, and bound to the rest with a double waxed thred; for the cure, I fed the patient with broths, gellies, and the like, and I made astringent gargarisms of cypress nuts, myrtle berries, and a little alom boil'd in oxycrate; and I willed him to hold it a good while in his mouth: by these means I brought it so to pass, that hee within a while after could chaw as safely upon those teeth, as upon the other. I heard it reported by a credible person, that hee saw a Ladie of the prime Nobilitie, who instead of a rotten tooth, shee drew, made a foolish vooth; drawn from one of her waiting-maids at the same time, to bee substituted and inserted, which tooth in process of time, as it were taking roote, grew so firm, as that shee could chaw upon it as well as upon anie of the rest. But as I formerly said, I have this but by hearsay. A Historie.

Now the teeth are corroded or eaten in by an acrid and thin humor penetrating by a pleuteous and frequent defluxion even to their roots, and beeing there contained, it putrefies, and becoming more acrid, it doth not onely draw the teeth into the contagion of its putrefaction, but also perforates and corrodes them. The causes of hollow teeth.

The putrefaction may bee corrected, if after general medicines, you put oil of vitriol or *aqua fortis* into the hole of the eaten tooth: or elſe, if you burn the tooth it self to the root with a small iron wier beeing red hot: you shall thrust this hot iron thorow a pipe or cane made for the same purpose, least it should harm any sound part by the touch thereof, and thus the putrefaction, the cause of the arrosion, may bee staied. But if the hole bee on the one side between two teeth, then shall you file away so much of the sound tooth, as that you may have sufficient libertie to thrust in your wier without doing anie harm. The cure.

The forms of Files made for fileing the teeth.

Worms breeding by putrefaction in the roots of the teeth, shall bee killed by the use of caustick, by gargles or lotions made of vineger, wherein either pellitorie of Spain hath been steeped, or treacle dissolved; also aloës and garlick are good to bee used for this purpose. Causes of worms in the teeth.

Setting the teeth on edg happens to them by the immoderate eating of acrid or tart things, or by the continual ascent of vapors endued with the same qualitie, from the orifice of the ventricle to the mouth, or by a cold defluxion, especially of acrid phlegm, falling from the brain upon the teeth, or elſe by the too excessive use of cold or stupifying liquors. This affect is taken away, if after general medicines and shunning those things that cherish the disease, the teeth bee often washed with *aqua vitæ*, or good wine, wherein sage, rosemarie, clovs, nutmegs, and other things of the like nature have been boiled. Causes of setting the teeth on edg.

CHAP. XXVII.

Of drawing of Teeth.

Teeth are drawn, either for that they cause intolerable pains, which will not yeeld to medicines, or elſe for that they are rotten and hollowed, so that they cause the breath to smell; or elſe, for that they infect the sound and whole teeth, and draw them into the like corruption, or becaus they stand out of order. Besides, when they are too deep and strongly rooted, so that they cannot bee pluck'd out, they must oft-times bee broken of necessitie, that so you may drop som caustick thing into their roots, which may take away the sense, and consequently the pain. The hand must bee used with much moderation in the drawing out of a tooth; for the jaw is sometimes dislocated by the too violent drawing out of the lower teeth. But the temples, eies and brain are shaken with greater danger by the too rude drawing of the upper teeth. Wherefore they must first bee cut about, that the gums may bee loosed from them, then A caveat in drawing of teeth.

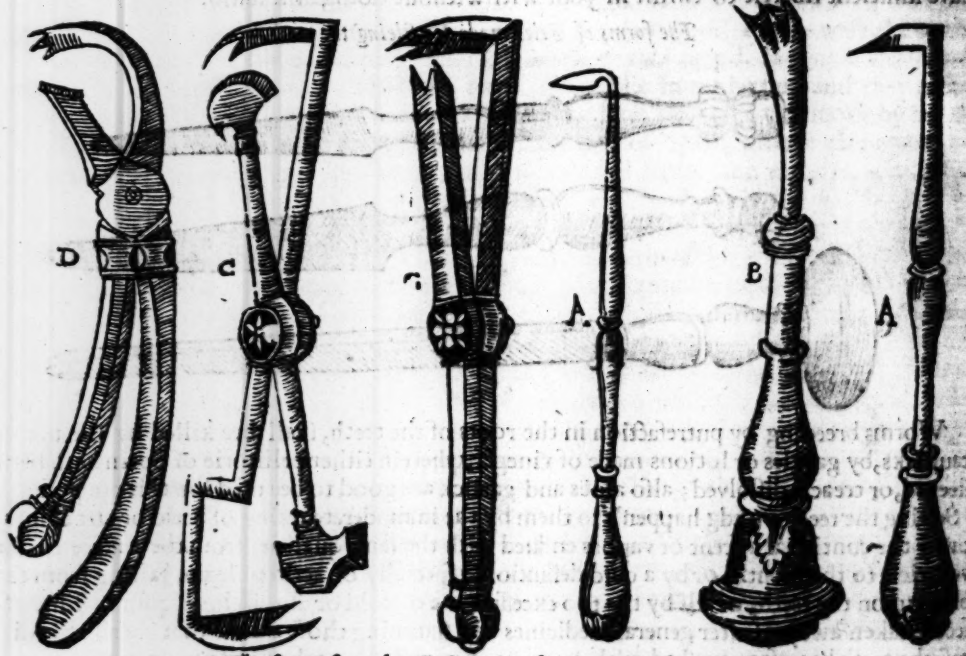
ſhake them with your fingers, and do this until they begin to bee looſe; for a tooth which is faſt in, and is plucked out with one pull, oft-times breaks the jaw, and bring's forth the piece together therewith, whence follow's a fever and a great flux of blood not eaſily to bee ſtaied (for blood or pus flowing out in great plentie is, in Celſus's opinion, the ſign of a broken bone) and manie other malign and deadlie ſympeoms. Some have had their mouths drawn ſo awrie, during the reſt of their lives, ſo that they could ſcarce gape. Beſides, if the tooth bee much eaten, the hole thereof muſt bee filled either with lint, or a cork, or a plate of lead well fitted thereto, leſt it bee broken under your forceps, when it is wrenched more ſtraightly to bee plucked out, and the root remain, readie in a ſhort time to cauſe more grievous pain. But judgment muſt bee uſed, and you muſt take ſpecial care, leaſt you take a ſound tooth for a pained one; for oft-times the patient cannot tell, for that the bitterneſs of pain by neighborhood is equally diffuſed over all the jaw. Therefore for the better plucking out a tooth, obſerving theſe things which I have mentioned, the patient ſhall bee placed in a low ſeat, bending back his head between the tooth-drawer's legs; then the tooth-drawer ſhall deeply ſcarifie about the tooth, ſeparating the gums there-from with the inſtrument marked with this letter A. and then if ſpoiled as it were of the wall of the gums, it grow looſe, it muſt bee ſhaken and thruſt out, by forceing it with the three-pointed levatorie noted with this letter B. but if it ſtick in too faſt, and will not ſtir at all, then muſt the tooth bee taken hold of with ſom of theſe toothed *forcipes* marked with theſe letters C. D. E. now one, then another, as the greatneſs, figure, and ſite ſhall ſeem to require. I would have a tooth-drawer expert and diligent in the uſe of ſuch toothed mullets; for unleſs one know readily and cunningly how to uſe them, hee can ſcarce ſo carrie himſelf, but that hee will force out three teeth at once, oft-times leaving that untouch't which cauſed the pain.

Lib. 7. cap. 18.

The maner of drawing teeth.

Inſtruments for ſcrapeing the teeth, and a three-pointed levatorie.

The effigies of Forcipes, *or Mullets for the drawing of teeth.*



The form of another Inſtrument for drawing of teeth.

What to bee don when the tooth is pluck't out.

After the tooth is drawn, let the blood flow freely, that ſo the part may bee free'd from pain, and the matter of the tumor diſcharged. Then let the tooth-drawer preſs the fleſh of the gums on both ſides with his fingers whereas hee took out the tooth, that ſo the ſocket that was too much dilated, and oft-times toen by the violence of the pluck, may bee cloſed again. Laſtly, the mouth ſhall bee waſhed with oxycrate; and if the weather bee cold, the patient ſhall take heed of going much in the open air, leaſt it cauſe a new defluxion upon his teeth.

CHAP.

CHAP. XXVIII.

Of cleansing the Teeth.

Causes of foul or rustie teeth.

Peices of meat in eating somtimes stick between the teeth, and becoming corrupt by long staying there, do also hurt the teeth themselvs, and spoil the sweetnes of the breath. Hee that would eschue this, ought presently after meat to wash his mouth with wine mixed with water, or oxycrate, and well to cleanse his teeth, that no slimie matter adhere to them. Manie folks teeth by their own default gather an earthie filth of a yellowish color, which eat's into them by little and little, as rust eat's into iron. This rustie filthines, or as it were mouldines of the teeth, doth also oft-times grow by the omitting of their proper dutie, that is, of chawing. Whence soever this slimie filth proceed's, wee must get *Dentifrices* to fetch it off withall, and then the teeth must bee presently rubbed with *aqua fortis* and *aqua vite* mixed together, that if there bee anie thing that hath scaped the *Dentifrices*, it may bee all fetched off; yet such acrid washings are hurtful to the sound teeth, for that they by little and little consume and waste the flesh of the gums.

The cure.

A caution in the use of acrid things.

Dentifrices shall bee made of the root of marsh-mallows boiled in white wine and allom; and, as when the teeth are loose, wee must abstain from such things as are hard to bee eaten & chawed, but much more from breaking of such things as are of a bonie consistence, so also heer wee must shun all things that by their toughnes stick to the teeth. Manie for the cleansing of the teeth, commend a powder made of scuttle-bones, purple-shells, pumice-stone, burnt allom, and Hart's-horn, and a little cinnamon, which is a singular remedie for the teeth howsoever affected. Manie other are content with bread onely tosted and beaten; but this following water is verie effectuall to whiten the teeth. R. *sal. ammon. & gemmei, an.* ℥i. *alum. roch.* ℥ß. *aquæ ros. quod sufficit, distillentur.* And let the teeth bee cleansed with this distilled liquor.

A water to whiten the teeth.

CHAP. XXIX.

Of the impediment and contraction of the Tongue.

The cause of being tongue-tied.

The tongue is somtimes tied and short from the nativitie; as when the libertie of the tongue is restrained by the subject and neighboring, as well membranes as muscles, being either too short or too hard. Somtimes this disease happen's after they are born by som accident or preternatural affect, as by too hard a scar left by the healing of an ulcer under the tongue. The patient at his begining to speak, is too slow in speaking, but presently leaving his slownes, bee becom's too quick, so that hee stammer's. If the disease proceed from the astriction and shortnes of the ligamental membrane lying under the tongue, then the incision shall bee made broad-wise, having great care that the veins and arteries which are there, bee not violated, for fear least they should caus an *hemorrhagie*, not easily to bee staied: Then the mouth shall bee presently washed with oxycrate, and som lint dipped in syrup of dried roses, or honie of roses put into the midst of the incision, least the part of the ligament, especially on the night time when the tongue is silent and at rest, should grow to the rest of the ligament. For the same purpose the finger shall bee often thrust this way, and the tongue more violently rowll'd up and down, and thrust out of the mouth. Yet somtimes this ligament is so thick and short, and therefore hold's down the tongue so close, that you cannot com to cut it with a knife or lancet without great and manifest danger of death by bleeding. Therefore in such a case a needle and thred shall bee thrust through it, and so the thred shall bee tied straighter and straighter everie day, until by little and little this ligamental tie of the tongue, which by its immoderate shortnes intercept's the libertie of the motion, shall bee consumed and broken.

The cure.

Another way to cut it.

CHAP. XXX.

Of superfluous Fingers, and such as stick together.

The differences.

Each hand hath naturally five fingers onely; whatsoever is more or les is against nature: and if there bee fewer, it is a fault not to bee helped by art. But if there bee more, that for the most part may bee helped by art: superfluous fingers usually grow by the thumb, or the little finger, but seldom otherwise. These are either wholly fleshie, or have bones of their kinde and nails upon them. Those which are of a bonie nature doe either arise from the joints of the natural fingers, and are jointed like them, and so are oft-times movable, or else from som middle space of a joint, and these have not power to stir or moov. Now they are somtimes

equall in magnitude to the natural fingers to which they grow, yet more frequently they are ſhorter. Thoſe which are onely fleſhie, are eaſily amputated and made even with a razor; but ſuch as are alſo bonie cannot bee cut off, unleſs with the cutting mullets hereafter deſcribed, and this is a diſeaſ of the fingers in number. There is alſo another diſeaſ in fingers, for they ſomtimes ſtick together, and otherwhiles they are verie little ſeparated. This fault happen's either from the firſt original, by the error of the formative faculti e; or elſ it happen's afterwards by accident, as by a wound, or burn ill cured. For neighboring fingers beeing ulcerated do eaſily grow together, unleſs they bee kept aſunder by a linnen rag. And if they by chance ſhall grow together by a little and thin skin and fleſh, they ſhall forthwith bee divided with a ſharp razor; but if they bee joined by the interpoſition of a more groſs and denſ ſubſtance, to wit, the nerve, tendons, and veſſels, being knit together on each ſide, it will bee beſt not to meddle at all with the divideing them.

Cutting Mullets neatly made for the cutting off ſuperflous fingers.

The cure of nails running into the fleſh of the fingers.

Neither muſt wee omit, that manie have their nails run with ſuch bonie ſharpneſs into the fleſh of their fingers lying under them, that they cauſ moſt cruel pain; neither commonly do you avail anie thing by pareing them; for growing up within a while after, they preſs downwards again with the more violence. Therefore the Surgeon is often forced to cut away all the fleſh whereinto the ſharpneſs of the nail run's. Which I have don in manie with happie ſucceſs. Manie have corns growing upon their fingers in divers faſhions: They

How to take off the corns of the fingers.

are taken off by paring away by little and little the callous hardneſs, and then laying a head of garlick beaten thereon. Yet the cure is more quick and certain, which is performed by cauſticks, as *aqua fortis*, or oil of vitriol.

CHAP. XXXI.

Of the too ſhort a Prepuce, and of ſuch as have been circumciſed.

The cauſ.

The cure.

When as the Prepuce or fore-skin is too ſhort, it cannot cover the *Glans*. This happen's either by nature, to wit, by the firſt conformation, or afterwards by ſom accident, as to thoſe whom religion and the cuſtom of their nation bid's to bee circumciſed. The cure is thus: The Prepuce is turned up, and then the inner membrane thereof is cut round, and great care is had, that the vein and arterie which are there between the two membranes of the Prepuce bee not cut in ſunder. Hence it is drawn downward by extenſion, until it cover the *Glans*, a deſiccative emplaſter beeing firſt put between it and the *Glans*, leaſt they ſhould grow together. Then a pipe being firſt put into the urinarie paſſage, the Prepuce ſhall bee there bound until the inciſion bee cicatrized. This cure is uſed to the Jews, when having abjured their religion full of ſuperſtitions, for handſomneſs ſake, they would cover the nut of their yard with a Prepuce, and ſo recover their cut offs-kin.

CHAP. XXXII.

Of Phimoſis *and* Paraphimoſis, *that is, ſo great a conſtriction of the Prepuce about the* Glans *or Nut, that it cannot bee barred or uncovered at pleaſure.*

The prepuce is ſtraightened about the *Glans* two waies; for it either cover's the whole nut, and ſo ſtraightly encompaſſe's the end thereof, that it cannot bee drawn upwards, and

and consequently the nut cannot bee uncovered; or elſ it leav's the *Glans* bare under it, being faſtned ſo ſtiffly to the roots thereof, that it cannot bee turned up, nor drawn down, or over the *Glans*. The firſt manner of conſtriction is termed *Phimoſis*, the later *Paraphimoſis*. The *Phimoſis* happen's either by the fault of the firſt conformation, or elſ by a ſcar, through which occaſion the prepuce hath grown leſſer, as by the growing of warts. Now *Paraphimoſis* is often occaſioned by the inflammation of the yard, by impure copulation; for hence ulcers breed between the prepuce and *Glans*, with ſwelling, and ſo great inflammation, that the prepuce cannot bee turned back. Whence it is that they cannot bee handled and cured as you would, and a gangrene of the part may follow, which may by the contagion bring death to all the bodie, unleſs it bee hindered and prevented by amputation: but if a ſcar bee the cauſ of the conſtriction of the prepuce, the patient beeing plac'd in a convenient ſite, let the prepuce bee drawn forth and extended, and as much as may bee ſtretched and enlarged, then let the ſcar bee gently cut in three or four places on the inner ſide with a crooked knife, but ſo, that the gaſhes com not to the outſide, and let them bee an equal diſtance each from other. But if a fleſhie excreſcence or a wart ſhall bee the occaſion of this ſtraitneſs and conſtriction, it ſhall bee conſumed by the ſame remedies, by which the warts of the womb and yard are conſumed or taken off. But when as the prepuce doth cloſely adhere to the *Glans* on everie ſide, the cure is not to bee hoped for, much leſs to bee attempted.

The cauſes.

The cure.

CHAP. XXXIII.

Of thoſe whoſe Glans *is not rightly perforated, and of the too ſhort or ſtrait ligament, bridle, or cord of the yard.*

SOm at their birth, by evil conformation, have not their *Glans* perforated in the middle, but have onely a ſmall hole underneath, toward the bridle and ligament of the yard, called the cord. Which is the cauſ, that they do not make water in a ſtrait line, unleſs they turn up their yard toward their bellie, neither by the ſame reaſon can they beget children, becauſ through this fault of conformation, the ſeed is hindered from beeing caſt directly into the womb. The cure is wholly chirurgical, and is thus performed. The prepuce is taken hold of and extended with the left hand, but with the right hand, the extremitie thereof, with the end of the *Glans*, is cut even to that hole which is underneath. But ſuch as have the bridle or ligament of the yard too ſhort, ſo that the yard cannot ſtand ſtraight, but crooked, and as it were turned downwards; in theſe alſo the generation of children is hindered, becauſ the ſeed cannot bee caſt directly and plentifully into the womb. Therefore this ligament muſt bee cut with much dexteritie, and the wound cured after the manner of other wounds, haveing regard to the part.

The cauſ.

The cure.

Children alſo are ſomtimes born into the world with their fundaments unperforated, for a skin preternaturally covering the part, hinder's the paſſage forth of the excrement; thoſe muſt have a paſſage made by art with an inſtrument, for ſo at length the excrements will com forth: yet I have found by experience, that ſuch children are not naturally long live'd, neither to live manie daies after ſuch ſection.

Such as are born without a hole in their fundament are not long lived.

CHAP. XXXIV.

Of the cauſes of the Stone.

THe Stones which are in the bladder have for the moſt part had their firſt original in the reins or kidnies, to wit, falling down from thence by the ureters into the bladder. The cauſ of theſe is twofold, that is, material and efficient. Groſs, tough, and viſcid humors, which crudities produce by the diſtempers of the bowels and immoderate exerciſes, chiefly and immediately after meat, yeeld matter for the ſtone; whence it is that children are more ſubject to this diſeaſ then thoſe of other ages. But the efficient cauſ is either the immoderate heat of the kidnies, by means whereof the ſubtler part of the humors is reſolved, but the groſſer and more earthlie ſubſide's, and is hardned as wee ſee bricks hardned by the ſun and fire; or the more remiſs heat of the bladder, ſufficient to bake into a ſtone the *faces* or dregs of the urine gathered in great plentie in the capacitie of the bladder. The ſtraightneſs of the ureters and urenarie paſſage may bee accounted as an aſſiſtant cauſ. For by this means the thinner portion of the urine floweth forth, but that which is more feculent and muddie being ſtaled behinde, groweth as by ſcale upon ſcale, by addition and collection of new matter into a ſtonie maſs. And as a wicke oftentimes dipped by the Chandler into melted tallow, by the copious adhetion of the tallowie ſubſtance preſently becom's a large candle; ſo the more groſs and viſcid *faces* of the urine ſtay as it were at the bars of the gathered gravel, and by their continual appulſ are at length wrought and faſhioned into a true ſtone.

Why children are ſubject to the ſtone in the bladder.

The cauſ.

CHAP.

CHAP. XXXV.

Of the ſigns of the Stone in the Kidnies and Bladder.

Why the thigh is numm in the ſtone of the reins.

THe ſigns of the Stone in the Reins, are the ſubſideing of red or yellow ſand in the urine, a certain obſcure itching at the kidnies, and the ſenſ of a weight or heavineſs at the loins, a ſharp and pricking pain in mooving or bending the bodie, a numneſs of the thigh of the ſame ſide, by reaſon of the compreſſion cauſed by the ſtone, of the nervs deſcending out of the *vertebræ* of the loins of the thigh. But when the ſtone is in the bladder, the fundament and whole *perinæum* is preſſed as it were with a heavie weight, eſpecially if the ſtone bee of anie bigneſs, a troubleſom and pricking pain run's to the verie end of the yard, and there is a continual itching of that part, with a deſire to ſcratch it: hence alſo by the pain and heat there is a tenſion of the yard, and a frequent and needleſs deſire to make water, and ſomtimes their urine cometh from them drop by drop. A moſt grievous pain torment's the patient in makeing water, which hee is forced to ſhew by ſtamping with his feet, bending of his whole bodie, and the grateing of his teeth. Hee is oft-times ſo tormented with exceſs of pain, that the *Sphincter* beeing relaxed, the right gut falleth down, accompanied with the ſwelling heat and pain of the *Hemorhoid* veins of that place. The cauſ of ſuch torment is, the frequent ſtriveing of the bladder to expel the ſtone wholly contrarie to the nature thereof, whereto by ſympathie the expulſive facultie of the guts and all their parts of the bellie com as it were for ſupplie. The ſediment of the urine is groſs and viſcid, and oft-times like the whites of eggs, which argueth the weakneſs of the native heat not attenuateing the juices. The patient looketh of a pale and yellowiſh complexion and hollow-eied, by reaſon of the almoſt continual watching which is cauſed by the bitterneſs of pain; yet may it morc certainly bee known by putting in or ſearching with a *Catheter*. Which to do, the patient ſhall bee wiſhed to ſtand with his bodie ſomwhat ſtooping, leaning againſt ſomwhat with his back, and holding his knees ſom foot aſunder. Then the *Catheter* beeing bigger or leſſer as the bodie ſhall require, and anointed with oil or butter ſhall bee thruſt with a skilful hand into the paſſages of the urine, and ſo into the capacitie of the bladder. But if the *Catheter* cannot com to that capacitie, the patient ſhall bee placed in ſuch a poſture; then ſhall hee bee laid upon his back on a bench, or the feet of a bed, with his knees bended, and his heels drawn to his buttocks, after which manner hee muſt almoſt lie when hee is to bee cut for the ſtone, as ſhall bee ſhew'n hereafter. For thus the *Catheter* is more eaſily thruſt into the bladder, and ſhew's there is a ſtone by the meeting and obſcure ſound of the obvious, hard and reſiſting bodie. You muſt have ſundrie *Catheters*, that they may ſerv for everie bodie bigger and leſſer, and theſe muſt bee crooked, ſmooth and hollow. When being thruſt into the urinarie paſſage (which before unawares I omitted) they com to the neck of the bladder, they muſt not bee thruſt ſtraight into the bladder; but takeing hold of the yard with the left hand, they muſt bee gently thruſt with the right directly into the bladder, eſpecially in men, by reaſon of the length and crookedneſs of the way, which tend's in the form of this letter S. It is not ſo in women by reaſon of the ſhortneſs and ſtraitneſs of the neck of the bladder. It is fit your *Catheters* bee hollow or fiſtulous in manner of a pipe, that they may receiv a ſilver wiar or ſtring, that may hinder the groſs and viſcid humor, clotted blood, or the like, from ſtopping the further end of the *Catheter*, through which the ſuppreſſed urine ought to paſs and bee made. But now aſſoon as wee perceiv that the *Catheter* is com into the capacitie of the bladder, the wiar muſt bee drawn forth, that ſo the urine may the freelier flow out by the hollowneſs of the *Catheter*. You may perceiv thſe ſhapes of theſe inſtruments by this following figure.

Signs of the ſtone in the bladder.

Why ſuch as have a ſtone in the bladder are troubled with the falling of the fundament.

How to ſearch for the ſtone in the bladder with a *Catheter*.

The figure of the neck of the bladder is different in men and women.

The figure of Catheters, *and of a ſilver ſtring or wiar.*

CHAP.

CHAP. XXXVI.

Prognosticks in the Stone.

WHen the Stone is cast forth of the kidnie (whereas it bred by little and little) and is so driven into one of the ureters, that it wholly stop it, yet thereupon there followeth no suppression of the urine; for seeing nature hath made diverse parts of our bodie double, all the urine floweth into the other ureter. But if they shall bee both stopped with stones, there is no doubt but the urine will bee wholly suppreſt, and death ensue by the suffocation and extinction of the native heat, by the urine flowing back by the rivelets of the veins over all the whole bodie. Such as have a small stone cast forth of their reins into the cavitie of the ureters, those, untill this stone bee fallen into the bladder, have cruel pain with gripeings, with often desire to go to stool and make water, but oftentimes do neither. For such oft-times have their bellies distended with flatulencies: an argument hereof is their continual belching or breaking of winde. But by sneesing and coughing, or anie other concussion of the whole bodie, a pricking pain is forthwith felt, whereas the stone stop's, especially if it bee either rough, or have sharp points like horns. This pain is communicated to the hip and thigh by sympathie, and soon have the stones drawn up as it were with great violence. To these may bee added the Colick, cholerick vomiting, and almost a general sweat. The stone in the kidnies is most commonly bred in such as are antient, by reason of the weakness of the expulsive facultie. But the stone in the bladder happeneth to such as are more young, becaus the native heat is more vigorous in such, and strong and inordinate motions encreas the strength of the expulsive facultie. When the stone is in the bladder, and the urine appeareth bloodie, it is the sign of a small, as also a prickle and rough stone, for thus it more easily entreth into the neck of the bladder, and exulcerateth it beeing fleshie, whence the blood cometh away with the urine, and most cruel pain as of needles thrust into the flesh, especially after labor and much exercise: on the contrarie, a larger and more smooth stone will not caus such tormenting pain, and it causeth a milkie water. The shapes of stones in the kidnies are various, according to the varietie of the strainers through which they pass whil'st they are bred. Verily I have seen stones which represented the figure of greyhounds, hogs and other creatures, and things wholly contrarie to man's nature, by the production of their prickles and as it were branches. Som are four square, others longish and like a finger, other som of a round figure with manie protuberancies like a pine-apple kernel; neither is the varietie less in magnitude, number and color: for som are yellowish, others whitish, red, ash-colored or som other like, according to the various temper of the affected bodies. The stones of cholerick and lean men vsually concrete by preternatural heat and drienes; but those of phlegmatick or fat bodies, of a certain congelation as it were and obstruction of the passages. A stone falling somtimes from the bottom of the bladder into the passages of the urine quite stop'a it up, and thence followeth a total suppressing of the urine. Therefore then the patient shall bee placed upon his back and his legs beeing lifted up on high, hee shall bee shaken and tossed up and down, just as one would shake up a sack to fill it; for thus it is forced back into the bladder from whence it came, from the passage of the urine whereinto it was got; yet it may also bee forced back by thrusting in a Catheter. The pain which afflicteth such as have the stone is somwhiles continual, yet more frequently it cometh by fits and returns, somtimes monthly, otherwhiles yearly. Such as have the stone in the kidnies make for the most part waterish urine. Women are not so subject to the stone as men, for they have the neck of their bladder more short and broad, as also more straight; wherefore the matter of the stone by reason of the shortnes of the passage is evacuated in gravel, before it can bee gathered and grow into a stone of a just magnitude; yet stones breed in som women and those equally as big as in men, and therefore they are to bee cured by section and the like remedies. When the stone exceedeth the bignes of an egg, it can scarce bee taken away without tearing of the bladder, whence happeneth an unvoluntarie shedding of the water, cureable by no art, becaus the bladder, seeing it is nervous and without blood, beeing once torn admitteth no consolidation, add hereto that inflamation and a gangrene, often following the rending of the bladder, bring inevitable death. The patient run's the same hazard, if a long stone bee pulled out sidewise with your instrument, or if it bee inclosed in a membrane (which kinde of stone can scarce bee found with a Catheter) and so bee fastned to the bladder, or otherwise if the stone it self bee fastned into the substance of the bladder, or lastly if by anie chance the Surgeon beeing about to pluck out the stone shall hurt the bodie of the bladder with his instruments. Yet stones of a more indifferent bignes are more safely extracted out of the bladder then those which are les, and the patient more frequently and happily recovereth. For they do not scape from the instrument, and the patient beeing used a long while to endure pain, as that which hath been a long time a growing doth more easily and constantly away with the inflamation, pain and other symptoms which happen after cutting, yea in cutting. Haveing thus spoken of the causes, signs, places, symptoms and pro-

How death may ensue by the suppressing of urine.

Why stones of the kidnies have sundrie shapes.

Why men are more subject to the stone then women.

What stones cannot bee taken out of the bladder without killing the patient.

prognoſticks, wee muſt com to the cure, begining with that part which is termed *Prophylactice*, that is the preventing part.

CHAP. XXXVII.

What cure is to bee uſed when wee fear the Stone.

What diet ſuch muſt uſeas fear the ſtone.

Diet muſt firſt bee appointed, which by the convenient uſe of the ſix things not natural (as they term them) may heap up ſmall ſtore of groſs, tough and viſcid humors in our bodies. Therfore cold and cloudie air is to bee ſhunned. They muſt abſtain from fiſh, beef, pork, water-foul, pulſ, cheeſ, milk-meats, fried and hard eggs, rice, cakes and all paſtrie, unlevened bread, and laſtly, all manner of obſtructing meats. Alſo garlik, onions, leeks, muſtard, ſpices, and laſtly, all things which over-heat the blood and humors muſt bee ſhunned, eſpecially if you fear that the ſtone is concrete by the heat of the reins. Standing and muddie waters, thick and troubled wines, beer, and ſuch kinde of liquors muſt bee eſchewed. Saltneſs in meats and drinks is to bee ſhunned, as that which breed's crudities. Alſo long watching and continual labor becauſ they inflame the blood, cauſ crudities, and preternatural heat muſt carefully bee eſchewed, as alſo more vehement paſſions of the minde. If the bodie bee plethorick, then it muſt bee evacuated by phlebotomie, purgeing and vomiting, which is accounted for a ſingular remedie for the prevention of this diſeaſ. For the performance of all which things a Phyſician ſhall bee conſulted with. But becauſ Phyſicians are not in everie place and alwaies as hand, I have thought good to ſet down theſe following medicines; yet wee muſt firſt remember this counſel of *Galen*; the uſe of diureticks, and ſtrong purgeing medicines is hurtful, as often as there is inflammation in the reins and bladder, for ſo the confluxe of the humors to the affected parts is the greater, whence the inflammation and pain are increaſed. *Lib. 13. method.*

Wherefore firſt uſeing relaxing medicines, as ſix drams of *Caſſia* newly drawn, with ℈iv. of *Rubarb* in powder mixed therewith; then lenitive and refrigerating medicines ſhall bee inwardly and outwardly uſed, ſuch as is this following ſyrrupe. ℞. *ſummitatum malv. biſmal. & violar. an.* m. ß. *rad. alth.* ℥i. *glycyr.* ℥ß. *4. ſem. frigid. major. an.* ℥i. *fiat decoctio.* ℞. *prædict. decoctionis* ℔ ß. *in colaturâ diſſolve ſacc. albiſſ.* ℥ii. *mellis albi* ℥iß. *fiat ſyrupus ſecund. artem;* let the patient uſe this often. This following apozeme is alſo verie effectual for the ſame purpoſe. ℞. *rad. aſpar. gramin. polyp. quercini, paſſul. mund. an.* ℥ß. *betonic. berniar. agrimon. omnium capill. & pimpinel. an.* m. ß. 4. *ſem. frigid. major. & ſem. fœnic. an.* ℥i. *folior. ſen.* ℥vi. *fiat decoct. ad* ℔ß. *in colaturâ diſſolve ſyrupi de Althæa & de berniar. an.* ℥iß. Make a clear apozeme and let it bee aromatized with a little cinnamon, for two doſes; let him take the firſt doſis in the morning two hours before meat, and the other at four of the clock in the afternoon. Moreover this following broth hath an excellent and certain power to prevent the ſtone. ℞. *bordei integr.* p.i. *radic. petroſelini, acetoſ. fœnic. cichor. bruſci an.* ℥i. 4. *ſem. frigidorum conquaſſatorum an.* ℥ß. *fol. acetoſ. portul. lactucæ, ſummitatum malvæ, & violar. an.* m. ß. *bulliant in aquâ fluviatili cum gallo gallinaceo & crure vitulino*; let the broth bee kept, and let the patient take thereof ſix ounces for four daies; in the morning two hours before meat, with an ounce of the juice of Citrons gently warmed with the ſame broth at the takeing thereof; for thus, much urine will bee made in a ſhort while after, full of a ſandie ſediment and a groſs viſcid humor. Whereby you may certainly gather, that this kinde of broth is verie effectual to cleanſ the paſſages of the urine, neither in the interim, doth it anie harm to the ſtomack and other parts by which it paſſeth: ſo that it may bee rightly termed a medicinal nouriſhment. You may alſo profitably uſe this following powder. ℞. *nucleorum meſpilorum* ℥i. *pul. elect. diamarg. frig.* ℥ii. 4. *ſem. frigid. majorum mund. glycyrbizæ razæ,* ℥i. *ſem. ſaxifrag.* ℥ii. *ſem. milii ſolis, geniſt. pimpin. bruſci & aſparag. an.* ℈i. *ſem albeæ,* ℥. ß. *ſacch. albiſſ.* ℥vi. *fiat pulvis*; let him take a ſpoonful in the morning three hours before meat. Alſo ſom think that lee made of the ſtalks and huſks of beans is a good preſervative againſt this diſeaſ. Beſides the uſe of this following glyſter hath done good to manie. ℞. *fol. lactuc. ſcariol. portul. an* m.i: *flor. viol. & nenuph. an.* p.i. *fiat decoctio. ad lib.* i. *in colaturâ diſſolve caſſiæ fiſtulæ* ℥i. *mellis viol. & ſacc. rub. an.* ℥iß. *olei viol.* ℥iii. *fiat clyſter.* This which followeth is the fitter to aſſwage the pain. ℞. *flor. cham. melil. ſummitat. aneth. berul. an.* p.ii. *fiat decoctio in lacte vaccino*; *in colaturâ diſſolve caſſiæ fiſtul. & ſaccar. alb. an.* ℥i. *vitellos ovorum num.* ii *olei anethini, & chamæm. an.* ℥ii. *fiat clyſter.* In the interim let the kidnies bee anointed on the outſide with *unguentum roſatum, refrigerans Galen.* and *populeon* uſed ſeverally, or mixed together, laying a double linnen cloth dipped in oxycrate. But if the concretion of the ſtone bee of a cold cauſ, the remedies muſt bee varied, as follow's: ℞. *terebenth. venet.* ℥i. *cort. citri* ℥ii. *aquæ coct.* ℥ii. *fiat potio.* Or elſ; ℞. *caſſiæ recent. extract.* ℥vi. *benedict. lax.* ℥iii. *aq. fœnic.* ℥ii. *aq. aſparag.* ℥i. *fiat potio*; let him take it three hours before dinner: this following apozeme is alſo good. ℞. *rad cepet. bardan. & gram. an.* ℥iii. *biſmal. cum toto, beton. an.* m. ß. *ſem. milii ſolis, bardan. urtic. an.* ℥ii. *ſem melon. glycyrbiz. raſ. an.* ℥iiß. *ficus num. 4. fiat decoct. ad quart. iii. in expreſſâ collaturâ, diſſolve ſirup. de capban. & oxymilitis ſcyl-*

CHAP. XXXVIII.

What is to bee don, when the ſtone falleth out of the Kidnie into the Ureter.

OFt-times it falleth out that the reins uſeing their expulſive facultie force down the ſtone (whoſe concretion and generation the Phyſicians by the formerly preſcribed means could not hinder) from themſelvs into the ureters; but it ſtaieth there either by reaſon of the ſtraightneſs of the place, or the debilitie of the expulſive facultie. Therefore then cruel pain tormenteth the patient in that place whereas the ſtone ſticketh, which alſo by deuſent may bee communicated to the hip, bladder, teſticles and yard, with a continual deſire to make water and go to ſtool. In this caſe it behooveth the Phyſician that hee ſupplie the defect of nature, and aſſiſt the weak indeavors. Signs of the ſtone ſtopping in the *ureter*.

Therefore let the patient if hee bee able mount upon a trotting horſ, and ride upon him the ſpace of ſom two miles, or if hee can have no opportunitie to do ſo, then let him run up and down a pair of ſtairs untill hee bee wearie, and even ſweat again; for the ſtone by this exerciſe is oft-times ſhaken into the bladder; then preſently ſhall bee given or taken by the mouth ſuch things as have a lenitive and relaxing facultie, as oil of ſweet almonds newly drawn and that without fire, and mixed with the water of pellitorie of the wall and white wine. Let frictions of the whole bodie bee made from above downwards with hot clothes; let Ventoſes with a great flame bee applied one while to the loins, and another while to the bottom of the bellie, a little below the grieved place; and unleſs the patient vomit of his own accord, or by the bitterneſs of his pain, let vomiting bee procured with a draught of water and oil luke-warm, for vomiting hath much force to drive down the ſtone by reaſon of the compreſſion of the parts, which is cauſed by ſuch an endeavor: laſtly, if the ſtone deſcend not by the power of theſe remedies, then the patient muſt bee put into a *Semicupium*, that is a Half-bath, made of the following decoction. ℞. *malvæ, biſmal. cum toto an.* m. ii. *beton. naſturt. ſaxifrag. berul. parietar. violar. an.* m. iii *ſem. melonum, milii ſolis, alkekengi an.* ʒvi. *citer. rub.* ℔.i. *rad. appii. gram. fœniculi, & eringii. an.* ℥iiii. *in ſufficienti quantitate aquæ pro inceſſu; coquantur iſta omnia incluſa ſacco;* herein let the patient ſit up to the navel: neither is it fit that the patient tarrie longer in ſuch a bath then is requiſite, for the ſpirits are diſſipated, and the powers reſolved by too long ſtay therein. But on the contrarie, if the patient remain as long as is ſufficient in theſe rightly made, the pain is mitigated, the extended parts relaxed, and the paſſages of the urine opened and dilated, and thus the ſtone deſcendeth into the bladder. But if it bee not mooved by this means any thing at all out of the place, and that the ſame total ſuppreſſion of urine do as yet remain, neither before the patiene entred into the bath the putting of a *Catheter* into the bladder did any thing avail, yet notwithſtanding hee ſhall trie the ſame again after the patient is com out of the bath, that hee may bee throughly ſatisfied whether peradventure there may bee anie other thing in theſe firſt paſſages of the yard and neck of the bladder, which may with-hold the urine; for the *Catheter* will enter far more eaſily, the parts beeing relaxed by the warmneſs of the bath: then inject ſom oil of ſweet almonds with a ſyringe into the *Urethra* or paſſage of the yard; whil'ſt all theſe things are in doing, let not the patient com into the cold air. But heer I have thought good to deſcribe a chair for a bath, wherein the patient may fitly ſit. Remedies to force down the ſtone ſticking in the *ureter*. A decoction for a bath.

The figure of a Chair for a Semicupium.

A. *Sheweth the whole frame of the Chair,*
B. *The hole wherein the patient muſt ſit.*
C. *The Ciſtern that holds the water.*
D. *A Cock to emptie the water when it groweth cold.*
E. *A Funnel whereby to pour in warm water.*

There may alſo bee another decoction made for the bath, as thus: ℞. *rad. raph. alth. an.* ℔.ii. *rad. ruſc. petroſel. & aſparag. an.* ℔. i. *cumin. fenicul. anesi an.* ℥iiii. *ſem. lini, ſenug. an.* ℥vi. *fol. marub. parietar. florum chamem. melil. anethi. an.* m. ii. *bullian omnia ſecundùm artem in aquæ ſufficienti, & vini albi odoriferi exiguâ quantitate ad conſumptionem tertiæ partis pro Semicupio.* Alſo the ſame decoction may bee uſed for gliſters, adding thereto two yolks of eggs, and foure ounces of oil of lillies, with ℥i. of oil of juniper, which hath a certain force to aſſwage the pain of the ſtone and collick. But a far leſs quantitie of the decoction in a gliſter muſt bee uſed in theſe diſeaſes, than uſually is appointed in other diſeaſes; otherwiſe there will bee danger leſt the guts beeing diſtended ſhould more preſs upon the kidnies and ureters, troubled in ſom ſort with inflammation, and ſo increaſe the pain and other ſymptoms. This following cataplaſm ſhall bee profitably applied to the grieved place, to wit, the loins or flanks and bottom of the bellie, for it is verie powerful to aſſwage pain, and held forwards the falling down of the ſtone. ℞. *rad. alth. & raphani, an.* ℥iiii. *pariet. fœnic. ſenecionis, naſurt. berul. an.* m.i. *herniariæ* m.ß. *omnibus in aquâ ſufficienti decoctis, & deinde contritis, adde olei anith. chamem. & pingued. cuniculi, an.* ℥ii. *farin. cicer. quantum ſufficit, fiat cataplaſma ad uſum prædictum.*

An anodine Cataplaſm.

Signs of the ſtone fallen out of the *ureter* into the bladder.

After, by theſe means, the ſtone forced out of the *ureter* is fallen into the bladder, the pain preſently (if there bee but one ſtone, for ſomtimes more with much gravel do again fall into the *ureter*) is mitigated, and then the patient is troubled with an itching and pricking at the end of his yard and fundament. Therefore then unleſs hee bee verie weak, it is fit that hee ride and walk a foot, and take ℥iv. of *ſpecies Litbontripbon* in four doſes with white wine, or the broth of red Cicers three hours before dinner and ſupper. Beſides, let him plentifully drink good wine, and after hee hath drunk, let him hold in his urine as long as hee can; that ſo it beeing gathered in great plentie, it may preſently thruſt the ſtone out of the bladder with the more force; for which purpoſe you may alſo inject the following liquor into the bladder. ℞. *ſyrupi capill. ven.* ℥i. *aquæ alkekengi* ℥iii. *olei ſcorpionum.* ℥ß. Let it bee injected into the bladder with a ſyringe.

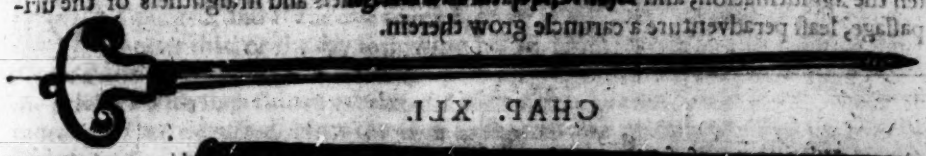
CHAP. XXXIX.

What muſt bee don the ſtone beeing fallen into the neck of the bladder, or paſſage of the yard.

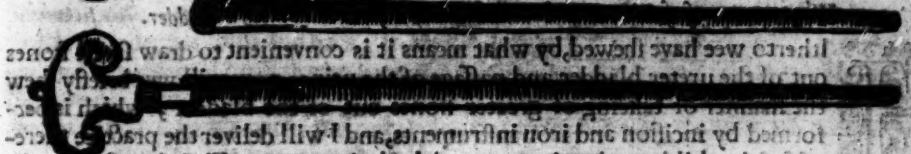
After the ſtone is fallen out of the capacitie of the bladder, and ſtop's in the neck thereof, or paſſage of the yard, the Surgeon ſhall have a ſpecial care that hee do not force or thruſt back the ſtone from whence it came, but rather that hee preſs it gently with his fingers to the end of the yard, the paſſage beeing firſt made ſlipperie by injecting ſom oil of ſweet almonds. But if it ſtop in the end of the *Glans*, it muſt bee plucked out with ſom crooked inſtrument; to which if it will not yeeld

yeeld; a Gimblet with a pipe or cafe thereto, shall bee put into the paſſage of the yard, and ſo it ſhall bee gotten out, by reaſon the ſtone is kept by the turning or twining about of the Gimblet, which I remember I have divers times experienced and done; for ſuch Gimblets are made with ſharp ſcrues, like ordinarie gimblets.

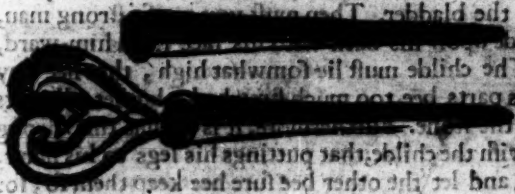
The delineation of a Gimblet made to breake the ſtone in the paſſage of the yard.



The figure of another leſſer Gimblet.



Verily what Gimblets ſoever are made for this buſineſs, their bodie or point muſt bee no thicker then a ſmall probe, leſt whil'ſt they are forced or thruſt into the *Vretra*, or urinarie paſſage, they might hurt the bodies next unto them by their violent entrance.



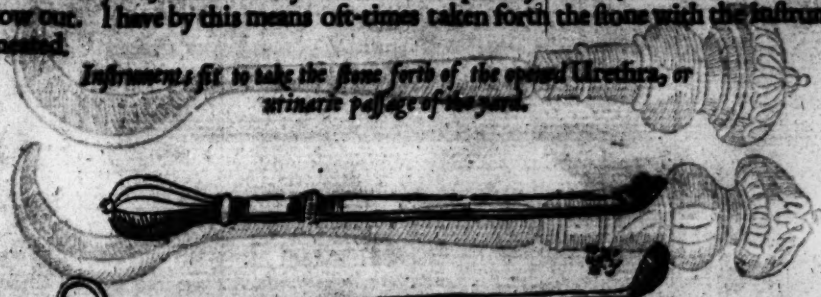
CHAP. XL.

What courſe muſt bee taken, if the ſtone ſticking in the Urethra, or urinarie paſſage, cannot bee gotten out by the forementioned arts.

BUt if the ſtone bee more thick, hard, rough and remote from the end of the yard, then that it may bee gotten out by the means formerly mentioned in the precedent Chapter, and if that the urine bee wholly ſuppreſt therewith; then muſt you cut the yard upon the ſide with a ſtraight wound; for you muſt not make inciſion on the upper part, for fear of a flux of blood, for a large vein and arterie ſtretch there-under; nor in the lower part, for ſo it would ſcarce ever heal again, for that it is a bloodleſs part, and beſides, the conchmal and acrid ſalting of the urine would hinder the agglutination: wherefore the inciſion muſt bee made on the ſide, on that part whereas the ſtone moſt riſes and ſwells out. For that part is the more fleſhie; yet firſt the end of the skin of the prepuce muſt bee much drawn up ſo to cover the *Glans*, which being don, the *Vretra* muſt bee tied with a thred a little above the ſtone, that ſo the ſtone may bee ſtaied there, and may not fall back again. Therefore then, inciſion being made, the ſtone muſt bee taken forth, and the skin which was drawn more violently to cover the *Glans*, is to bee let go back again; for ſo it will com to paſſ that a whole part of the skin may cover the cut-yard, and ſo it may bee the more ſpeedily united, and the urine may naturally flow out. I have by this means oft-times taken forth the ſtone with the inſtruments heer delineated.

When the yard may bee ſafely cut.

Inſtruments fit to take the ſtone forth of the opened Urethra, or urinarie paſſage of the yard.



The ſtone being taken out, a ſmall pipe muſt bee put into the wound, and there kept for ſom ſpace after [illegible] to be delivered; then his knees muſt be bound together, for thus the wound [illegible] cure muſt bee performed by reducing [illegible] of the child's age, and [illegible] of the childe in cure.

General rules muſt bee reduced to particular bodies.

An agglutinative medicine.

Then for the agglutination, if need require, it will bee requisite to seal up the lips of the wound, and applie this agglutinative medicine following. *R. trad. arma. Zifil. glut. Zi. sang. draton. & mastic. an. ℈ss. ter. sigillat. Armen. ℈i. ol. ros. q. s. f. ceratum.* Then the whole privy part shall bee covered over with a repercussive medicine made of the white of eggs, with the powder of bole armenick, aloes, *farina volatilis*, and oil of roses. Lastly, if need so require, a wax-candle, or leaden pipe annointed with oil of roses shall bee thrust into the *Urethra*, to hasten the agglutination, and retain the naturall straightness and straightness of the urinarie passage, least peradventure a caruncle grow therein.

How to hasten the agglutination.

CHAP. XLI.

What manner of fashion are to be used when a stone is in a boy's bladder.

Hitherto wee have shewed, by what means it is convenient to draw small stones out of the ureter, bladder and passage of the veins; now will we briefly shew the manner of taking of greater stones out of the bladder, which is performed by incision and iron instruments, and I will deliver the practise thereof first in children, then in men, and lastly in women. First therefore let the Surgeon take the boy (upon whom it is determined the work shall bee performed) under the arm-holes, and so give him five or six shakes, that so the stone may descend the more downwards to the neck of the bladder. Then must one strong man, sitting upon an high seat, take the childe upon his back with his face from him-ward, having his hips lying upon his knees. The childe must lie somwhat high, that he may breathe the freelier, and let not the nervous parts bee too much [illegible] but let them bee loos and free for the drawing forth of the stone. Furthermore it is good that the strong man, the childe's legs being bended back with the childe, that puttings his legs to his navel, that hee draw them up as much as hee can, and let the other bee sure hee keep them so; for this site of the childe much conduceth to well performing of the work. Then let the Surgeon thrust two of the fingers of his left hand as far into the childe's fundament as hee is able; but let him with his other hand prese the lower bellie, first wrapping a cloth about his hand, that so the compression may bee the less troublesom, and least inflammation should happen rather by this meanes then by the incision. Now the compression hath this use, to caus the stone to descend out of the bottom of the bladder into the neck thereof under the *os pubis*, whither after it is arrived, it must bee there kept, and as it were governed by the command of your hand, least it should slide from that place whereto you have brought it. These things thus don, nothing now remaineth, but that the Surgeon, with a sharp knife two fingers breadth distant from the fundament, cut through all the flesh even to the stone on the left side of the *Perineum*. But in the *interim*, let him beware that hee sure not the *intestinum rectum*, for it may, and usually doth happen, that when the stone is brought out of the bottom of the bladder to the neck thereof, this gut is doubled in; now if it bee cut with your incision-knife, it cometh to pas that the excrements may sometimes com out at the wound, and the urine by the fundament, which thing hath in manie hindred the agglutination and consolidation of the wounds; yet in som others it hath don little harm, because in this tender age manie things happen, which may seem to exceed nature; the incision being made, the stone must bee plucked forth with the instrument heer expressed.

Where to divide the *perinæum*.

Nature verie powerful in children.

Hooks to pull stones forth of children's bladders.

The stone being drawn out, a small pipe shall bee put into the wound, and there kept for som space after, for reasons hereafter to bee delivered; then his knees shall bee bound together, for thus the wound will the sooner close and bee agglutinated. The residue of the cure shall bee performed by reducing the general cure of wounds, to the particular temper of the childe's age, and the peculiar nature of the childe in cure.

General rules must bee reduced to particular bodies.

CHAP. XLII.

How to cut men, for the taking out of the stone in the bladder.

SEeing wee cannot otherwise help such men as have stones in their bladders, wee must com to the extreme remedie, to wit, cutting. But the patient must first bee purged, and if the case require, draw som blood; yet must you not immediately after this, or the day following hasten to the work: for the patient cannot but bee weakned by purgeing and bleeding. Also it is expedient for som dales before to foment the privities with such things as relax and soften, that by their yeelding, the stone may the more easily bee extracted. Now the cure is thus to bee performed: The patient shall bee placed upon a firm table or bench with a cloth manie times doubled under his buttocks, and a pillow under his loins and back, so that hee may lie half upright with his thighs lifted up, and his legs and heels drawn back to his buttocks. Then shall his feet bee bound with a ligature of three fingers breadth cast about his ankles, and with the heads thereof beeing drawn upwards to his neck, and cast about it, and so brought downwards, both his hands shall bee bound to his knees, as the following figure sheweth.

What to bee don before dissection.

How to lay the patient.

The figure of a man lying readie to bee cut for the stone.

The patient thus bound, it is fit you have four strong men at hand; that is, two to hold his arms, and other two who may so firmly and straightly hold the knee with one hand, and the foot with the other, that hee may neither moov his limbs, nor stir his buttocks, but bee forced to keep in the same posture with his whole bodie. Then the Surgeon shall thrust into the urenarie passage even to the bladder, a silver or iron and hollow *probe*, anointed with oil, and opened or slit on the out-side, that the point of the knife may enter therein, and that it may guide the hand of the workman, and keep the knife from piercing anie farther into the bodies lying there-under. The figure of this *probe* is heer expreft.

Why the *probe* must bee slit on the out-side.

Probes with slits in their ends.

Hee shall gently wrest the *probe*, beeing so thrust in, towards the left side, and also hee who standeth on the patiene's right hand, shall with his left hand gently lift up his cods, that so in the free and open space of the left side of the *perinæum* the Surgeon may have the more libertie to make the incision upon the *probe*, which is thrust in and turned that way. But in making this incision, the Surgeon must bee careful that hee hurt not the seam of the *perinæum* and fundament. For if that seam bee cut, it will not bee easily consolidated, for that it is callous and bloodless, therefore the urine would continually drop forth this way. But if the wound bee made to near the funcment, there is danger, least by forcible plucking forth of the stone hee may break som of the hemorrhoid veins, whence a bleeding may ensue, which is scarce to bee stopped by anie means, or that hee may rend the sphincter

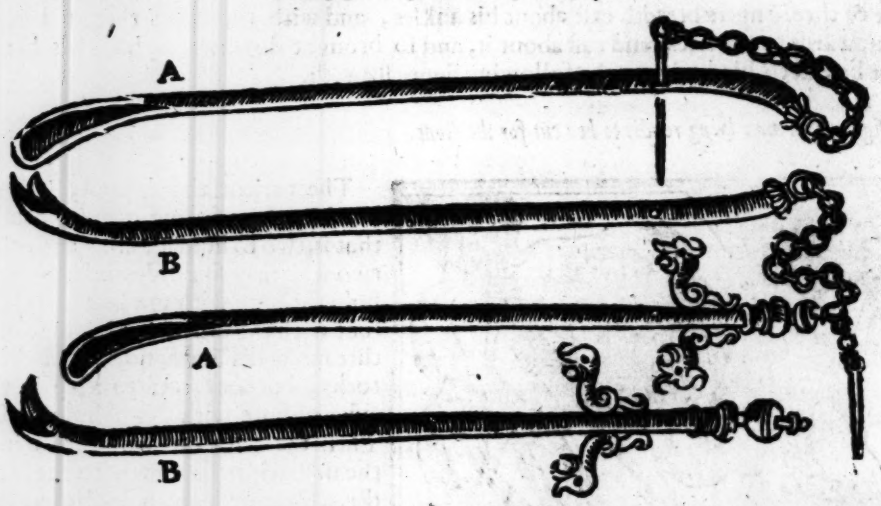
Why the seam of the *perinæum* must not bee cut.

Where to make the wound to take forth the ſtone.

That which is torn is ſooner healed then that which is cut.

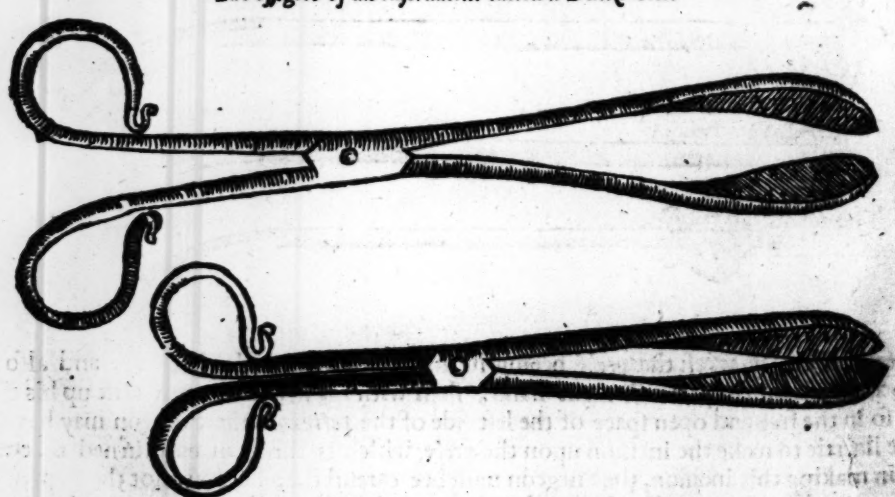
muſcle, or bodie of the bladder, ſo that it can never bee repaired. Therefore it muſt bee made the ſpace of two fingers from the fundament, according to the ſtraightneſs of the fibres, that ſo it may bee the more eaſily reſtored afterwards. Neither muſt the inciſion thus made, exceed the bigneſs of ones thumb, for that it is afterwards enlarged by putting in the Crow's beak and the dilater, but more by the ſtone as it is plucked forth. But that which is cut, is neither ſo ſpeedily nor eaſily healed up, as that which is torn. Then preſently put into the wound ſom one of theſe ſilver inſtruments delineated heer below, and called by the name of *Guiders*, for that they ſerv as guides to the other inſtruments which are to bee put into the bladder; theſe are made with a round and prominent head, whereby it may bee put into the deſcribed cavitie of the *probe*, and they are noted by theſe letters, A.A. then there are others marked with the letters, B.B. and called by the like name, and are to bee put under the former, beeing made forked at the end, that ſo it may, as it were, embrace the end of the former.

The figures of Guiders of two ſorts.



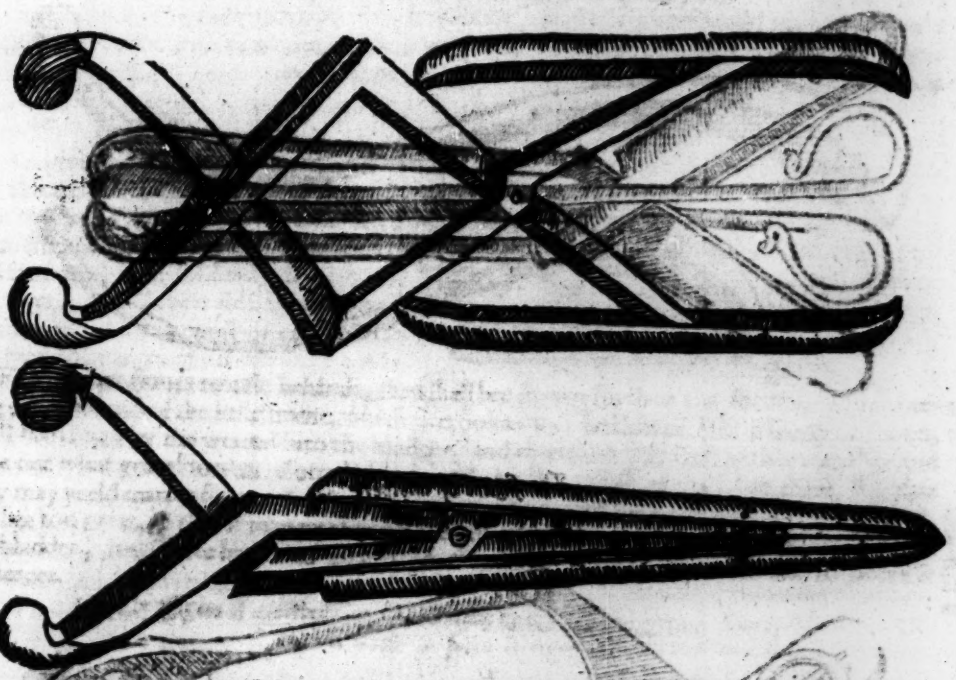
Now the *probe* is to bee drawn forth, and the guiders to bee thruſt and turned up and down in the bladder, and at length to bee ſtaied there by putting in the pin; yet ſuch guiders as want a pin are fitter for the hand, and are by ſom called *ſpathæ*. Then muſt they bee held betwixt the Surgeon's fingers. It will bee alſo neceſſarie for the Surgeon to put another inſtrument called the Duckſ-bill between the two guiders into the capacitie of the bladder; hee muſt thruſt it in ſomwhat violently, and dilate it ſo thruſt in with both his hands, turning it everie way to enlarge the wound as much as ſhall bee ſufficient for the admitting the other inſtruments which are to bee put into the bladder; yet it is far better for the patient, if that the wound may with this one inſtrument bee ſufficiently dilated, and the ſtone pulled forth with the ſame without the help of anie other.

The effigies of an inſtrument called a Ducks-bill.



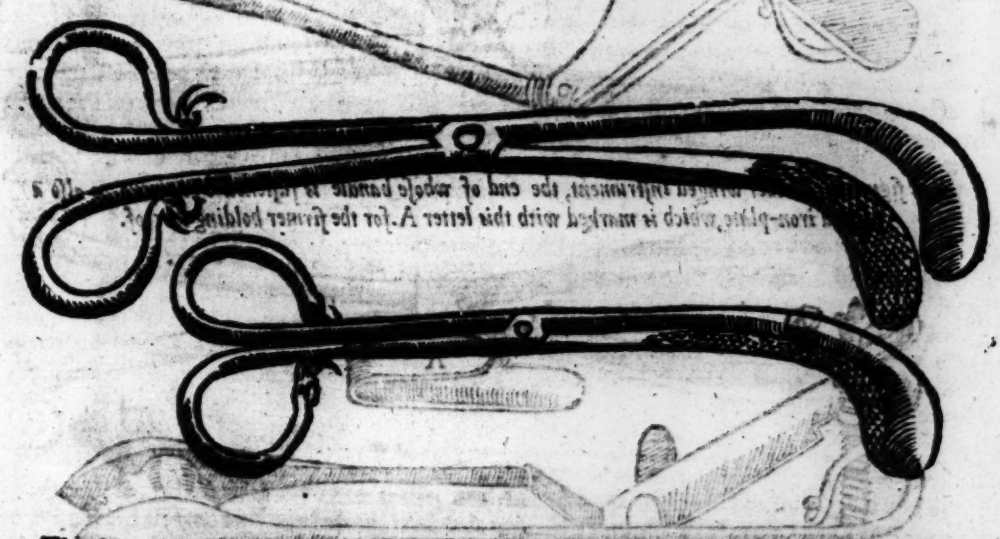
Which if you have not in a readineſs, and the largeneſs of the ſtone require more dilatation, then muſt you put in this dilater; for beeing put into the bladder, and the handle preſſed together, it will dilate the inciſion as much as you deſire.

The figure of a Dilator shut and opened.



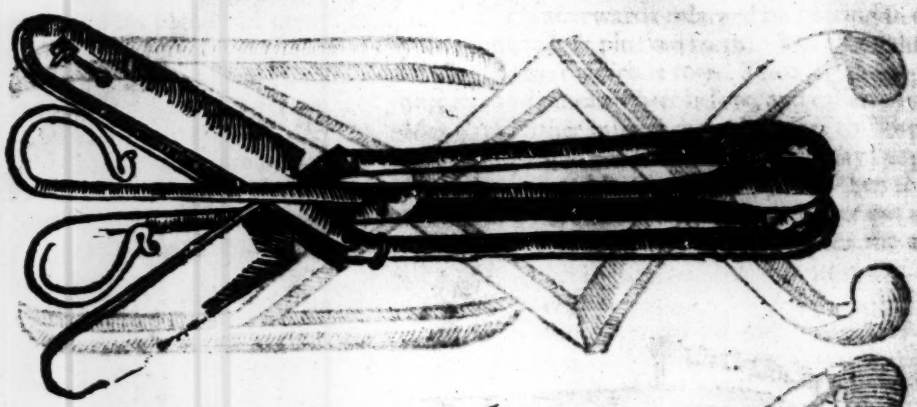
The wound by the help of this instrument being dilated as much as is sufficient, then put in the straight Ducks-bill before described, or the crooked here expreſt.

Crooked Forcipes *like a Ducks-bill.*

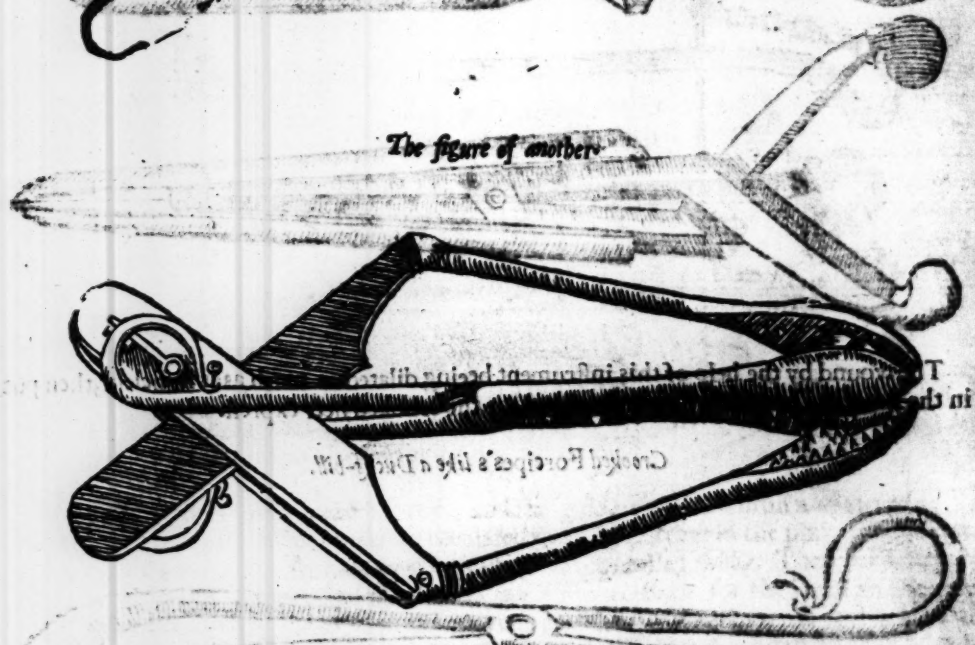


The stone may bee sought and taken hold of with these instruments, and beeing taken hold on, the branches of the instrument shall bee tied together, least they should suffer that to slide away which they have once taken hold of. Neither shall the stone bee suddenly plucked out, but easily shaken to and again, and at length gently drawn forth. Yet you must beware that you do not presse it too straightly in the *forceps*, least you should break it in pieces: Som, least it should slip away, when they have once taken hold thereof, put their two fingers into the fundament, and put them above the stone that it may not fall out, nor slip back again, which I think conduceth much to the easie extraction of the stone. There are others who strengthen this comprehension by putting in on each side above and below these winged instruments, so that the stone can slip forth on no side.

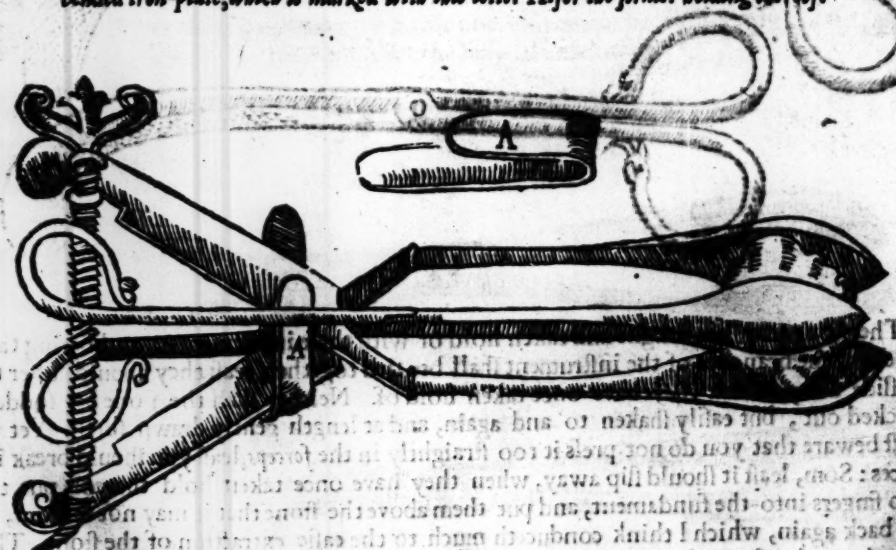
Winged instruments to hold the stone with the Duck's-beak.



The figure of another.



The figure of another winged instrument, the end of whose handle is fastened by a screw, as also a bended iron-plate, which is marked with this letter A. *for the firmer holding thereof.*



A note of more stones then one.

After the stone is by these means drawn forth, observ diligently whether it bee worn on anie side, and as it were levigated; for that happeneth by the wearing or rubbing of one or more stones upon it; yet there is no surer way to know this, then by searching with a *Catheter*. The one end of the following instrument may supplie the want of a *Catheter* or probe, and the other may serv for a scoop or cleanser.

A cleanser

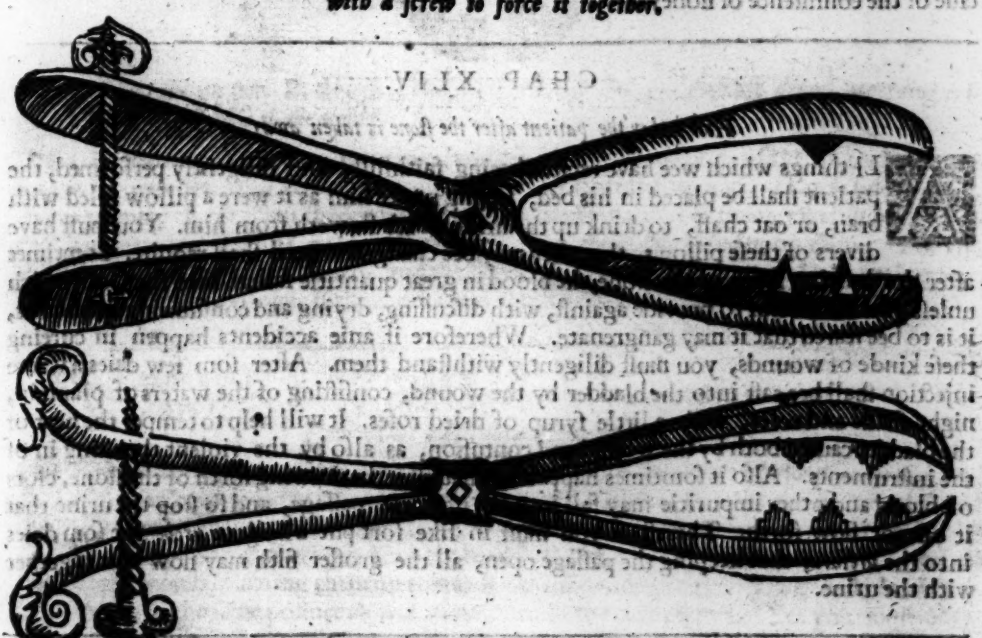
A cleanser or scoop whereby you may search whether there bee anie more stones behinde, as also cleanse or purge the bladder from gravel, clots of blood, and other such bodies, as use to remain behinde after the drawing forth of the stone.

For if other stones remain behinde, they shall bee drawn forth as the former, which being don, the end of the instrument, which is crooked and hollowed like a scoop or spoon, shall bee thrust by the wound into the bladder, and therwith you shall gather together and take out what gravel soever, clotted blood, and the like refuse as shall bee there, for that they may yeeld matter for another stone. But if you finde that the stone which is in the bladder bee too great, so that it may not bee plucked forth without great and fearful rending of the bladder, it will bee better to take hold thereof with this Crowe bill and so break it to peeces.

How to cleanse the bladder.

How to break a stone that cannot bee taken out whole and at once.

The effigies of a toothed Crow's-bill made meatly to break greater stones, with a screw to force it together.



Remedies for the Cod, least it gangrenate.

This Crows-bill hath onely three teeth, and those sharp ones on the inside, of which two are placed above, and one below, which is the middle-most, so that it falleth between the two upper. When the stone is broken, all the peeces thereof must bee taken forth, and wee must have a special care, left any peece thereof be hid; for that in time, increased by the access of a tough and viscerous matter, or conjoined with other fragments by the interposition of the like matter as glew, may rise to a stone of a large bignesse.

What things ballan the urine.

CHAP. XLIII.

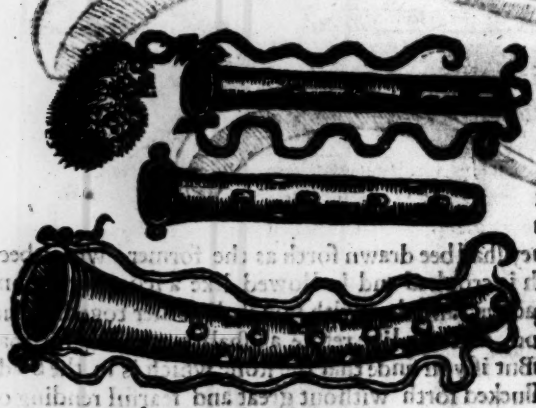
What cure must bee used to the wound, when the stone is taken forth.

THe stone beeing drawn out, if the greatnesse of the wound so require, it shall have one or two stitches with a needle and thred, leaving onely so much space as shall bee sufficient to put in a pipe for the use wee shall hereafter shew; your thred must bee of crimson silk waxed, and let it not bee too small, least it by bindeing should cut asunder the fleshie lips of the wound, or rot in a short time, either by the moisture of the urine, or matter flowing from the ulcer. Therefore you shall

Of sewing the wound when the stone is taken forth.

ſhall take up much fleſh with the skin in ſewing it, leaſt the lips of the wound beeing torn, your labor proov in vain, and ſo you are forced to trouble the patient with makeing a new one. Things beeing thus performed, a ſilver pipe ſhall bee put through the wound into the bladder, whereof I have here given you divers forms, that you may take your choice, & ſo fit them to the wounds, and not the wounds to them, which oft-times in want of inſtruments the Surgeons are forced to do, to the great harm of the patient.

Silver pipes to bee put into the bladder when the ſtone is drawn out.



Theſe muſt have no holes in their ſides (as thoſe here expreſſed) but onely in their ends, that all the matter of the wound, and the filth gathered and concrete in the bladder may flow and bee carried forth this way. When cleer urine ſhall begin to flow out of the wound, there ſhall bee no more need of a pipe; therefore if you continue it and keep it longer in the wound, there is ſom danger leaſt nature accuſtomed to that way, may afterwards neglect to ſend the water through the *Urethra*, or urinarie paſſage.

A repercuſſive medicine.

Neither muſt you forget to defend the parts near to the wound with the following repercuſſive medicine, to hinder the defluxion and inflammation, which are incident by reaſon of the pain. R. *album ovorum nu.* iii. *pul. boli armeni, ſanguinis dracon. an.* ℥iii. *olei roſ.* ℥i. *pilorum leporinorum quantum ſufficit*, make a medicine of the conſiſtence of honey.

CHAP. XLIV.

How to lay the patient after the ſtone is taken away.

ALl things which wee have recited beeing faithfully and diligently performed, the patient ſhall be placed in his bed, laying under him as it were a pillow filled with bran, or oat chaff, to drink up the urine which floweth from him. You muſt have divers of theſe pillows, that they may bee changed as need ſhall require.

Remedies for the Cod, leaſt it gangrenate.

Somtimes after the drawing forth of the ſtone, the blood in great quantitie falleth into the Cod, which unleſs you bee careful to provide againſt, with diſcuſſing, drying and conſumeing medicines, it is to bee feared that it may gangrenate. Wherefore if anie accidents happen in cureing theſe kinde of wounds, you muſt diligently withſtand them. After ſom few daies a warm injection ſhall bee caſt into the bladder by the wound, conſiſting of the waters of plantain, night-ſhade and roſes, with a little ſyrup of dried roſes. It will help to temper the heat of the bladder cauſed both by the wound and contuſion, as alſo by the violent thruſting in of the inſtruments. Alſo it ſomtimes happen's, that after the drawing forth of the ſtone, clots of blood and other impuritie may fall into the urinarie paſſage, and ſo ſtop the urine that it cannot flow forth. Therefore you muſt in like ſort put a hollow *probe* for ſom daies into the *urethra*, that keeping the paſſage open, all the groſſer filth may flow out together with the urine.

CHAP. XLV.

How to cure the wound made by the inciſion.

What things haſten the union.

YOu muſt cure this wound after the manner of other bloodie wounds, to wit, by agglutination and cicatrization, the filth, or ſuch things as may hinder, beeing taken away by detergent medicines. The patient ſhall haſten the agglutination if hee lie croſs-legged, & keep a ſlender diet until the ſeventh or ninth day bee paſt. Hee muſt wholly abſtain from wine, unleſs it bee verie weak; in ſtead thereof let him uſe a decoction of barlie and licoriſh, or mead, or water and ſugar, or boiled water mixed with ſyrrups of dried roſes, maidenhair, and the like. Let his meat bee panado, raiſons, ſtewed prunes, chickens boiled with the cold ſeeds, purſlain, ſorrel, borage, ſpinage, and the like. If hee bee bound in his bellie, a Phyſician ſhall bee called, who may help it, by appointing either *Caſſia*, a glyſter, or ſom other kinde of medicine as hee ſhall think good.

CHAP.

CHAP. XLVI.

What cure is to bue used to Ulcers, when as the urine flow's through them, long after the stone is drawn out.

MAnie, after the stone is drawn out, cannot have the ulcer consolidated, therefore the urine flow's out this way continually by little & little, and against the patient's will dureing the rest of his life, unless the Surgeon help it. Therefore the callous lips of the wound must bee amputated, so to make a green wound of an old ulcer; then must they bee tied up, & bound with the instrument wee term a *Retinaculum* or stay; this must bee perforated with three holes, answering to three other on the other side; needles shall bee thrust through these holes, takeing hold of much flesh, and shall bee knit about it, then glutinative medicines shall bee applied, such as are Venice Turpentine, gum *Elemi*, *sanguis draconis*, bole armenick and the like; after five or six daies the needles shall bee taken out, and also the stay taken away. For then you shall finde the wound almost glewed, and there will nothing remain but onely to cicatrize it. How to make a fresh wound of an old ulcer.

The figure of a Retinaculum, *or stay.*

A. *shew's the greater.* B. *the lesser, that you may know that you must use divers according to the different bigness of the wound.*

If a *Retinaculum* or stay bee wanting, you may conjoin the lips of the wound after this following manner. Put two quills somwhat longer then the wound, on each side one, and then presently thrust them through with needles haveing thred in them, takeing hold of the flesh between, as often as need shall require, then tying the thred upon them. For thus the wound shall bee agglutinated, and the fleshie lips of the wound kept from beeing torn, which would bee in danger if the needle and thred were onely used. What to do in want of a stay.

CHAP. XLVII.

How to take stones out of women's bladders.

WEe know by the same signs that the stone is in a woman's bladder as wee do in a man's, yet it is far more easily searched by a *Catheter*, for that the neck of the bladder is the shorter, broader and the more streight. Wherefore it may not onely bee found by a *Catheter* put into the bladder, but also by the fingers thrust into the neck of the womb, turning them up towards the inner side of the *Os pubis*, and placeing the sick woman in the same posture as wee mentioned in the cure of men. Yet you must observ that maids younger then seven yeers old, that are troubled with the stone, cannot bee searched by the neck of the womb, without great violence. Therefore the stone must bee drawn from them by the same means as from boies, to wit. by thrusting the fingers into the fundament; for thus the stone beeing found out, and the lower bellie also pressed with the other hand, it must bee brought to the neck of the bladder, and then drawn forth by the forementioned means. Yet if the riper yeers of the patient permit it to bee don without violence, the whole work shall bee more easily and happily performed, by putting the fingers into the neck of the womb, for that the bladder is nearer the neck of the womb, then it is to the right gut. Wherefore the fingers thus thrust in, a *Catheter* shall bee presently put into the neck of the bladder: This *Catheter* must bee hollow, or slit on the outside like those before described but not crooked, but straight, as you may perceiv by the following figure. How to search for the stone in women.

A Cathe-

A Catheter, *upon which, beeing put into the bladder, the neck thereof may bee cut, to draw out a ſtone from a woman.*

Upon this inſtrument the neck of the bladder may bee cut, and then with the *Dilater* made for the ſame purpoſe, the inciſion ſhall bee dilated as much as need require's; yet with this caution, that ſeeing the neck of a womans bladder is the ſhorter, it admit's not ſo great dilatation as a mans, for otherwiſe there is danger that it may com to the bodie of the bladder, whence an involuntarie ſhedding of the water may enſue and continue thereafter. The inciſion beeing dilated, the Surgeon putting one or two of his fingers into the neck of the womb, ſhall preſs the bottom of the bladder, and then thruſt his crooked inſtruments or *forcipes* in by the wound, and with theſe hee ſhall eaſily pluck out the ſtone, which hee ſhall keep with his fingers from ſlipping back again. Yet *Laurence Collo* the King's Surgeon, and both his ſons (then whom I do not know whether ever there were better cutters for the ſtone) do otherwiſe perform this operation; for they do not thruſt their fingers into the fundament or neck of the womb, but contenting themſelvs with putting in onely the guiders (whereof wee formerly made mention) into the paſſage of the urine, they preſently thereupon make a ſtraight inciſion directly at the mouth of the neck of the bladder, and not on the ſide, as is uſually don in men. Then they gently by the ſame way thruſt the *forcipes* hollowed on the out-ſide formerly delineated, and ſo dilate the wound by tearing it as much as ſhall bee ſufficient for the drawing of the ſtone forth of the bladder. The reſidue of the cure is the ſame with that formerly mentioned in men: yet this is to bee added, that if an ulcer grow in the neck of the bladder by reaſon of the rending it, you may by putting in the *ſpeculum matricis*, dilate the neck of the womb, that fitting remedies may bee applied with the more eaſ.

CHAP. XLVIII.

Of the ſuppreſſion of the Urine by internal cauſes.

In ſuppreſſion of the urine wee muſt not preſently flie to diuretick's.

BEſides the fore-mentioned cauſes of ſuppreſſed urine, or difficultie of making of water, there are manie other, leaſt anie may think that the urine is ſtop't onely by the ſtone or gravel, as Surgeons think, who in this caſe preſently uſe diuretick's. Therefore the urine is ſuppreſt by external and internal cauſes. The internal cauſes are clotted blood, tough phlegm, warts, caruncles bred in the paſſages of the urine, ſtones, and gravel; the urine is ſomtimes ſuppreſt, becauſ the matter thereof, to wit, the ſerous or whayiſh part of the blood, is either conſumed by the feveriſh heat, or carried other waies by ſweats or a ſcouring; ſomtimes alſo the flatulencie there contained, or inflammation ariſing in the parts made for the urine and the neighboring members, ſuppreſſe's the urine. For the right gut, if it bee inflamed, intercept's the paſſage of the urine, either by a tumor whereby it preſſeth upon the bladder, or by the communication of the inflammation. Thus by the default of an ill-affected liver, the urine is oft-times ſuppreſt in ſuch as have the dropſie; or elſ by dulneſs or decay of the attractive, or ſeparative facultie of the reins by ſom great diſtemper, or by the default of the animal-facultie, as in ſuch as are in a phrenſie, lethargie, convulſion, apoplexie. Beſides alſo a tough and viſcid humor falling from the whole bodie into the paſſages of the urine, obſtruct's and ſhut's up the paſſage. Alſo too long holding the water ſomtimes cauſe's this affect. For when the bladder is diſtended above meaſure, the paſſage thereof is drawn together, and made more ſtraight: heerto may bee added, that the too great diſtenſion of the bladder is a hinderance that it cannot uſe the expulſive facultie, and ſtraiten it ſelf about the urine to the excluſion thereof; heerto alſo pain ſucceed's, which preſently deject's all the faculties of the part which it ſeizeth upon. Thus of late a certain young man, riding on horſ-back before his miſtreſs, and therefore not dareing to make water, when hee had great need ſo to do, had his urine ſo ſuppreſt, that returning from his journie home into the citie, hee could by no means poſſible make water. In the mean time hee had grievous pain in the bottom of his bellie and the *perinæum*, with gripeings, and a ſweat all over his bodie, ſo that hee almoſt ſwooned. I beeing called, when I had procured him to make water by putting in an hollow *Catheter*, and preſſing the bottom of his bellie, whereof hee forthwith made two pintes; I told them that it was not occaſioned by the ſtone, which notwithſtanding the ſtanders by imagined to bee the occaſion of that ſuppreſſion of urine.

Why the too long holding the urine cauſeth the ſuppreſſion thereof.

An hiſtorie.

urine. For thence, for ought there appeared no signs of the stone in the youth, neither was hee afterwards troubled with the stopping of his urine.

CHAP. XXXVI.

By what external cause the urine is suppressed: and precepts concerning the suppression thereof.

There are also manie external causes, through whose occasion the urine may be suppressed: such are cold and tempestuous weather, the too long continuance in cold water, the too long sojourning upon the cold ground, and such other like. Moreover the diseases of the Reins, as the Apostem, Ulcer, Stone

Why the ſuppreſſion of the urine becom's deadly.

ſoever cauſ the oppreſſion of the urine proceed's, if it perſevere for ſom daies, death is to bee feared, unleſs either a fever which may conſume the matter of the urine, or a ſcouring or flux, which may divert it, ſhall happen thereupon. For thus by ſtay it acquireth an acrid and venenate qualitie, which flowing by the veins readily infecteth the maſs of blood, and carried to the brain, much moleſt's it by reaſon of that ſimilitude and ſympathie of condicon which the bladder hath with the *Meninges*. But nature, if prevalent, eaſily free'th it ſelf from this danger by a manifeſt evacuation by ſtool, otherwiſe it muſt neceſſarily call as it were to its aid, a feveriſh heat, which may ſend the abounding matter of this ſerous humiditie out through the skin, either by a ſenſible evacuation as by ſweat, becauſ ſweat and urine have one common matter, or elſ diſperſ and breath it out by tranſpiration, which is an inſenſible excretion.

A fever following thereon help's the ſuppreſſion of urine.

CHAP. LI.

Of bloodie Urine.

The differences.

Cauſes.

SOm piſs pure blood, others mix't, and that either with urine, and then that which is expelled reſemble's the waſhing of fleſh newly killed, or elſ with pus or matter, and that either alone or mixed with the urine. There may bee diverſ cauſes of this ſymptom, as the too great quantitie of blood gathered in the bodie, which by the ſuppreſſion of the accuſtomed and periodical evacuation by the courſes or hemorrhoids, now turn's its courſ to the reins and bladder: the fretting aſunder of ſom veſſel by an acrid humor, or the breaking thereof by carrying or lifting of ſom heavie burden, by leaping, falling from high, a great blow, the falling of ſom weight upon the loins, rideing Poſt too violently, the too immoderate uſe of venerie, and laſtly, from anie kinde of painful and more violent exerciſe, by a rough and ſharp ſtone in the kidnies, by the weakneſs of the retentive facultie of the kidnies, by a wound of ſom of the parts belonging to the urine, by the too frequent uſe of diuretick and hot meats and medicines, or elſ of things in their whole nature contrarie to the urinarie parts; for by theſe and the like cauſes, the reins are oft-times ſo inflamed, that they neceſſarily impoſthumate, and at length the impoſthume beeing broken it turn's into an ulcer, caſting forth quiture by the urine.

Signs of what cauſes they proceed.

In ſo great varietie of the cauſes of bloodie urine, wee may gather whence the cauſes of this ſymptom may ariſe, by the depraved action of this, or that part, by the condition of the flowing blood, to wit, pure or mix't, and that either with the urine alone, or with *pus*. For example, if this bloodie matter flow from the lungs, liver, kidnies, diſlocated *Vertebræ*, the ſtraight gut, or other the like part: you may diſcern it by the ſeat of the pain and ſymptoms, as a fever: and the proprietie of the pain, and other things which have preceded, or are yet preſent. And wee may gather the ſame by the plentie and qualitie, for if, for example, the *pus* flow from an ulcer of the arm, the purulent matter will flow by turns, one while by the urine, ſo that little is caſt forth by the ulcer, then preſently, on the contrarie the urine becom's more cleer. That purulent matter which flow's from the lungs by reaſon of an *Empiema*, or from the liver, or any other bowel placed above the midriff, the *pus* which is caſt forth with the urine, is both in greater plentie and more exactly mixed with the urine, then that which flow's from the kidnies and bladder. It neither belong's to our purpoſe, or a Surgeon's office, either to undertake, or deliver the cure of this affect. It ſhall ſuffice onely to note that the cure of this ſymptom is not to bee hoped for ſo long as the cauſ remain's. And if this blood flow by the opening of a veſſel, it ſhall bee ſtaied by aſtringent medicines; if broken, by agglutinative; if corroded or fretted aſunder, by ſarcotick.

Cure.

CHAP. LII.

Of the ſigns of the ulcerated kidnies.

Why the matter which flow's from the kidnies is leſs ſtinking then that which flow's from the bladder.

I Had not determined to follow or particularly handle the cauſes of bloodie urines, yet becauſ that which is occaſioned by the ulcerated reins or bladder more frequently happen's, therefore I have thought good briefly to ſpeak thereof in this place. The ſigns of an ulcer of the reins are, pain in the loins, matter howſoever mix't with the urine, never evacuated by it ſelf, but alwaies flowing forth with the urine, and reſideing in the bottom of the chamber-pot, with a ſanious and red ſediment, and as it were bloodie fibres ſwimming up and down in the urine, the ſmell of [illegible] not ſo great as that which which flow's from the ulcerated bladder, for that the kidnies, ſeeing they are of a fleſhie ſubſtance, do far better ripen and digeſt the purulent matter, then the bladder which is nervous and bloodleſs.

CHAP.

CHAP. LIII.

Of the signs of the ulcerated Bladder.

Differences.

Ulcers are in the bottom of the bladder, and the neck thereof. The signs of an ulcer in the bladder are, a deep pain at the share-bones; the great stench of the matter flowing there-from, white and thin skins swimming up and down in the water. But when the ulcer possesseth the neck of the bladder, the pain is more gentle, neither doth it trouble before the patient com to make water, but in the verie making thereof, and a little while after.

But it is common both to the one and the other, that the yard is extended in making of water, to wit, by reason of the pain caused by the urine fretting of the ulcerated part in the passage by: neither is the matter seen mixed with the urine, as is usual in an ulcer of the upper parts, becaus it is poured forth not together with the urine, but after it.

CHAP. LIV.

Prognosticks of the ulcerated Reins and Bladder.

Why ulcers of the bladder are cured with more difficultie.

Ulcers of the kidnies are more easily and readily healed then those of the bladder; for fleshie parts more speedily heal and knit, then bloodless and nervous parts. Ulcers which are in the bottom of the bladder, are unpleasant, or certainly most difficult to heal; for besides that they are in a bloodless part, they are daily vellicated and exasperated by the continual afflux of the contained urine; for all the urine is never evacuated: now that which remains after making water, becom's more acrid by the distemper and heat of the part, for that the bladder is alwaies gatherd about it, and dilated and straightned according to the quantitie of the contained urine: therefore in the *Ischuria*, that is, the suppression or difficultie of making water, you may sometimes see a quart of water made at once. Those which have their legs fall away, haveing an ulcer in their bladder, are near their deaths. Ulcers arising in these parts, unless they bee consolidated in a short time, remain uncureable.

CHAP. LV.

What cure must bee used in the suppression of the Urine.

Scopes of curing.

In curing the suppression of the urine, the indication must bee taken from the nature of the disease, and cause thereof, if it bee yet present or not: But the diversitie of the parts, by which being hurt, the *Ischuria* happens, intimate a diversitie of medicines, neither must wee presently run to diuretick, and things breaking the stone, which manie Empericks do. For hence grievous and malign symptoms often arise, especially if this suppression proceed from an acrid humor, or blood prest out by a bruise, immoderate repletion, and all more violent exercise, a hot and acrid potion, as of *Cantharides*, by too long abstaining from making water, by a *Phlegmon*, or ulcer of the urinaria parts. For thus the pain and inflammation increased, whence follows a gangrene, and at length death. Wherefore attempt not any thing in this case without the advice of a Physician, no not when you must cure by Surgerie. For diuretick medicines have place in another case, then when the urine is passage is obstructed by a gross and viscid humor, or else in some cold countrie, or in the application of Narcotiks to the loins, although wee must not hee ruse, that before wee have first made use of general medicines, now diuretick may bee administred, as hereafter shall appear.

To what suppression of the urine diuretick must not bee used.

To which, and when to bee used.

Narcotick things to bee applied to the loins.

Re. *agrimon. artic. parietar. saxifrag. rubrar. bebenin. an. m. i. rad. altheæ, marshal. ʒiiß. graminis, hedysar. an. ʒiß. rad. asparagi ʒi. bullient. omnia simul in q. s. aquæ fontanæ, ad ℔ iß. colatur. adde syrup. de althea ℥ß. fiat potus.*

Let the patient take ʒiiß. hereof with ʒi. of sugar candie, and drink [illegible] falling in a morning, three hours before meat. Thistle or scorpion-herbs boyled in white wine, and given the patient to drink, som two hours before meat, are good for the same purpose. Also ʒi. of nettle-seeds made into fine powder, and drunk in chicken-broth, is good for the same purpose. A decoction also of grummel, Goat's-saxifrage, pellitorie of the wall, white saxifrage, the roots of parsley, *asparagus, acorus, bruscus*, and orris drunk in the quantitie of som three or four ounces, is profitable also for the same purpose. Yet this following water is commended above the rest to provoke urine, and open the passages thereof: *Rx. aquæ [illegible] ana ℔ iß. [illegible] ana ʒiß. [illegible] ana ʒiß. [illegible] ana ʒi

biſmal.an. p.ii. *berul.cicer. rub.an.* p.i. *ſem. melon. citrul.an.* ℥ii.ß. *alkekengi, gra.*xx. *glycyrriz.*℥.i. *bulliant omnia ſimul ad tertias: in colaturâ infunde per noctem fol. ſen.oriental.*lb.ſ. *fiat iterum parva ebullitio, in expreſſione colatâ infunde cinam. electi.*℥vi. *colentur; iterum colatura injiciatur in alembicum vitreum, poſtea tereb.venet.lucid.*lb.ii. *aq.vitæ* ℥vi. *agitentur omnia ſimul diligentiſſimè. Lutetur alembicum luto ſapientiæ, fiat diſtillatio lento igne in balneo mariæ.* Uſe it after the following manner: R. *aq. ſtillatitiæ præcipitæ* ℥ii. *aut* iii. According to the operation which it ſhall perform, let the patient take it four hours before meat. Alſo radiſh-water diſtilled in *balneo mariæ* is given in the quantitie of ℥iiii. with ſugar, and that with good ſucceſs. Baths and *ſemicupia*, or half baths are artificially made, relax, ſoften, dilate, and open all the body; therefore the preſcribed diuretick mixed with half a dram of treacle, may bee fitly given at the going forth of the bath. Theſe medicines following are judged fit to cleanſe the ulcers of the kidnies and bladder. Syrup of maiden-hair, of roſes, taken in the quantitie of ℥i. with *hydromel*, or barlie-water: Aſſe's or Goat's-milk are alſo much commended in this affect, becauſe they cleanſe the ulcers by their ſerous or wheyiſh portion, and agglutinate by their cheeſe-like. They muſt bee taken warm from the dug, with honie of roſes, or a little ſalt, leaſt they corrupt in the ſtomach; and that to the quantitie of four ounces, drinking or eating nothing preſently upon it. The following Trochiſces are alſo good for the ſame purpoſe. R. *quatuor ſem.frigid.major. ſeminis papaveris albi, portulac, plantag.cydon,myrtil, gum. tragacanth. & arab.pinear. glycyrrhi.mund.bordei mund.macag.piſtil, amygdal.dulcium, an.*℥.i. *boli armen. ſanguin.dracon. ſpodii, roſar. maſtich.terræ, ſigil myrrhæ, an.*℥ii. *cum oxymelite, conficiatur ſecundum artem trochiſci.* Let the patient take ℥ß. diſſolved in whay, piſan, barlie-water, and the like; they may alſo bee profitably diſſolved in plantain-water, and injected into the bladder. Let the patient abſtain from wine, and inſtead thereof let him uſe barlie-water, or *hydromel*, or a piſan made of an ounce of raiſins of the Sun, ſtoned and boiled in five pintes of fair water, in an earthen pipkin well leaded, or in a glaſs, until one pinte bee conſumed, adding thereto of liquorice ſcraped and beaten ℥i. of the cold ſeeds likewiſe beaten two drams. Let it, after it hath boiled a little more, bee ſtrained through an hyppocras bag, with a quartern of ſugar, and two drams of choice cinnamon added thereto, and ſo let it bee kept for uſual drink.

Why the uſe of diureticks is better after bathing.

To cleanſe the ulcers of the kidnies and bladder.

Trochiſces to heal the ulcers of the kidnies.

Drink inſtead of wine.

CHAP. LVI.

Of the Diabete, *or inabilitie to hold the Urine.*

What *Diabete* is.

THe *Diabete* is a diſeaſe, wherein preſently after one hath drunk, the urine is preſently made in great plentie, by the diſſolution of the retentive facultie of the reins, and the depravation or immoderation of the attractive facultie. The external cauſes are the unſeaſonable and immoderate uſe of hot and diuretick things, and all more violent and vehement exerciſes. The internal cauſe is the inflammation of the liver, lungs, ſpleen, but eſpecially of the kidnies and bladder. This affect muſt bee diligently diſtinguiſhed from the excretion of the morbifick cauſes by urine.

The cauſes.

Signs.

The loins in this diſeaſe are moleſted with a pricking and biting pain, and there is a continual and unquenchable thirſt: and although this diſeaſe proceed from a hot diſtemper, yet the urine is not colored, red, troubled, or thick, but thin and white or wateriſh, by reaſon the matter thereof make's verie ſmall ſtay in the ſtomach, liver, and hollow veins, being preſently drawn away by the heat of the kidnies or bladder. If the affect longendure, the patient for want of nouriſhment falleth away, whence certain death enſue's. For the cure of ſo great a diſeaſe, the matter muſt bee purged, which cauſe's bee ſeal's the inflammation or *phlegmon*, and conſequently blood muſt bee let. We muſt abſtain from ſour cold ſeeds, for although they may profit by their firſt qualitie, yet will they hurt by their diuretick facultie. Refrigerating and aſtringent nouriſhments muſt bee uſed, and ſuch as generate groſs humors; as rice, thick and aſtringent wine mixed with much water. Exceeding cold, yea narcotick things muſt bee applied to the loins, for otherwiſe by reaſon of the thickneſs of the muſcles of thoſe parts, the force, unleſs of exceeding refrigerating things, will not bee able to arrive at the reins; of this kinde are oil of white poppie, henbane, *opium*, purſlain, and lettuce-ſeed, mandrage, vinegar, and the like; of which, cataplaſms, plaſters and ointments, may bee made fit to corroborate the parts, and correct the heat.

Why the urines are wateriſh.

The cure.

Narcotick things to bee applied to the loins.

CHAP. LVII.

Of the Stranguria.

What the Strangurie is.

THe Stranguria is an affect having ſome affinitie with the *Diabete*, in that wherein the water is involuntarily made, but not together as in once, it is by drops, continually and with pain. The external cauſes of a ſtranguria are, the too abundant drinking of cold

The cauſes.

water, and all too long ſtay in a cold place. The internal cauſes are, the defluxion of cold humors into the urinarie parts; for hence they are reſolved by a certain palſie, and the *ſphincter* of the bladder is relaxed, ſo that hee cannot hold his water according to his deſire: inflammation alſo and all diſtemper cauſeth this affect, and whatſoever in ſom ſort obſtruct's the paſſage of the urine; as clotted blood, thick phlegm, gravel, and the like. And becauſ, according to *Galen's* opinion, all ſorts of diſtemper may cauſ this diſeaſ, diverſ medicines ſhall bee appointed according to the difference of the diſtemper. Therefore againſt a cold diſtemper fomentations ſhall bee provided of a decoction of mallows, roſes, *origanum*, calamint, and the like, and ſo applied to the privities: then preſently after, let them bee anointed with oil of bays, and of *Caſtoreum*, and the like. Strong and pure wine ſhall bee preſcribed for his drink, and that not opely in this cauſ, but alſo when the ſtrangurie happen's by the occaſion of obſtruction, cauſed by a groſs and cold humor, if ſo bee that the bodie bee not plethorick. But if inflammation, together with a *Plethora* or fulneſs, hath cauſſed this affect, wee may, according to *Galen's* advice, heal it by blood-letting. But if obſtruction bee in fault, that ſhall bee taken away by diureticks either hot or cold, according to the condition of the matter obſtructing. Wee heer omit to ſpeak of the *Dyſuria*, or difficultie of makeing water, becauſ the remedies are in general the ſame with thoſe which are uſed in the *Iſchuria*, or ſuppreſſion of urine.

Com. ad aphor. 15. ſect. 3.

Ad aphor. 48. ſect. 7.

CHAP. LVIII.

Of the Colick.

WHenſoever the guts beeing obſtructed, or otherwiſe affected, the excrements are hindred from paſſing forth, and if the fault bee in the ſmall guts, the affect is termed *Volvulus*, *Ileos*, and *Miſerere mei*; but if it bee in the greater guts, it is called the Colick, from the part affected, which is the *Colon*, that is, the continuitie of the greater guts; but eſpecially that portion of the greater guts, which is properly and eſpecially named *Colon*, or the Colick-gut. Therefore *Avicen* rightly define's the Colick, A pain of the guts, wherein the excrements are difficultly evacuated by the fundament. *Paulus Æginet.* reduceth all the cauſes of the Colick, how various ſoever, to four heads: to wit, to the groſneſs, or toughneſs of the humors impact in the coats of the guts: flatulencies hindred from paſſage forth: the inflammation of the guts: and laſtly, the collection of acrid and biteing humors. Now wee will treat of each of theſe in particular. Almoſt the ſame cauſes produce the groſneſs of humors, and flatulencies in the guts, to wit, the uſe of flatulent and phlegmatick, tough and viſcid meats, yea alſo of ſuch as are of good nouriſhment, if ſundrie thereof, and of ſundrie kindes bee eaten at the ſame meal, and in greater quantitie then is fit. For hence cruditie and obſtruction, and at length the collection of flatulencies, whereon a tenſive pain enſue's. This kinde of Colick is alſo cauſed by the uſe of crude fruits, and too cold drink, drunken eſpecially when anie is too hot by exerciſe, or anie other way: for thus the ſtomach and the guts continued thereto, are refrigerated, and the humors and excrements therein contained are congealed, and, as it were, bound up. The Colick which is cauſed by the inflammation of the kidnies, happen's by the ſympathie of the reins pained or troubled with the ſtone or gravel contained in them or the ureters. Therefore then alſo pain trouble's the patient at his hips and loins, becauſ the nerve, which ariſing from the *vertebræ* of the loins, are oppreſſed by the weight of the ſtones and gravel, about the joint of the hip are diſſeminated into the muſcles of the loins and thigh. Alſo the ureters are pained (for they ſeem nothing elſ but certain hollow nerves) and alſo the cremaſter muſcles, ſo that the patient's teſticles may ſeem to bee drawn upwards with much violence. Hence great, phlegmatick, and cholerick vomiting, and ſweat of the whole bodie, all which do not ſurceaſ before that the ſtone, or gravel ſhall bee forced down into the bladder. Now vomiting happen's in this affect, for that the ventricle, by reaſon of its continuitie and neighborhood which it hath with the guts, ſuffer's by conſent or ſympathie. For the ſtomach is of the ſame kinde or matter as the guts are, ſo that the guts ſeem nothing elſ but a certain production of the ſtomach. Therefore if at anie time nature endeavor to expel anie thing that is troubleſom in the kidnies, ureters, coats of the guts, meſenterie, *pancreas*, and hypochondries, it cauſeth a Colick with pain and vomiting. An hot and drie diſtemper alſo cauſeth the Colick, producing a pricking and biteing pain, by drying the excrements ſhut up in the guts, as alſo by waſting as it were the radical humors of that place provided for the lubricateing of the guts. Acrid, viſcid, and tough phlegm cauſeth the ſame. There is alſo another cauſ of the Colick which is not ſo common, to wit, the twineing of the guts, that is, when they are ſo twined, folded, and doubled, that the excrements, as it were, bound in their knots, cannot bee expelled, as it manifeſtly happen's in the rupture called *Enterocele*, by the falling of the guts into the cod. Likewiſe alſo worms generated in the Colick-gut, whil'ſt that they mutually fold or twine

What *Ileus*, or *iliaca paſſio* is.

What *Colica paſſio*, or the Colick is.

themselvs up, do also twine the *Colon* it self, and fold it with them. Also the too long stay of the excrements in the guts, whether it shall happen by the peculiar default of the too hot and drie bodie of the patient, or by his diet, that is, the use of too drie meats, or exercises and pains taken in the heat of the sun, or by the greatness of business, the minde being carried away, causeth the colick, with head-ach, and plentie of vapors flying upwards.

An historie. I remember I once dissected the bodie of a boy of som twelv years old, who had his guts folded with manie as it were ties or knots of the restrained, too hard and drie excrements, the which hee cast out by his mouth a little before his death, which brought him to his end, beeing not helped in time by fitting medicines. Now these are the causes of the colick, according to the opinion of the ancient and modern Physicians, of whose signs I judg it noe amiss heer to treat in particular. You shall know the patient is troubled with the stone-colick, by the pain which is fixed, and as it were kept in one place, to wit, of the kidnies; by his former manner of life, as if the patient hath formerly voided stones or gravel together with his urine; by the pain of the hips and testicles for the formerly mentioned causes, and lastly, by that the patient cast's forth by stone or urine, for that the great and laborious endevor of nature to cast forth the stone which is in the kidnies, is propagated by a certain sympathie, and like studie of the neighboring parts, stirring up the expulsive faculties each to his work.

Signs whereby wee know that the colick proceed's from this or that caus.

The signs of a flatulent colick are, a tensive pain, such as if the guts were rent or torn in pieces, together with a noise or rumbling in the bellie. The force of the shut-up winde is somtimes so great, that it rendeth or teareth the guts in sunder, no otherwise then a swine's bladder too hard blown up. Which when it happen's, the patient die's with much vomiting, becaus the stomack oppress with winde, can contain nor imbrace no meat. The colick whith is occasioned by the too long keeping in of the excrements, is accompanied with the weight and pain of the bellie, the tension of the guts, head-ach, apparent hardness of the bellie, and the complaint of the patient that hee hath not been to stool in a long time. That which proceed's from a cholerick inflammation, yeelds a feel of great heat and pulsation in the midst of the bellie, by reason of the veins and arteries which are in the *pancreas* and coats of the guts, and there are the other signs of a *Phlegmon*, although also this as it were inflammation may arise also from salt, acrid and viscous phlegm, which nature can neither expel upwards by vomit, nor downwards by stool; this sundrie times is associated with a difficultie of makeing water, for that when as the right gut is inflamed, the bladder is pressed by reason of their societie or neighborhood. The collick which proceed's from the contorsion of the guts, shew's it self by the excessive crueltie of the pain arising, for that the guts are not in their due site and place, and becaus the excrements by their too long detension acquire a preternatural heat; and this is the caus of the death of manie such as have ruptures, for that the gut falling down from the natural place into the cod, beeing a preternatural place, is redoubled, and kept there as it were bound, whereby the excrements beeing baked, becoming more acridly hot, caus inflammation, and by raising up flatulencies, increas the distension through all the guts, until at length a deadly *Ileus* or colick arising, they com forth at the mouth. For prognosticks; it is better to have the pain in the colick to wander up and down, then to bee fixed: it is good also that the excrements are not wholly suppress. But the evil signs that are heer pronounce the affect either difficult or deadly. Now these shew that it is deadlie, intolerable tormenting pain, continual vomiting, cold sweat, coldness of the extreme parts, hicketing by reason of the sympathie the stomack hath with the guts, a phrensie by the consent of the brain with the stomach, and oft-times a convulsion, by drawing the matter into the nerys. But such as have gripeing and pain about their navil and loins, which can neither bee helped by medicine nor otherwise, it end's in a dropsie.

Aviten. li. 3. Hip. aphor. 10. sect. 4.

The cure. The cure must bee diversified according to the varietie of the causes, for the stone-collick is cured by medicines proper to the stone; that which is caused by an *Enterocele*, is cured by the onely restoreing the gut to its place; that which is occasioned by worms, require's medicines fit to kill and cast forth the worms. But that which proceed's from the weakness and refrigeration of the guts and stomack, is cured by heating and strengthening medicines as well applied outwardly, as taken in inwardly by the mouth, or otherwaies. The beginning of the cure of that which is occasioned by tough phlegm and flatulencies, is by the mitigation of the pain, seeing there is nothing which more deject's the powers then pain. To this purpose shall you provide baths, *Semicupia*, fomentations of mallows, marsh-mallows, violet leavs, penie-royal, fennel, *Origanum*, the seeds of time and fenugreek, flowers of camomil, melilote, and other such like, which have power to heat, drie, attenuate, and rarifie the skin, so to dissipate the winde. But all such must bee actually hot. Also the bellie may bee anointed with this following ointment. ℞. *olei chamam. aneth. butyr. recent. an.* ℥i. *sem. apii, petros. & galang. an.* ℥ß. *aq. vitæ, ol. salviæ aut thymi chimicè extract. q. s.* The following liniment is much commended by *Hollerius*: ℞. *olei rut. & nardi, an.* ℥vi. *galbani cum aq. vit. dissoluti* ℥ii. *liquefactis simul adde zibetæ* gr. iiii. *croci*, gr. vi. *fiat linimentum.* Also little bags made with millet, oats and salt fried with a little white wine in a frying-pan, shall bee applied hot upon the bellie and flanks, and renewed before they grow cold. You may, in stead of these bags, use ox-bladders half filled with a decoction of resolving

Baths and anodine fomentations.

An ointment.

things;

things; as salt, rosemarie, time, lavander, bay-berries, and the like: then inject a glyster beeing thus made. R. *quatuor remol. an.* m.i. *orig. puleg. calamenth. an.* m.ß. *anisi, carui an.* m.ß. *flor. aneth. an.* p.i. *bulliant in hydromele ad* ℔.i. *in quâ dissolve bened. laxat. mellis anthosati, succ rub. an.* ℥i. *olei aneth. & chamem. an.* ℥iß. Let a glyster bee made to bee injected at twice; for the guts beeing stretched out cannot contain the accustomed *dosis* of a glyster: Also this following glyster is much approoved. R. *vini malvat. & olei nucum, an.* ℥iii. *aqua vitæ,* ℥i. *olei juniperi, & rut. per quintam essent extract. an.* ℥iii. Let this bee injected as hot as the patient can endure. I have oft-times as by miracle helped intolerable pain caused by the winde-collick and phlegm with this glyster. *Avicen* prescribe's a carminative glyster made of hyssop, *origanum, acorus,* anis-seeds, and English galengal. Let the patient feed upon meats of good juice and easie digestion, as broths made with the yolks of eggs, saffron, hot herbs and a nutmeg; let him drink good wine, as Muskedine, or hypocras made with good wine so to heat the stomach and guts. For in *Galen's* opinion, all windinesse is generated by a remiss heat. But if the pain shall continue, a large cupping-glass shall bee applied to the navel, to draw and dissipate the windinesse; the bellie shall bee bound with strong and broad ligatures, to strengthen the guts, and discuss the matter of flatulencies. The patients taught by nature, use this remedie, whil'st none admonishing them, they press the bellie with their hands in the bitternes of pain. But if the pain cannot bee thus appeased, wee must com to such medicines as work by an occult propertie, as the dried gut of a Wolf, for a dram thereof made into powder it given in wine with good success. That colick which is caused by a cholerick inflammation require's contrarie medicines, to wit, blood-letting, and a refrigerateing diet; potions made of *Diacatholicon* and *Cassia* dissolved in barlie-water, also cooling glysters. *Avicen* prescribe's narcoticks, for that beeing cold, they are contrarie to the morbifick caus which is hot and drie; such are pills of *Philonium.* Also pills of *Hyera picra* in the quantitie of ℥iv. with *opium* and saffron, of each one grain, may bee used. Also baths are appointed, made of water wherein mallows, marsh-mallows, violet-leavs, flowers of white lilies, lettuce, purslain have been boiled, to correct the acrimonie of the cholerick and hot humors, whence the disease and symptom ariseth. That colick which is like to this, and proceed's from salt, acrid, thick and tough phlegm, is cured, the humor beeing first attenuated and diffused, and at length evacuated by medicines taken by the mouth and otherwise, according to the prescription of the learned Physician. But *Avicen* cure's that which is occasioned by the suppression of the hardened excrements, and twineing of them by meats which have an emollient facultie, such as humecting broths, as that which is made of an old cock tired with running, and threshed to death, and so boiled with dill, polypodie, and a little salt, until the flesh fall from the bones; also hee useth detergent glysters, such as this which follow's. R. *betæ,* m.i. *furfuris,* p.i. *ficus,* nu.x. *alth. m.i. fiat decoctio ad* ℔.i. *in quâ dissolve nitri & muriæ an.* ℥ii. *succ.* ℥i. *ol. sesamini,* ℥ii. But if the obstruction bee more contumacious, you must use more powerful ones made *ex cyclamin. centaurio, & hiera diacolocinth. ad* ʒli. But if the obstruction do notwithstanding remain, so that the excrements com forth at the mouth, *Marianus Sanctus* wisheth (by the counsel of manie who have so free'd themselvs from this deadlie symptom) to drink three pounds of quick-silver with water onely. For the doubled, and as it twined up-gut is unfolded by the weight of the quick-silver, and the excrements are depresst and thrust forth, and the worms are killed which gave occasion to this affect. *John* of S. *Germans,* that most worthie Apothecarie, hath told mee that hee saw a Gentleman, who when as hee could not bee free'd from the pain of the colick by anie means prescribed by learned Physicians, at length by the counsel of a certain German his friend, drank three ounces of oil of sweet almonds drawn without fire, and mixed with som white wine and pellitorie-water, and swallowed a leaden bullet besmeared with quick-silver, and that bullet coming presently out by his fundament, hee was wholly free'd from his colick.

Why glysters in the collick must bee given in less quantitie.

CHAP. LIX.

Of Phlebotomie, or Blood-letting.

What Phlebotomie is.

The use.

Repletion two-fold.

The signs.

PHlebotomie is the opening of a vein, evacuating the blood with the rest of the humors; thus Arteritomie, is the opening of an arterie. The first scope of phlebotomie is the evacuation of the blood offending in quantitie, although oft-times the Physician's intention is to draw forth the blood which offend's in qualitie, or either way by opening a vein. Repletion, which is caused by the quantitie, is two-fold; the one *ad vires,* that is, to the strength, the veins beeing otherwise not verie much swelled; this make's men infirm and weak, nature not able to bear his humor, of what kinde soever it bee. The other is termed *ad vasa,* that is, to the vessels, the which is so called comparatively to the plentie of blood, although the strength may verie well away therewith. The vessels are oft-times broke by this kinde of repletion, so that the patient cast's and spit's up blood, or elf evacuate's it by the nose, womb, hemorrhoids, or *varices.* The repletion which is *ad vires,* is known by the heavines and weari-

ſomneſs of the whole bodie; but that which is *ad vaſa*, is perceived by their diſtenſion and fulneſs, both of them ſtand in need of evacuation. But blood is onely to bee let by opening a vein, for five reſpects: the firſt is to leſſen the abundance of blood, as in phletorick bodies, and thoſe who are troubled with inflammation without anie plenitude. The ſecond is for diverſion, or revulſion, as when a vein of the right is opened to ſtay the bleeding of the left noſtril. The third is, to allure or draw down: as when the *ſaphena* is opened in the ankle, to draw down the courſes in women. The fourth is for alteration or introduction of another qualitie; as when in ſharp fevers wee open a vein to breath out that blood which is heated in the veſſels, and cooling the reſidue which remain's behinde. The fifth, is to prevent imminent diſeaſes; as when in the Spring and Autumn wee draw blood by opening a vein in ſuch as are ſubject to ſpitting of blood, the ſquinancie, plurifie, falling-ſickneſs, apoplexie, madneſs, gout, or in ſuch as are wounded, for to prevent the inflammation which is to bee feared. Before blood-letting, if there bee anie old excrements in the guts, they ſhall bee evacuated by a gentle glyſter, or ſuppoſitorie, leaſt the meſaraïck veins ſhould thence draw unto them anie impuritie. Bloud muſt not bee drawn from ancient people, unleſs ſom preſent neceſſitie require it, leaſt the native heat, which is but languid in them, ſhould bee brought to extreme debilitie, and their ſubſtance decay; neither muſt anie in like ſort bee taken from children, for fear of reſolving their powers by reaſon of the tenderneſs of their ſubſtance, and rareneſs of their habit. The quantitie of blood which is to bee let, muſt bee conſidered by the ſtrength of the patient, and greatneſs of the diſeaſ: therefore if the patient bee weak, and the diſeaſ require large evacuation, it will bee convenient to part the letting of blood, yea by the interpoſition of ſom daies. The vein of the forehead beeing opened is good for the pain of the hind part of the head; yet firſt wee foment the part with warm water, that ſo the skin may bee ſofter, and the blood drawn into the veins in greater plentie. In the ſquinancie, the veins which are under the tongue muſt bee opened aſſant, without putting anie ligatures about the neck, for fear of ſtrangling. Phlebotomie is neceſſarie in all diſeaſes which ſtop or hinder the breathing, or take away the voice or ſpeech, as likewiſe in all contuſions by a heavie ſtroke, or fall from high, in an apoplexie, ſquinancie, and burning fever, though the ſtrength bee not great, nor the blood faultie in quantitie or qualitie, blood muſt not bee let in the height of a fever. Moſt judg it fit to draw blood from the veins moſt remote from the affected and inflamed part, for that thus the courſ of the humors may bee diverted, the next veins on the contrarie beeing opened, the humors may bee the more drawn into the affected part, and ſo increaſ the burden and pain. But this opinion of theirs is verie erroneous, for an opened vein alwaies evacuate's and burden's the next part. For I have ſundrie times opened the veins and arteries of the affected part, as of the hands and feet in the Gout of theſe parts; of the temples in the Megrim: whereupon the pain alwaies was ſomwhat aſſwaged, for that together with the evacuated blood, the malignitie of the Gout, and the hot ſpirits (the cauſers of the Head-ach or Megrim) were evacuated. For thus *Galen* wiſheth to open the arteries of the temples in a great and contumacious defluxion falling upon the eies, or in the Megrim, or Head-ach.

Five ſcopes in letting blood.

From whence wee muſt not draw blood.

When and for what it is neceſſarie.

13. *meth. cap. ult.*

CHAP. LX.

How to open a vein, or draw blood from thence.

How to place the patient.

THe firſt thing is, to ſeat or place the patient in as good a poſture as you can, to wit, in his bed, if hee bee weak; but in a chair, if ſtrong; yet ſo, that the light may fall directly upon the vein which you intend to open. Then the Surgeon ſhall rub the arm with his hand, or a warm linnen cloth, that the blood may flow the more plentifully into the vein. Then hee ſhall binde the vein with a ligature a little above the place appointed to bee opened, and hee ſhall draw back the blood upwards towards the ligature from the lower part; and if it bee the right arm, hee ſhall take hold thereof with his left hand; but if the left, then with his right hand, preſſing the vein in the mean time with his thumb a little below the place where you mean to open it, leaſt it ſhould ſlip away; and that it may bee the more ſwoln by forcing up the blood. Then with his nail hee ſhall mark or deſign the place to bee opened, and ſhall anoint it, beeing ſo marked, with butter or oil, whereby the skin may bee relaxed, and the lancet enter more eaſily, and therefore the ſection may bee the leſs painful. Hee ſhall hold his lancet between his thumb and fore-finger, neither too near, nor too far from the point; hee ſhall reſt his other three fingers upon the patient's arm, that ſo his hand may bee the more ſteddie, and leſs trembling. Then ſhall hee open the vein with an inciſion agreeable to the magnitude of the veſſel, and the indifferent thickneſs of the contained blood, ſomwhat aſſant, diligently avoiding the arterie which lie's under the *Baſilica*, and the nerv, or tendon of the two-headed muſcle, which lie's under the Median vein. But for the Cephalick, it may bee opened without danger. As much blood as is ſufficient beeing drawn, according to the minde of the Phyſician, hee ſhall looſ the ligature, and laying a little bolſter under

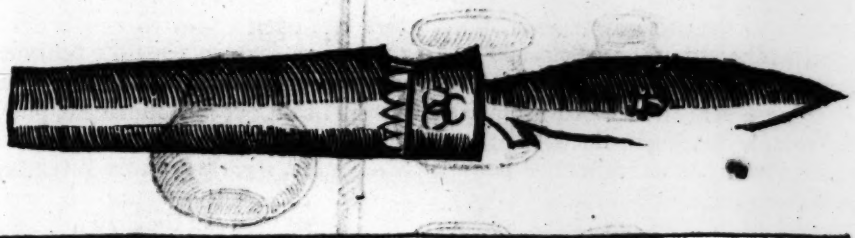
Rubbing the arm.

Bindeing it before wee open the vein.

Why the *Baſilica* and Median may not bee opened ſo ſafely as the Cephalick.

under, hee ſhall with a ligature binde up the wounded part to ſtay the bleeding, the ligature ſhall bee neither too ſtraight, nor looſe, but ſo that the patient may freely bend and extend his arm; wherefore whil'ſt that is in doing, hee muſt not hold his arm ſtraight out, but gently bended, otherwiſe hee cannot freely bend it. The bindeing up after blood-letting.

The figure of a Lancet to let blood withall.



CHAP. LXI.

Of Cupping-glaſſes, or Ventoſes.

The uſe of Cupping-glaſſes.

Cupping-glaſſes are applied eſpecially when the matter conjunct and impact in anie part is to bee evacuated, and then chiefly there is place for ſcarification after the Cupping-glaſſes: yet they are alſo applied for revulſion and diverſion; for when an humor continually flow's down into the eies, they may bee applied to the ſhoulders with a great flame, for ſo they draw more ſtrongly and effectually. They are alſo applied under women's breaſts, for to ſtop the courſes flowing too immoderately, but to their thighs, for to provoke them. They are alſo applied to ſuch as are bit by venemous beaſts, as alſo to parts poſſeſſed by a peſtiferous *Bubo* or Carbuncle, ſo to draw the poiſon from within outwards. For (as *Celſus* ſaith) a Cupping-glaſs where it is faſtned on, if the skin bee firſt ſcarified, draw's forth blood; but if it bee whole, then it draw's ſpirit. Alſo they are applied to the bellie, when anie groſs or thick windineſs ſhut up in the guts, or membranes of the muſcles of the *Epigaſtrium*, or lower bellie cauſing the colick, is to bee diſcuſſed. Alſo they are faſtned to the *Hypocondrie's*, when as flatulencie in the liver, or ſpleen, ſwell's up the entrail lying there-under, or in too great a bleeding at the noſe. Alſo they are ſet againſt the reins in the bottom of the bellie, whereas the ureters run down to draw down the ſtone into the bladder, when as it ſtop's in the middle or entrance of the ureter. You ſhall make choice of greater and leſſer Cupping-glaſſes, according to the condition of the part, and the contained matter. But to thoſe parts whereto theſe cannot by reaſon of their greatneſs bee applied, you may fit horns for the ſame purpoſe. *Lib.8 cap.1.*

The

The figures of Cupping-glaſſes of different bigneſs, with little holes in their bottoms, which ſhall bee ſtopped with wax, when you apply them to the part; but opened when you would take them off, that ſo the air may enter in with the more eaſ.

A Lancet.

Horns which without fire, by onely sucking at the upper hole, draw from the part lying under them.

CHAP. LXII.

Of Leeches, and their use.

The use of Leeches.

IN those parts of the bodie whereto Cupping-glasses and horns cannot bee applied, to those Leeches may for the most part bee put, as to the fundament, to open the coat of the hemorrhoid veins, to the mouth of the womb, the gums, lips, nose, fingers. After the Leech, beeing filled with blood, shall fall off, if the disease require a large evacuation of blood, and the part affected may endure it, Cupping-glasses, or Horns, or other Leeches shall bee substituted. If the Leeches bee handled with the bare hand, they are angred, and becom so stomachful, as that they will not bite; wherefore you shall hold them in a white and clean linnen cloth, and applie them to the skin, beeing first lightly scarified, or belmeared with the blood of som other creature; for thus they will take hold of the flesh, together with the skin more greedily and fully. To cause them fall off, you shall put som powder of aloes, salt or ashes upon their heads. If anie desire to know how much blood they have drawn, let him sprinkle them with salt made into powder, as soon as they are com off; for thus they will vomit up what blood soever they have sucked. If you desire they should suck more blood then they are able to contain, cut off their tails as they suck, for thus they will make no end of sucking, for that it run's out as they suck it. The Leeches, by sucking, draw the blood not onely from the affected part whereto they are applied, but also from the adjacent and distant parts. Also somtimes the part bleeds a good while after the Leeches bee fallen away, which happen's not by scarification after the application of Cupping-glasses or Horns. If you cannot stop the bleeding after the falling away of the Leeches, then prese the half of a bean upon the wound, until it stick of it self, for thus it will stay; also a burnt rag may bee fitly applied with a bolster and fit ligature.

How to applie them.

How to cause them to fall off.

The end of the seventeenth Book.

Of the GOUT.

The eighteenth Book.

CHAP. I.

The deſcription of the Gout.

What it is.

THe Gout is a diſeaſ occupying and harming the ſubſtance of the Joints by the falling down and collection of a virulent matter accompanied by four humors. This word *Arthritis* or Gout, is general for everie joint ſo affected; yet it enjoie's diverſ particular names in ſundrie joints of the bodie: as that which falleth upon the joint of the Jaw, is termed *Siagonagra*, for that the Greeks call the Jaw *Siagon*; that which affect's the neck is termed *Trachelagra*, for that the neck is termed *Trachelos*: that which trouble's the back-bone is called *Rhaciſagra*, for the ſpine is termed *Rhacis*: that which moleſt's the ſhoulders *Omagra*, for the joint of the ſhoulder is called *Omos*: that which affect's the joint of the Collar-bones *Cleiſagra*, for that the Greeks call this bone *Cleis*: that in the Elbow, *Pechyagra*, for *Pechys* ſignifieth the elbow: the gout in the hand is called *Chiragra*, in the Hip *Iſchias*, in the knee *Gonagra*, in the feet *Podagra*, for that the Hand, Hip, Knee, and Foot are in Greek termed, *Cheir*, *Iſchion*, *Gony*, and *Pous*. When as there is great abundance of humors in a bodie, and the patient lead's a ſedentarie life, not ſom one, but all the joints of the bodie are at once troubled with the Gout.

Particular Gouts.

CHAP. II.

Of the occult cauſes of the Gout.

THe humor cauſing the Gout is not of a more known, or eaſily expreſt nature then that which cauſeth the plague, *Lues venerea*, or falling ſickneſs. For it is of a kinde and nature clean different from that which cauſ a *Phlegmon*, *œdema*, *eryſipelas*, or *Scirrhus*; for, as *Aëtius* ſaith, it never cometh to ſuppuration like other humors, not for that, as I think, becauſ it happen's in bloodleſs parts, but through the occaſion of ſom occult malignitie. Hereto may bee added that the humors which cauſ the fore-mentioned tumors, when as they fall down upon anie part, not then truly when they are turned into *pus* or matter, do they cauſ ſo ſharp pains as that which cauſeth the Gout, for the pain thereof is far more ſharp, then of that humor which cauſeth an ulcerated *Cancer*. Beſides theſe humors, when they fall upon the joints through anie other occaſion, never turn into knots, onely that which cauſeth the Gout in the joints, after it hath fallen thither, is at length hardned into a certain knottie and as it were plaſter-like ſubſtance to bee amended by no remedies. But ſeeing it offend's not the parts by which it flow's down, (no more then the matter which creeping upwards from the lower parts to the brain, cauſeth the *Epilepſie*) as ſoon as it falleth into the ſpaces of the Joints it cauſeth cruel pain, one while with heat, another while with cold. For you may ſee ſom troubled with the Gout, who complain that their pained joints are burn't; there are others to whom they ſeem colder then anie ice, ſo that they cannot bee ſufficiently heated to their heart's deſire; verily you may ſomtimes ſee in the ſame bodie troubled with the Gout, that the Joints of the right ſide will as it were burn with heat, but on the left ſide will bee ſtiff with cold; or which is more, the knee in the ſame ſide to bee tormented with a hot diſtemper, and the ancle troubled with a cold. Laſtly, there ſomtimes happen's a ſucceſſion of pain in a ſucceſſion of daies, as the ſame joints will bee this day troubled with a hot, to morrow with a cold diſtemper, ſo that wee need not marvel to ſee Phyſicians preſcribe one while hot, another while cold medicines againſt the ſame diſeaſ of the ſame part and bodie. Alſo it ſomtimes happen's that the malignitie of this humor doth not onely not yeeld to medicines, but it is rather made worſ, ſo that the patients affirm that they are far better when they have none, then when they have anie remedies applied. For all things beeing rightly don, and according to reaſon, yet the diſeaſ will com again at certain ſeaſons by fits; and hereupon it is ſaid by *Horace*:

Lib. 1 a. cap. 12.

The reſemblance of the Gout to the Epilepſie.

The ſtrange varietie of the Gout.

Qui cupit, aut metuit, juvat illum ſic domus aut res,
Ut lippum pictæ tabulæ, fomenta podagram.
Riches the covetous, and fearful ſo do pleaſ,
As pictures ſore eies, Bathes the Gout do eaſ.

Certain-

Certainly such as have this diseas heneditarily, can no more bee helped and throughly free'd therefrom, then those in whom the matter of the diseas is becom knottie, whereof *Ovid* thus speaketh:

Tollere nodosam nescit medicina podagram.
Physick the knottie Gout it cannot heal.

These reasons have induced manie to belive that the essence of this diseas is unknown, for there is a certain occult and inexplicable virulencie, the autor of so great malignitie and contumacie. Which *Avicen* seem's to acknowledg, when hee write's that there is a certain kinde of Gout whose matter is so acute and malign, that if it at anie time bee augmented by the force of anger, it may suffice to kill the partie by sudden death. Therefore *Galen* himself write's that Treacle must bee used in all Arthritical and goutie affects, and as I think, for no other reason, then for that it drie's, wast's and weaken's the malignitie thereof. *Gordonius* is of the same opinion, but addeth withall, that the bodie must bee prepared and purged before wee use Treacle. Therefore the matter of the Gout is a thin and virulent humor, yet not contagious, offending in qualitie rather then quantitie, causing extreme pains, and therefore ingendering the humors together with the calighnous and flatulent spirits prepared or readie for defluxion upon the affected parts. Therefore as the bitings of Aspes, and stinging of Wasps cause cruel pain with sudden swelling and blistering, which is by the heat of the humors which the poison hath tainted, and not by the simple solution of continuitie, seeing that wee daily see Shoo-makers and Tailors pricking their flesh with awles and needles without having anie such symptom's. So the virulencie of the goute causeth intolerable tormenting pain, not by the abundance, becaus it happen's to manie who have the gout, no sign of defluxion appearing in the joints, but onely by a malign and inexplicable qualitie, by reason whereof these pains do not cease unless abated by the help of medicines, or nature, or both. The recital of the following histories will give much light to that inexplicable and virulent malignitie of the matter causing the Gout. Whil'st King Charls the ninth of happie memorie, was at Burdeaux, there was brought to *Chappellain* and *Castellan* the King's Physicians, and *Tate* a Physician of Burdeaux, *Nicolas Lambert* and my self Surgeons, a certain Gentlewoman fom fortie yeers old, exceedingly troubled for manie yeers by reason of a tumor scarce equalling the bignes of a pease, on the outside of the joint of the left Hip: one of her tormenting fits took her in my presence; shee presently began to crie and roar, and rashly and violently to throw her bodie this way and that way, with motions and gestures above a woman's, yea a man's nature. For shee thrust her head between her legs, laid her feet upon her shoulders, you would have said shee had been possessed of the Divel. This fit held her som quarter of an hour; dureing all which time I heedfully observed whether the grieved part swelled anie bigger then it was accustomed, whether there happened anie new inflammation; but there was no alteration as far as I could gather by sight or feeling, but onely that shee cried out more loudly when as I touched it. The fit passed, a great heat took her, all her bodie ran down with swear, with so great wearines and weakness of all her members, that shee could not so much as stir her little finger. There could bee no suspicion of an Epilepsick, for this woman all the time of her agonie did perfectly make use of all her senses, did speak, discourse, and had no convulsion. Neither did shee spare anie cost or diligence, whereby shee might bee cured of her diseas by the help of Physicians or famous Surgeons; shee consulted also with witches, wizzards and charmers, so that shee had left nothing unattempted, but all are was exceeded by the greatness of the diseas. When I had shewed all these things at our consultation, wee all with one consent were of this opinion, to applie a potential Cauterie to the grieved part, or the tumor. I my self applied it: after the fall of the Eschar verie black and virulent matter flowed out, which free'd the woman of her pain and diseas for ever after. Whence you may gather, that the cause of so great evil was a certain venenate malignitie, hurting rather by an inexplicable qualitie, then quantitie, which being overcom and evacuated by the Cauterie, all pain absolutely ceased. Upon the like occasion, but on the right arm, the wife of the Queen's Coach-man at Amboise consulted *Chappellain*, *Castellan* and mee, earnestly craveing ease of her pain, for shee was so grievously tormented by it, that through impatience, being careless of her self, shee endeavored to cast her self headlong out of her chamber window, for fear whereof shee had a guard put upon her. Wee judged that the like mother was to be assaulted with the like weapon, neither were wee deceived, for using a potential Cauterie, this had like succes as the former. Wherefore the bitternes of the pain of the goût is not occationed by the onely weakness of the joints; for thus the pain should bee continual, and alwaies like it self; neither is it from the distemper of a simple humor, for no such thing happen's in other tumors of what kinde soever they bee of; but it proceed's from a venenate, malign, occult and inexplicable qualitie of the matter; wherefore this diseas stand's in need of a diligent Physician and a painful Surgeon.

CHAP. III.

Of the manifeſt cauſes of the Gout.

The firſt primitive cauſ of the Gout.

ALthough theſe things may bee true which wee have delivered of the occult cauſ of the Gout, yet there bee and are vulgarly aſſigned others, of which a probable reaſon may bee rendred, wherein this malignitie, whereof wee have ſpoken, lie's hid and is ſeated. Therefore as of manie other diſeaſes, ſo alſo of the Gout there are aſſigned three cauſes; that is, the primitive, antecedent, and conjunct: the primitive is twofold, one drawn from their firſt original and their mother's womb, which happen's to ſuch as are generated of Goutie parents, chiefly if whil'ſt they were conceived, this goutie matter did actually abound and fall upon the joints. For the ſeed fall's from all the parts of the bodie, as ſaith *Hippocrates*, and *Ariſtotle* affirm's *lib. de gen. animal.* Yet this cauſe's not an inevitable neceſſitie of haveing the Gout, for as manie begot of ſound and healthful parents are taken by the Gout by their proper and primarie default; ſo manie live free from this diſeaſ, whoſe Fathers notwithſtanding were troubled therewith. It is probable that they have this benefit and priviledg by the goodneſs of their Mother's ſeed, and the laudable temper of the womb; whereof the one by the mixture and the other by the gentle heat, may amend and correct the faults of the paternal ſeed; for otherwiſe the diſeaſ would becom hereditarie, and goutie perſons would neceſſarily generate gouties; for the ſeed followeth the temper and complexion of the partie generateing, as it is ſhewed by *Avicen.* Another primitive cauſ is from inordinate diet, eſpecially in the uſe of meat, drink, exerciſe and Venerie. Laſtly, by unprofitable humors which are generated and heaped up in the bodie, which in proceſs of time acquire a virulent malignitie; for theſe fill the head with vapors raiſed up from them, whence the membranes, nervs and tendons, and conſequently the joints becom more lax and weak. They offend in feeding who eat much meat, and that of ſundrie kindes at the ſame meal, who drink ſtrong wine without anie mixture, who ſleep preſently after meat, and which uſe not moderate exerciſes; for hence a plenitude, an obſtruction of the veſſels, cruditites, and the encreaſ of excrements, eſpecially ſerous. Which if they flow down unto the joints, without doubt they cauſ this diſeaſ; for the joints are weak either by nature or accident in compariſon of the other parts of the bodie: by nature, as if they be looſ & ſoft from their firſt original: by accident, as by a blow, fall, hard travelling, runing in the ſun by day, in the cold by night, racking, too frequent Venerie, eſpecially ſuddenly afeer meat; for thus the heat is diſſolved by reaſon of the diſſipation of the ſpirits cauſed in the effuſion of ſeed, whence manie crude humors, which by an unſeaſonable motion are ſent into the ſinews and joints. Through this occaſion old men, becauſ their native heat is the more weak, are commonly troubled with the Gout. Beſides alſo the ſuppreſſion of excrements accuſtomed to bee avoided at certain times, as the courſes, hemorhoids, vomit, ſcouring, cauſeth this diſeaſ. Hence it is, that in the opinion of *Hippocrates*, A woman is not troubled with the Gout, unleſs her courſes fail her. They are in the ſame caſe who have old and runing ulcers ſuddenly healed, or *varices* cut and healed, unleſs by a ſtrict courſ of diet they hinder the generation and encreaſ of accuſtomed excrements. Alſo thoſe which recover of great and long diſeaſes, unleſs they bee fully and perfectly purged, either by nature or art, theſe humors falling into the joints, wch are the reliques of the diſeaſ, make them to becom goutie: and thus much for the primitive cauſ.

Lib. de aere, loc. & aqua.

Lib. 1. cap. 17.

Lib. 3. ſeu. 22. tract. 2. cap. 5.

Another primitive cauſ of the Gout.

Aph. 19. Sect. 9.

The antecedent cauſ of the Gout.

The internal or antecedent cauſ is, the abundance of humors, the largeneſs of the veſſels and paſſages which run to the joints, the ſtrength of the amandating bowels, the looſneſs, ſoftneſs and imbecilitie of the receiving jonits.

The conjunct.

The Conjunct cauſ is the humor it ſelf impact and ſhut up in the capacities and cavities of the joints. Now the unprofitable humor, on everie ſide ſent down by the ſtrength of the expulſive faculti, ſooner linger's about the joints, for that they are of a cold nature and denſ, ſo that once impact in that place, it cannot bee eaſily digeſted and reſolved. This humor then cauſeth pain by reaſon of diſtention or ſolution of continuitie, diſtemper, and beſides the virulencie and malignitie which it acquire's. But it favor's of the nature ſomtimes of one, ſomtimes of more humors; whence the Gout is either phlegmonous, or eryſipilatous, edematous, or mix't. The concourſ of flatulencies, together with the flowing down humors, and as it were tumult by the hinderance of tranſpiration, encreaſeth the dolorifick diſtention in the membranes, tendons, ligaments and other bodies wherein the joint conſiſt's.

Five cauſes of the pain of the Gout.

CHAP. IV.

Out of what part the matter of the Gout may flow down upon the joints.

What and how the matter of the gout com's down from the brain.

THe matter of the Gout cometh for the moſt part from the liver, or brain; that which deſcend's from the brain is phlegmatick, ſerous, thin and clear, ſuch as uſually drop's out of the noſe, endued with a malign and venenate qualitie. Now it paſſeth out by the muſcu-

muſculous skin and *pericranium*, as alſo through that large hole by which the ſpinal marrow, the brain's ſubſtitute, is propagated into the ſpine, by the coats and tendons of the nervs into the ſpaces of the joints, and it is commonly cold. That which proceed's from the liver is diffuſed by the great vein and arteries filled and puffed up, and participate's of the nature of the four humors, of which the maſs of the blood conſiſt's, more frequently accompanied with an hot diſtemper, together with a goutie malignitie. Beſides this manner of the Gout, which is cauſſed by defluxion, there is another which is by congeſtion; as, when the too weak digeſtive facultie of the joints cannot aſſimilate the juices ſent to them. Gout by congeſtion.

CHAP. V.

The ſigns of the Arthritick humor flowing from the brain.

WHen the defluxion is at hand, there is an heavineſs of the head, a deſire to reſt, and a dulneſs with the pain of the outer parts, then chiefly perceptible, when the hairs are turned up, or backwards; moreover, the muſculous skin of the head is puffed up as ſwoln with a certain œdematous tumor; the patients ſeem to bee much different from themſelvs by reaſon of the functions of the minde hurt by the malignitie of the humor, from whence the natural faculties are not free; as the crudities of the ſtomach, and the frequent and acrid belchings may teſtifie.

CHAP. VI.

The ſigns of a goutie humor, proceeding from the liver.

THe right Hypocondrie is hot in ſuch goutie perſons, yea the inner parts are much heated by the bowel; blood and choler carrie the ſway, the veins are large and ſwoln, a defluxion ſuddenly fall's down, eſpecially if there bee a greater quantitie of choler then of other humors in the maſs of the blood. But if, as it often fall's out, the whole blood, by means of crudities degenerate into phlegm and a whayiſh humor; then will it com to paſs, that the Gout alſo, which proceed's from the liver, may bee pituitous or phlegmatick, and participate of the nature of an *anaſarca*, like that which proceed's from the brain. As if the ſame maſs of blood decline towards melancholie, the Gout which thence ariſeth, reſemble's the nature of a *ſcirrhus*; yet that can ſcarce happen, that melancholie by reaſon of the thickneſs and ſlowneſs to motion may fall upon the joints. Yet notwithſtanding, becauſe wee ſpeak of that which may bee of theſe, it will not bee unprofitable briefly to diſtinguiſh the ſigns of each humor, and the differences of Gouts to bee deduced from thence. When the Gout, which proceed's from the default of the liver, aſſimilate's the nature of an *œdema*. Why the Gout ſeldom proceed's from melancholie.

CHAP. VII.

By what ſigns wee may underſtand this or that humor to accompanie the goutie malignitie.

YOu may give a gueſs hereat by the patient's age, temper, ſeaſon of the year, condition of the countrie where hee live's, his diet and condition of life, the increaſe of the pain in the morning, noon, evening or night, by the proprietie of the bearing, pricking, ſharp or dull pain; by numneſs, as in a melancholie gout or itching; as in that which is cauſſed by tough phlegm, by the ſenſible appearance of the part in ſhape and color (as for example ſake in a phlegmatick Gout, the color of the affected part is verie little changed from its ſelf and the neighboring well parts, in a ſanguine Gout it look's red, in a cholerick it is fierie or pale, in a melancholie livid or blackiſh) by the heat and bigneſs which is greater in a ſanguine and phlegmatick then in the reſt, by the change: and laſtly, by things helping and hurting. And there bee ſom, who for the knowledg of theſe differences, with us to view the patient's urine, and feel their puls, and conſider theſe excrements, which in each particular nature are accuſtomed to abound or flow, and are now ſuddenly and unacuſtomarily ſuppreſt. For hence may bee taken the ſigns of the dominion of this or that humor. But a more ample knowledg of theſe things may bee drawn from the humors predominant in each perſon, and the ſigns of tumors formerly delivered. Onely this is to bee noted by the way, that the Gout which is cauſſed by melancholie, is rare to bee found.

CHAP. VIII.

Prognoſticks in the Gout.

BY the writeings of Phyſicians the pains of the Gout are accounted amongſt the moſt grievous and acute; ſo that through vehemencie of pain manie are almoſt mad, and wiſh themſelvs dead. They have certain periods and fits, according to the matter and condition of the humor wherin this malign and inexplicable goutie virulencie reſide's. Yet they more frequently invade in the Spring and Autumn; ſuch as have it hereditarie are ſcarce ever throughly free therfrom, as neither ſuch as have it knottie: for in the former it was born with them, and implanted, and as it were fixed in the original of life; but in the other, the matter is becom plaſter-like, ſo that it can neither bee reſolved nor ripened. That which proceed's from a cold and pituitous matter, cauſſeth not ſuch cruel tormenting pain, as that which is of an hot, ſanguine or choleric cauſ, neither is it ſo ſpeedily healed, for that the hot and thin matter is more eaſily diſſolved; therfore commonly it ceaſeth not until fortie daies bee paſt: Beſides alſo, by how much the ſubſtance of the affected part is more denſ, and the expulſive faculcie more weak, by ſo much the pain is more tedious. Hence it is, that thoſe goutie pains which moleſt the knee, heel and huckle-bone, are more contumacious The Gout which proceed's of an hot matter, reſt's not before the fourteenth or twentieth daie. That which is occaſioned by acrid choler, by the bitterneſs of the inflammation and pain cauſſeth a difficultie of breathing, raveing, and ſundrie times a gangrene of the affected part, and laſtly death; and healed, it often leav's a palſie behinde it. Amongſt all the goutie pains, the Sciatica challengeth the prime place, by the greatneſs of the pain and multitude of ſymptoms; it bring's unquietneſs and watching, a fever, diſlocation, perpetual lameneſs, and the decaie of the whole leg, yea and often-times of the whole bodie. Now lameneſs and leanneſs, or decaie of the part are thus occaſioned, for that the decurrent humor forceth the head of the thigh-bone out of the cavitie of the huckle-bone; this beeing forced out preſſeth the muſcles, veins, arteries, and that notable and large nerv which run's along the thigh, even to the furtheſt joints of the toes, and by the waie is diverſly diſperſed over the muſcles of the whole leg: Therfore becauſ the head of the thigh is put out of its place, the patient is forced to halt; becauſ the veſſels and nervs are oppreſſed, the nouriſhment and ſpirits do not freely flow into the parts ther-under, whence proceed's their decaie. Yet it ſundrie times happen's, that the head of the thigh beeing not diſplaced, manie halt becauſ the viſcid humor, which is naturally implanted in that place, and continually flow's thither, both for the nutrition of theſe parts, and the lubrication of the joint for quicker motion, is hardened by heat and idleneſs, and the other unprofitable humors which flow down do there concrete, and ſo intercept the libertie of motion. A groſs and viſcid humor into what joint ſoever it falleth and ſtaieth, doth the ſame. For by concretion it turn's into a plaſter-like nature at or near the joint, poſſeſſing the cavities therof, and it depraveth the figure of the part, makeing it crooked and knotted, which formerly was ſtraight and ſmooth. Furthermore, everie diſtemperature cauſſed by the defluxion of humors, if it ſhall lie long upon anie part, deprave's all the actions, and oft-times wholly aboliſheth them; ſo that there may bee three cauſſes of the leanneſs or decaie of the joint by the Gout, the obſtruction or compreſſion of the veſſels, idleneſs and an hectick diſtemper: but two of lameneſs, diſlocation and the concretion of an adventitious humor impact in the joint. If contrarie to cuſtom and reaſon the pains of the Gout do not go away, or return at their accuſtomed periods, moſt grievous and dangerous diſeaſes theron follow; for the matter accuſtomed to flow down into the joints, if it ſeiz upon the ſubſtance of the liver, cauſſe's a phlegmon; if it ſtaie in the larger veins, a continual fever: if it flow in the membrane inveſting the ribs, a pluriſie; if it betake it ſelf to the guts, and adhere to their coats, the colick, or *Iliaca paſſio*: and to conclude, it produceth divers other ſymptoms, according to the diverſitie of the parts whereto it flow's and abide's. For thus ſundrie that have been troubled with the Gout, becom paralytick, becauſ the matter, which formerly flowed down into the joints, ſtaie's in the ſubſtance and pores of the nerve, and ſo hinder's the ſpirit that it cannot freely in its whole ſubſtance paſs through them: hence therfore com's the reſolution of the part, whereinto the nerv is inſerted. Old men can never bee quite or abſolutely cured of the Gout, for that the maſs of their blood is ſo departed from its primarie and native goodneſs, that it can no more bee reſtored, then dead or ſowred wine. The Gout, which proceed's from a cold cauſ, invadeth ſlowly, and by little and little, and is helped by the uſe of hot things; that which is from an hot matter, quickly ſhew's it ſelf, and is helped by the uſe of cold things. Now, although the Gout more frequently return's in the Spring and Fall, yet it com's in the midſt of winter, the nervs beeing weakned by the exceſs of cold, and the humors preſſed out; otherwhiles in the mid'ſt of Summer, the ſame beeing diffuſed and diſſipated. Laſtly, it com's at anie time or ſeaſon of the year, if thoſe who are ſubject to this diſeaſ feed plenteouſly, and do all things accord-

ing

Thee cauſſes of the lameneſs or decay of the limbs.

How the Gout turn's into the Palſie.

Why the Gout take's one in winter, and the midſt of ſummer.

ing to their own mindes and desire. Those who are troubled with the Gout, feel and perceiv change of weather, storms, rains, showrs, windes, and such like, before they com. A Southerlie constitution of the air, for example, fill's the bodie with humidities, and stir's up the humors that lie quiet in the bodie; and therefore caus'd defluxions upon the weaker parts, such as the joints, both by nature, as being without blood and flesh, as also by accident, for that they a long time have been accustomed to bee so tormented; therefore their pains are increased in a wet season. Manie of these that are troubled with the Gout, desire venerie in the bitterness of their pain, becaus the internal heat wherewith they then are inflamed, doth not dissipate into spirits and air, as the feverish heat doth, but dissolv's, and as it were melt's down the seminal humor, which dissolved, flow's to the genitals, filleth and distend's them. The same thing befall's carriage and running horses, for in these by labor, much heat send's flatulencies to the bottom of the bellie. Yet venerie is verie hurtful to such as are troubled with the Gout, becaus it dissipate's the spirits and native heat, and encreaseth the unnatural heat; whereby it cometh to pass, that the nervous parts are weakned, and the pain exasperated. Rich men, that is, such as feed riotously on varietie of dainties, and in the mean space live idlely and lazily are more frequently and cruelly tormented with the Gout then poor people, who live spareingly and hardly: Wherefore there have been seen not a few of such rich and riotous persons, who haveing spent their estates, have therewith changed their health, together with their fortune and diet, and so have been wholly freed from the Gout.

Why such as have the Gout upon them, do oft-times desire venerie.

Venerie hurtful in the Gout.

CHAP. IX.

The general method of preventing and cureing the Gout.

THose who desire to prevent the Gout, must not glut themselvs with meat, must bee quick to labor, and abstain from wine & venerie, or certainly must not use them, unless for their healths sake, must vomit and purge at certain times. *Hippocrates* write's, that boies are not troubled with the Gout before the use of venerie. Yet at this day manie Eunuchs are seen to have the Gout, but especially those who abound with idleness and pleasure; yet these wee have heretofore mentioned are verie effectual, not onely for the prevention, but also for the cure of the present disease. Yet wee must diligently distinguish the causses, what they bee, and whence they may proceed, and oppose thereto remedies contrarie in quantitie and qualitie. There are absolutely three distinct causses of the Gout: A tainture from the parents; a corruption of the humors by diet and air; a native, or adventitious weakness of the joints. Against these there is a two-fold indication: the first is the evacuation and alteration of the peccant humors, the other the strengthning of the weak joints. These two shall bee performed by diet conveniently appointed, purgeing, blood-letting, provocation of the hemorrhoids, courses, vomit, sweat, urine, and fit application of local medicines. Therefore, when the time shall com, wherein the Gout accustometh to return by cours, the patient shall have a care of himself by a diligent manner of diet, hee shall lessen the matter of the disease by phlebotomie (if that the Gout shall arise from the blood) from the opposite part, that by the same means revulsion and evacuation may bee made; as if the upper parts bee inflamed, blood shall bee drawn from the lower; if on the contrarie the lower, out of the upper, alwaies observing the straightness of the fibres. Thus the right arm being troubled with a goutie inflammation, the *Sapheia* of the right leg shall bee opened, and so on the contrarie; but if this general blood-letting being premised, the pain shall not ceas, it will bee requisite to open the vein next to the pain, which I have often performed with happie succes.

Aph. 30. *sect.* 6.

Two general scopes of cureing the Gout.

Whence blood must bee let in the Gout.

Yet phlebotomie hath not the like effect in all, for it is not available to such as are continually and uncertainly troubled with goutie pains, or whose bodies are weak and cold, wherein phlegm onely is predominant. Wee may say the same of purgeing, for though it bee oft-times necessarie, yet too frequently re-iterated, it prove's hurtful; furthermore, neither of these remedies is usually verie profitable to such as observ no order in meat & drink, which use venerie too intemperately, who abound with crude and contumacious humors; whose joints by long vexation of the disease, have contracted an hectick distemper and weakness, so that they are departed from their natural constitution, and suffered a great change of their proper substance. Wherefore as often as these greater remedies shall bee used a Physician shall bee called, who according to his judgment may determine thereof. For oft-times diet proveth more available then medicines: therefore the patient (if the matter of the Gout bee hot) shall either drink no wine at all, or els verie much allaied, that is, as much as his custom and the constitution of his stomach can endure. A fit time for purgeing and bleeding is the Spring and Autumn, becaus, according to the opinion of *Hippocrates*, Gouts reign chiefly in these season; in Autumn, for that the heat of the precedent Summer debilitateth the digestive facultie, the native heat beeing dissipated; as also the eating of Summer-fruits hath heaped up plentie of crude humors in the

What goutie persons finde no benefit by phlebotomie.

In what Gout diet prove's more effectual then medicines.

Aph. 33. *sect.* 6.

bodie, which eaſily flow down into the paſſages of the joints opened and dilated by the Summer's heat: add heerunto, that the inequalitie or variableneſs of Autumn weaketh all nervous parts, and conſequently the joints. But in the Spring, for that the humors forced inward, by the coldneſs of the Winter, are drawn forth from the centre to the circumference of the bodie, and beeing attenuated, fall into the joints upon a verie ſmall occaſion, therfore theer is great both neceſſitie and opportunitie for evacuation, which if it ſhall not avert the accuſtomed fit, yet it will make it more gentle and eaſie.

CHAP. X.

Of Vomiting.

To what gout vomiting is to bee uſed.

VOmiting is by all the Antients exceedingly commended, not onely for the prevention, but alſo for the cure, eſpecially when as the matter floweth from the brain and ſtomach; for the phlegmatick, ſerous and cholerick humors, which uſually flow from the joints, are excluded and diverted by vomit, and alſo theer is attenuation of that phlegm, which beeing more thick and viſcid, adhereth to the roots of the ſtomach: yet you muſt conſider and ſee, that the patient bee not of too weak a ſtomach and brain, for in this caſe vomiting is to bee ſuſpected. For the time, ſuch as have excrementitious humors flowing down to the ſtomach through anie occaſion, as by exerciſe and motion, muſt vomit before they eat; on the contrarie, ſuch as are over-charged with an old congeſtion of humors, muſt vomit after they have eaten ſomthing. Certainly, it is ſafer vomiting after meat, then it is before. For the drie ſtomach cannot, unleſs with great contention and ſtraining, free it ſelf from the viſcid humors impact in the coats thereof; and hence there is no ſmall danger of breaking a vein or arterie in the cheſt or lungs, eſpecially if the patient bee ſtraight-cheſted, and long-necked, the ſeaſon cold, and hee unaccuſtomed to ſuch evacuation. I remember that with this kinde of remedie I cured a certain Gentleman of Geneva, grievouſly moleſted with a cruel pain in his ſhoulder, and therby impotent to uſe his left arm; the Phyſicians and Surgeons of Lions ſeemed to omit nothing elſ for his cure. For they had uſed purgeing, phlebotomie, hunger, a diet-drink of *Gudiacum* and *China* (although his diſeaſ was not occaſioned by the *Lues Venerea*) and diverſ other topick medicines, neither yet did they anie thing avail. Now learning by him that hee was not apt to vomit, but that it was difficult to him, I wiſhed him to feed more plentifully, and that of manie and ſundrie meats; as fat meat, onions, leeks: with ſundrie drinks; as beer, ptiſan, ſweet and ſharp wine, and that hee ſhould as it were over-charge his ſtomach at his meal, and preſently after get him to his bed; for ſo it would happen, that nature not endureing ſo great confuſion and perturbation of meats and drinks, wherof ſom weer corrupted alreadie in the ſtomach, and other-ſom ſcarce altered at all, nature not endureing this confuſion and perturbation, would eaſily, and of its own accord provoke the ſtomach to vomit; which that it might the beteer ſucceed, hee ſhould help forward nature's endeavor, by thruſting his finger or a feather into his throat, that ſo the thick and tenacious phlegm might by the ſame means bee evacuated: and not content to do thus once, I wiſhed him to do the like the ſecond and third daie following; for ſo it verifieth that ſaying of *Hippocrates*, *The ſecond and third daie exclude the reliques of the firſt*: afterwards, that hee ſhould vomit twice a month, chaw maſtick faſting, rub his neck and the pained part with *aqua vitæ*, ſtrengthened by infuſing therin lavander, roſemarie, and cloves groſly beaten, confirm his arm by indifferent exerciſe: hee performed all this, and ſo became free from his pain, and recovered the uſe of his arm. Thoſe who do not like ſuch plentiful feeding, ſhall drink a great quantitie of warm water, wherin radiſh roots have been boiled, and they ſhall have a care leaſt by uſing their ſtomachs to this excretion by vomit, they weaken the digeſtive and retentive facultie therof. Wherfore ſuch as can naturally, ſhall think it ſufficient to vomit twice a month.

What time the fitteſt therfore.

An hiſtorie.

How to make one vomit eaſily.

Lib. de rat. victis.

CHAP. XI.

The other general remedies for the Gout.

How diuretick are good for the Gout.

THe defluxion of ſerous humors is verie fitly diverted from the joints by the urine by the uſe of diuretick medicines. Therfore the roots of ſorrel, parſlie, *ruſcus*, *aſparagus*, and graſs, and the like, ſhall bee boiled in broth, and given to ſuch as have the Gout: for when the urine floweth much and thick, the pain is leſſned. Manie have found benefit by iſſues; for the Arthritick malignitie flow's forth of theſe, as by rivelets; experience ſhew's it in ſuch as are troubled with the *Lues Venerea*, for in thoſe that you cannot overcom the malignitie by the proper antidote, that is, Quick-ſilver, they feel no greater eaſ of the pain, then by application of cauſticks, and making of iſſues. They ſhall bee made in ſundrie places, according to the difference of the pained joints,

Iſſues or fontanels.

joints, to wit, in the beginning of the neck, if the defluxion proceed from the brain, and fall into the joints of the collar-bones or shoulder; if into the elbow or hand, under the muscle *Epomis*; if into the hip, knees and feet, som three fingers breadth under the knee, on the in-side: for thus theer will follow more plentiful evacuation, by reason that the *Sephena* runneth down that way. Yet if the patient bee troubled with much business, and must travel much on horse-back, then shall they bee made on the out-side of the leg, between the two bones thereof, that so they may trouble him the less in rideing. If anie had rather use an actual cauterie, let him take such an one as is triangular and sharp, that so hee may with more speed and less pain perform that which hee intend's, and let him thrust it through a plate of iron which hath an hole therein, and let the place bee marked, least hee should err; the ulcer shall bee kept open, by putting in a pill of gold, silver, lint, of the root of orris, hermodactises, gentian, wax, wherwith som powder of vitriol, mercurie or alum shall bee incorporated, least it should fill up with flesh sooner then the Physician shall think fit. In the mean space, the head, oft-times the original of the evil, shall bee evacuated by takeing in the winter the pils *cochiæ*, and *de Assajereth*; but in summer *sine quibus*, or *Imperiales*, before the Full of the Moon. ℞. *pul. hyere simp.* ʒi. *agar. recent. troch. & rhei. an.* ʒii. *myrobal. chebul.* ʒß. *tamarind.* ℈iii. *cum infusione sennæ, fiat massa de quâ formentur pill.* vi. *pro dracmâ*; let the patient take two before supper everie eighth daie; the daie after hee shall drink som broth of the decoction of cicers, and the diuretick roots. Also these following pils will bee good to purge the phlegmatick and serous humor. ℞. *pillular. fœtid. & de hermodactil. an.* ʒß. *formentur cum succo vel syrup. rosar. solut.* Or els, ℞. *aloës* ʒiii. *agarici trochis. & rhei, an* ʒi. *massæ pilul. arthrit. & de hermodact. an.* ℈ii. *diacrid.* ℈. *cum melle rosato fiat massa, capiat pondus,* ʒi. as the Physician shall think fit, by whose advice these shall bee used and changed as occasion shall offer it self, and the nature of the humor causing the disease. The day after the purgeing, the patient shall take three hours before meat half a dram of treacle, to strengthen the entrails: pils are preferred before liquid medicines, for that by their long staie in the stomach they easily attract the noxious humor from the brain, and the other more distant parts. I have known som Physicians, who mixing with ordinarie pils a good quantitie of scamonie, as seven or eight grains, with a little ginger, least it should hurt the stomach, have purged by stool a great quantitie of serous humors; the daie following they gave barlie cream to correct the harm which the scamonie may have don to the stomach. Others for the same purpose give treacle, which doth not onely strengthen the entrails, but also weaken's the virulencie of the goutie malignitie; the orifice of the ventricle must bee shut after meat, that so the vapors ascending to the brain may bee restrained: for this purpose common drige-powder, marmelate, or conserv of roses are good. In a wet season use cephalick perfumes thus made: ℞. *thuris, vernicis, & mastich. an.* ʒi. *granorum juniperi, baccarum lauri, an* ʒß. *ligni aloës* ʒii. *assæ odorat.* ʒi.ß. Let them bee grosly beaten; let the fume bee received in tow, or carded cotton, and so applied to the head. Also the excrementitious humors shall bee dried up by the following powder strowed on the patient's head for fifteen daies. ℞. *fol. ros. rub. sennæ, staechad. utriusque an.* m.ß. *milii,* ʒiiii. *furfuris loti in vino albo,* ʒiii. *florum chamæm. melil. an.* p.i. *sem. anisi,* ʒi. *salis com.* ʒii. *fiat omnium pulvis.* Let it bee put into linnen bags, with which, beeing warmed at the fire in a frying-pan, and kept with stirring, the head shall bee rubbed. Let the following medicine bee chawed, and kept in the mouth in the form of a masticatorie, in the time of the falling down of the defluxion. ℞. *cubebarum, nucis moschat. glycyrrhiz. anis. an.* ʒi. *pyrethri,* ʒii. *mastich. rad. staphisagr. eryngii, an.* ʒii. Let them all bee made into powder, and mixed together, and tied up in a little taffatie to the bigness of a hasel-nut, and let them bee rowled up and down the mouth with the tongue to caus spitting or salivation. Working with the hands, and frictions of the arms, especially in the morning after the evacuation of the excrements, are good for such as are troubled with the Gout in the feet, for so, it not onely causeth revulsion from the feet, but also the resolution of that which is unprofitable.

Where to bee made.

An actual cauterie.

Pils.

Common pils with the addition of scamonie.

Treacle, how useful in the Gout.

Cephalick fumigations.

Cephalick bags.

A masticatorie.

CHAP. XII.

What diet is convenient for such as have the Gout.

After the bodie is once fed, they must not return to meat before that the concoction bee perfected in the stomach, least the liver bee forced to draw by the mesaraïck veins that which is yet crude and ill digested, and as it were forced thence. Whence the depravation of the nutriment of the whole bodie; for the following decoctions doe not amend the default of the first. Let them make choice of meat of good juice and easie digestion, rosted for such as are phlegmatick, but boiled for such as are cholerick: As they shall shun much varietie one meal, so must they eschue the use of pulses, milk-meats, sallads, and sharp things; as verjuice, vineger, the juice of oranges, and citrons. They shal not eat unless they bee hungrie, & shall desist ther-from before they bee fully satisfied, if it bee but for this, that whil'st the native heat is busied in the digestion of meat

The fault of the first concoction, is not amended in the after.

plenteouſly eaten, it is diverted from the concoction of the noxious humors. The fleſh of great fowl, as ſwans, cranes, peacocks are not of laudable juice, and are with more difficultie digeſted in the ſtomach. Som of the ancients have diſallowed of the eating of capons, and the like birds, becauſ they are ſubject to bee troubled with the Gout in the feet. Fiſhes are to bee ſhunned, for that they heap up excrementitious humors, and are eaſily corrupted in the ſtomach, yea and relax it by continual uſe. Of the fleſh of beaſts, veal is moſt to bee commended, for that it breed's temperate blood, and laudable juice, and is eaſily digeſted. Neither in the mean time is mutton to bee found fault withall. But the like hunger or abſtinence muſt not bee appointed to all men troubled with the Gout, for ſuch as are of a ſanguine and cholerick complexion, becauſ they are endued with much, and much waſteing heat, are to bee refreſhed with more plentiful nouriſhment; for hunger ſharpen's choler, and ſo augment's their pains; neither in the *interim* muſt they bee fed with too much moiſt meats, for too much moiſture, beſides that it is the autor of putrefaction, will cauſ deflurions, and draw down the matter to the joints. Therefore the cholerick humor muſt bee incraſſated and refrigerated by takeing things inwardly, and applying things outwardly, leaſt by its tenuitie it ſhould fall down into the grieved parts. To this purpoſe conduce broths altered with lettuce, purſlain, ſorel, and the like herbs, and barlie creams made with a decoction of the four cold ſeeds. Phlegmatick bodies, by reaſon that they have not ſo vigorous heat, do as it were cartie their provant about them, wherefore they muſt not bee fed, neither with manie, nor with moiſt meats. All that are troubled with the Gout, muſt ſhun thoſe things which are hard of digeſtion, and which are ſoon corrupted, for they all have a certain remiſs fever, which diminiſheth the native heat, and make's the meats apt to putrefie. Too plentiful drinking not onely of wine, but alſo of anie other liquor, is to bee avoided. For by too great a quantitie of moiſture the meat floats in the ſtomach, and the native heat is in ſom ſort extinguiſhed, whence proceed crudities. Som Phyſicians commend the uſe of white wine, for that it provoke's urine, which is not altogether to bee diſallowed, if ſo bee that the bodie bee free from excrements, otherwiſe by this, as it were a vehicle, eſpecially if the temperature of the bodie bee ſomwhat more hot, they ſhall bee carried down into the joints. Therefore in ſuch a caſe I ſhould rather adviſe them to uſe claret, which is ſomwhat weak and aſtringent, for that it doth not ſo much offend the head nor joints, and it ſhut's and ſtrengthen's the orifices of the veſſels. Yet it will bee more convenient wholly to abſtain therefrom, and inſtead thereof to drink an *Hydromel* made after this manner: ℞. *aquæ* ℔.iiii. *mellis opt.* q.i. *bulliant ad conſumptionem* ℔.i. *bene deſpumando, adde ad finem, ſalviæ* p.i. *imò ſi æger ſit pituitoſus, cinnamomi aut caryophillorum momentum.* For cholerick perſons make a ſugred water thus: ℞. *aquæ fontis* ℔.iiii. *ſaccari* ℔.ß. *colentur per manicam ſine ebullitione, addendo in fine cinnamomi* ℥ii. For thus the ſtomach ſhall alſo bee ſtrengthened; alſo hee may drink *ptiſan*, wherein at the end of the decoction ſhall bee boiled ſom dried roſes, or elſ ſom ſyrup of pomegranates added thereto, leaſt it ſhould offend the ſtomach; as ſoon as it come's from off the fire, let it ſtand and ſettle, and then ſtrain it through an hypocras-bag, or clean linnen cloth.

Capons ſubject to the gout.

Cholerick perſons cannot away with long faſting.

Phlegmatick bodies in faſting feed upon themſelvs.

White wine not good for the gout.

Claret may bee the ſafelier drunk.

Hydromel moſt ſafely.

An *Hydroſaccarum.*

CHAP. XIII.

How to ſtrengthen the Joints.

IT is a matter of much conſequence for the prevention of this evil, to ſtrengthen the joints, whereby they may bee able to reſiſt the humors preternaturally falling down upon them. Wherfore it is good morning and evening to rub them with *oleum omphacinum*, that is, oil made of olives not com to their perfect maturitie; or with oil of roſes mixed with common ſalt finely powdered. It may alſo bee mixed with common oil, adding thereto the powder of Hart's-horn, as that which hath an aſtringent and drying facultie. Alſo it is good to bathe them in this following lee: ℞. *cort. granat. nucum cupreſſ. gallarum, ſumach. cortic. querni, an.* ℥ii. *ſalis com. alumin. roch. an.* ℥i. *ſalviæ, roriſmar. lavendul. lauri, ivæ arthretic. an.* m.i. *roſar. rub.* m.ß. *bulliant omnia in ſex* ℔. *vini craſſi & aſtringentis, & lixivio parato ex aquâ chalibeatâ, & cinere querno.* Then foment the part with ſponges or cotton-cloths; after, this fomentation ſhall bee carefully wiped and dried with hot linnen cloths, takeing heed of cold. The juice of unripe haws tempered with oxycrate is a ſingular thing for this purpoſe. But if you deſire to ſtrengthen the joints weakned by a cold cauſ, then, ℞. *ſalviæ, roriſm. thymi, lavendul. laur. abſinth. an.* m.i. *caryophyl. zinzib. piperis, conquaſſatorum an.* ℥i. *infundantur in aquâ vitæ & vini rubri aſtringentis, an.* ℔.iiii. *bulliant leniter in balneo mariæ.* With this liquor foment the joints morning and evening. Som think it good to ſtrengthen the joints, to tread grapes in vintage-time, which if they bee not able to do, then let them waſh their feet in the muſt or new preſſed wine. Alſo bags may bee thus made for the ſame purpoſe. ℞. *ſalis com. alum. roch. cort. granat. ſumach. berberis, nucum cupreſſi, an.* ℥iiii. *fol. ſalviæ, roriſm. roſar. rub. an.* m.ß. Let them bee all put in linnen bags, and boiled in lee, and ſo make a decoction for to foment the joints.

A fomentation to ſtrengthen the joints.

The juice of haws with oxycrate.

Bags.

CHAP. XLV.

Of the Palliative Cure of the Gout and the material cauſes thereof.

HEr alſo muſt wee conſider the cauſes whence this diſeaſ proceed's, the temper of the diſeaſed bodie, the parts affected, and thoſe from whence it proceed's. For as theſe are not alwaies alike, ſo neither can one and the like remedie bee uſeful in everie Gout. For firſt thoſe which proceed of a cold cauſ require other remedies, then thoſe which ariſe from a hot, and that which proceed's from anie one ſimple humor, then that from wch ariſeth diverſ mixed together. For Choler alone cauſeth cruel pains, but tempered by the admixture of Phlegm, it becom's more gentle. Furthermore ſom remedies are good in the beginning, ſom in the encreaſ, and ſom at other times. Neither may wee uſe repercuſſives in the Sciatica, as wee may in the Gout of the feet and other joints; unleſs peradventure the part bee fearfully inflamed. Takeing theſe things to conſideration wee muſt obſerv that the Palliative cure of that Gout, which cannot abſolutly bee helped, as that which is hereditarie and inveterate, is performed by four ſcopes. The firſt is by appointing a convenient diet in the *ſix things* wch are termed *not-natural*. The ſecond by evacuateing & diverting the antecedent matter, both by purgeing and phlebotomie. The third by topick medicines according to the condition of the morbifick humor and nature. The fourth by correcting the ſymptoms, but eſpecially the pain, whereof in theſe affects there is oft-times ſo great exceſs by reaſon of the inexpliable and invincible malignitie of the virulent qualitie aſſociateing the humor that it alone is oft-times ſufficient to kill the patient. And becauſ the varietie of morbifick cauſes, bring's a varietie of remedies, fitted to theſe four intentions, therefore it behoov's a Phyſician to bee moſt attentive in the diſtinction of the cauſes. For hee may bee eaſily deceived and miſtake one for another; for arthritick pains proceeding from a cold matter, if they bee mitigated by the application of Narcotick and cold medicines, it may induce us to believ that the material cauſ is hot, though really it bee not ſo; for Narcoticks aſſwage pain, not for that they are contrarie to the cauſ thereof, but becauſ they take away the ſenſ by induceing a numneſs; on the contrarie, the material cauſ may ſomtimes ſeem cold, which notwithſtanding is hot, for that it becom's better by application of hot medicines, that is, by takeing an argument from that which help's, becauſ contraries are cured by contraries, and the like preſerved by the like. But hercin conſiſt's the error, for that hot medicines profit not by their contrarietie, but by the attenuation of the groſs matter, by the rarefaction of the skin and diſſipateing them into air. Whence you may gather, that an argument drawn from that which help's and hurt's, is verie deceitful: moreover it may happen that a large quantitie of cold matter flowing down from the brain, may cauſ great pain by reaſon of the virulencie, and a ſmall quantitie of choler mixed therewith, which ſerv's for a *vehicle* to carrie down the tough and ſlow phlegm into the joints, whence the patient becom's thirſtie and feveriſh by reaſon of the heat and inflammation of theſe parts, wherby ſuch as are leſs cautelous and heedie will eaſily bee induced to believ that ſom hot matter is the occaſion of this Gout. Now when as not ſom one ſimple humor but different by reaſon of mixture, cauſeth the Gout, the yellowiſh color of the part may deceiv one, as, if the evil matter ſhould proceed from choler onely, which by the tenuitie of its ſubſtance leaving the center, eaſily poſſeſſeth the circumference of the bodie or part: and notwithſtanding much phlegm beeing as it were enraged by the admixtion of a little choler, may bee the chief cauſ of the diſeaſ, and may peradventure bee diſcovered by the encreaſ of pain in the night ſeaſon. A fever ariſeing by means of pain and watching may encreaſ the conceived opinion of choler, which attenuateing and diffuſeing the humors, drive's them into the joints, and cauſeth fierie urines, tinctured with much choler, and a quick pulſ. Yet notwithſtanding the Phyſician ſhall bee in an error, if deceived with theſe appearances, hee attempt the cure of this Gout, as ariſeing from a hot, and not from a cold cauſ: yet I am not ignorant that the cure of the proper diſeaſ muſt bee neglected for the cure of the ſymptoms. Beſides alſo it may com to paſs that choler may bee the cauſ of the Gout, and notwithſtanding no ſigns thereof may appear in the skin and ſurface of the affected part, becauſ the coldneſs of the ambient air, and the force of applied Narcoticks may have deſtroied the color of the juices lying therunder, and as it were imprinted a certain blackneſs. It alſo happen's, that the bodie beeing over-charged with a great quantitie of groſs and viſcid humors, the expulſive faculties may diſcharge ſom portion thereof unto the joints, but leav the reſt impact in the cavitie of ſom entrail, where cauſing obſtruction and putrefaction may preſently cauſ a fever, and that intermitting, if it bee ſmall, and obſtruct onely the leſſer veins, and theſe of the habit of the bodie. Wherfore then it is not ſufficient that the Phyſician employ himſelf in the cure of the Gout, but it behoov's him much more to attend the cure of the fever, which if it bee continual, it diſcredit's the Phyſician, and endanger's the patient; if it bee intermitting, it eaſily becom's continual, unleſs it bee withſtood with fit remedies, that is, unleſs you let blood, the bellie beeing firſt gently purged, and nature bee preſently free'd by a ſtronger purge

The ſcopes of cureing.

Repercuſſives not to bee uſed in the *Sciatica*.

The palliative cure performed by four ſcopes.

An argument taken from that which helpeth or giveth eaſ, is not alwaies certain.

How cold diſeaſes may bee helped by cold. and hot, by hot medicines.

The firſt thing that may deceiv a Phyſician.

The ſecond.

The third.

The fourth.

The fifth.

The ſixth.

Why ſtrong purges muſt be given to ſuch as have the Gout.

purge of the troubleſom burden of humors. Now it is convenient, the purge bee ſomwhat ſtronger then ordinarie, for if it ſhould bee too weak, it will ſtir up the humors, but not carrie them away, and they thus agitated will fall into the pained and weak joints, and cauſe the Gout to encreaſ. By this it appear's how deceitful that conjecture is,, which relie's and is grounded on one ſign, as often as wee muſt pronounce judgment of morbifick cauſes.

That judgment moſt certain which reſt's upon multiplicitie of ſigns.

Wherfore to conclude, wee muſt think that opinion moſt certain concerning the matter of the diſeaſ, which is ſtrengthened with multiplicitie of ſigns, as thoſe which are drawn from the color of the part, the heat or coldneſs manifeſt to the touch, thoſe things that help and hurt, the patient's familiar and uſual diet, temper, age, region, ſeaſon of the yeer, proprietie of pain, the exacerbation or exceſs thereof, in what daies, and in what hours of the daie, the length of theſe fits, the urine and other excrements coming from the patient's bodie. But for that not a few are in that hereſie, that they think that wee muſt neither purge nor let blood in the Gout, weee muſt heer convince that opinion. For ſeeing that phyſick is the addition of that which want's, and the takeing of thoſe things that are ſuperfluous, and the Gout is a diſeaſ which hath its eſſence from the plentie of abounding humors, certainly, without the evacuation of them by purgeing and bleeding, wee cannot hope to cure, either it, or the pain which accompanie's it.

Why wee muſt uſe purgeing and bleeding in the Gout.

Metrius, in his Treatiſe of the Gout write's, that it muſt bee cured by purgeing, uſed not onely in the declination, but alſo in the height of the diſeaſ, which wee have found true by experience; and it is conſonant to this ſaying of *Hippocrates*; in pains wee muſt purge by the ſtool. Beſides alſo, *Galen* profeſſeth that in great inflammations, fevers and pains, hee knew no greater nor ſurer remedie then to let blood, even to the fainting of the patient. If thoſe which are in this caſe ſhall not becom better by purgeing and phlebotomie conveniently preſcribed, then it happen's by the means of drunkenneſs, gluttonie, and the like diſtemper. For hence abundance of crude humors are heaped up, which by thir contumacie yeeld themſelvs leſs obedient to medicines. Therefore ſuch goutie perſons as are intemperate and giv'n to gluttonie and venerie, may hope for no health by uſe of medicines.

Lib. de affect. ubi de Arthrit. loquitur. Adaph. 23. ſect. 1. Lib. de cur. per ſang. miſſionem.

CHAP. XV.

Of local medicines which may bee uſed to a cold Gout.

It is not ſafe to uſe repercuſſives in the Gout before purgeing.

Little do topick medicines avail, unleſs the bodie of the goutie patient ſhall bee purged from excrementitious humors; beſides alſo there is danger leaſt by the uſe of repelling medicines, the virulencie of the humor may bee driv'n into the entrails, which thing hath been the cauſ of ſudden death to manie. Now in the firſt place wee will ſpeak of local medicines which are thought meet for a phlegmatick juice, becauſ this is more frequent, then that which is from a hot cauſ. At the begining in everie gout, the *Sciatica* excepted, wee muſt uſe aſtringent things which have a facultie to binde or ſtrengthen the joints, and to drie and waſte the excrementitious humor.

An aſtringent Cataplaſm.

As, ℞. *fol. ſabinæ* m. ß. *nucum cupreſſi* ℥iii. *aluminis roch.* ℥i. *gum. tragacanthæ* ℥iiii. *mucaginis pſilii & cydon. quantum ſufficit, fiat cataplaſma.* Or, ℞. *ſtercoris bubuli recentis* ℔. i. *mellis roſ.* ℥iiii. *olei roſ. & aceti an.* ℥ii. *bulliant ſimul parùm, fiat cataplaſma.* Or elſ, ℞. *olei roſar. & myrtill. an.* ℥ii. *pulveris myrrhæ & aloës an.* ℥i. *acaciæ* ℥ii. ß. *incorporentur cum aquâ gallarum coctarum, & fiat unguentum.*

A diſcuſſing fomentation.

Som boil ſage, camomile and melilote flowers, wormwood and dane-wort, of each a handful in a ſufficient quantitie of vineger, then they put the grieved part into this decoction beeing warm; and by frequent uſeing this medicine, it hath been found to repel and conſume the noxious humor, not onely cold, but alſo cholerick; and alſo to ſtrengthen the part. The freſh *faces* of Olives laid to the part, aſſwage pain; dried Oranges boiled in vineger, beaten and applied, do the ſame. Or, ℞. *medii corticis ulmi* ℔. ß. *caudæ equin. ſtœchad. conſolid. majoris, an.* m. ß. *aluminis roch. thuris an.* ℥iii. *farin. hordei* ℥v. *lixivii com. quantum ſufficit, fiat cataplaſma ad formam pultis ſatis liquidæ.*

One, partly aſtringent and partly diſcuſſing.

Commonly then when as the part ſwelleth up, the pain is leſſned, for that the expulſive facultie driveth the humor from the center into the circumference of the part, that is, from within outward; for in like ſort, ſuch as have the tooth-ache have leſs pain when their cheeks begin to ſwell.

After repercuſſives, wee muſt com to thoſe which evacuate the conteined humor by evacuateing or reſolving it. For everie defluxion of humors remaining in anie part require's evacuation. Neither muſt wee marvel thereat, if the digeſted humor doth not vaniſh at the firſt time; for wee muſt have regard to the cold phlegm which is thick and viſcid, as alſo of the part which is ligamentous, membranous and nerveus, and conſequently more denſ then fleſhie parts.

Why the goutie humor doth not preſently vaniſh upon the uſe of repercuſſives.

℞. *rad. Bryon. ſigilli beat. Mariæ. an.* ℥iv. *bulliant in lixivio, poſtea teranturs & colentur per ſetaceum, addendo farin. hordei & fabarum an.* ℥i. *olei chamem.* ℥iii. *fiat cataplaſma.* Or, ℞. *hordei & lupin. ag.* ℥iii. *ſulphuris vivi & ſalis com. an.* ℥i. *mellis com.* ℥v. *pul aloës & myrrhæ an.* ℥ß. *aq. vit.* ℥i. *cum lixivio, fiat cataplaſma.* Or, ℞. *ſucci calium rub. aceti boni, an.* ℥iiii. *farin. hordei* ℥iß. *pul. Hermodactyl.* ℥ß. *vitellos ovorum* nu. iii. *olei chamem.* ℥iii. *croci* ℈ii, ſom burn the roots and ſtalks of Coleworts, and mix the aſhes with hog's greaſ and the powder of Orris, and

Greater diſcuſſes

ſo

so make a pultis. Or, R. *Lactis vaccini* ℔ ii. *micæ panis albi quantum sufficit, bulliant simul, addendo pulveris subtilis florum chamæm. & meliloti an.* m. ß. *croci* ℈ i. *vitellos ovorum* nu. iiii. *ol. ros.* ʒiii. *butyri recentis* ʒi. *terebinth.* ʒii. *fiat cataplasma ad formam pultis satis liquida.* This Cataplasm may bee applied with good success, not onely to phlegmatick and cold, but also to anie gout, at anie time to mitigate the extremitie of the pain in men of anie temper, and it must bee changed twice or thrice a daie. Also Triacle dissolved in wine, and anointed on the part, is said to allwage this pain. You may for the same purpose make and applie emplasters, unguents, cerats and liniments: This may bee the form of an emplaster. R. *gummi ammoniaci, bdelii, styracis, an.* ʒii. *cum aceto & aquâ vit. dissolve & adde farin. fænugr.* ʒß. *olei chamæm. & aneth. an.* ʒii. *ceræ quantum sufficit, fiat empastrum molle.* Or, R. *rad. bryon. sigill. bene Mariæ. an.* ʒv. *bulliant in lixivio complete, & colentur per setaceum, addendo olei cham.* ʒiiii. *sevi bircini* ʒiiii. *ceræ nov. quantum sufficit, fiat emplastrum molle.* Or, R. *gum. ammon. opopanacis, galbani. an.* ʒii. *dissolvantur in aceto, postea colentur, adde olei liliorum, terebinth. venet. an.* ʒi. *picis navalis, & cer. nov. quantum sufficit, fiat emplastrum molle.* Or elſ, R. *succi rad. tuss. camp. & thuſ an.* ʒiii. *rad. altb.* ℔ ß. *coquantur & colentur per setaceum, addendo florum cham. meliſ. sambuchi, roriſmar. & hyperici an.* p. ii. *nucum cupreſſi,* nu. iiii. *ol. cham. aneth. hyper. liliorum, de picâ an.* ʒii. *pinguedinis anatis, gallin. anseris an.* ʒß. *ranas viridis vivas* nu. vi. *catellos duos nuper natos, bulliant omnia simul, in* ℔ ii. ß. *vini oderiferi & unâ aquæ vit. ad consumptionem succorum & vini, & offa catellorum dissolutionem, & fortiter exprimantur; & expressionis adde terebinth.* ʒiii. *cer. quantum sufficit, fia emplastrum molle.* Also, *Emp. de vigo. Oxicroceum, de mucilaginibus, de meliloto* and the like mixed together, and softned with a little oil or *axungia*, are of the like facultie, and good for the same purpose.

A caraplasm good for anie Gout at anie time.

Discussing emplasters.

Let this bee the form of an ointment. R. *anserem pinguem, & simple catellis duobus, de quibus deme cutem, viscera, caput & pedes; item accipe ranas* nu. x. *colubros detracta cute in frustra dissectos* nu. iv. *mithridat. & theriac. an.* ʒß. *fol. salviæ, roriſmar. thymi, rutæ, an.* m. ß. *baccarum lauri, & juniperi, conquassat. an.* ʒi. *pulveris nuc. moschat. zinzib. caryophyl. & piper. an.* ʒi. *de eo quod stillabat fiat unguentum vel linimentum cum cerâ & terebinth. venetâ, paucâ aquâ vitæ additâ*; this marvelously allwageth the pain of the Gout arising from a cold cause. Another, R. *gummi pini, & lodani, an.* ʒiv. *gummi elemi & picis naval. an.* ʒß. *terebinth. venet. claræ* ʒvi. *chamæm. & liliorum an.* ʒvi. *vini rub.* ℔ i. ß. *aq. vit. & salv. an.* ʒvi. *dissolvantur omnia simul lento igne, baculo semper agitando, deinde adde pul. ireos. flor. baccarum lauri et bermodactyl. an.* ʒiiß. *mastiches, myrrhæ et olibani an.* ʒii. *farinæ fabar.* ʒiv. *incorporentur omnia simul, fiat unguentum molle.* Or elſ, R. *micæ seminis fænugr. in aceto extract. quantum volueris, cui misce mellis quantum sufficit*; let them bee boiled together until they acquire the consistence of an ointment. These things shall bee changed, as often as need shall seem to require. Also an anodine and discussing fomentations are good to resolv; as this, R. *fol. rutæ, salv. roriſmar. an.* m. i. *bulliant cum aceto & vino*; and so make a decoction for a fomentation, which you may use not onely in a cold Gout, but also in a hot, because it resolveth and strengtheneth the part by astriction, and freeth it from the defluxion: you must have a care that the medicines which are used to pains of the Gout bee changed now and then. For in this kinde of disease that remedie which did good a little before, and now availeth, will in a short time becom hurtful.

Ointments.

Discussing fomentations.

Remedies must bee often changed in the gout.

But if the contumacie and excess of the pain bee so great, that it will not yeeld to the described medicines; then it is fit, becaus the disease is extreme, to use (according to *Hippocrates*'s counsel) extreme, such as are those which follow. R. *axungiæ gallinæ, olei laurini mastic. & euphorb. an.* ʒi. *pulv. euphorb. & pyreth an.* ʒi. *fiat linimentum*; herewith let the part bee rubbed everie daie, for it is a verie effectual medicine. For *euphorbium* and Pellitorie by their heat attenuate and resolv, the capon's greas and oil of baies relax, the oil of mastich strengtheneth the part and hindereth a new defluxion. Also there is made a verie anodine ointment of oil of Foxes, wherein earth-worms, the roots of elecampane and bryonie have been boiled, with a little turpentine and wax; this soften's, attenuate's and resolv's the cold humor impact in the joints. Or elſ R. *seminis sinapi pulveriserati, & aceto acerrimo dissolut.* ʒiii. *cardani* ʒii. *aquæ vitæ* ʒi. *salis com.* ʒii. let them bee all mixed together, and applied to the pained part. Or, R. *picis nigræ,* ʒiii. *terebinth. venetæ* ʒi. *f. sulphuris vivi subtiliter pulverisati* ʒiii. *olei quantum sufficit, liquefiant simul, fiat emplastrum*; let it bee spread upon lether, and laid on the part for two or three daie's space, if the patient percelv anie ease thereby; if otherwise, let it bee changed as wee said before. Som for the same purpose applie nettles thereto, and presently after wash the part in the sea or salt water. Others foment the part with vinegar wherin pigeons hath been boiled. A vesicatorie made of verie flower leaven, *cantharides*, and a little *aqua vitæ* is verie powerful to evcuate the conjunct matter. For thuslike malign and virulent *serum*, or whayish humor is let out, whence follow's som eas of the pain. Now there are som goutie pains, which cannot bee lessned or allwaged unless by remedies more powerful then the distemper, therfore vesicatories ought not to bee rejected, seeing that the Ancients in this affect have also made use of actual cauteries, as wee shall shew heerafter. *Christopher Andreas* in his book termed *Oeconomie* [that is, domestick physick] much commend's Ox-dung wrapped in cabbage or vine-leavs, and roasted in the embers, and so applied hot too the grieved part.

A great discusser.

An anodine.

A vesicatorie against the conjunct matter.

CHAP.

CHAP. XVI.

Of local medicines to bee applied to hot or ſanguin Gout.

What repercuſſives are here required.

HEre muſt wee in the begining make uſe of repercuſſives, ſuch as are cold and drie, that they may contend with the morbifick matter by both their qualities; alſo let them bee aſtrictive, ſo to add ſtrength to the part. But I would have you alwaies to underſtand that you muſt firſt premiſe general medicines. R. *albuminum ovorum* nu. iv. *ſucci lactucæ & ſolani an.* ʒi. *aq. roſar.* ʒii. *incorporentur ſimul, & fiat linimentum ſæpius renovandum.* Others take the meal of barlie, lentils, *acatia*, oil of roſes, myrtles, and with a little vineger they make a cataplaſm; Or, R. *ſumach. myrtillorum, boli arm. an.* ʒß. *acatiæ, corticum granat. balauſt. an.* ʒi. *aq. plantag. & roſar. an.* ʒiii. *ol. roſati* ʒiß. *aceti* ʒii. *farinæ hordei & lentium quantum ſatis erit, fiat cataplaſma.* This is verie excellent and effectual to ſtay or hinder phlegmonous and eriſipelatous tumors. Alſo you may make a cataplaſm *ex mucagine Cydoniorum in aquâ roſarum extractâ, caſsiæ fiſtulâ, oleo roſato, & aceto:* Or, R. *pampinorum vitis viridum*, m. ii, *terantur & bulliant in oxycrato ex aquâ fabrorum, cui adde ſumach. conquaſſat.* ʒi. *olei roſat.* ʒii. *farinæ hordei quantum ſufficit, fiat cataplaſma.* Or elſ, R. *ſucci ſempervivi, byoſcyami, portulacæ an.* ʒiv. *corticum mali granati* ʒiiß. *farinæ hordei* ʒv. *vini auſteri quantum ſufficit, fiat cataplaſma*; this is much commended, for it hath entring thereinto wine and the pomgranate pill, which both are verie great aſtrictives; and the juices are exceeding cooling, the meal alſo hinder's and thicken's the ſanguin humors that are readie to flow down, and make the medicine of a good conſiſtence. Another: R. *fol. byoſcyami & acetoſæ an.* m. i. *involvantur papyro, & ſub cineribus coquantur, mox cum unguento populeon. aut roſat.* ʒii. *incorporentur*; and then lay this Cataplaſm thus made warm unto the part. Another: R. *florum byoſciami* lb. ii. *ponantur in phialâ vitreatâ, & reconde in fimo equino donec putruerint, accipe ex putredine* ʒii. *in quibus diſſolve olei de junipero* ʒß. *fiat linimentum ad uſum.* Others beat pulp of a Gourd or Citrul in a mortar, and ſo applie it. Another: R. *mucag. ſem. pſilii, & cyton. exteact. in aq. roſar. & ſolani an.* ʒiiii. *olei roſati ompbacini* ʒiii. *vini granat.* ʒi. *vitellos ovo. cum albumine* nu. iii. *camphoræ* ʒi. *encorporentur ſimul, fiat linimentum.* Or elſ, R. *ol. roſat. ompbacini* ʒiv. *album. ovorum cum vitellis* nu. vi. *ſucci plantag. et ſolani an.* ʒi. *farinæ hordei* ʒiii. *incorporentur ſimul, fiat cataplaſma.* Or, R. *farinæ fabarum et hordei an.* ʒiii. *olei roſati*, ʒii *oxycrati quantum ſufficit, coquantur ſimul, fiat cataplaſma.* Another: R. *mucag. ſem. pſilii* ʒiiii. *ol. roſati* ʒii. *acet* ʒi *vitellos ovorum*, nu. iii. *croci* ℈i. *miſce. Plinie* reporteth that *Sextus Pomponius* the Governor of the hither-Spain, as hee overlooked the winowing of his corn, was taken by the pain of the Gout in his feet, wherfore hee cover'd himſelf with the Wheat above his knees, and ſo was eaſed, his feet beeing wonderfully dried; and hee afterwards uſed this kinde of remedie. It is note-worthie, which often happeneth, that the pain cannot bee altogether eaſed by ſuch remedies, by reaſon of the abundance of blood impact in the part; wherefore it muſt bee evacuated; which I have don in manie with good ſucceſs, opening the vein which was moſt ſwelled and nigh to the affected part; for the pain was preſently aſſwaged. Neither muſt wee too long make uſe of repercuſſives; leaſt the matter becom ſo hardned, that it can ſcarce bee afterwards reſolved, as when it ſhall bee concrete into knots and plaſter-like ſtones: reſolving medicines are to bee mixed with repercuſſives conveniently applied, ſo to diſcuſs the humor remaining as yet in the part, whereof ſhall bee ſpoken in the following Chapter.

An excellent aſtringent cataplaſm.

Lib. 22. cap. 25.

Phlebotomie to evacuate the conjunct matter, and aſſwage pain.

CHAP. XVII.

Of local medicines for a cholerick Gout.

What repercuſſives are heer required.

THe repercuſſives that muſt firſt bee uſed in this kinde of Gout ought to bee cold and moiſt, that ſo they may reſiſt both the qualities of choler; ſuch are the leavs of night-ſhade, purſlain, houſ-leek, henbane, ſorrel, plantain, popple, cold water and the like, whereof may bee made diverſ compoſitions. As, R. *ſucci byoſcyami, ſempervivi. lactuc. an.* ʒii. *farin. hordei* ʒi. *olei roſati* ʒii. *agitando ſimul fiat medicamentum*; let it bee applied and often changed, for ſo at length it will aſſwage the inflammation. Som think the brain of a hog mixed with white ſtarch, or barlie-meal and oil of roſes, an excellent medicine. The leavs of mallows boiled in water, and beaten with a peſtil, and applied, aſſwage pain. R. *mucag. ſem. pſilii extract. in aq. ſolani, vel roſarum* ʒii. *farin. hordei* ʒi. *aceti q. ſ. fiat linimentum.* Or elſ, R. *unguent. roſat. meſnæ & populei an* ʒiii. *ſucci melonum* ʒii. *alb. ovorum*, nu. iii. *miſceantur ſimul pro litu.* Alſo a ſponge dipped in oxycrate, and preſſed out again and applied thereto doth the ſame. Or elſ, R. *fol. caulium rub.* m. ii. *coquantur in oxycrato & terantur: adde ovorum vitellos tres, olei roſati* ʒiii. *farinæ hordei quantum ſufficit, fingatur cataplaſma.* Alſo you may take the crude juice of cole-worts, dane-weed, and roſes beaten and preſſed out, and of theſe incorporated with oil of roſes and barlie-meal make a cataplaſm. In winter-time, when as theſe things cannot bee had green, you may uſe

unguent.

unguentum infrigidans Galeni & populeon. Or elſ, R. *ceræ albæ* ℥i. *croci* ℈i. *opii* ℈iiii. *olei roſati quantum ſufficit, marcerentur opium & croci in aceto, deinde terantur & incorporentur dum cerâ & oleo, fiat cerotum;* ſpread it upon a cloth, and lay it upon the part, and all about it, and let it bee often renewed. Som cut Frogs open and applie them to the grieved part. It is confirmed by ſundrie men's experience, that pain of the *Sciatica*, when it would yeeld to no other remedie, to have been aſſwaged by anointing the affected with the raccous water or gellie of Snails, beeing uſed for the ſpace of ſeven or eight daies; the truth whereof was aſſured mee by the worthie Gentleman the Lord of *Longmai*, a man of great hopefulnes and credit, who himſelf was troubled for ſix month's ſpace with the *Sciatica*. This water is thus made, Take fiftie or ſixtie red Snails, put them in a copper-pot or kettle, and ſprinkle them over with common ſalt, and keep them ſo for the ſpace of a daie; then preſs them in a courſ or hair-cloth; in the expreſſed liquor dip linnen rags and applie them ſo dipped to the part affected, and renew them often. But if there bee great inflammation, the Snails ſhall bee boiled in Vineger and Roſe-water. They ſay that Citrons or Oranges boiled in Vineger, and beaten in a mortar, and incorporated with a little barlie or bean flowre, are good againſt theſe paine. Or elſ, R. *pomorum colorum in lacte* lb. i. *butyri* ℥i. *vitellus ovorum* nu. ii. *aceti* ℥i. *fiat cataplaſma.* There are ſom who take cheeſ-curd newly made, and mix it in a mortar with oil of Roſes and barlie-meal, and ſo applie it; it repreſſeth inflammation and aſſwageth pain. Others mix *caſſia* newly extracted forth of the cane, with the juice of Gourds or Melons. Others applie to the part the leavs of Coleworts, and Dane-weed or Smallage, or all three mixed together and beaten with a little Vineger. Others macerate or ſteep an ounce of linſeed in Wurt, and make the mucilage extracted therefrom into a Cataplaſm with ſom oil of Roſes and barlie-meal. Som put oil of poppies to the pulp of Citrulls or Gourds beeing beaten, and ſo incorporate them together, and applie it.

A cerate with opium.

The water of Snails.

This following medicine hath its credit from a certain Gaſcoin of Baſas that was throughly cured therewith, when as hee had been vexed long and much with gouts paine, above the common cuſtom of ſuch as are troubled with that diſeaſe. Thus it is: Take a great ridg-tile thick and ſtrong, and heat it red hot in the fire, then put it into ſom another tile of the ſame bigneſs, but cold, leaſt it ſhould burn the bed-clothes, then ſtrew with all the hot one with ſo manie Dane-wurt-leavs, that the patient may ſafely lay the affected part therein without anie danger of burning it. Then let the patient endure the heat that com's therefrom, and by ſweat receiv the fruit thereof, for the ſpace of an hour, ſubſtituteing freſh Dane-wurt-leavs, if the former becom too drie, as alſo another hot tile, if the former ſhall grow too cold before the hour bee ended. This beeing don, let the part bee dried with warm and drie linnen clothes. Uſe this particular ſtove for the ſpace of fifteen daies, and that in the morning faſting; afterward annoint the part with this following ointment. R. *ſucci ebuli* lb. i. ß. *olei com.* lb. i. *miſceantur ſimul*, and let them bee put into a ſtrait mouthed glaſs, and well luted up, then let it boil in *balneo Mariæ*, beeing firſt mixed with ſom wine, untill the half thereof bee conſumed; for the ſpace of ten or twelv hours, then let it cool, and ſo keep for uſe, adding thereto in the time of anointing, ſom few drops of *aqua vitæ*. It may bee anointed twice or thrice in a daie, long after meat. Moreover, the roots and leavs of Dane-wurt boiled in water, beaten and applied aſſwage pain; the oil thereof chimically extracted perform's the ſame.

An hiſtorie.

A particular ſtove.

An ointment of the juice of Dane-wurt.

But if the contumacious pain cannot bee mitigated by the deſcribed remedies, and becoming intolerably hot and rageing, make the patient almoſt to ſwoun, then muſt wee flie to Narcoticks. For although the temper of the part may bee weakned by theſe, the native heat diminiſhed or rather extinguiſhed; yet this is a far leſs inconvenience then to let the whole bodie bee waſted by pain. Theſe things have a powerful refrigerateing and drying facultie, taketh away the ſenſ of the pain, and furthermore, incraſſate, thin acrid and biteing humors, ſuch as cholerick humors are. Wherefore if the matter which cauſſeth the pain bee thick, wee muſt abſtain from Narcoticks, or certainly uſe them with great caution. R. *micæ panis ſecalini parum cocti in lacte*, ℥ii. *vitellos ovorum*, nu. ii, *opii*, ℈i, *ſuccorum ſalani, byoſcyami, mandragoræ, portulacæ, ſempervivi, an.* ℥i. let them bee mixed together and applied, and often changed. Or elſ, R. *fol. byoſcyami cicutæ, acetoſ. an.* m. i. *bulliant in oxycrato & contundantur, cumque vitellis ovorum crudorum* nu. ii. *& olei roſat.* ℥ii. *farin. hordei quod ſatis ſit, incorporentur, fiat cataplaſma*; with the uſe thereof I am accuſtomed to aſſwage great paine. Or elſ, R. *opii* ℥iii. *camphor.* ℥ß. *olei nenuph.* ℥i. *lactis* ℥ii. *unguent. roſ. Galeni* ℥iv. *incorporentur ſimul in mortario, applicentur.* Moreover, cold water applied and dropped upon the part drop by drop, is narcotick and ſtupefactive, as *Hippocrates* affirmeth, *Aphor.* 29. *Sect.* 5. for a moderate numneſs mitigateth pain. There is alſo another reaſon why it may bee profitably uſed in all pains of the Gout, for that by repelling the humors, it hindereth their defluxion into the part. Mandrag-apples boiled in milk, and beaten, do the ſame thing; alſo the leavs of henbane, hemlock, lettuce, purſlain, beeing ſo boiled, do the ſame. If anie deſire to uſe theſe more cold, hee muſt applie them crude, and not boiled.

A cataplaſm with opium.

When to uſe narcoticks.

But the exceſs of pain beeing mitigated, wee muſt deſiſt from the uſe of ſuch narcoticks, and they muſt rather bee ſtrengthened with hot and digerateing things; otherwiſe there will

How to amend the harm don by Narcoticks.

Discussers.

A mean to bee used in discussing.

will bee danger lest it bee too much weakned, the temper thereof beeing destroied, and so afterwards it may bee subject to everie kinde of defluxion. Wherefore it shall bee strengthened with the formerly discussing fomentations, and these ensuing remedies. As, *Rx. gum. ammoniaci & bdelii an. ℥i. dissolvantur in aceto, & passetur per setaceum, addendo styracis liquid. & farin. fenugr. an. ℥ß. pulv. ireos ℥iiii. olei chamem. ℥ii. pulveris pyrethri ʒii. cum cerâ, fiat emplastrum molle.* Or, else, *Rx. rad. enulæ, chili albeæ an. lb. ß. sem. lini, fenugr. an. ʒii. ficuum pinguium nu. xx. coquantur completè & trajiciantur per setaceum, addendo pul. euphorb. ʒii. olei chamem. anethi, & rutacei, an. ℥iii. medullæ cervi ℥ß. fiat cataplasma.* Yet you must use moderation in discussing, lest the subtiler part of the impact humor beeing discussed, the grosser part may turn into a sconie consistence, which also is to bee feared in using repercussives.

Bathes assuage the pain of the Gout.

How meats of gross juice are profitable.

I also omitted, that according to the opinion of the Antients, bathes of fresh water, wherein cooling herbs have been boiled, used three hours after meat, conduce much to the asswageing of pain; for so used, they are more convenient in cholerick natures, and spare bodies, for that they humect the more, and quickly digest the thin and cholerick, and consequently acrid vapors, the pores beeing opened, and the humors dissipated by the gentle warmness of the bath. After the bath, the bodie must bee anointed with *hydrelæum*, or oil and water tempered together, lest the native heat exhale and the bodie becom more weak. Meats of more gross juice are more convenient, as beef, sheeps-feet, and the like, if so bee that the patient can digest them, for these inspissate the cholerick blood, and make it more unfit for defluxion.

CHAP. XVIII.

What remedies must bee used in pains of the joints proceeding of a distemper onely, without matter.

An historie.

PAins also happen in the joints by distemper without anie matter, which though rare, yet becaus I happened once to feel them, I have thought good to shew what remedies I used against them. I once earnestly busied in studie, and therefore not sensible of such external injuries as might befall mee; a little winde coming secretly in by the crannies of my studie, fell upon my left Hip; at length wearied with studie, assoon as I rose up to go my way, I could not stand upon my feet, I felt such bitter pain without anie swelling or humor which might bee discerned. Therefore I was forced to go to bed, and calling to minde, that cold, which was absolutely hurtful to the nervs, had bred mee that pain, I attempted to drive it away by the frequent application of verie hot clothes; which, though they scorched and bliftered the sound parts adjoining thereto, yet did they scarce make anie impression upon the part where the pain was settled, the distemper was so great, and so firmly fixed therein. And I laied thereto bags filled with fried oats and millet, and dipped in hot red wine; as also ox-bladders half filled with a decoction of hot herbs. And lastly, a wooden dish almost filled with hot ashes, covered over with sage, rosmarie and rue lightly bruised, and so covered with a cloth, which, sprinkled over with *aqua vitæ*, sent forth a vapor which asswaged the pain. Also brown bread newly drawn out of the oven, and sprinkled over with rose-water, and applied, did verie much good. And that I might more fully expel this hurtful cold, I put stone-bottles filled with hot water, to the soals of my feet, that the brain might bee heated by the straightnes and continuitie of the nervs. At length, by the help of these remedies, I was verie well free'd from this contumacious distemper, when it had held mee for the space of four and twentie hours.

Hip. ap. 10. sect.

Divers remedies for pain arising from a cold distemper without matter.

A fuliginous vapor sometimes the caus of the Gout.

There is another kinde of Goutie pain somtimes caused by a certain excrementitious matter, but so thin and subtle that it cannot bee discerned by the eies. It is a certain fuliginous or sootie vapor, like to that which passeth from burning candles or lamps, which adhere's and concrete's to anie thing that is opposed thereto; which beeing infected by the mixture of a virulent serous humor whithersoever it runneth, causeth extreme pain, somwhiles in these, and otherwhiles in other joints, unless you make a way therefore, when as it seeketh passage forth, wich must bee don by horns, cupping-glasses, vesicatories, cauteries, or other the like art.

CHAP. XIX.

What is to bee don after the fit of Gout is over.

How to strengthen the joints.

IT is convenient when the pain is asswag'd, that you strengthen the joints. Now, to strengthen them is not onely to binde and drie, but wholly to amend the weakness left in the part by the disease, that is to discuss the humor, if anie superfluitie thereof remain; but to humect the part, if the moisture bee exhausted and dried up. But such as are troubled with the gout, after they are free'd from their pain, have notwithstanding such impotencie of their joints that they cannot go of a long time after; for that the nervs and

Remedies for the weakness left in the joints after the pain is gon.

tendons

tendons which are in great number in the feet, beeing moistned with much phlegm, are so relaxed, that they can no more sustain or bear themselvs upon their feet, then paper when it is wet can bee made to stand. Wherefore, that they may recover the use of their feet, the impacted humor must by all means bee discussed, and spent with fomentations, cataplasms, drying and astringent emplasters. You may use the formerly described fomentation, encreasing the quaintitie of alum and salt, and adding thereto a like quantitie of *sulphur vivum*: then the following emplaster shall bee applied thereto. Rx. *mas. emplast. contra rupturam* ℥iiii. *tereb.* ℥ii. *pulv. ros. rub. nucum cupress. gallarum, gran. myrtil. & foliorum ejusdem, thuris, mastich. & caryophyl. an.* ℥i. *malaxentur omnia simul, mixtus immixtis olei myrtini & mastichini, fiat emplastrum.* Let it bee spread upon leather to a just bigness, and applied to the top and sole of the foot. Draw over the plaster, and the whole leg a stocking made of a tanned-dog's-skin; this emplaster strengtheneth the nervs, draweth forth the humor impact therein, and intercept's the defluxion. But the dog-skin-stocking preserveth the native heat of the part, and for that it bindeth, hindreth the defluxion into the feet.

The benefit of a dog-skin stocking.

CHAP. XX.

Of the Tophi, *or knots which grow at the joints of such as are troubled with the Gout.*

Whence the *Tophi* are generated.

SOm that are troubled with the Gout, have knottie bunches growing in their joints, which by the antients were called *Tophi*. These are generated by the congestion of gross, viscid and crude phlegm, with a little admixtion of an acrid and cholerick humor. These matters remain settled in the part, for that it beeing too weak cannot digest and depress them; wherefore beeing there impact, they easily concrete into a certain plaster-like or chalk-like substance, whilest by the adventitious and burning heat caussed by pain, and the goutie malignitie, their more subtle part is dispersed, but the grosser subside's. Yet somtimes the unfit application of repercussive or discussive medicines is a caus of the generation of these *Tophi*. For by the former, the impact matter is incrassated and gathered together; but by the later, the subtle part beeing discussed, the remnant that subside's, concrete's into *Tophi*. Those medicines which are made to mollifie, ought to have a moderately heating, and humecting facultie, that they may diffuse, and as it were dissolv the impact matter; such is warm water, the decoction of emollient herbs, the decoction of calv's or sheep's entrails, heads and feet: after these or the like fomentations, you shall use the following medicine. Rx. *axungiæ, human. anseris & gallinæ, medul. cervin. an.* ℥ii. *tereb. ven.* ℥i. *aq. vitæ parum, ceræ quantum sufficit, fiat unguentum molle.* Then this which followeth will bee good. Rx. *rad. altb. liliorum, bryon. lapath. acuti, an.* ℥iiii. *coquantur completè, & trajiciantur per setaceum; adde gum. ammon. bdel. galb. opopanacis in aceto dissolutorum* ℥i. *medul. cervin.* ℥iß. *incorporentur simul, & applicentur.* Or elß, Rx. *olei liliorum, amygd. dul. medullæ cruris cer. an.* ℥iiß. *mucag. sem. lini, alth. fœnugr. an.* ℥i. *ceræ quantum sufficit; fiat ceratum.* Or elß, Rx. *empl. de vigo cum mercurio, & cerat. de æspo humidâ descript. Philagrii, an.* ℥ii. *malaxentur simul cum oleo lilior. fiat massa.* Or elß, Rx. *gum. ammon. opopan. galb. bdel. dissolutorum in aceto, an.* ℥ii. *panno lineo colatis, adde pulv. sulph. nitr. sinapi, pyrethri, an.* ℥ß. *styracis, liq & axung. hum. an.* ℥i. *res. pini, tereb. ven. an.* ℥ß. *ceræ quantum sufficit, fiat ceratum molle.* This which follow's is thought most effectual in the opinion of *Galen* and *Avicen.* Rx. *pedes porcel. bene salsos, nu.* iiii. *veterem pernam, cum illis coque, addendo sub finem, radicis bryoniæ, lapath. acut. an.* ℥iii. *axungiæ tauri, & medul. cervin an.* ℥i. *cum caseo putrefacto fiat empl. molle ad usum.* This which follow's is also most effectual. Rx. *casei acris & putrefacti,* ℥iiii. *pulv. sulph. vivi euphorb. & pyreth. an.* ℥iii. *decoctionis veteris, pernæ & porcellorum quod sufficit ad incorporandum, ducantur in mortario, & fiat empl. ad usum.* Or elß, Rx. *fumi nitri,* ℥vi. *tereb.* ℥ii. *olei veteris, lixivii, quo lanæ pileorum lavantur, & ceræ quantum sufficit, fiat ceratum satis molle.* After the use of emollients, a fumigation shall bee made in this manner: Heat a cogle-stone, mill-stone or brick red hot in the fire, take it forth, and cast upon it a sufficient quantitie of verie sharp vineger, and *aqua vitæ*, the rising vapor shall bee diligently received by the affected member, for this hath a facultie to attenuate and cut gross, viscid, and plaster-like matter, yea also, and to break the skin; yet that is broken oftime of its own accord, without the help of either medicine or instrument. To conclude, these medicines which are good to mollifie scirrhous tumors, the same are also good to soften the goutie knots and *tophi*. But wee must note, that these knottie bunches are somtimes suppurated, not truly by the impact and plaster-like matter, but by a new defluxion comming on a sudden, and then it is necessarie to make way for the contained matter, which beeing don, first there commeth forth an humor like milk, then a plaster-like matter, then it leav's behinde it an ulcer to bee cured by applying thereto *empl. gratiâ Dei*, and others as the Surgeon shall think fit.

Lib. 10. simp. c. 7. sect. 22. lib. 3. tract. 2. c. 21.

An effectual fumigation.

CHAP. XXI.

Of Flatulencies contained in the joints, and counterfeiting true Gouts, and of the remedies to bee used thereto.

In what joints flatulencies are chiefly generated.

OFtimes there is small quantitie of humor, which move's the pain of the Gout; but much flatulencie mixed therewith, especially in great joints, as in the huckle or hip-bone, and the knees; they somtimes caus so great distention, that they drive the heads of the bones forth of their places. You may partly understand it is so, if a tensive pain afflict the patient with anie sent of heavineſs; if when you pres the tumor with your fingers, the place retain no mark or impression thereof, as happen's in an *œdema*: but on the contrarie, a flatulent spirit lift's it up as it were by renitencie, as if one should thrust a pair of bellows, which are filled with winde; hence the part cannot perform its dutie, for that the spaces of the joints are possessed with abundance of flatulencies, so that the libertie of motion is intercepted, and the member is kept as it were bound up. Manie no verie skilful Surgeons, putting their fingers to these kinde of tumors, so that lifting up the one, they pres down the other, when as they perceive the flatulencie, as it were, riling between their fingers, supposing it to bee the motion of *pus*, or matter alreadie generated & flowing up and down, as is usual in impostumes, they have opened it by incision; but when as nothing flowed forth, it appeared how much they were deceived, yet in the *interim*, by this their rashneſs they have caused manie dangerous symptoms: as increas of pain, defluxion of humors, by force whereof the bones have been dislocated, and brought to the patient an uncureable lameneſs. But these flatulent Gouts are seldom without som phlegmatick matter, which is neither too crude, nor viscid. Such like flatulencies are not easily discussed, nor at the first endeavor, by reason of a cold distemper which they bring to the part, and the densitie of the membranes and ligaments, by which the articulation is knit and fastened, so that scarce anie part of that which is there shut up can breathe forth of such straight passages. Therefore the cure must bee undertaken with resolving, discussing, and drying fomentations; as for example, with a decoction of fennel, anis-seeds, rue, chamomil, melilote, sage, rosemarie, *origanum*, calaminta, hore-hound, and the like, boiled in wine with a little lee, rose-vineger, and common salt. This following ointment shall bee used after the fomentation. ℞. *olei chamæm. aneth. rut. lauri, an.* ℥ii. *cum cerâ albâ, fiat linimentum, addendo aq. vitæ parum.* After you have annointed it, applie thereto this following cataplasm. ℞. *flor. cham. melil. aneth. ros. rub. pulv. an.* m. i. *fol. malv. & absinth. an.* m. ß. *furfur,* m i. *bulliant omnia simul cum lixivio, & vino rubro, deinde pistentur cum medullâ panis, & farinâ fabarum, quantum sufficit, fiat cataplasma, addendo ol. ros. & myrtin. an.* ℥ii. Som highly approov of this following medicine for the wasting of flatulencies. ℞. *axung. suil.* ℥iv. *calcis vivæ,* ℥iß. *terantur diligenter in mortario, & incorporata applicentur.* Or elſ, ℞. *stercor. caprar. cocti cum vino & aceto, an.* ℞ß. *tereb. venet. & mel. com. an.* ℥ii. *aq. vitæ,* ℥ß. *pul. rad. Irevs florent. & sabin. an.* ℥iii. *olei rut. & aneth. an.* ℥i. *farin. fabarum quantum sufficit.* Make a cataplasm to the form of a pultis. Also stoups dipped in oxycrate, and wrung out, shall bee applied: in this oxycrate shall bee boiled wormwood, *origanum*, chamomil, melilote, rue, common salt, adding thereto som *aqua vitæ*. Then the part shall bee bound up as straight as the patient can endure it; in conclusion, that the native strength may by little and little bee restored to the part, it shall bee fomented with lee made of the ashes of oak-wood, and the cuttings of vines, wherein shall bee boiled salt, sulphur, choice alum, and wetting linnen-clothes, or stoups therein, and applying them, it shall bee straightly swathed up. Yet if great pain shall more cruelly vex the part, then neglecting for a time the proper cure of the disease, you shall withstand the symptom by rubbing the part, and annointing it with som discussing oil, laying thereon som moist wooll, and other anodyne things.

How flatulencies may make you believ there is *pus*, or matter.

Why hard to cure.

Signs of flatulencies.

CHAP. XXII.

Of the Ischias, *Hip-gout, or* Sciatica.

Why it hath the most grievous symptoms.

FOr that the Hip-gout in the greatneſs of the causes, bitterneſs of pain, and vehemencie of other symptoms, easily exceed's the other kindes of Gout, therefore I have thought good to treat thereof in particular. The pain of the *Sciatica* is therefore the most bitter, and the symptoms most violent, for that the dearticulation of the huckle-bone, with the head of the thigh-bone, is more deep then the reſt; becaus also the phlegmatick humor which causeth it, is commonly more plenteous, cold, gross, and viscid, that flow's down into this joint: and lastly, becaus the *Sciatica* commonly succeed's som other chronical disease, by reason of the translation and falling down thither of the matter, becom malign and corrupt by the long continuance of the former disease. But the pain not onely trouble's the hip, but entring deep, is extended to the muscles of the buttocks, the groins, knees, and verie ends of the toes, yea often times it vexeth

The caus of the large spreading of the pain.

vexeth the patient with a ſenſ of pain in the verie *vertebra* of the loins, ſo that it make's the patients, and alſo oftimes the verie Phyſicians and Surgeons to think it the winde or ſtone-colick. The cauſe of ſuch wandering and diſperſed pain is to bee referred to the manifold diſtribution of the nerve which com to that joint from the loins and *bolie-bone*, for they are ſent into the muſcles of the buttocks, and ſo diſperſed over the whole leg to the verie ends of the toes, as it is ſhewed in our Anatomie. Therefore the pain is largely extended, that is, to what part ſoever a nerv run's which com's from the affected hip. Often times there is no ſwelling, no redneſs, nor diſtemper manifeſt to the eie, by reaſon that the veins are verie few which riſe into the ſurface and skin of this part, and the humor lies, as it were, ſunk in; which is the cauſ that diverſ times the excrementitious humors mixed with flatulencie, run ſo violently into the cavitie of this joint, that relaxing the ligaments, as well proper as common, the head of the thigh-bone is eaſily driven out from hence, ſo that it may never bee reſtored again, if it remain ſo for anie ſpace of time; for that in this time the humor falling down into this cavitie, by delaie concrete's as it were into a ſtonie bodie, and the head of the thigh-bone wear's it ſelf another cavitie in the neighboring bone; but the lips of the true cavitie, which are griſtlie, becom more ſtraight and depreſt: and laſtly, all the ligamentous bodies moiſtned with this excrementitious humor becom more looſ and weak, whence ſucceed manie and moſt grievous ſymptoms; as lameneſs, and the decaie not onely of the thigh and leg, but at length of the whole bodie; and laſtly, a ſlow and hectick fever, which in continuance of time will conſume the patient for the cauſſes formerly mentioned. Therefore let Phyſicians and Surgeons have a care that they reſiſt it at the firſt, and, with ſuch powerful remedies as are mentioned in the following Chapter, hinder the ſpringing up and growth of the formerly mentioned ſymptoms.

The thigh-bone often diſlocated by the Sciatica.

CHAP. XXIII.

The cure of the Sciatica.

THough the *Sciatica* bee commonly occaſioned by tough phlegm, yet if the patient bee ſtrong, and abound with blood, and all things elſ conſent, it ſhall bee good to draw blood by opening a vein; for phlebotomie equally evacuate's all humors: therefore the falling down of the humors into the part affected, is thereby hindered or retarded. Verily, I have known no ſpeedier remedie to aſſwage the pain of inflammation, then blood-letting, beeing firſt made on the *Baſilica* of the grieved ſide for revulſion's ſake; and then for evacuation of the conjunct matter on the *vena Iſchiadica*, which is at the out-ſide of the ankle, if the pain of the *Sciatica* bee more on the out-ſide; or elſ on the *Sapheia*, which is on the in-ſide of the ankle, if the inner parts bee more pained. The quantitie of blood which is to bee drawn, muſt bee left to the judgment of the Phyſician, without whoſe advice I would attempt nothing in this caſe. Alſo acrid glyſters are good, if there bee nothing which may hinder; as ulcers of the guts, or hemorrhoids. ℞. *rad. acor.* ℥ii. *centaur. rut, ſalv. roriſm. calam. origan. puleg. an.* m.ß. *ſtæchad. arabic. flo. chamm. melil. aneth. an* p.i. *ſem. aniſ. & fœnic. an.* ℥ß. *fiat decoctio ad* lbi. *in colaturâ diſſolve bieræ & diaphen. an.* ℥ß. *mellis anthoſ. ſacc. rub. an.* ℥i. *olei liliorum* ℥iii. *fiat clyſter.* Strong purgations are alſo here uſefull, as of *pillul. fœtid. arthritic. Aſſajereth. de Hermodactylis*, and others uſed in phlegmatick cauſſes. *Electuarium Diacarthami* purgeth choler and phlegm. Often vomitings do not onely evacuate the humors, but alſo make revulſion, as wee have formerly delivered. Baths & ſweats profit no otherwiſe then a decoction of *Guaicum* or *ſarſaparilla*. If heat moleſt the part, then foment it with oil of roſes and vineger, eſpecially if the pain bee deep in, for vineger by its tenuitie pierceth to the bottom, and make's a way for the oil, which of its own nature is anodyne. After the uſe of general medicines, you ſhall applie attractive and reſolving things: emplaſters of pitch and ſulphur, or of *ammoniacum, euphorbium, terebinthina, propolis, galbanum, bdelium, Opopanax*, draw the humor from within to the ſurface or skin. As in like ſort alſo the chymical oil of ſage, roſemarie, pellitorie of Spain, and ſuch other like do the ſame, which by reaſon of the tenuitie of their ſubſtance, and their ſeparation from earthie impuritie, have far more powerful and expedite faculties to penetrate and diſcuſs. Yet muſt you uſe none of all theſe without verie good judgment and deliberation, otherwiſe there will bee danger of inflammation.

Why wee muſt open a vein in the Sciatica.

When the vena Iſchiadica and Sapheia muſt bee opened in the Sciatica.

Strong purgations in the Sciatica.

There may alſo bee made fomentations of diſcuſſing and reſolving herbs, as the roots and leavs of dane-weeds, orris, bay and juniper-berries, the ſeeds of fenugreek, aniſ, fennel, the leavs of ſage, roſemarie, chamomile, melilote, elder, and the like, boiled in wine and oil: the following plaſter is much commended by the antients to digeſt, or reſolv and aſſwage the pain, with this which draw's forth thorns, ſplinters, and rotten bones. ℞. *ſem. urtic. mundat. ſpumæ borac. ſalis ammoniaci, rad. ariſtoloch. rotund. colocynth. terebinth. venet. an.* ℥x. *fœnug. piperis longi, xylobalſam. thur. myrrhæ, adipis cap. gum. pini, an.* ℥v. *cereæ,* lbß. *lactis ficus ſylv.* ℥ß. *ex omnibus ſecundum artem præparatis cum oleo liliorum, & vini generoſi quantitate ſufficiente fiat emplaſtrum.* Let it bee applied to the hip. Or, ℞. *ſinapi acerrimo aceto diſſoluti,* ℥ii. *fermenti*

acria, ʒß. *pul. hermodact.* ʒii. *mellis com.* ʒiii. *tereb.* ʒiv. *olei laur. & de ſpicâ, an.* ʒii. *far. fœnug.* ʒiß. *terræ formicarum cum ovis, lbi. ſel. laur. ſalv. rut. rorism. an. m.* ß. *permixtum torreſt. præpar.* lbſ. The earth with the eggs and worms ſhall bee boiled apart with the white wine, and herbs cut in pieces, and theſe beeing ſtrained out, the reſt of the things ſhall bee added according to art, and then it ſhall bee applied to the hip. Or elſ, ℞. *rad. enul. comp. ſigil. ſalem. bryon. biſmal. an.* ʒii. *coquantur omplexè & terantur, trajiciantur per ſetaceum, addendo farin. fœnug. & hordei, an.* ʒi. *olei liliorum, & chamæm. an.* ʒiii. *tereb.* ʒiv. *ceræ quantum ſufficit, fiat cataplaſma.* It reſolv's, aſſwageth pain, and calleth forth the humors to the skin. Or elſ, ℞. *rad. ſigil. beätæ Mariæ,* ʒvi. *empl. diachyl. albi,* ʒiv. *croci in aquâ vitæ diſſoluti,* ʒii. *terebinth.* ʒi. *ol. de ſpicâ nardi quantum ſufficit, fiat empl.* Let it bee ſpread upon leather, and applied warm. I have oftentimes ſuddenly aſſwaged the pain of the *Sciatica*, by putting to the pained hip the root of black Brionie cut into ſlices, and applied, when the matter was cold. Or elſ, ℞. *ceræ citrin. & tereb. abiet. an.* ʒii. *liqueſiant ſimul in vaſe duplici, & ubi reſtixerint, adde pulv. hermodact.* ʒſs. *flor. chamæm. irid. flor. an.* ʒiii. *ſpicæ nardi, flor. thymi, an.* ʒii. *interioris cinamomi electi. & ſemin. naſturt. an.* ʒii. *croci,* ℈iv. *malaxentur ſimul manibus axungiâ porci vetere non ſalitâ unctis, & fiat maſſa empl.* But if the pain bee not by this means aſſwaged, then muſt wee com to more powerful medicines, as to uſe great cupping-glaſſes applied with much flame, and to veſicatories: As, ℞. *cantharid. quibus detractæ ſunt alæ,* ʒii. *ſtaphiſagr.* ʒiii. *ſinapi,* ʒiß. *fermenti acerrimi* ʒß. *incorporentur ſimul, & fiat veſicatorium.* Alſo bliſters may bee raiſed by applying the inner rinde of Travellers-joy to the weight of ſom two drams, a little beneath the grieved part: you muſt have a care that the ulcers that remain after the skin of the bliſters is taken off, do run, and bee kept open for ſom time after, that ſo more of the humor contained in the part may bee drawn away. But if wee cannot avail by theſe means, wee muſt, according to *Hippocrates* his counſel, com to the laſt and extremeſt remedie. *Such* (ſaith hee) *as are troubled with a long pain of the* Sciatica, *have their hip fall out of joint, their leg conſume's, and they becom lame, unleſs they bee burnt.* Wee have alſo read the ſame approved by *Celſus*. *It is the laſt* (ſaith hee) *and moſt effectual medicine in longer diſeaſes, to cauterize with hot irons the skin of the hip in three or four places; and then not to heal up theſe ulcers or fontenels as ſoon as may bee, but to keep them open, by putting thereinto bullets of gold, or ſilver, or pills of gentian, or wax melted and wrought up with the powder of vitriol, mercurie, and the like catheretieks, until the affect againſt which wee uſe this remedie bee helped, for by this means manie have been helped.* Therefore three or four actual cauteries, or hot irons ſhall bee ſo thruſt in about the joint of the hip, that they may enter into the fleſh ſom fingers breadth, yet ſo that you ſhun the nervs. Cauteries here do good, for that by heating the part, they heat and diſſolv the cold humors, they cut, attenuate, and draw forth the groſs and viſcid, ſo that they flow out by the ulcers, together with the quitture. Over and beſides, the ligaments are ſtrengthned by their cicatrization, and their looſneſs helped; and by this means the whole part is notably corroborated.

Black brionie diſcuſſeth.

A ſtrong veſicatorie.

The inner rinde of Travellers-joy a veſicatorie.

The uſe of cauteries in the *Sciatica*.

CHAP. XXIIII.

Of the flatulent convulſion, or convulſive contraction, which is commonly called by the French, Goute Grampe, *and by the Engliſh,* The Cramp.

What the Cramp is.

THat which the French call *Goute Grampe*, wee here intend to treat of, induced thereto rather by the affinitie of the name, then of the thing; for if one ſpeak truly, it is a certain kinde of convulſion generated by a flatulent matter, by the violence of whoſe running down or motion, oftimes the neck, arms, and legs are either extended, or contracted into themſelvs with great pain, but that for a ſhort time.

The cauſ thereof.

The cauſ thereof is a groſs and tough vapor, infinuating it ſelf into the branches of the nervs, and the membranes of the muſcles. It take's one on the night, rather then on the day, for that then the heat and ſpirits uſually retire themſelvs into the entrails and centre of the bodie; whence it is that flatulencies may bee generated, which will fill up, diſtend and pull the part whereinto they run, juſt as wee ſee lute-ſtrings are extended.

Who ſubject thereto.

This affect often take's ſuch as ſwim in cold water, and cauſſeth manie to bee drowned, though excellent ſwimmers, their members by this means beeing ſo ſtraightly contracted, that they cannot by anie means bee extended. For the skin, by the coldneſs of the water is contracted and condenſed, and the pores thereof ſhut, ſo that the engendered flatulencies have no paſſage forth. Such as give themſelvs to drunkenneſs and gluttonie, or ſloth and idleneſs, are uſually more frequently troubled with this diſeaſ, by reaſon of their heaping up of crudities.

The cure.

Therefore it is cured by moderate diet, and ordering of the bodie, and exerciſe of each part thereof; for thus they gather ſtrength, and the generation of the flatulent matter is hindred. In the verie time when it take's one, the patient ſhall bee cured by long rubbing with warm clothes, and *aquâ vitæ*, wherein the leavs of ſage, roſemarie, thyme, ſavorie, lavander, cloves, ginger, and the like diſcuſſing and reſolving things have been infuſed. The extenſion and flexion of the members or joints, and walking, are alſo good.

The end of the eighteenth Book.

Of the *Lues Venerea*, and thoſe Symptoms which happen by means thereof.

The nineteenth Book.

CHAP. I.

THe French call the *Lues Venerea* the *Neapolitan diſeaſ*; the Italians and Germans (as alſo the Engliſh) term it the *French diſeaſ*; the Latines call it *Pudendagra*: others name it otherwiſe. But it make's no great matter how it bee called, if the thing it ſelf bee underſtood: Therefore the *Lues Venerea* is a diſeaſ gotten or taken by touch, but chiefly that which is in unclean copulation; and it partake's of an occult qualitie, commonly takeing its original from ulcers of the privie parts, and then further manifeſting its ſelf by puſtles of the head, and other external parts; and laſtly, infecting the entrails and inner parts with cruel and nocturnal tormenting pain of the head, ſhoulders, joints, and other parts. In proceſs of time, it cauſſeth knots and hard *tophi*: and laſtly, corrupt's and foul's the bones, diſſolving them, the fleſh about them beeing ofttimes not hurt; but it corrupteth and weakneth the ſubſtance of other parts, according to the condition of each of them, the diſtemper and evil habit of the affected bodies, and the inveteration or continuance of the morbifick cauſ. For ſom loſe one of their eies, others both: Som loſe a great portion of the eie-lids, other-ſom look verie gaſtly, and not like themſelvs, and ſom becom ſquint-eied. Som loſe their hearing, others have their noſes fall flat, the palat of their mouths perforated with the loſs of the bone *Ethmoides*, ſo that inſtead of free and perfect utterance, they faulter and fumble in their ſpeech. Som have their mouths drawn awry, others their yards cut off, and women a great part of their privities tainted with corruption. There bee ſom, who have the *uretbra* or paſſage of the yard obſtructed by budding caruncles, or inflamed puſtles, ſo that they cannot make water without the help of a Catheter, readie to die within a ſhort time, either by the ſuppreſſion of the urine, or by a gangrene ariſing in theſe parts, unleſs you ſuccor them by the amputation of their yards. Others becom lame of their arms, and other-ſom of their legs, and a third ſort grow ſtiff by the contraction of all their members; ſo that they have nothing left them ſound but their voice, which ſerveth for no other purpoſe but to bewail their miſeries, for which it is ſcantly ſufficient. Wherefore ſhould I trouble you with mention of thoſe that can ſcantly draw their breath by reaſon of an *Aſthma*: or thoſe whoſe bodies waſte with an hectick fever, and ſlow conſumption? It fare's far worſ with theſe, who have all their bodies deformed by a leproſie ariſeing there-hence, and have all their throttles and throats eaten with putrid and cancrous ulcers; their hair falling off from their heads, their hands and feet cleft with tetters and ſcalie chinks: neither is their caſe much better, who, haveing their brains tainted with this diſeaſ, have their whole bodies ſhaken by fits of falling-ſickneſs; who troubled with a filthie and curſed flux of the bellie, do continually caſt forth ſtinking and bloodie filth. Laſtly, there are no kindes of diſeaſes, no ſorts of ſymptoms, wherewith this diſeaſ is not complicate, never to bee taken away, unleſs the virulencie of this murrain bee wholly taken away, and impugned by its proper antidote, that is, *argentum vivum*.

What the *Lues Venerea* is.

What hurt it doth to the bodie.

The Leproſie ſomtimes the off-ſpring of the *Lues Venerea*.

CHAP. II.

Of the cauſſes of the Lues Venerea.

THere are two efficient cauſſes of the *Lues Venerea*; the firſt is, a certain occult and ſpecifick qualitie, which cannot bee demonſtrated; yet it may bee referred to God, as by whoſe command this hath aſſailed mankinde, as a ſcourge or puniſhment to reſtrain the too wanton and laſcivious luſts of unpure whoremongers. The other is an impure touch or contagion, and principally, that which happeneth in copulation. Whether the man or woman have their privities troubled with virulent ulcers, or bee moleſted with a virulent ſtrangurie (which diſeaſ craftie Whores color by the name of the whites) the malignitie catcheth hold of the other; thus a woman

The *Lues Venerea* the ſcourge of Whore-mongers.

taketh this diſeaſ by a man, caſting it in her hot, open and moiſt womb; but a man taketh it from a woman, which, for example ſake, hath ſom ſmall while before received the virulent ſeed of a whore-maſter polluted with this diſeaſ, the mucous *ſanies* whereof remaining in the wrinckles of the woman's womb, may bee drawn in by the pores of the ſtanding and open yard, whence ſucceed malign ulcers, and a virulent ſtrangurie. This virulencie, like a torch or candle ſet on fire, will by little and little bee propagated and ſent by the veins, arteries and nervs to the noble parts; whoſe malignitie a ſtrong liver not endureing, by the ſtrength of the natural expulſive faculrie, will ſend it into the groins, whereon follow abſceſſes, therefore called *Venereal Bubo's*. Theſe, if they return in again, and caſt not forth matter by beeing opened, they will, by their falling back into the veins and arteries, infect the maſs of the blood by the like tainture, and thence will enſue the *Lues Venerea*. Yet this diſeaſ may bee got by a more occult manner of touch, as by breathing onely. For it is not altogether beſides reaſon and experience, that a woman long troubled with this diſeaſ, may by importunate and often kiſſing, transfuſe malignitie into a childe; for the tender and ſoft ſubſtance of a little childe may bee altered, infected, and by little and little corrupted by receiving of filthie, and in their whole kinde malign vapors. For it is known, and now vulgarly beleeved, that mid-wives, by receiving the childe of a woman infected with this diſeaſ, to have got this affect, the malignitie beeing taken and drawn into their bodies through the pores of their hands by the paſſages of the veins and arteries. Neither doth it ſpare anie condition, ſex, nor age of men: for, not onely whoſoever uſe copulation, but ſuch as onely lie with them, may bee taken by this virulencie; yea verily, if they onely lie in the ſheets or coverings which retain his ſweat, or the virulencie caſt forth by an ulcer. The ſame danger may aſſail thoſe who ſhall drink in the ſame veſſel after ſuch as are troubled with this diſeaſ. For by the impure touch of their lips, they leav a virulent *ſanies* and ſpittle upon the edges of the cup, which is no leſs contagious in its kinde then the virulencie of leprous perſons, or the ſome of mad dogs. Wherefore it is no marvel if children nurſed by an infected nurſ, draw in the ſeeds of this diſeaſ together with the milk, which is onely blood whitened in the breaſts; or infected ſucking children by their hot and ulcerated mouths, may transfuſe this malignitie into the bodie of the nurſ, by the rare, looſ and porous ſubſtance of the dugs which it frequently ſucketh.

Venereal Bubo's returning in again, occaſion the *Lues Venerea*.

The *Lues Venerea* may bee got by the onely communication of vapos.

How nurſes may infect children, and they their nurſes.

This following hiſtorie is verie memorable to this purpoſe. A certain verie good Cittizen of this Cittie of Paris granted to his wife, beeing a verie chaſte woman, that conditionally ſhee ſhould nurſ her own childe, of which ſhee was lately delivered, ſhee ſhould have a nurſ in the houſ to eaſ her of ſom part of the labor: by ill hap, the nurſ they took was troubled with this diſeaſ; wherfore ſhee preſently infected the childe, the childe the mother, the mother her husband, and hee two of his children, who frequently accompanied him at bed & board, beeing ignorant of that malignitie wherewith hee was inwardly tainted. In the mean while the mother when ſhee obſerved that her nurſ-childe came not forward, but cried almoſt perpetually, ſhee asked my counſel to tell her the cauſ of the diſeaſ; which was not hard to bee don, for the whole bodie thereof was repleniſhed with venereal ſcabs and puſtles, the hired nurſes and the mother's nipples were eaten in with virulent ulcers; alſo the father's, and the two other children's bodies, whereof the one was three, the other four years old, were troubled with the like puſtles and ſcabs. I told them, that they had all the *Lues Venerea*, which took its original and firſt off-ſpring by malign contagion from the hired nurſ. I had them in cure, and by God's help healed them all, except the ſucking-childe, which died in the cure. But the hired nurſ was ſoundly laſhed in the priſon, and ſhould have been whipped through all the ſtreets of the Cittie, but that the Magiſtrate had a care to preſerv the credit of the unfortunate familie.

An hiſtorie.

CHAP. III.

In what humor the malignitie of the Lues Venerea *reſide's.*

THough in the opinion of manie the antecedent cauſ of this diſeaſ bee the maſs of blood containing the four humors, yet I had rather place the matter, and primarie, and chief ſeat thereof in groſs and viſcid phlegm infected with the malign qualitie of the venereous venom, and from this beginning and foundation, I think by a certain contagious growth it ſooner or later infect's the other humors, as each of them is diſpoſed or apt to ſuffer. Of which my opinion there are manie arguments, but this chiefly, That by the evacuation of a phlegmatick humor, whether by the mouth and ſalivation, or by ſtool, urine, or ſweat in men of what temper ſoever, whether cholerick, ſanguine or melancholick, the diſeaſ is helped or cured. Secondly, for that the exceſs of pain is more by night then by day, becauſ then the phlegm bearing ſway, ſever's the *perioſtium* from the bone, or elſ offend's it and the reſt of the membranous and nervous bodies by the acrimonie of its malignitie. Thirdly, becauſ the patients are hurt by the uſe of cold things, but uſually finde benefit by hot medicines, whether they bee

Why the pain is worſ upon the night, then on the day.

bee ointments, plaſters fumigations, or whatſoever elſe, inwardly taken, or outwardly applied. Fourthly, for that in venereous puſtles there is found a certain hardneſs at the root, though outwardly they make ſhew of choler or blood. For being opened, you ſhall finde them ſtuffed with a certain plaſter-like and tophous matter, or elſe with rough phlegm, or viſcous *pus*; whence ariſe theſe hard *tophi*, or bonie excreſcences upon the bones, if not from phlegmatick humors there heaped up and concrete. Fifthly, for that the ſpermatick and cold parts do primarily and principally feel the harm of this diſeaſ. Sixthly, for that the ulcers which over-ſpread the bodie by reaſon of this diſeaſ, admit of no cure, unleſs you cauſ ſweats. Therefore if the matter of the diſeaſ, and ſuch ulcers as accompanie it, were hot and drie, it would grow worſ, and bee rather increaſed by a decoction of *Guajacum*, the roots of *China*, or *ſarſaparilla*. Seventhly, becauſ oftimes this diſeaſ, the ſeed thereof having taken or drawn into the bodie, ſo lieth hid for the ſpace of a year, that it ſhews no ſign thereof, which happen's not in diſeaſes proceeding from an hot matter, which cauſeth quick and violent motions. By this it appeareth that the *baſis* and foundation of the *Lues venerea* is placed or ſeated in a phlegmatick humor; yet may not denie, but that other humors confuſed therewith may bee alſo in fault, and defiled with the like contagion. For there are ſcarce anie tumors which proceed from a ſimple humor, and that of one kinde, but as in tumors, ſo here the denomination is to bee taken from that humor which carrieth the chief ſway.

This diſeaſ ſomtimes lie's long hid in the bodie before it ſhew it ſelf.

CHAP. IV.

Of the ſigns of the Lues Venerea.

When the *Lues venerea* is lately taken, malign ulcers appear in the privities, ſwellings in the groins, a virulent ſtrangurie runneth oftimes with filthie *ſanies*, which proceed's either from the *proſtata*, or the ulcers of *urethra*; the patient is troubled with paine in his joints, head, and ſhoulders, and as it were breakings of his arms, legs and all his members, they are wearie without a cauſ, ſo that neither the foot nor hand can eaſily perform his dutie; their mouths are inflamed, a ſwelling trouble's their throats, which take's away their freedom of ſpeaking and ſwallowing, yea of their verie ſpittle; puſtles riſe over all their bodies, but chiefly certain garlands of them engirt their temples and heads; the ſhedding or loſs of the hair, diſgraceth the head and chin; and leanneſs deformeth the reſt of the bodie; yet all of theſe uſe not to appear in all bodies, but ſom of them in ſom. But the moſt certain ſigns of this diſeaſ are, a callous ulcer in the privities, hard and ill conditioned, and this ſame is judged to have the ſame force in a prognoſtick, if after it bee cicatrized, it retain the ſame callous hardneſs; the Bubo's or ſwellings in the groins to return back into the bodie without coming to ſuppuration or other manifeſt cauſ: theſe two ſigns, if they concur in the ſame patient, you may judg or foretel that the *Lues venerea* is either preſent, or at hand; yet this diſeaſ happeneth to manie without the concourſ of theſe two ſigns, which alſo bewraieth it ſelf by other manifeſt ſigns, as ulcers and puſtles in the reſt of the bodie, rebellious againſt medicines though powerful, and diſcreetly applied, unleſs the whole bodie bee anointed with *Argentum vivum*. But when as the diſeaſ becometh inveterate, manie becom impotent to venerie, and the malignitie and number of the ſymptoms encreaſ, their pains remain fixed and ſtable, verie hard and knotted *tophi* grow upon the bones, and oftimes they becom rotten and foul, as alſo the hands and feet by the corruption of ſalt phlegm are troubled with chops or clefts, and their heads are ſeazed upon by an *ophiaſis* and *alopecia*; whitiſh tumors with roots deep faſtned in, ariſe in ſundrie parts of the bodie, filled with a matter like the meat of a cheſnut, or like a tendon; if they bee opened they degenerate into diverſ ulcers, as putrid, eating, and other ſuch, according to the nature and conditon of the affected bodies. But why the pains are more grievous on the night ſeaſon, this may bee added to the true reaſon wee rendred in the precedent Chapter, firſt for that the venereous virulencie lying as it were aſleep is ſtirred up and enraged by the warmneſs of the bed and coverings thereof; Secondly, by reaſon of the patient's thoughts which on the night ſeaſon are wholly turned and fixed upon the onely ob ject of pain.

The moſt certain ſigns of the *Lues venerea*.

Two other cauſes of the exceſs of pain in the night.

CHAP. V.

Of Prognoſticks.

If the diſeaſ bee lately taken, aſſociated by a few ſymptoms, as with ſom ſmal number of puſtles, and little and wandring paine, and the bodie beſides bee young and in good caſe, and the conſtitution of the ſeaſon bee good and favorable, as the Spring, then the cure is eaſie, and may bee happily performed. But on the contrarie, that which is inveterate and enraged by the fellowſhip of manie and malign ſymptoms;

The ſigns of a cureable *Lues venerea*.

as a fixed pain of the head, knots and rottenneſs of the bones, ill-natur'd ulcers in a bodie verie much fallen away and weak, and whereof the cure hath been alreadie ſundrie times undertaken by Empyricks, but in vain; or elſ by learned Phyſicians, but to whoſe remedies, approved by reaſon and experience, the malignitie of the diſeaſ and the rebellious virulencie hath refuſed to yeeld, is to bee thought incureable, eſpecially, if to theſe ſo manie evils, this bee added, that the patient bee almoſt waſted with a conſumption and hectick leanneſs, by reaſon of the decaie of the native moiſture. Wherefore you muſt onely attempt ſuch by a palliative cure; yet bee warie here in makeing your prognoſtick: for many have been accounted in a deſperate caſe, who have recovered; for by the benefit of God and nature, wonders oftimes happen in diſeaſes. Young men who are of a rare or lax habit of bodie are more ſubject to this diſeaſ, then ſuch as are of a contrarie habit and complexion. For as not all who are converſant with ſuch as have the Plague, or live in a peſtilent air, are alike affected; ſo neither all who lie or accompanie with ſuch as have the *Lues venerea*, are alike infected or tainted. The pains of ſuch as have this diſeaſ, are far different from the pains of the Gout. For thoſe of the Gout return and torment by certain periods and fits, but the other are continual and almoſt alwaies like themſelvs; Goutie pains poſſeſs the joints, and in theſe condenſ a plaſter-like matter into knots; but thoſe of the Pocks are rather faſtned in the mid'ſt of the bones, and at length diſſolv them by rottenneſs and putrefaction. Venereous ulcers which are upon the yard are hard to cure, but if beeing healed, they ſhall remain hard and callous, they are ſigns of the diſeaſ lying hid in the bodie.

The ſigns of an incureable noc.

How theſe pains differ from thoſe of the gout.

Generally, the *Lues venerea* which now reigneth is far more milde and eaſie to bee cured then that which was in former times, when as it firſt began amongſt us: beſides, each day it ſeemeth to bee milder then other. Aſtrologers think the cauſ hereof to bee this, for that the celeſtial influences which firſt brought in this diſeaſ, in ſucceſs of time by the contrarie revolutions of the Stars, loſe their power and becom weak; ſo that it may ſeem ſomwhat likely, that at length after ſom few yeers it may wholly ceaſ; no otherwiſe then the diſeaſ termed *Mentagra*, which was verie like this in manie ſymptoms, and troubled manie of the Romans in the reign of *Tiberius*; and the *Lichen*, which in the time of *Claudius* (who ſucceeded *Tiberius*) vexed not onely *Italie*, but all *Europe* beſides. Yet Phyſicians had rather take to themſelvs the glorie of this leſs rageing diſeaſ, and to refer it to the manie and wholſom means, which have been invented, uſed and oppoſed thereto by the moſt happie labors of noble wits.

The *Lues venerea* becom's more gentle then formerly it was.

CHAP. VI.

How manie, and what means there are to oppugn this diſeaſ.

Why the decoction of *Guaicum* is not ſufficient to impugn the diſeaſ.

MAnie ſorts of remedies have been found out by manie to oppugn and overcom this diſeaſ. Yet at this daie there are onely four which are principally uſed. The firſt is by a decoction of *Guaicum*; the ſecond by unction; the third by emplaſters, and the fourth by fumigation: all of them by *Hydrargyrum*, the firſt excepted. Yet that is not ſufficiently ſtrong and powerful; for experience hath taught, that the decoction of *Guaicum* hath not ſufficient ſtrength to extinguiſh the venom of the venereous virulencie, but onely to give it eaſ for a time; for becauſ it heat's, attenuate's, provoke's ſweat and urine, waſt's the excrementitious humors by drying them, it ſeemeth to cure the diſeaſ, for that thereupon, for ſom time, the pain and all other ſymptoms ſeem more remiſs; but theſe endeavors are weak and deceitful, as whereby that onely which is more ſubtle in the humors in fault, is exhauſted and diſperſed by ſweat. But *Hydrargyrum*, is a certain higher power, contain's therein all the power of *Guaicum*, yet much more excellent and efficacious; for beſides that it heat's, attenuate's, cut's, reſolv's and drie's, it provoke's ſweat and urine, and beſides it expel's noxious humors upwards and downwards, by the mouth and ſtool. By which evacuations not onely the more ſubtle, but alſo the more groſs and feculent excrements, wherein the ſeat of this diſeaſ is properly fixed, are diſperſed and evacuated; by which the Phyſician may bee bold to aſſure himſelf of certain victorie over the diſeaſ. But after the uſe of the decoction of *Guaicum*, freſh pains and knots ariſe by the reliques of the more groſs and viſcous humors left in the cavities of the entrails; but *Hydrargyrum* leav's no reliques behinde it.

Hydrargyrum is ſufficient to overcom the diſeaſ.

CHAP. VII.

How to make choice of the wood Guaicum.

THat is preferred before the reſt, which is of a great log, of a duskie color, new, gummie, with a freſh ſtrong ſmell, an acrid and ſomwhat biteing taſte, the bark cleaving verie cloſe to the wood. It hath a facultie to heat, rariſie, attenuate, attract, to cauſ ſweat, and move urine, and beſides by a ſpecifick propertie to weaken the virulencie of the *Lues venerea*.

The facultie.

tree. There are three ſubſtances taken notice of in that wood: the firſt is the bark, the other is a whitiſh wood which is next to the bark, the third is the heart of the wood, that is the innest, blackiſh, and more ſolide part thereof. The bark is the more drie, wherefore you ſhall uſe it when as you would drie more powerfully. The middle ſubſtance is more moiſt, becauſe it is more ſucculent and fat; that which lieth between both, is of a milde temper. Wherefore the two laſt are more convenient for delicate natures and rare bodies, which requiire leſs drying. Furthermore, the bark muſt bee given to dreaſ and ſtuing natures, that by the more fierie force thereof, the humors may bee made more fluid; and the paſſages of the bodie rather paſſable. But I would here bee underſtood to mean ſuch bark as not putrid & rotten with age, of which ſort it is verie ſubject, for that long before it bee ſhipped by our people, the wood lieth in heaps upon the ſhore in the open air, until they can finde chappers for it; which when it is brought aboard, is ſtowed in the hold or bottom of the ſhip, where beneath by the ſea through the chinks of the boards, and above by the mariners, it uſually gathereth much dirt. When it is brought hither to us, it is bought and ſold by weight, wherefore, that it may keep the weight, the Druggiſts lay it up in vaults and cellars under ground, where the ſurface thereof bedewed with much moiſture, can ſcarce eſcape mouldineſs and rottenneſs. Wherefore, I do not like to give the decoction either of the bark or wood which is next thereto to ſick people.

The parts.

The hot and fierie facultie of the bark.

CHAP. VIII.

Of the preparation of the decoction of Guaicum.

FIrſt you muſt have your *Guaicum* ſhaved into ſmall pieces, and to everie pound of the ſhaveings, add of fair water eight, ten, or twelv pintes, more or leſs as the nature of the partie, and condition of the diſeaſ ſhall ſeem to require, according to the rule of the formerly mentioned indications. Let the water bee hot or warm, eſpecially if it bee in Winter, that ſo it may the more eaſily and throughly enter into the bodie of the wood, and draw into it ſelf the faculties thereof in the ſpace of twentie four hours, wherein it is macerated; then boil it in *in balneo*, to avoid empyreuma, or taſte of fire, which it will contract by boiling it over a hot fire. Yet ſom, nothing regard this, but think the patient ſufficiently ſerved, if they make a decoction in an earthen-pot well glazed, over a gentle fire, ſo that no part of the liquor may run over the mouth of the veſſel, for that thus ſo much of the ſtrength of the decoction might vaniſh away. Howſoever it bee made, let it bee boiled to the conſumption of half, a third, or fourth part, as the nature of the patient, and diſeaſ ſhall ſeem to require. There bee ſom who mix divers ſimples therwith, which have an occult and proper ſympathie with that part of the bodie which is principally hurt by the diſeaſ, which at the leaſt may ſerv in ſtead of a vehicle to carrie the faculties of the decoction thither where the diſeaſ moſt reigneth. Others add thereto purgeing medicines, whoſe judgment I cannot approve of, for that I think it is not for the patient's good to attempt two evacuations at once; that is to expell the humors by ſweat, by the habit of the bodie, and by purgeing by the bellie; for that as much urine, ſo alſo much ſweat ſhew's little evacuation by ſtool. For theſe two motions are contrarie, which nature cannot brook at once. For purgeing draw's from the Circumference to the Center, but ſweat run's a quite contrarie courſ, and this is the opinion of manie and great Phyſicians. This firſt decoction beeing boiled out and ſtrained, the like quantitie of water ſhall bee put to the ſtuff, or maſs, that ſo beeing boiled again without anie further infuſion, and ſtrained, with the addition of a little cinnamon for the ſtrengthening of the ſtomack, the patient may uſe it at his meals, and between his meals, if hee bee drie, for his ordinarie drink. The quantitie of the firſt decoction to bee taken at once, ought to bee ſom five or ſix ounces, and it ſhall bee drunk warm, that ſo it may bee the ſooner brought into action, and leſt the actual coldneſs ſhould offend the ſtomach; and then the patient beeing well covered, ſhall keep himſelf in bed, and there expect ſweat which if it com ſlowly on, it ſhall bee helped forwards with ſtone-bottles filled full of water, and put to the ſoles of the feet. If anie parts ſo the interius ſhall bee much pained, they ſhall bee comforted by applying of ſwines-bladders half filled with the ſame decoction heated. Neither will it bee unprofitable before the decoction bee drunk, to rub over all the bodie with warm linnen clothes, that by this means the humors may bee attenuated, and the pores of the ſkin opened. When hee ſhall have ſwet ſom two hours, the parts oppoſite to the grieved places, ſhall firſt bee wiped, then preſently, but more gently the grieved parts themſelvs, leſt a greater conflux of humors flow thereto. Theſe things beeing don, hee ſhall keep himſelf in bed, ſhunning the cold air until hee bee cooled and com to himſelf again, ſom two hours after hee ſhall ſo dine, as the diſeaſ and his former cuſtom ſhall ſeem to require; ſix hours after, betakeing himſelf to his bed, hee ſhall drink the like quantitie of the decoction, and order himſelf as before. But if hee bee either weak, or wearie of his bed, it ſhall bee ſufficient to keep the bouſ without lying down; for although hee ſhall not ſweat, yet there will bee a great diſſipation of the vapors

The proportion of the *Guaicum* to the water.

Why the decoction ought to bee performed with a drie heat.

Whether it bee fit to add purges to a decoction of *Guaicum*.

Hip. aph. ult. ſect. 6.

How, and in what quantitie this decoction muſt bee taken.

How to drie the ſweat of the bodie.

vapors, and venenate ſpirits, by inſenſible tranſpiration; for the *Lues venera* by the onely communication of theſe, often times catcheth hold, and propagat'es it ſelf in lying with a bedfellow tainted therewith. But as it is requiſite to have let blood, and purged the bodie by the advice of a Phyſician, before the taking of the decoction of *Guaicum*; ſo whil'ſt hee doth take it, it much conduceth to keep the bellie ſoluble (which is much bound by the heat and drieneſs of ſuch a drink) and to preſerv the puritie of the firſt veins by a glyſter, or laxative medicine taken everie fifth, or ſixth day. But for the uſe of it, wee muſt warily obſerv, taking indication, not onely from the malignitie and contumacie of the diſeaſ, but alſo from the particular nature of the patient; for ſuch as have their bodie waſted by heat & leanneſs, & their skin drie and ſcalie (whence you may gather a great aduſtion of the humors, &, as it were, a certain incineration of the habit of the bodie) muſt more ſparingly make uſe of theſe things, but rather temper the bodie by humecting things taken inwardly, and applied outwardly, as bathes, ointments without Quick-ſilver, and other ſuch like things. And then a verie weak decoction of *Guaicum* ſhall bee uſed for a few daies before your unction with Quick-ſilver. A more plentiful diet, as it draw's forth the diſeaſ, which of its own nature is long, ſo a more ſpareing and ſlender diet make's the ulcers more rebellious and contumacious, by a hectick drieneſs.

How long this decoction muſt bee uſed.

The manner of diet.

Therefore a middle courſ muſt bee kept, and meats made choice of which are fit, and naturally engender good and laudable juice in the bodie. For it is not onely great ignorance, but much more crueltie, to go about to contein all patients without anie difference, within the ſtrait allowance of four ounces of Ship-biſket, & twelv damask prunes: for I judg it far better to diet the patient with Lamb, Veal, Kid, Pullets, fat Larks, and black-birds, as thoſe which have a greater familiaritie with our bodies, then Prunes and the like Junkets. Let his bread bee made of white wheat, well levened, neither too new, or tough, neither too old or hard. Let his drink bee made of the maſs, or ſtrainings of the firſt decoction of *Guaicum* boiled with more water, as was formerly mentioned; yet if there ariſe anie great weakneſs of the faculties, you may permit the uſe of ſom little wine, drinking eſpecially before each a cup of the laſt mentioned decoction. Let him avoid ſleep preſently after meat, for ſo the head is filled with groſs vapors. Paſſions, or perturbations of the minde muſt alſo bee avoided, for that by theſe the ſpirits are inflamed and diſſipated; all the delights of honeſt pleaſure are to bee deſired, but venerie wholly avoided, as that which weaken's all the nervous parts. Manie in ſtead of a decoction of *Guaicum*, uſe a decoction of *China*. Now this *China* is the root of a certain Ruſh, knottie, rare, and heavie, when it is freſh, but light when it is waxed old; it is alſo without ſmell, whence manie judg it void of anie effectual qualitie, it is brought into uſe out of *India*, it it thus prepar'd, it is cut into thin round ſlices, boil'd in fountain or river water, and is given to patients to drink morning & evening after this manner. ℞. *rad. chin. in talcol. ſect.* ℥ii. *aquæ font.* ℔xii. *infundantur per hor.* xii. *& coquantur ad conſumption. tertiæ partis.* Let him take ℥vi. in the morning, and ſo much at night; let him expect a ſweat in his bed: a ſecond decoction may bee made of the maſs remaining of the firſt, but with a leſs quantitie of water put thereto, which alſo by longer boiling may draw forth the ſtrength remaining in the maſs, and bee uſed at meals for ordinarie drink. There are ſom who make a third decoction thereof, but that is wholly unprofitable & unuſeful. *Sarſaparilla* is prepared alſo juſt after the ſame manner.

To whom, and what manner of wine may bee allowed

The preparation.

Of *Sarſaparilla*.

CHAP. IX.

Of the ſecond manner of cureing the Lues Venerea, *which is performed by friction or unction.*

When the bodie muſt bee prepared with humecting things before unction.

THe cure of the *Lues Venerea* which is performed by unction and friction is more certain, yet not in everie kinde, condition and ſeaſon thereof. For if the diſeaſ bee inveterate from an humor, tough, groſs, viſcous, and more tenaciously fixed in the ſolid parts, as you may gather by the knottie tumors of the bones; for then wee are ſo far from doing anie good with a friction uſed at the firſt, that on the contrarie wee bring the patient in danger of his life, unleſs wee ſhal have firſt prepared the humor to expulſion, by emollient and digeſting things firſt uſed. But if it bee lately taken with moveable pains, puſtles, and ulcers in the jaws, throat and privie parts, then may it bee eaſily cured without ſuch preparatives, eſpecially if the humor bee ſufficiently obedient, and as it were prepared of it ſelf, and its own nature. Therefore firſt uſeing general medicines, you may afterwards com to uſe the unction with *Hydrargyrum*.

CHAP. X.

Of the choice preparation and mixing of Hydrargyrum.

HYdrargyrum which is cleer, thin, white and fluid, is the beſt: on the contrarie, that which is livid, and not ſo fluid, is thought to bee adulterated by the admixture of ſom lead.

lead. That it may bee the purer, ſtrain it through ſom ſheep-leather, for by preſſing it, when it is bound up, it paſſeth through by its ſubtiltie, and leav's the filth and leaden droſs behinde it on the inside. Then it may bee boil'd in vinegar with ſage, roſemarie, thyme, camomile, melilote, and ſtrained again; that ſo much waſte cleanſed, it may enter into ointments and plaſters: To kill it more ſurely, it ſhall bee long wrought, and as it were ground in a mortar, that it may bee broken and ſeparated into moſt ſmall particles, that by this means it may not bee able to gather it ſelf into the former bodie: to which purpoſe you may alſo add ſom *ſulphur*, or *ſublimate*, as wee ſhall ſhew hereafter. It is moſt uſually mixed with hogs-greaſ, adding thereto ſow oil of turpentine, nutmegs, cloves, ſage, and *Galen's* treacle. If a *Leucophlegmatia* together with the *Lues Venerea* affect the bodie, then hot, attenuateing, cutting and drying things ſhall bee added to the medicine, which ſhall bee provided for unction; the ſame ſhall bee don when as wee would have it to enter into the ſubſtance of the bones. But if the patient bee of a cholerick temper, and his blood eaſie to bee inflamed, you ſhall make choice of leſs hot, attractive and diſcuſſing things. As when the bodie ſhall bee repleniſhed with knottie and ſchirrhous tumors, or ſqualid by exceſſive drineſs, then ſhall emolliens and humecting things uſed therewith. But that ſuch ointments may have a better conſiſtence, I uſe to add to each pound thereof, four, five, or ſix yolks of hard eggs. Therefore this ſhall bee the form of the ointment called Vigoes. ℞. *axung. porci*, lbi. *olei chamæm. anethi. maſtich. & laurini, an.* ℥i. *ſtyrac. liquid.* ℥ſs. *rad. enulæ, cinnp. parkin tritic, & ebuli, an.* ℥iii. *pul. euphorb.* ℥ſs. *vini odorif.* ℞. *bulliant omnia ſimul uſque ad conſumptionem vini, deinde colentur; colaturæ adde hydargyri extinct.* ℥vi. *thuris, maſtich. an.* ℥vi. *reſ. pini* ℥iſs. *terebinth. veter.* ℥i. *argenti vivi* ℥iv. *ceræ albæ* ℥iſs. *liquefactis oleis, cum cerâ incorporentur omnia ſimul, fiat linimentum ad uſum.* Or elſe, ℞. *argenti vivi præparati* ℥vi. *ſublimati* ℥ſs. *ſulphuris vivi* ℥ſs. *axung. porci, ſalis experti*, lbi. *vitellos ovorum ſub cineribus coctorum*, nu. iii. *olei terebinth. & laurini, an.* ℥ii. *theriac. vet. & methridat.* ℥ſs. *fiat linimentum ut artis eſt.* You ſhall compoſe it thus, firſt the *ſublimatum* and *ſulphur* ſhall bee finely pounded, then ſom part of the *Argentum vivum* and hogs-greaſ put to them, then preſently after, ſom of the hard yolks of eggs, continually and diligently ſtirring and mixing them all together. All theſe being well incorporate, add ſom more *Argentum vivum*, hogs-greaſ, and yolks of eggs, and incorporate them with the former; at the laſt add the oils, then treacle, and methridate, and ſo let them all bee beaten together for a whole daies ſpace, and thus you ſhall make an ointment of a good conſiſtence, which I have often uſed with good ſucceſs. Yet the hogs-greaſ ſhall bee firſt boiled with the hot herbs good for the ſinews, as ſage, roſemarie, thyme, marjerom, lavander and others which the ſeaſon affords. For ſo the *axungia* acquires a more attenuating faculty, and conſolidateing of thoſe parts which the *Lues Venerea* afflict's. Beſides, when unguents are made for this purpoſe, that ſuch virulencie may bee drawn from within outwards, by ſweats and tranſpiration through the pores of the skin, no man need doubt, but that they ought to bee furniſhed with relaxing, and rarifying, and attractive faculties. But *axungia*, beſides that it verie fit to kill the *Argentum vivum*, it alſo relaxeth and mollifieth. Now *Oleum laurinum, de ſpica, ruta etiam*, rarifie, digeſt and aſſwage pain. Turpentine alſo extinguiſheth and bridleth the *Argentum vivum*, moderately heat's, reſolv's and ſtrengthen's the nervous parts. But *Argentum vivum* is the proper antidote of the *Lues Venerea*, as that which cure's it howſoever uſed, drying by the ſubtiltie of the parts, and provokeing ſweat. Verily Treacle and Methridate ſomwhat conduce to remind the virulencie of this diſeaſe, but unleſs *Argentum vivum* aſſiſt as a ferret to hunt, and an *Alexiterium* to impugn the diſeaſe, they can do no great matter.

CHAP. XLI.

How to uſe the Unction.

THe bodie and humors apt to cauſe or nouriſh a *phlebera* or inflammation, being prepared by digeſtive ſirups, and evacuated by purgeing and bleeding as is fitting, according to the direction of ſom Phyſitian, the patient ſhall bee ſhut up in a parlor or chamber, hot either by nature or art, and free from cold blaſts of winde. For cold is moſt pernitious in this diſeaſe, both for that it hurt's the nervous parts, already ill affected by reaſon of the diſeaſe, as alſo for that it leſſen's the efficacie of medicines. Wherefore many do ill in this, who, whether in winter or ſummer, anoint their patients in a large room, expoſed on every ſide to the windie. They deal ſomwhat more wiſely, who put a cloth faſtned like half a tent preſently behinde the patient, through annointed by the fire-ſide, ſo to keep away the cold air from him. Yet it is beſt to ſit, and anoint the patient either in a little room, or elſe in ſom corner of a large room, ſeparated from the reſt of the room by ſoft hangings, and building a fire, or making your fire therein, for to bee ſure ſtand or ſit as before like a tent, long, and with the head narrow, and bee equally heated on every ſide, where as ſuch as are annointed in a chamber by a fire, muſt needs bee heated unequally, ſweating profuſely on the one ſide, when as the other is cold, which motions are contrarie and hurtful to thoſe that are weak; beſides, if the patient ſhall bee weak, hee

Cold moſt hurtful to ſuch as are troubled with the *Lues venerea.*

hee cannot ſtand and endure the heat of the fire. Or if hee bee ſhamefac't, hee will bee unwilling to ſhew all his bodie at once naked to the Surgeon, but hee may without anie harm, and with modeſtie, lying on a bed in a little room, wherein a ſtove is made, have all his limbs annointed about the joints, and preſently bound up, either with ſtoupe, or carded cotton, or brown paper.

CHAP. XII.

What cautions to bee obſerved in rubbing or annointing the Patient.

The patient, if it may bee conveniently don, muſt bee annointed faſting.

WEe ſhall bee annointed or rubbed over with the ointment in the morning, the concoction and diſtribution of the meat beeing perfected, which functions otherwiſe would not bee well performed, the powers of nature beeing diſtracted into ſeveral operations. Yet if the patient ſhall bee weak, you may ſom hour before the unction, give him ſom gellie, the yolk of an egg, or ſom broth made of meat, boiled to pieces, but verie ſpareingly, leſt nature, intent upon the concoction of ſolid meats, or in great quantitie, ſhould bee drawn away from that which wee intend. At firſt, let onely the joints of the limbs bee annointed, as about the wreſts, elbows, knees, anckles, ſhoulders. But afterward, if the patient ſhall bee more ſtrong, and a greater commotion of the humors and bodie ſeem neceſſarie, the emunctories of the principal parts may alſo bee annointed, and the whole ſpine of the back; yet haveing much care, and alwaies ſhunning the principal and noble parts, leſt wee ſhould do as thoſe butcherlie Empericks do, who equally, and in like manner daub and rub over all the bodie, from the ſoles of the feet, to the crown of the head: moreover, diligent regard muſt bee had of thoſe parts, which are ſeazed upon by the ſymptoms of this diſeaſe, that they may bee more annointed, and that it may bee more throughly rubbed in. Yet you muſt alwaies begin your annointing or rubbing at thoſe parts which are leſs offended, leſt the humors ſhould bee drawn in greater meaſure to the grieved part. And as gentle fications do not ſufficiently open the pores of the ſkin, ſo more ſtrong and hard ones ſhut them up, cauſ pain, and more plentifully attract the morbifick matter. Wherefore it will bee more couvenient to uſe moderate frictions, takeing indication from the ſtrength of the patient, as that whereto wee muſt ſtill have the chief regard. There is alſo another thing whereto the Phyſician and Surgeon muſt diligently attend, as that, which if it bee not carefully prevented, will either haſten the death of the patient, or make him ſubject to a relapſe; that is, the quantitie of the remedies and unctions, and the number of the frictions. Which conſideration, together with that which is of the degrees of the temperaments of the whole bodie, and each part thereof, much trouble's the mindes of good Phyſicians, and maketh the art conjectural, it is far from beeing attained to by Empericks. Yet wee muſt endeavor by method and reaſon, that by the rule of indications ſo frequently mentioned, wee may attain to the knowledg thereof, as near as may bee. For to have perfect knowledg hereof, and to ſay that thoſe need onely four, others five, and otherſom ſix, more or fewer frictions at the beginning, which Empericks commonly do, is a thing both impoſſible and vain. All theſe muſt bee changed and ordered according to the malignitie and continuance of the diſeaſe, and the condition of the affected bodies. Verily wee muſt ſo long uſe frictions and unctions, until the virulent humors bee perfectly evacuated by ſpitting and ſalivation, by ſtool, urine, ſweat, or inſenſible tranſpiration. Which you may underſtand by the falling away and drying up of the puſtles and ulcers, and the ceaſing of the pains and other ſymptoms proper to this diſeaſe. In manie, by reaſon of the more denſ and compact habit of the bodie nature is more ſlow in excretion. Yet I have learn't by long experience, that it is beſt to annoint and chafe ſuch twice in a daie, to wit, morning and evening, ſix hours after meat. For ſo you ſhall profit more in one daie, then by the ſingle friction of three daies. But on the contraie, I have often, and with good ſucceſs, rubbed over but each other day more tace and delicate bodies, giveing them one or two daies reſt to recollect their ſtrength, which by the too much diſſolution of their ſpirits becomming too weak, were not ſufficient to expell the reliques of the morbifick matter: and certainly about the end of the appointed friction, eſpecially when as the patient begin's to flux at the mouth, the bodies, together with the noxious humors are made ſo fluid by the meins of the precedent friction, that one friction is then more efficacious then two were at the beginning. Therefore as *Galen* bid's, when as the diſeaſe is great, and the ſtrength of the patient infirm, that wee ſhould part our blood-lettings, and draw a little and a little at once; ſo alſo here when as wee ſhall obſerv nature ſtirred up, and readie bent to anie kinde of evacuation by the mouth, ſtool, or other like; you ought not to uſe anie unction or friction oftner then once in a daie; yea, certainly it will bee better to intermit for ſom ſom daies. For thus *Maſſa* report's, that there was a certain man who almoſt waſted with a conſumption, beeing continually afflicted with the moſt grievous pains of this diſeaſe, and reputed in a deſperate caſe by other Phyſicians, was notwithſtanding at length recovered by him, when as hee had annointed him thirtie ſeven times, putting ſom time between for the recoverie of his ſtrength.

In what places the bodie muſt bee annointed.

Where to begin the unction.

What it is that maketh the art of Phyſick conjectural.

Who muſt bee rubbed over once, who twice in a daie, and who but everie other daie.

Lib. de vene ſect.

I my

I my self have observed others, who thus, by the interposition of one or two daies, being rubbed over som fifteen or seventeen times, have perfectly recovered. Wherefore you must take this cours in resolved and weak bodies; yet in the *interim* must you have a care, that the frictions bee not too weak; and so few, that the morbifick cause may not bee touched to the quick: for in this kinde of disease nature doth not of it self endeavour unto *crisin*, or excretion; it require's the auxiliarie forces of medicines, by whose assistance it may expell all the malignitie. These are signs of such a *crisis*, either at hand, or alreadie present, if the patient bee so restless, so loath all things, that hee cannot remain in one place either standing or lying, hee can neither eat nor drink; if hee bee oppressed with a continual weariness, almost readie to swound, yet have a good and equal pulse, and gripings in his bellie afflict him with bloodie and viscous dejections; until at length nature after one or two daies portion of the morbifick matter being spent, bee somwhat freed, and all pains and symptoms so much abated, as the excretions have proceided. But whereas medicines are not sufficient in number or strength, there follow's an imperfect *crisis*, which leav's behinde in som reliques of the morbifick matter, which like leaven do so by little and little infect the whole mass of the humors, that oftimes after ten years space, the disease riseth as out of an ambush, or lurking-hole, and becom's far worse then before. But wee must in like manner have a care least these medicines, that are either given inwardly, or applied outwardly, bee not too strong: for by causing such colliquation of the radical moisture and solid parts, manie have been brought into an incureable consumption. In others sordid and putrid ulcers have thence arisen in the mouth, which having eaten a great part of the pallate and tongue, have degenerated into a deadly *Cancer*. In others hereupon the tongue hath so swelled up, that it hath filled the whole capacitie of the mouth, so that it could not bee bended to anie part of the mouth for chawing, whereupon they have by little and little been famished. In other som there hath been caused so great colliquation of humors, that for a whole moneth after, tough and filthie slaver hath continually flowed out of their mouths. Other som have the muscles of their jaws relaxed; others troubled with a convulsion, so that during the rest of their lives they can scarce gape. Others, by losing a portion of their jaw, have lost som of their teeth. But you must not alwaies so long annoint and chafe the bodie, until a flux of the mouth or bellie appear. For you may finde sundrie persons, who, if you should annoint or rub them to death, you cannot bring them to flux at the mouth; yet these will recover notwithstanding, excretion being made either by insensible transpiration, or evacuation of urine, or som gentle flux of the bellie, either procured by art, or comming of it self. In which case I have observed that manie have received much good by a purgeing decoction of *Guaicum*, administred according to the quantitie of the peccant humor, and given for sixe daies in the morning, adding thereto white wine, if the bodie abounded with tough and viscid humors. Dysenteries, or bloodie Fluxes caused by unctions, may bee helped by glysters, wherein much Hogs-greas is dissolved to rotund the acrimonie caused by the medicine and humor which nourisheth the Dysenterie. Also new treacle dissolved in new milk, is thought wonderfully to mitigate this symptom.

Nature is not sufficiently able to expel the virulent matter.

Signs that the *crisis* is nigh.

Inconveniences following upon immoderate unctions.

For what persons a purgeing decoction of *Guaicum* is good.

The cure of a Dysenterie occasioned by too strong friction.

CHAP. XIII.

Of the third manner of cure, which is performed by cerates, and emplasters, as substitutes of unctions.

Or that sundrie by reason of the name abhor the use of friction, which is performed by the fore-mentioned ointments, therefore there is found out another manner of cure by cerates and emplasters, as substitutes of Frictions; but that usually is somwhat slower; for which purpose it is not needful only to use the things which are described by *Vigo*, but you may also devise other, which are more or less anodyne, emollient, attenuating, discussing, or drying, according to the condition of the present disease, symptome, humors and patient, never omitting *Hydrargyrum*, the onely antidote of this disease. Such emplasters mitigate paine and knots, and resolv all hardness, and are absolutely verie effectual, for continually sticking to the bodie, they continually operate. Wherfore they are of prime use in relapses of this disease, or when the humors are thick and viscous, or otherwise lie deep in the bodie, and verie difficult to root out. But for that they work more slowly oftimes, such as use them are forced at length to use som frictions to stimulate nature, and caus the speedier excretion. Yet in som whole bodies and humors have been fluid, either by nature or art, the applied emplasters have in three daies space procured evacuation sufficient for the disease, so that if they had not been taken away, they would have caused a colliquation, like that which wee lately mentioned in too violent friction. Wherfore you shall use the like discretion in taking of these, as you use in your unctions and friction. In stead of *emp. de Vigo*, this following may bee fitly used. *Recipe emplastri melil. & oxycroci, an. libram unum vivi cotidie, &c. olei laurini, & de pilulis reducantur*

The cure by emplasters more slow.

In what case they are chiefly useful.

The description of an emplaster.

reducantur ad formam emplastri. These plasters must bee equally spread upon lether, and laid upon the same places of the joints, as were formerly mentioned in the cure by frictions. Yet som there bee, who cover with the plaster all the arm, from the hand even to the shoulder, and all the leg from the top of the knee, even to the ends of the toes, which thing I do not disallow of, if so bee that the places of the joints bee covered over with a thicker plaster. They must bee left sticking there so long, until nature bee stirred up and provoked to cause excretion of the virulent humors. Yet if in the *interim* great itching shall arise in the parts, you may take them off so long until the parts shall bee fomented with a decoction of the flowers of camomile, melilote, red roses, and the like made in wine, to discuss that which caused the itching, and then you may lay them on again. Som, to hinder the rising of anie itch, lay not the bare plaster to the part, but cover it over with sircote, so to keep it from sticking, and thus intercept the transpiration of the part, the cause of itching. They shall bee stronger or weaker, and lie to the parts a longer or shorter space, as long as the indications, so often formerly mentioned, shall seem to require. The effects of emplasters are the same as of frictions; for they cause excretion, one while by insensible transpiration, otherwhiles by a *Diarrhea*, or flux of the bellie; somtimes by urines, but most frequently (which *Crisis* is also most certain) by salivation. Sordid and virulent ulcers often breed in the mouth, tongue, pallate and gums by salivation, by reason of the acrimonie of the virulent humors adhering to the sides of the mouth: to hinder the growth of these, manie inject glysters made of emollient things, especially at the beginning of the salivation, so to draw downwards the humors forcibly flying up in greater quantitie then is fit, although the part it self may endure them.

What excretion best in this disease.

There are also som, who to the same end give a purgeing medicine at the verie time when as the humors are readie to move upwards, the which I think is not a safe course. The cure of such ulcers is far different from the cure of others. For they ought by no means to bee repercussed or repelled, how inflamed soever they bee, but onely to bee mitigated by gargarisms, so onely to lessen the heat, and that by this frequent washing of the mouth, you may hinder the sticking or furring of viscid humors to such like ulcers. A decoction of barlie, cow's-milk warm, held and gargled in the mouth, the mucilages of the seeds of mallows, marsh-mallows, *psilium*, lettuce, line extracted in the water of barlie, mallows, and pellitorie of wall, are good for this purpose; for thus the ulcers becom more milde, and the tenacitie of the adherent humors is loosed. You must at the first beware of strong detergent medicines, for almost all such have acrimonie joined with them, which will encrease the paid, but chiefly in the state of the disease: for so, the ulcers gently cleansed by frequent gargling, would becom worse by the use of acrid things. Therefore it shall bee sufficient to make use of the fore-mentioned medicines, so to hinder the encrease of the filth, and inflammation of the ulcers, if so bee that such ulcers bee not too exceeding malign and burning. For if it shall happen either by the powerful efficacie of the applied plasters, or by the violence of nature in its motion of the ill humors upward, that such store of viscous and gross humors are carried to the mouth, that it want's little, but that the part it self is over-ruled by the morbifick matter, so that by the violence and continuance of the flux, the mouth and jaws becom so swelled, that a gangrene is to bee feared, by hindering the entrance of the spirits, and extinguishing of the native heat of these parts. In this case wee are forced to leav the proper cure for to withstand the accidents, and for this purpose wee use restrictive and repelling things, such as are barlie water, plantain, night-shade, knot-grass, shepherds-Purse, and the like, with syrup of roses, violets, quinces, berberies, pomegranates and the like; also such are the mucilages and decoctions of the seeds of lettuce, *psilium*, quinces, plantain, night-shade, water-lillies, wood-bine, &c. Also it is convenient to procure sweats by slowes, or the application of anie hot and drie things; for thus the humors which run forth of the vessels into all the surface of the bodie are diverted. But when as the course of the humors running to the mouth, is beginning to stop, and the tumors and ulcers begin to lessen, then nothing hinder's, but that wee may use gently detergent things, as, *Syrup. roſarum ſiccarum*, *mel roſatum*, *Diamoron*, *Diamoron*, and the like. But when it is time to drie the ulcers, they may bee lightly touched with alum-water, or with *aqua fortis*, such as Gold-smiths have used for the separation of mettls. They may also frequently use drying gargarisms made with astriction of the waters of roses, plantain, night-shade, shepherd's-purse, knot-grass, and dog's-tongue, boiling therein *balaustiæ*, *roſ. rub. myrtil. ſumach. alumen. acacia*, *berber. galla maticor.* and the like. Dureing the time of fluxing or salivation you must diet and feed the patient with liquid meats, and those of good juice, and ease digestion, for that they bee can neither chaw, swallow, nor digest hard things. For nature wholly insists upon the excretion of the noxious and peccant humors, as also weakned by the bitterness of pain, watchings, and unquietness, and consequently a great resolution of the spirits, cannot insist powerfully upon the work of concoction. Therefore hee shall bee fed with rear new-laid eggs, broaths of the same, barlie-creame, cullesses made of a decoction of knuckles of veal, and a capon, and gellies, and

To avoid the ulcers of the mouth. To cure them.

Restrictive and repelling gargarisms.

To drie the ulcers of the mouth.

Manner of diet when the mouth is ulcerated.

with

with these in small quantitie, but frequently administred, alwaies gargling his mouth before hee eat. For his drink hee shall use a decoction of *Guaicum* aromatized with a little cinnamon; but if anie desire that the drink shall becom nourishment, for that the patients cannot feed on more solid meats, you may give them old wine, claret and thin, mixed with som barlie-water. Som there are who steep som crums of pure manchet in the foresaid wine, and then press it out, but yet so, that there may som part of the bread remain therein, which may make it more nourishing, and less sharp or acrid. Others steep bread hot out of the oven, in wine, for the space of a night, then they distil it all over in *balneo Mariæ*; the liquor which first com's over is more strong and hot, but that which flow's out afterwards, more milde, and such as the patient may use to mix with his wine without anie danger, for his better nourishment, and the recoverie of his strength. To make their drink nourishing.

For to refresh the spirits in fear of fainting, muskedine, hippocras, rose-vineger, and the like, put to the nose to smell to, will bee sufficient, unless peradventure the patient should naturally abhor such things, for so they would rather deject the powers and spirits. In the *interim*, you must have care of the bellie, that you keep it open by gentle and emollient glysters.

CHAP. XIIII.

Of the fourth manner of cureing the Lues Venerea.

Som have devised a fourth manner of cureing the *Lues Venerea*, which is by *suffitus*, or fumigations. I do not much approov hereof, by reason of sundrie malign symptoms which thence arise, for they infect and corrupt by their venemous contagion, the brain and lungs, by whom they are primarily and fully received, whence the patients dureing the residue of their lives have stinking breaths. Yea manie while they have been thus handled, have been taken hold of by a convulsion, and a trembling of their heads, hands, and legs, with a deafnes, apoplexie, and lastly, miserable death, by reason of the malign vapors of sulphur and quick-silver, whereof *cinnabaris* consist's, drawn in by their mouth, nose, and all the rest of the bodie. Wherefore I can never approov the use of such fumigations which are to bee received in fumes by the mouth and nostrils for to work upon the whole bodie; yet I do not dislike of that, which is undertaken for som one part onely, as to dri[e] up ill-conditioned ulcers, which so affect it, that they cannot bee overcom by anie other means, or for to dispers or digest knots, or to resolv fixed pains, otherwise unmoveable. These fumigations, by reason of the admixture of *argentum vivum*, have an attenuating, cutting, resolving, and colliquating facultie. Those who prepare these fumigations for the cure of the whole disease and bodie, take this cours. They put the patient under a tent or canopie made close on everie side, lest anie thing should expire, and they put in unto him a vessel filled with hot coles, whereupon they plentifully throw *Cinnabaris*, that so they may on everie side enjoy the riseing fume, just after the same manner as Farriers use to smoak their horses for the glaunders: they repeat this everie day so long, until they begin to flux at the mouth. The principal matter or *basis* of such fumigations, as wee have already noted, is *Cinnabaris* consisting of sulphur and *argentum vivum* mixed together; there is added also, *radix ireos flor. thus, olibanum, myrrha, juncus odoratus, assa odorata, mastiche, terebinthina, & theriaca*, all which have a facultie to resolv and strengthen the spirits, and nature, and correct the stinch and evil qualitie of the *argentum vivum*. There are also other fumigations made after another manner, but that also when as the *argentum vivum* is extinct, and as it were fixt after this manner; let som lead bee melted, & let there bee poured or put thereto som *argentum vivum*, then let it all bee powdred, adding thereto antimonie, aloes, mastich, coopres, orpiment, and benjamin made into powder, and framed into Trochisces with som turpentine. Or el[s], ℞ *cinnabaris*, ℥i. *styracis rub. & calamitæ, nucis moschat. an.* ℥iii. *benzoini*, ℥ß *excipe terebinth. fiant trochisci ponderis* ℥ii. for the fore-said use. The *terebinthina* is added to incorporate the drie things, and the gums are added to yield matter to the fume. But silent ulcers of the *Lues Venerea* shall not bee fumigated before they bee cleansed; also this following fumigation is good. ℞ *cinnab.* ℥i. *benzoini, myrrhæ, styracis, olibani, opopanacis, an.* ℥ß *mastiches, nucis, thuris, an.* ℥iii. *excipiantur terebinthina, & fiat suffumigium.* What fumigations good. The common manner of using them. The matter of them. Trochisces for fumigations.

CHAP. XV.

The cure of the symptoms, or symptomatick affects of the Lues Venerea: *and first, of the Ulcers of the Yard.*

Fallous and malign ulcers in this disease may grow all over the yard; but these are far more malign which arise on the prepuce, then those that grow on the *Glans*, or nut of the yard. Now they are rebellious to the common medicines of ulcers, which happen other-waies, and they are also subject to turn into a gangrene, so that sundrie, who have not in time provided for themselvs by The ulcers of the prepuce more malign then those of the *Glans*.

the uſe of *argentum vivum*, are forced for their negligence to ſuffer the loſs of their *Glans*, and oftimes of their whole yard. Yet I am of opinion, that I think wee muſt begin the cure of all ulcers of the yard with the general remedies of ulcers. For all ulcers ariſing in theſe parts by reaſon of copulation, are not virulent. But when as wee ſhall finde that wee doe no good by this means, and that the diſeaſ notwithſtanding grow's worſ and worſ, then muſt wee com to make uſe of ſuch things as receiv *argentum vivum*, that by theſe wee may reſiſt the virulencie which is readie to diſperſ it ſelf over all the bodie, yet it is abſolutely neceſſarie that all theſe things bee endued with ſuch faculties as may remnd the malign acrimonie of this venom, ſuch an one is this following *collyrium* of *Lanſranck*. ℞. *vini albi*, ℔i. *aq. roſ. & plan. ag. an.* quart. 1. *auripig.* ℥ii. *viridis æris*, ℥i. *aloës, myrrhæ, an.* ℈ii. *terantur ſubtiliſſimè, & fiat collyrium*. Alſo theſe ulcers may bee profitably touched with mercurie-water, or *aqua fortis* which the Gold-ſmiths have uſed, or elſ mercurie in powder, or our *ægyptiacum*: but the falling away of the Eſchar ſhall bee procured with *baſilicon*, or freſh butter. Yet I think it not fit to uſe theſe acrid things without verie great caution, for fear of a gangrene, which eaſily happen's to this part. But if ſuch ulcers are ſo ſtubborn, that they will not yeild to theſe remedies, then muſt we com to the friction or unction of the groins, *perinæum*, and ulcers, with the ointments formerly preſcribed for the general friction. Alſo fumigations may bee made, as wee mentioned in the former chapter. For thus at length the malignitie of the virulent humor will bee overcom, and the callous hardneſs mollified; and laſtly, the ulcers themſelvs cleanſed, and beeing cleanſed, conſolidated. Somtimes after the perfect cure of ſuch ulcers, there will appear manifeſt ſigns of the *Lues Venerea* in manie, which ſhewed not themſelvs before, for that the virulencie flowed forth of the running ulcers, and now this vent beeing ſtopt, it flow's back into the bodie, and ſhew's ſigns thereof in other parts; and theſe men have need of a general unction.

Lanfranck's *collyrium.*

* This which by our Autor is here termed *Strangura virulenta*, and in French *Chaudepiſſe*, is the ſame which by other Autors is uſually termed *Gonorrhœa virulenta*, and by us vulgarly in Engliſh, *The running of the reins.*

CHAP. XVI.

How a Gonorrhœa *differeth from a* * *virulent Strangurie.*

EVen to this day verie manie have thought that the virulent Strangurie hath ſom affinitie with the *Gonorrhœa* of the Antients, but you ſhall underſtand by that which follow's, that they are much different. For a *Gonorrhœa* is an unvoluntarie effuſion of ſeed running from the whole bodie to the genitals, by reaſon of the reſolution and palſie of the retentive faculties of theſe parts, as it is delivered by *Galen, lib. de loc. affect.* This diſeaſ befalleth others by the collection of the blood and ſeminal matter by the veſſels of the whole bodie, which not turning into fat and good fleſh, take's it courſ to the genitals; but on the contrarie, a virulent Strangurie is a running, or rather dropping out of the urinarie paſſage, of a yellowiſh, livid, bloodie, filthie *ſanies*, like to *pus*, or matter not well concocted, oftentimes fretting and exulcerating the paſſage with the acrimonie, and cauſſing a painful erection of the yard, and diſtenſion of all the genital parts. For in this erection there is cauſſed as it were a convulſive contraction of theſe parts. And hence it is that the patients complain, that they feel as it were a ſtring ſtretched ſtiff in that part, which draw's the yard as it were downwards. The cauſ hereof is a groſs and flatulent ſpirit, filling and diſtending by its plentie, the whole channel or hollow nerv; yea verily, the whole porous ſubſtance of the yard. If to theſe ſymptoms this bee added, that the urinarie paſſage bee exulcerated, a grievous pain afflict's the patient, whil'ſt hee make's water, for that the ulcers are irritated by the ſharp urine paſſing that way. Such a virulent ſtrangurie or running of the reins oftimes continueth for two or three years ſpace: but the *Gonorrhœa*, or running of the ſeed cannot endure ſo long, but that it will bring the bodie to an extreme and deadlie leanneſs, for that the matter of the ſeed is of the more benign and laudable portion of the blood, as you may perceiv by thoſe who have too immoderately uſed copulation but the ſpace of one night. For ſuch have their faces more lean and lank, and the reſt of their bodies enervated, languiſheth and becommeth dull. By this wee have delivered, it may bee perceived that the running of a virulent ſtrangurie, is not the running of a ſeminal humor, fit for generation of iſſue, but rather of a viſcous and acrid filth, which hath acquired a venenate malignitie by the corruption of the whole ſubſtance.

What a virulent ſtrangurie is.

The cauſ of the convulſive diſtenſion of the yard.

Vid. Aut. definit. med. apud Galen.

What kinde of matter floweth forth in a virulent ſtrangurie.

CHAP. XVII.

Of the cauſſes and differences of the ſcalding, or ſharpneſs of the urine.

THe heat or ſcalding of the water, which is one kinde of the virulent ſtrangurie, ariſeth from ſom one of theſe three cauſſes; to wit, repletion, inanition, and contagion. That which proceed's from repletion, proceed's either from too great abundance of blood, or by a painful and tedious journie in the hot ſun, or

The cauſ of a particular repletion of the privie parts.

or by feeding upon hot, acrid, diuretick and flatulent meats cauſſing tenſion and heat in the urinarie parts, whence proceed's the inflammation of them and the genital parts, whence it happen's that not onely a ſeminal, but alſo much other moiſture may flow unto theſe parts, but principally to the *proſtatæ*, which are glandules ſituate at the roots, or beginning of the neck of the bladder, in which place the ſpermatick veſſels end; alſo abſtinence from venerie cauſſeth this plenitude in ſom who have uſually had to do with women, eſpecially the expulſive faculdie of the ſeminal and urinarie parts beeing weak, ſo that they are not of themſelvs able to free themſelvs from this burden. For then the ſuppreſſed matter is corrupted, and by its acrimonie contracted, by an adventitious and putredinous heat, it cauſſeth heat and pain in the paſſage forth. The *proſtatæ* ſwelling with ſuch inflamed matter, in proceſs of time becom ulcerated, the abſceſs beeing broken. The purulent *ſanies* dropping and flowing hence alongſt the urinarie paſſage cauſſes ulcers by the acrimonie, which the urine falling upon, exaſperate's, whence ſharp pain, which alſo continueth for ſom ſhort time after makeing of water, and together therewith by reaſon of the inflammation, the pain's attraction, and the vaporous ſpirit's diſtenſion, the yard ſtand's, and is contracted with pain, as wee noted in the formed Chapter. But that which happen's through inanition, is acquired by the immoderate and unfit uſe of venerie, for hereby the oilie and radical moiſture of the fore-mentioned glandules is exhauſted, which waſted and ſpent, the urine cannot but bee troubleſom and ſharp by the way to the whole *urethra*. From which ſenſ of ſharp pain, the ſcalding of the urine hath its denomination. That which com's by contagion, is cauſſed by impure copulation with an unclean perſon, or with a woman, which ſom ſhort while before hath received the tainted ſeed of a virulent perſon, or elſ hath the whites, or her privities troubled with hidden and ſecret ulcers, or carrieth a virulent ſpirit ſhut up or hidden there, which heated and reſuſcitated by copulation, preſently infect's the whole bodie with the like contagion, no otherwiſe then the ſting of a Scorpion or *Phalangium*, by caſting a little poiſon into the skin, preſently infect's the whole bodie, the force of the poiſon ſpreading further then one would believ, ſo that the partie fall's down dead in a ſhort while after. Thus therefore the ſeminal humor contained in the *proſtatæ*, is corrupted by the tainture of the ill drawn thence by the yard, and the contagion infect's the part it ſelf; whence follow's an abſceſs, which caſting forth the virulencie by the urinarie paſſage, cauſſeth a virulent ſtrangurie; and the malign vapor carried up with ſom portion of the humor unto the entrails and principal parts, cauſ the *Lues Venerea*.

The cauſſes of the inanition of the genital parts.

The reaſon of a contagious ſtrangurie.

CHAP. XVIII.

Prognoſticks in a virulent Strangurie.

WEe ought not to bee negligent or careleſs in cureing this affect, for of it proceed pernicious accidents, as wee have formerly told you, and neglected, it becom's uncureable, ſo that ſom have it run out of their urinarie paſſage dureing their lives; oftimes to their former miſerie is added a ſuppreſſion of the urine, the *proſtatæ* and neck of the bladder beeing inflamed and unmeaſurably ſwelled. Copulation, and the uſe of acrid or flatulent meats increaſ this inflammation, and alſo together therewith cauſ an *Iſcburia*, or ſtoppage of the urine; they are worſt at the change of the Moon: certain death follow's upon ſuch a ſtoppage; as I obſerved in a certain man, who troubled for ten years ſpace with a virulent ſtrangurie, at length died by the ſtoppage of his water. Hee uſed to bee taken with a ſtopping of his urine, as often as hee uſed anie violent exerciſe, and then hee helped himſelf by putting up a ſilver Catheter, which for that purpoſe hee ſtill carried about him; it happened on a certain time, that hee could not thruſt it up into his bladder, wherefore hee ſent for mee, that I might help him to make water, for which purpoſe when I had uſed all my skill, it proved in vain: when hee was dead, and his bodie opened, his bladder was found full, and verie much diſtended with urine, but the *proſtatæ* preternaturally ſwelled, ulcerated, and full of matter reſembling that which formerly uſed to run out of his yard, whereby you may gather, that this virulencie flow's from the *proſtatæ*, which run's forth of the yard in a virulent ſtrangurie, and not from the reins, as manie have imagined. Certainly, a virulent ſtrangurie, if it bee of anie long continuance, is to bee judged a certain particular *Lues Venerea*, ſo that it cannot bee cured unleſs by frictions with *Hydrargyrum*. But the ulcers which poſſeſs the neck of the bladder are eaſily diſcerned from theſe which are in the bodie or capacitie thereof. For in the later the filth com's away as the patient make's water, and is found mixed with the urine, with certain ſtrings or membranous bodies comming forth in the urine: to theſe may bee added, the far greater ſtinch of this filth which iſſueth out of the capacitie of the bladder. Now muſt wee treat of the cure of both theſe diſeaſes, that is, the *Gonorrhœa* and virulent Strangurie; but firſt of the former.

A virulent ſtrangurie continue's with ſom dureing their lives.

An hiſtorie.

From what part the matter of a virulent ſtrangurie flow's.

CHAP. XIX.

The chief heads of cureing a Gonorrhœa.

Diet.

LEt a Phyſician bee called, who may give direction for purgeing, bleeding and diet, if the affect proceed from a fulneſs and abundance of blood and ſeminal matter; all things ſhall bee ſhunned which breed more blood in the bodie, which increaſ ſeed, and ſtir to venerie. Wherefore hee muſt abſtain from wine, unleſs it bee weak and aſtringent, and hee muſt not onely eſchue familiaritie with women, but their verie pictures, and all things which may call them to his remembrance, eſpecially if hee love them dearly; ſtrong exerciſes do good, as the carrying of heavie burdens even until they ſweat, ſwimming in cold water, little ſleep, refrigerations of the loins and genital parts, by annointing them with *unguentum roſarum refrigerans Galeni & nutritum*, putting thereupon a double cloth ſteeped in oxycrate, and often renewed. But if the reſolution or weakneſs of the retentive facultie of theſe parts bee the cauſ of this diſeaſ, contracted by too much uſe of venerie before they arrive at an age fit to perform ſuch exerciſe; in this caſe ſtrengthning and aſtringent things muſt both bee taken inwardly, and applied outwardly. But now I haſten to treat of the virulent Strangurie, which is more proper to my purpoſe.

For a ſtrangurie occaſioned by repletion.

For the decaie of the retentive facultie.

CHAP. XX.

The general cure both of the ſcalding of the water, and the virulent Strangurie.

Diet.

VEe muſt diverſly order the cure of this diſeaſ, according to the varietie of the cauſſes and accidents thereof. Firſt, care muſt bee had of the diet, and all ſuch things ſhunned as inflame the blood, or cauſ windineſs; of which nature are all diuretick and flatulent things, as alſo ſtrong and virulent exerciſes. Purgeing and bleeding are convenient, eſpecially, if fulneſs cauſ the affect. Womens companies muſt bee ſhunned and thoughts of venereous matters; the patient ought not to lie upon a ſoft bed, but upon a quilt or matterice, and never, if hee can help it, upon his back: boiled meats are better then roſted, eſpecially boil'd with ſorrel, lettuce, purſlain, cleanſed barlie, and the four cold ſeeds beaten: for ſauce, let him uſe none, unleſs the juice of an orange, pomegranate, or verjuice; let him ſhun wine, and in ſtead thereof uſe a decoction of barlie and liquorice, an *hydromel*, or *hydroſaccarum* with a little cinnamon, or that which is termed *Potus divinus*. In the morning let him ſup of a barlie cream, wherein hath been boiled a *nodulus* of the four cold ſeeds beaten together with the ſeeds of white poppie; for thus is refrigerateth, mitigateth and cleanſeth; alſo the ſyrups of marſh-mallows and maiden-hair are good. Alſo purgeing the bellie with half an ounce of *Caſſia*, ſomtimes alone, otherwhiles with a dram or half a dram of Rubarb in powder put thereto, is good. And theſe following pills are alſo convenient. ℞. *maſſæ pilul. ſine quibus* ℈i. *rhei electi* ʒß. *capburæ gr.* iii. *cum terebinthinâ formentur pilulæ*; let them bee taken after the firſt ſleep. Venice turpentine alone, or adding thereto ſom Rubarb in powder, with oil of ſweet almonds newly drawn without fire, or ſom ſyrup of maiden-hair, is a ſingular medicine in this caſe, for it hath an excellent lenitive and cleanſing facultie, as alſo to help forwards the expulſive facultie, to caſt forth the virulent matter contained in the *proſtatæ*. You may by the bitterneſs perceiv how it reſiſt's putrefaction, and you may gather how it perform's its office in the reins and urinarie parts, by the ſmell it leav's in the urine after the uſe thereof. But if there bee anie who cannot take it in form of a bole, you may eaſily make it potable, by diſſolving it in a mortar with the yolk of an egg, and ſome white wine, as I learned of a certain Apothecarie, who kept it as a great ſecret. If the diſeaſ com by inanition or emptineſs, it ſhall bee helped by fattie injections, oilie and emollient potions, and inwardly takeing and applying theſe things which have the like facultie, and ſhunning theſe things which cauſſed the diſeaſ. How to cure that which happen's by contagion, or unpure copulation, it ſhall bee abundantly ſhewed in the enſuing Chapter.

Pills.

The force of Venice-turpentine in this diſeaſ.

How to bee made potable.

CHAP. XXI.

The proper cure of a virulent Strangurie.

An injection to ſtay inflammation.

FIrſt, wee muſt begin with the mitigation of pain, and ſtaying the inflammation, which ſhall bee performed by makeing injection into the *ureibra*, with this following decoction warm. ℞. *ſem. pſilii, lactucæ, papav. albi, plantag. cydon. lini, byoſcyami albi, an.* ʒii. *detrabantur mucores in aquis ſolani & roſar. ad quantitatem ſufficientem, adde trochiſc. alborum Rhaſis camphoratorum in pollinem redactorum,* ʒi. *miſce ſimul, & fiat injectio frequens.* For this becauſ it hath a refrigerateing facultie, will help the inflamma-

inflammation, mitigate pain, and by the mucilaginous faultie lenifie the roughneſs of the *urethra*, and defend it by covering it with the ſlimie ſubſtance, againſt the acrimonie of the urine and virulent humors. In ſtead hereof you may uſe cow's milk newly milked, or warmed at the fire. Milk doth not onely conduce hereto, beeing thus injected, but alſo drunk, for it hath a refrigerateing and cleanſing faultie, and by the ſubtiltie of the parts it quickly arrive's at the urinarie paſſages. Furthermore, it will bee good to annoint with *cerat. refriger. Galeni addita camphora*, or with *ceratum ventalinum*, *ung. comitiſſæ*, or *nutritum*, upon the region of the kidnies, loins and *perinæum*, as alſo to annoint the cods and yard. But before you uſe the foreſaid ointments or the like, let them bee melted over the fire, but have a care that you make them not too hot, leaſt they ſhould loſe their refrigerateing qualitie, which is the thing wee chiefly deſire in them. Haveing uſed the foreſaid ointment, it will bee convenient to applie thereupon ſom linnen clothes moiſtened in oxycrate, compoſed *ex aquis plantaginis, ſolani, ſempervivi, roſarum*, and the like. If the patient bee tormented with intolerable pain in makeing water, and alſo ſom ſmall time after, as it commonly commeth to paſs, I would wiſh him that hee ſhould make water, putting his yard into a chamber-pot filled with milk or water warmed. The pain by this means beeing aſſwaged, wee muſt com to the cleanſing of the ulcers by this or the like injection: ℞. *hydromelitis ſympt.* ℥iv. *ſyr. de roſis ſiccis, & de abſinth. an.* ℥ß. *fiat injectio.* But if there bee need of more powerful deterſion, you may ſafely add, as I have frequently tried, a little *ægyptiacum*. I have alſo found this following decoction to bee verie good for this purpoſe. ℞. *vini albi odoriferi*, ℔ß. *aquar. plantag. & roſ. an.* ℥ii. *auripigmenti*, ℥ß. *viridis æris*, ℈i. *aloës opt.* ℥ß. *pulveriſentur pulveriſanda, & bulliant ſimul.* Keep the decoction for to make injection withall. You may increaſ or diminiſh the quantitie and force of the ingredients entring into this compoſition, as the patient and diſeaſ ſhall ſeem to require. The ulcers beeing thus cleanſed, wee muſt haſten to drie them, ſo that wee may at length cicatrize them. This may bee don by drying up the ſuperfluous moiſture, and ſtrengthning the parts that are moiſtned and relaxed by the continual defluxion, for which purpoſe this following decoction is verie profitable. ℞. *aq. fabrorum*, ℔i. *pſidiarum, baluſt. nucum cupreſ. conquaſſatorum, an.* ℥iſß. *ſemin. ſumach. & berber. an.* ℥ii. *ſyrup. roſar. & de abſinth. an.* ℥i. *fiat decoctio.* You may keep it for an injection to bee often injected into the *urethra* with a ſyringe, ſo long as that there ſhall no matter or filth flow over thereat, for then there is certain hope of the cure.

The faculties of milk againſt a virulent ſtrangurie.

How to make water without pain.

Detergent injections.

How the cleanſed ulcers may bee dried.

CHAP. XXII.

Of Caruncles, or fleſhie excreſcences which ſomtimes happen to grow in the Urethra, *by the heat or ſcalding of the urine.*

A Sharp humor which flow's from the Glandules, termed *Proſtatæ*, and continually run's alongſt the urinarie paſſage, in ſom places by the way it fret's, and exulcerate's by the acrimonie the *urethra* in men, but the neck of the womb in women. In theſe, as alſo is uſual in other ulcers, there ſomtimes grow's up a ſuperflous fleſh, which oftimes hinder's the caſting or comming forth of the ſeed and urine by their appropriate and common paſſage, whence manie miſchiefs ariſe; whence it is that ſuch ulcers as have caruncles growing upon them muſt bee diligently cured. But firſt wee muſt know whether they bee new or old. For the later are more difficultly to bee cured then the former, becauſ the caruncles that grow upon them becom callous and hard, beeing oftimes cicatrized. Wee know that there are caruncles, if the *Catheter* cannot freely paſs alongſt the paſſage of the urine, but finde's ſo manie ſtops in the way, as it meet's with caruncles that ſtop the paſſage; if the patient can hardly make water, or if his water run in a verie ſmall ſtream, or two ſtreams, or crookedly, or onely by drop and drop, with ſuch tormenting pain, that hee is readie to let go his excrements, yea and oftimes doth ſo, after the ſame manner as ſuch as are troubled with the ſtone in the bladder. After makeing water, as alſo after copulation, ſom portion of the urine and ſeed ſtaie's at the rough places of the caruncles, ſo that the patient is forced to preſs his yard, to preſs forth ſuch reliques. Somtimes the urine is wholly ſtopped, whence proceed's ſuch diſtenſion of the bladder, that it cauſſeth inflammation, and the urine flowing back into the bodie, haſten's the death of the patient. Yet ſomtimes the urine thus ſuppreſt, ſweat's forth preternaturally in ſundrie places, as at the fundament, *perinæum*, cod, yard, groins. As ſoon as wee, by anie of the fore-mentioned ſigns, ſhall ſuſpect that there is a caruncle about to grow, it is expedient forthwith to uſe means for the cure thereof; for a caruncle from a verie little beginning doth in a ſhort time grow ſo big, that at the length it becom's incureable: verily, you may eaſily gueſs at the difficultie of the cure by that wee have formerly delivered of the eſſence hereof, beſides, medicines can verie hardly arrive thereat. The fitteſt ſeaſon for the undertakeing hereof is the Spring, and the next thereto is Winter; yet if it bee verie troubleſom, you muſt delaie no time. Whileſt the cure is in hand, the patient ought wholly to abſtain from venerie, for by the uſe thereof, the kidnies, ſpermatick veſſels, *proſtatæ*, and the whole yard,

How caruncles com to grow upon the ulcers of the genital parts.

Callous caruncles hard to cure.

Signs.

The ſuppreſt urine com's forth whereas it can get vent.

The fitteſt time for the cure.

Why venerie muſt bee eſchued.

yard, ſwell up and wax hot, and conſequently draw to them from the neighboring and upper parts, whence abundance of excrements in the affected parts, much hindering the cure. You muſt beware of acrid and corrodeing things in the uſe of detergent injections, for that thus the *urethra* beeing endued with moſt exquiſite ſenſ, may bee eaſily offended, whence might enſue manie ill accidents. Neither muſt wee bee frighted, if at ſom times wee ſee blood flow forth of ſecret or hidden caruncles. For this help's to ſhorten the cure, becauſ the diſeaſis hindered from growth, by takeing away portion of the conjunct matter, the part alſo it ſelf is eaſed from the oppreſſing burden, for the material cauſ of caruncles is ſuperfluous blood. Wherefore unleſs ſuch bleeding happen of it ſelf, it is not amiſs to procure it by thruſting in a *Catheter* ſomwhat hard, yet with good advice. If the caruncles bee inveterate, and callous, then muſt they bee mollified by fomentations, ointments, cataplaſms, plaſters, and fumigations; you may thus make a fomentation. R. *rad. alth. & lilior. alb. an.* ℥iv. *rad. bryoniæ, & fœnic. an.* ℥iß. *fol malvar. violarum, parietar. & mercur. an.* m.ß. *ſem. lini. fœnugr. an.* ℥ß. *caricas ping.* nu. xii. *florum chamæm. & melil. an.* p. i. *contundantur contundenda, incidenda incidantur, bulliant omnia in aquâ communi*: make a fomentation, and applie it with ſoft ſponges. Of the maſs of the ſtrained-out things, you may make a cataplaſm after this manner. R. *prædicta materialia, terantur, & trajiciantur, adde axungiæ porci, unguenti baſiliconis, an.* ℥ii. *fiat cataplaſma*: let it bee applied preſently after the fomentation. You may uſe this following liniment whil'ſt the cataplaſm is providing. R. *unguenti alth. & agrippæ an.* ℥iß. *æſipi humidæ, & axung. human. an.* ℥i. *butyri recentis, olei lilior. & chamæm. an.* ℥vi. *liqueſiant ſimul, addendo aquæ vitæ* ℥i. *fiat linimentum*: let it bee applied outwardly upon the part wherein the caruncles are. For the ſame purpoſe plaſters ſhall bee applied, which may bee diverſified, and fitted as you ſhall think good; yet *Emplaſtrum de Vigo* truly made, exceedeth all the reſt in a mollifying faculty, and in waſteing ſuch callous hardneſs. The following fumigation is alſo good for the ſame purpoſe; take ſom pieces of a mill-ſtone (for this wee uſe in ſtead of the *pyrites* mentioned by the Antients) or elſ ſome bricks of large ſize, after they are heated hot in the fire, let them bee put into a pan, and ſet under a cloſe ſtool, then cauſ the patient to ſit thereon, as if hee were going to ſtool, then pour upon the hot ſtones equal parts of verie ſharp vineger, and verie good *aqua vitæ*, and caſting clothes about him, that nothing may exhale in vain: let him receiv the aſcending vapor at his fundament, *perinæum, ſcrotum*, and *urethra*. Moreover, that this medicine may work the better effect, you may put the patient naked into the barrel noted with this letter A. ſo that hee may ſit upon a ſeat or board perforated on that part, whereas his genitals are, then place the pan, holding the hot ſtones between his legs, then preſently ſprinkle the ſtones with the fore-mentioned liquor, by the door marked with the letter B. Thus the patient ſhall eaſily receiv the fume that exhale's therefrom, and none thereof bee loſt, hee covering and vailing himſelf on everie ſide. Such a fumigation in *Galen*'s opinion, hath a facultie to penetrate, cut, reſolv, ſoften and digeſt ſcirrhous hardneſſes.

CHAP. XXIII.

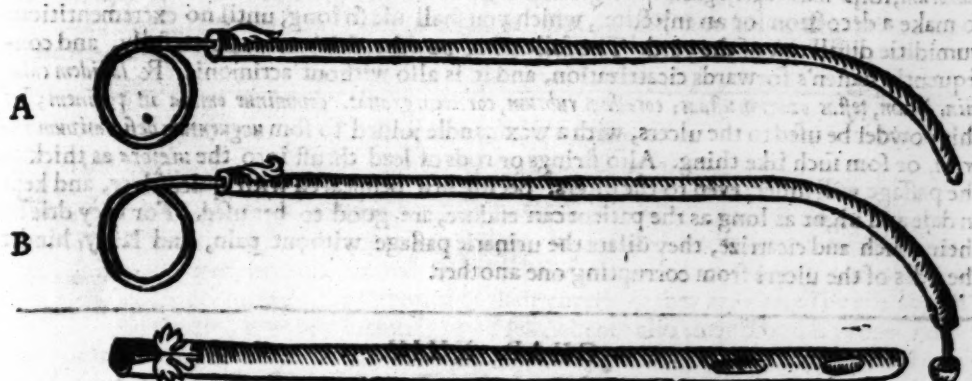
What other remedies ſhall bee uſed to Caruncles occaſioned by the Lues Venerea.

BUt if you ſuſpect that theſe Caruncles com or are occaſioned by a virulent humor, or the malignitie of the *Lues venerea*, it is meet that the patient obſerv ſuch a diet as uſually is preſcribed to ſuch as are troubled with the *Lues Venerea*; let him uſe a decoction of *Guaicum*, and let the *perinæum* and the whole yard bee annointed with ointment made for the *Lues Venerea*; otherwiſe the Surgeon will loſe his labor. In the interim, whil'ſt hee ſhall ſweat in his bed, hee ſhall bee willed to hold betweem his legs a ſtone-bottle filled with hot water, or elſ a hot brick wrapped in linnen cloaths, moiſtened in vineger and *aqua vitæ*; for thus the heat and vapor will aſcend to the genitals, which, together with the help of the applied ointment, will diſſolv the matter of the Caruncles, and beeing thus ſoftened, they muſt bee conſumed with convenient medicines. Wherefore firſt if they becom callous, or cicatrized (which you may ſuſpect if they caſt forth no excrementitious humiditie) they ſhall bee exaſperated, excoriated and torn with a leaden *Catheter* haveing a rough button at the end like a round file. Hee ſhall ſo long uſe the *Catheter* put into the *Urethra*, thruſting it up and down the ſame way ſo long and often as hee ſhall think fit for the breaking and tearing the Caruncles, hee ſhall permit them thus torn to bleed freely, ſo to eaſe the affected part. You may alſo for the ſame purpoſe put into the *Urethra* the *Catheter* marked with this letter B; whereinto putting a ſilver wier ſharp at the upper end, that by often thruſting it in and out it may wear and make plain the reſiſting Caruncles. Verily, by this means I have helped manie much perplexed with the fearful danger of this diſeaſ. Som better like of the *Catheter* marked with this letter A, beeing thus uſed: it is thruſt into the *Urethra* with the prominent cutting ſides downwards, and then preſſing the yard on the outſide cloſe with your hand to the *Catheter* in the place where the Caruncles are, it is drawn forth again.

Particular defaults of the *Lues Venerea* not to bee cured unleſs by the general remedie of the virulencie.

Caruncles, if callous, muſt firſt bee ſoftened.

Catheters fit to wear aſunder, or tear Caruncles.



A *ſheweth the* Catheter *with the inſerted ſilver wier, but not banging forth thereat.*
B *ſheweth the* Catheter *with the inſerted ſilver wier banging forth at the end.*

The Caruncle thus torn ſhall bee ſtrowed over with the following powder, beeing verie effectual to waſte and conſume all Caruncles of the privities without much pain. *R. herb. ſabin. in umbrâ exſiccat. ℥ii. vitr. antimon. tub. præparat. an. ℥ſs. fiat pulvis ſubtiliſſimus*, let it bee applied in the following manner. Put the powder into the pipe or *Catheter* haveing holes in the ſides thereof, the which is the lowermoſt of the laſt deſcribed. Then put the *Catheter* into the urinarie paſſage until the ſlit or openneſs of the ſide com to the Caruncle, then into the hollowneſs of the *Catheter* put a ſilver wier, wrapped about the end with a little linnen rag, which as it is thruſt up, will alſo thruſt up the powder therewith, until it ſhall com to the ſlit againſt the caruncle, then will it adhere to the caruncle, bloodie, by reaſon of the late ſtriction. Then ſhall you draw forth the *Catheter*, firſt twineing it about, that ſo it may not ſcrape off the powder again. If intolerable pain hereupon happen, it ſhall bee aſſwaged, and the inflammation reſtrained by the following injection. *R. ſuccorum pentaphyll. plantag. ſolani, & ſempervivi, an. ℥ſs. albumin ovorum, nu. vi. agitentur diu in mortario plumbeo*, let it bee injected warm into the *urethra* with a ſyringe. In ſtead hereof you may alſo make uſe of another injection, which is formerly preſcribed. Neither will it bee unprofitable to applie topericliſives to the genitals, to hinder pain and inflammation. You may alſo uſe other medicines, haveing a facultie to conſume the Caruncle, amongſt which theſe following are excellent.

A powder to waſte Caruncles.

How to apply it.

An injection to hinder inflammation.

An emplaſter uſed by the Surgeons of *Mountpelier* for Caruncles.

cellent. ℞. *viridis æris, auripigmenti, vitriol. Rom. aluminis roch. an.* ℥ii. *infundantur omnia in acet. acerrimo, atque inter duo marmora in pollinem rediganiur:* then let it bee expoſed to the ſummer's ſun, and dried, again infuſed in ſharp vineger, and then as before ground upon a marble, ſo that you finde nothing ſharp with your fingers; laſtly, let it bee oppoſed to the ſun until it may bee made into moſt ſubtil powder, and all the acrimonie bee vaniſhed, which will bee commonly in eight daies ſpace. Then, ℞. *ol. roſat.* ℥iv. *lythargyr.* ℥ii. *coquantur ad ignem, quouſque coïerint in emplaſt. ſolidæ conſtentiæ, ab igne tum ſemotis, adde pulv. prædicti.* ℥ii. let them bee mixed with a ſpatula, and put it upon the fire until it com to ſo hard a conſiſtence, that it will ſtick faſt to a wax candle, or lead wier, ſo that it may not com off by handling with your hands. The Surgeons of *Montpelier* uſe this medicne: This following is another, ℞. *tuthiæ præparat.* ℥vi. *antimonii,* ℥iii. *trochiſc. alborum, Rhaſ. camphorat.* ℥i. *corticis granati, aluminis uſti, an.* ℥iſ. *ſpongiæ uſtæ,* ℈ii. let them bee all made iuto powder: then, ℞. *ung. diapompholigos, & alb. Rhaſis, an.* ℥ii. *miſceantur tum prædictis pulveribus in mortario plumbeo, & diu agitentur:* let a verie fine rag bet ſpread over with this ointment, and wrapped about a wax candle, and ſo thruſt into the *Urethra*, and then draw forth the candle by twineing it a contrarie way; ſo let the end of the rag hang out of the yard, ſo to pluck it forth again, when as you ſhall think it hath don what it can to the Caruncle, which is, when it hath covered it with the medicine with which it was ſpread. Som alſo make wax candles with a ſlender, but ſtiff wick, whoſe end, which is to bee put to wear and conſume the Caruncle, is compoſed of the following medicine. ℞. *dmpl. ſtri nigri, vel diathylonis irea i,* ℥ii. *pulv. ſabinæ, ocræ, viriol Rom. calcin. pul. mer. an.* ℥ſ. *omnia liqueſcant ſimul ad dictum uſum.* Whil'ſt the cure ſhall bee in hand, by theſe following medicins; Let the patient bee careful that hee ſo ſhake hit yard after makeing water, that hee may ſhake forth all the reliques of the urine which may chance to ſtop at the Caruncles; for if but one drop ſhould ſtay there, it would bee ſufficient to ſpoil the whole operation of the applied medicines. After that the Caruncle ſhall bee worn awey and wholly conſumed by the deſcribed medicines, which you may know by the urine flowing forth freely, and in a full ſtream, and by thruſting up a *Catheter* into the bladder without anie ſtoppage; then it remain's that the ulcers bee dried and cicatrized; for which purpoſe the following injection is verie powerful and effectual, and without anie acrimonie. ℞. *aq. fabrorum,* ℔. ſ. *nuc. cupreſ. gallar. cort. granat. an.* ℥iſ. *alum. roch.* ℥ſ. *bulliant omnia ſimul ſecund. art.* ſo make a decoction for an injection, which you ſhall uſe ſo long, until no excrementitious humiditie diſtill out of the yard. The following powder drie's more powerfully, and conſequently haſten's forwards cicatrization, and it is alſo without acrimonie. ℞. *lapidem calamin. lotum, teſtas ovorum uſtas, corallum rubrum, corticem granat. comminue omnia in pollinem;* let this powder be uſed to the ulcers, with a wax candle joined to ſom *unguentum deſiccativum rubrum*, or ſom ſuch like thing. Alſo ſtrings or rods of lead thruſt into the *urethra* as thick as the paſſage will ſuffer, even to the ulcers, beeing firſt beſmeared with quickſilver, and kept in daie and night as long as the patient can endure, are good to bee uſed. For they drie by their touch and cicatrize, they dilate the urinarie paſſage without pain, and laſtly hinder the ſides of the ulcers from corrupting one another.

Another emplaſter.

How to applie it.

A caution in makeing water.

Signs that the Caruncle is worn away.

An epulotick injection.

Quick-ſilver by drying cauſeth cicatrization.

CHAP. XXIV.

Of venereal Buboes, *or ſwellings in the Groins.*

The efficient and material cauſes of venereous Bubo's.

THe virulencie of the *Lues Venerea* is ſomtimes communicated to the Liver, which if it have a powerful expulſive facultie, it expell's it into the groins, as the proper emunctories thereof, whence proceed venereal Buboes. The matter of theſe for the moſt part is abundance of cold, tough, and viſcous humors, as you may gather by the hardneſs and whiteneſs of the tumor, the pravitie of the pain, and contumacie of cureing; which alſo is another reaſon, beſides theſe that wee formerly mentioned, why the virulencie of this diſeaſ may bee thought commonly to faſten it ſelf in a phlegmatick humor. Yet ſomtimes venereal Buboes proceed from a hot, acrid and cholerick humor, aſſociated with great pain and heat, and which thereupon often degenerate into virulent and corroding ulcers. Som venereous Buboes are ſuch conjoined accidents of the *Lues Venerea*, that they foretel it; ſuch are theſe which for a ſmall while ſhew a manifeſt tumor, and ſuddenly, without anie manifeſt occaſion hide themſelvs again, and return back to the noble parts. Others are diſtinct from the *Lues Venerea* though they have a ſimilitude of eſſence and matter therewith, and which therefore may bee healed, the *Lues Venerea* yet remaining uncured. Such are theſe which are uſually ſeen, and which therefore compared with the former, may bee termed ſimple and not implicit. For the cure, you muſt not uſe diſcuſſing medicines, leſt reſolving the more ſubtil part, the groſſer dregs becom impact and concrete there; but much leſs muſt wee uſe repercuſſives, for that the matter is virulent. Wherefore onely attractive and ſuppurateing medicines are here to bee uſed, agreeable to the humor predominant and cauſing the the tumor, as more hot things in edematous and ſcirrhous tumors, then in thoſe which reſemble the natures of a *phlegmon* or *eryſipelas*: the indiction

What Bubo's foretel the *Lues venerea*.

tion taken from the rattie and denſitie of bodies inſinuate's the ſame varietie. The applying of cupping glaſſes is verie effectual to draw it forth. But when as it is drawn forth, you ſhall forthwith applie on emplaſtick medicine, and then you ſhall come to ſuppuratives. When the tumor is ripe it ſhall bee opened with a potencial cauterie, if it proceed from a cold cauſe; for by the inducing of heat the reſidue of the crude matter is more eaſily concocted; beſides when as an ulcer of this kinde is opened, the matter will bee more eaſily evacuated, neither ſhall it bee fit to uſe antetent, but onely to applie pledgets. The reſidue of the cure ſhall bee performed by detergent medicines, and then if need require, the patient ſhall bee let blood, and the humors evacuated by a purging medicine, but not before the perfect maturitie thereof.

Cupping.

A potential Cauterie.

CHAP. XXV.

Of the Exoſtoſis, bunches or knots growing upon the bones by reaſon of the Lues Venerea.

HArd tumors, *Exoſtoſes* and knots have their matter from thick and tough phlegm, which cannot bee diſſolved, unleſs by hot medicines, which have a mollifying and diſſolving faculties. For which purpoſe, beſides thoſe medicines which uſually are applied to feirrhous humors, you muſt alſo make uſe of *arg. viv.* commonly after this manner. R. *empl. ſilit Zachar. Tarent.* ℥iii. *euphorb.* ℈ſs. *emplaſt. de vigo,* ℥ii. *cerat. diſſip. Philagr.* ℥i. *argent. vivi extinct.* ʒvi. *fiat emplaſtrum.* Spread it upon leather for your uſe. In the mean ſpace let the patient obſerv a ſpareing diet; for thus but ſhall bee helped, if ſo bee that the ſubſtance of the bones bee yet unperiſhed. For if it bee putrified and rotten, then deſcribed medicines are of no uſe, but you muſt of neceſſitie lay bare the bone, either by inciſion, or elſ by an actual or potential cauterie; but I had rather do it with an actual, for that it extracts the virulencie impact in the bones, as alſo it haſten's the abſceſs by falling away of the corrupted bone. It ſhall bee of a convenient figure to cauterize the bone, as round, ſquare, or long. Uſually, before the application of ſuch a Cauſtick, firſt divide the fleſh that lie's over it with an inciſion-knife, that ſo the pain may bee the leſs, becauſ the fleſh cannot burn't through but in a long time, by which the fire may come to the bone. But it will not bee amiſs, before wee treat of this art, firſt to conſider the nature of the rottenneſs of the bones.

The matter of knots and virulent *Tophi*.

An emplaſter againſt the bunching out of the bones.

CHAP. XXVI.

Why the bones becom rotten, and by what ſigns it may bee perceived.

THat ſolution of Coutinuitie which is in the bones, is called by *Galen, Catagma.* This uſually is the cauſ of rottenneſs; for, bones that are grated, bruiſed, rent, perforated, broken, luxated, inflamed and deſpoiled of the fleſh and skin are eaſily corrupted; for diſpoiled of their covering, they are altered by the appulſ of the air, wch they formerly never felt, whence alſo their blood & proper nouriſhment is dried up & exhauſted. Beſides alſo, the *ſanies* running down by reaſon of wounds & old ulcers, in proceſs of time faſten's it ſelf into their ſubſtance, and putrefie's by little and little; this putrefaction is encreaſed and cauſed by the too much uſe of oilie and fattie medicines, as moiſt and ſuppuirace things; for hence the ulcer becommeth more filthie and malign, the fleſh of the neighboring parts groweth hot, is turned into *pus*, which preſently falling upon the bone lying under it, inflame's it. Laſtly, the bones are ſubject to the ſame diſeaſes, as the fleſh that lieth under them is; beſides alſo according to *Galen*, the beginning of inflammation oftimes proceed's from the bones; but they beat not, becauſ, according to the opinion of the ancients, pulſation is a dolorifick motion of the Arteries, but the bones want ſenſ. Which verily I cannot denie, but alſo wee muſt confeſs that the membrane that encompaſſeth them, and the arteries that enter into their bodie, are endued with moſt exquiſite ſenſ. Wherefore the arteries compreſſed and waxing hot by reaſon of the inflamed bone, cauſ a ſenſ of pain in the *perioſteum*, ſo that the patiehts complain of a dull and deep pain, as it were ſunk into the ſubſtance of the bones. The rottenneſs or corruption is oftimes manifeſt to the eie, as when the bone is laid bare, for then it varieth from the natural color, and becom's livid, yellowiſh or black. Otherwiſe you may perceiv it by touch, as by ſearching it with a probe, as when you meet with ſome inequalitie or roughneſs, or when but gently touching it, your *probe* ſink's into the ſubſtance of the bone as into rotten wood; for a bone is naturally hard, but beeing rotten, becom's ſoft. Yet hardneſs is not an infallible ſign of a ſound bone. For I have ſeen rotten and bared bones, to have ſomtimes grown ſo hard, by the appulſ of the air, that a Trepan could not, without a ſtrong endeavor, enter them. Alſo the rottenneſs of the bone is known by the condition of the filth which flow's forth of the ulcer, for it is not onely more thin and liquid, but alſo, more ſtinking. Furthermore, ſuch ulcers have a ſoft, looſ and waterie fleſh; beſides alſo, they are untoward and rebellious to

Gal. meth. 6.

The frequent cauſ of the rottenneſs of bones.

Signs of the rottenneſs.

Hardneſs is no infallible ſign of ſound bones.

ſarcotick

ſarcotick and epulotick medicines; to which if they chance to yeeld and bee cicatrized, yet within a ſhort while after the ſcar will relent of its own accord, for that nature, deſtitute of the firm and ſound foundation of the bones, cannot build up a laudable and conſtant fleſh. Neither is it ſufficient that the Surgeon know certainly that the bone is rotten and corrupt, it is furthermore fit hee know, whether this corruption bee ſuperficiarie, or pierce deep into the ſubſtance of the bone, that hee may know how much of the bone muſt bee ſcaled. For ſcaleing is the onely cure of that which is corrupted; now it is ſcaled by that which drie's excedingly, & draw's forth all the humiditie, aſwell the excrementitious, the autor of the rottenneſs, as the alimentarie. For thus it remain's without blood and nouriſhment, and conſequently life alſo; whence it muſt of neceſſitie ſcale or fall off, beeing deſtitute of the glue or moiſture which joined it to the ſound parts in vicinitie and communion of life, like as leavs which fall away from the trees, the humiditie beeing exhauſted, by which, as by glue, they adhered to the boughs. For this purpoſe Catagmatick powders are prepared to amend the corruption which is onely ſuperficiarie. R. *pul. aloës, cretæ combuſtæ, pompholygos, an.* ℥ii. *ireos flor. ariſtoloch. rot. myrrh. ceruſſæ, an.* ℥i. *pul. oſteor. combuſt.* ℥ß. *terantur ſubtiliſſ. fiat pulvis*; let it bee applied either alone by it ſelf, or elſ with honie and a little *aqua vitæ*. Alſo the following emplaſter beeing applied, ſtir' sup nature to the exclusion of the broken bones, and cleanſeth the ulcers from the more groſs and viſcid *ſanies*. R. *cer. nov. reſ. pini, gum. ammon. & elemi, an.* ℥vi. *tereb.* ℥iii. *pul. maſtich. myrrh. an.* ℥ß. *ariſtol. rot. ireos flor. aloës, opopan. euphorb. an.* ℥i. *olei roſati quantum ſufficit, fiat emplaſt. ſecundum artem.* Euphorbium, according to *Dioſcorides* take's off the ſcales of bones in one daie. Hereto alſo conduceth *Emp. de betonicâ*. Or, R. *olei caryophyl.* ℥ß. *camph.* ℥ii. *miſceantur ſimul in mortario, & utere.* But if that part of the bone which is corrupt cannot thus bee taken away, then muſt you uſe the ſcaleing Trepans and Scrapers deſcribed formerly in wounds of the head; eſpecially if anie more great or ſolid bone bee foul. Furthermore the here-deſcribed Trepan will bee good to perforate the rotten bone in manie places where it is corrupted, until, as it were, a certain bloodie moiſture iſſue forth at the holes; for thus it more freely enjole's the air, and alſo the force of the medicines admitted by theſe holes work's more powerfully.

The cure of a rotten bone.

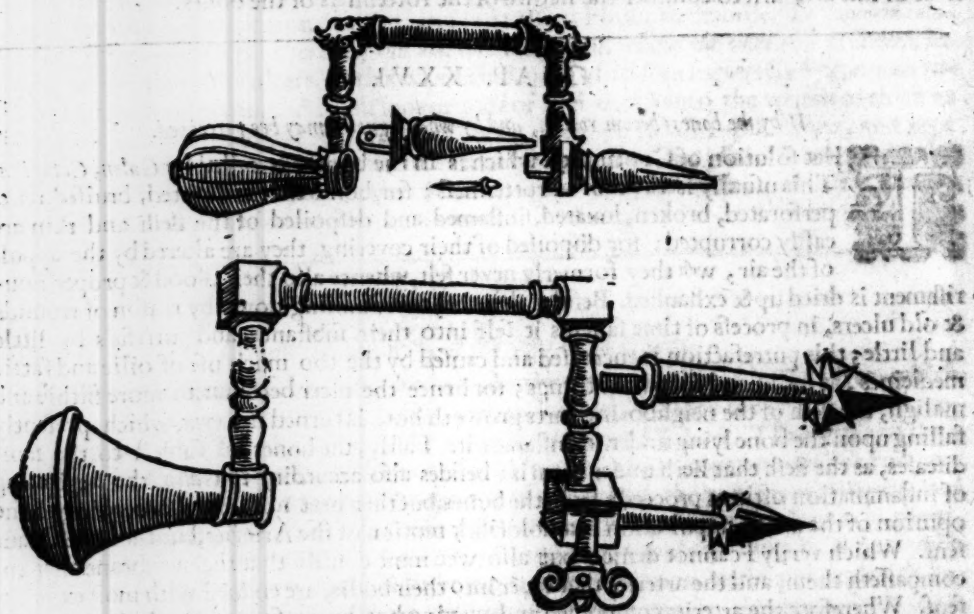
Dioſc. lib. 3. cap. 78.

A Trepan with two triangular bits and a pin to hold them in the ſtock: as alſo another Trepan haveing four-ſquare and ſix-quare bits convenient for to bee uſed in the rottenneſs of greater bones.



But if the rottenneſs bee more deep, and the bone more hard, either by nature or accident, as by the occaſion of the too long admiſſion of the air, then the rotten ſcales ſhall bee cut off by the inſtruments deſcribed in wounds of the head, driveing them into the bone with leaden mallets, leſt the part ſhould bee too much offended or ſhaken with the blow. The ſcales and fragments ſhall bee taken forth with mullets, the ſigns that all the rottenneſs is taken away, are the ſolidneſs of the bone thereunder, and the bloodie moiſture ſweating out thereat.

Signs that the rottenneſs is taken away.

CHAP.

CHAP. XXVII.

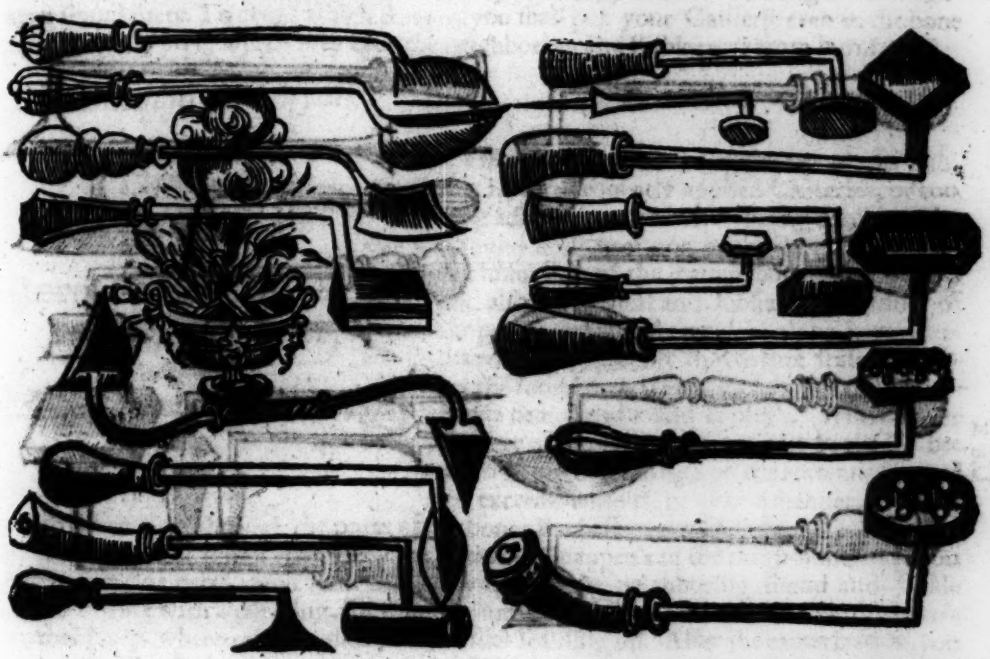
Of actual and potential Cauteries.

BUt if the described remedies cannot be placed for reason of the malignitie or magnitude of the rottenneſs, then muſt wee come to actual and potential Cauteries. But I ſhould rather approve of actual, becauſe by ſtrengthening the part, they conſume the excrementitious humors wherewith it is over-charged, to wit, the matter of the Caries; which is not ſo effectually performed by potential Cauteries. Yet are wee oftimes forced to uſe theſe, to pleaſe the patients which are terrified at, and affraid of hot irons. Potential Cauteries are *aqua fortis*, *aqua vitrioli*, ſcalding oil, melted ſulphur and boiling, and the like; in pouring on of which I would have the Surgeon to bee prudent and induſtrious; leſt hee ſhould rathly violate the neighboring ſound parts by the burning touch of theſe things; which his temeritie would cauſe vehement pains, inflammations, and other horrid ſymptoms. For actual Cauteries, their varietie in figure is ſo great, that it cannot bee defined, much leſs ſet down in writeing, for they muſt bee varied according to the largeneſs of the rottenneſs, and the figure and conformation of the fouled bones. Such as are more uſual I have thought good here to delineate unto you, content onely to admoniſh you thus much, that ſom of theſe work by pricking, ſom by cutting, ſom flat-wiſe, and other-ſom with their points made to the form of an Olive-leaf.

Actual Cauteries to bee preferred before potential.

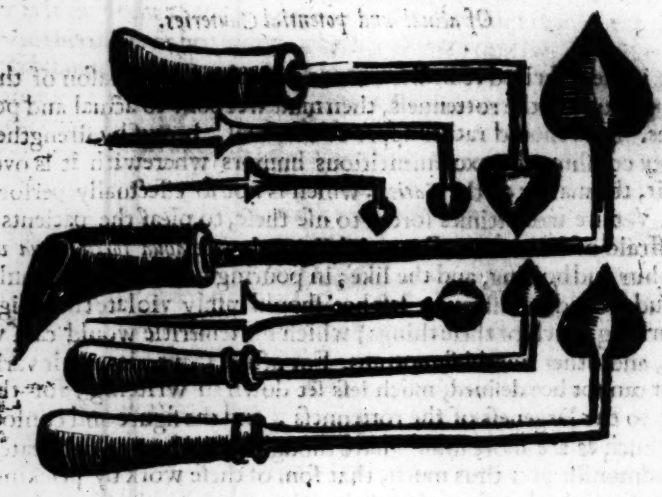
Potential Cauteries.

Sundrie forms of actual Cauteries fit for all neceſſarie caſes of all parts.

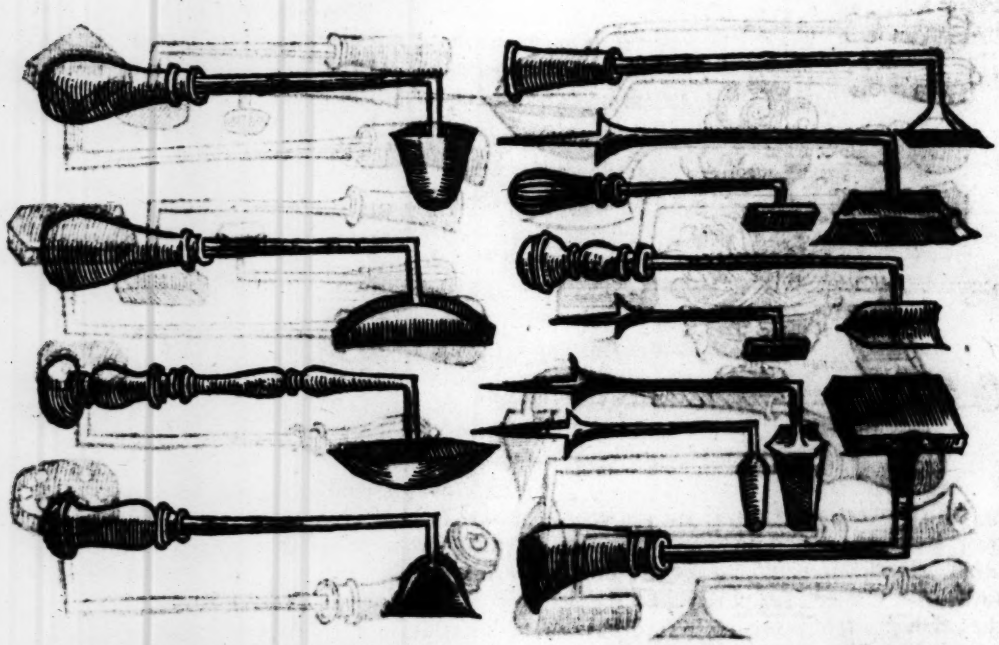


The following figure of a Cauterie is fit for virulent knots that arise in the knee, when you deſire to take away the fleſh that cover's the bone; for this purpoſe it is made hollow and ſharp in a triangular and quadrangular form, divided as it were into three branches, that you may ſo make uſe of which you pleaſe.

Other Cauteries.



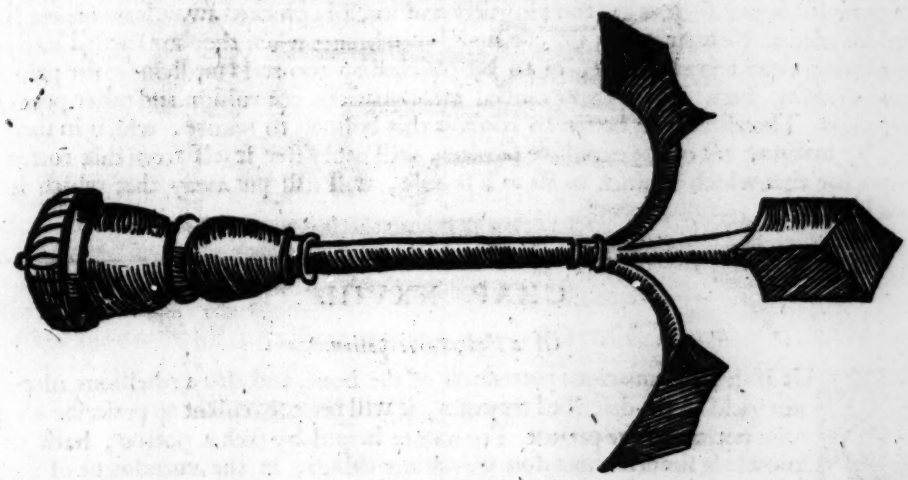
Other Cauteries for the ſame purpoſe.



The following figure of a Cauterie is fit for virulent knots that ariſe in the ſcull, when you deſire to take away the fleſh that cover's the bone; for this purpoſe it is made hollow and ſharp in a triangular and quadrangular form, divided as it were into three branches, that you may ſo make uſe of which you pleaſ.

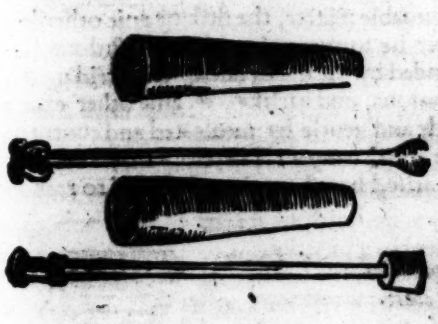
The

The figure of an hollow and cutting Cauterie.



The Cauteries, whoſe forms are hereafter expreſt, take place in rotten bones that lie deep in, wherein you cannot make uſe of the formerly deſcribed, without touching of the neighboring ſound parts. To avoid which danger, you ſhall put your Cauterie even to the bone through an iron pipe, which may keep the neighboring and fleſhie parts from burning.

Actual Cauteries with their pipes.



Great diſcommodities enſue upon too raſh, that is, too frequently applied Cauteries, or too long adhering to the bone; for by this immoderate and fierie heat not onely the excrementitious humiditie of the rotten bone is conſumed, but alſo the radical and ſubſtantial moiſture of the part is exhauſted; wherein alone nature endeavouring to caſt off the corrupt ſcales, and ſever the ſound from the rotten bone, and to ſubſtitute fleſh, ſtand's and confift's. Whereof, the meaſure of applying of Cauteries ought to bee taken from the greatneſs of the rottenneſs, and the excrementitious, or after a manner, foaming humiditie ſweating through the pores of the bone. But before you preſs your Cauterie into the rotten bone which lie's verie deep in, as that which happen's in the thigh-bone, and upon other verie fleſhie parts, you muſt diligently defend the neighboring ſound and fleſhie part, as it were with a covering, for that the humor diffuſed by the touch of the fire, burn's the other places whereunto it diffuſeth it ſelf like ſcalding oil. After the cauterization, you muſt help forwards the falling away of the ſcales, by ſomtimes dropping in our oil of whelps, beeing made ſcalding hot. This oil, though verie fit for this purpoſe, yet do I not judge it fit to uſe it too often, it may ſuffice to have dropped it in, ſom twice or thrice. For at length it may violate the ſound bone, that lie's under the rotten, by the oilie, ſubtil and moiſt ſubſtance. Furthermore, a bone is the moſt drie part of the bodie, therefore unctuous and moiſt medicines are contrarie to its temper and confiſtence. But it conduceth often and gently to moov the ſcales alreadie beginning to ſeparate themſelvs, and it haſten's the ſlackneſs of nature in caſting them off. Yet may you not uſe forte, unleſs peradventure when as they hang as it were by a ſlender thred; otherwiſe if the unwarie Surgeon forcibly pluck away the ſcales before that nature hath put a cover upon the ſound bone, hee ſhall give way to a new alteration and fowlneſs by the appulſ of the air. Furthermore, after the corrupt ſcale is falling off by the force of nature expelling it, you muſt have diligent heed that you put not eating or corroding medicines upon the bone that is under it; for thus thou ſhalt conſume or waſte the fleſh which nature hath generated thereupon, which compoſed of newly concreted blood, is like in ſoftneſs to newly crudled milk, which otherwiſe in time would grow into a more ſolid and hard conſiſtence. This under-growing fleſh by little and little thruſt's the rotten bone above it, out of its place, and is the cauſ of the ſcaling thereof; it is at the firſt gathered together like the grains of a pomegranate, with a red, ſmooth & equal *ſanies*, and not ſtinking, and at length it caſt's forth a white matter. Therefore then wee muſt rather ſtraw thereon cephalick powder compoſed of ſuch things as have a facultie

Manner of applying of Cauterics.

Oil of whelps help's forwards the caſting off of ſcales.

A caution in mooving the ſcales of burnt bones.

Cephalick powders of what compoſed.

to drie without biteing, ſuch as are Orrif-roots, waſhed aloës, maſtich, myrrh, barlie-flowr, and the like. Laſtly, it muſt bee cicatrized; it is better that ſcales of bones fall away of themſelvs by the onely force of nature, then to bee plucked away by the force of medicines or inſtruments; becauſ, ſuch as are too violently and forcibly plucked away, leav corners like to fiſtulous ulcers. Neither ought the corrupted membranes when they are turned into pus to bee plucked away too violently, or to bee touched by too acrid medicines; for pain hereupon ariſeing hath divers times cauſſed inflammation, convulſion and other pernicious ſymptoms. Therefore it is better to commit this buſineſs to nature, which in ſucceſs of time, by makeing uſe of the expulſive faculti, will eaſily free it ſelf from this rotten ſubſtance; for that which is quick as far as it is able, will ſtill put away that which is dead from it.

CHAP. XXVIII.

Of a Vulnerarie potion.

BUt if the contumacious rottenneſs of the bone, and alſo a rebellious ulcer ſhall not yield to the deſcribed remedies, it will bee convenient to preſcribe a vulnerarie potion to the patient. For nature helped by ſuch a potion, hath to my knowledg ſundrie times don wondrous things, in the amendment of corrupt bones, and conſolidation of ulcers. For theſe potions though they do not purge the noxious humors away by ſtool, yet are they wondrous effectual to cleanſ ulcers, and free them from the exceſs of excrementitious humors, to cleanſ the blood, and purge it from all impuritie, to agglutinate broken bones, and knit the ſinews. I have here thought good to ſpeak of them, and chiefly, for that they were much commended by the Antients, but neglected by the modern Phyſicians and Surgeons. But if the cure of wounds and old ulcers bee performed by deterſion, and the repoſition of the loſt ſubſtance, what medicine can ſooner or rather do it then that, which by its admirable and almoſt divine force ſo purgeth the blood, that thereof, as from a fit and laudable matter, the fleſh or anie other loſt ſubſtance may bee fitly reſtored, and the part recover its former union? But if fiſtulous Ulcers, Cancers, Gouts, and the like diſeaſes bee offended by the uſe of ſalt, ſpiced, acrid meats, and others which are of ſubtil parts, as muſtard, onions, and garlike, or anie other exceſs in meat or drink; why may they not becom milde and gentle by medicated and contrarie meats and drinks, or at leaſt bee reduced to a more equal temper? Therefore that Surgeons may know of what things ſuch compoſitions may ariſe, I have here thought good to reckon them up, that you may learn what they are.

The uſe of vulnerarie potions.

Speed-well.	*Plantane.*
Agrimonie.	*S. John's-wurt.*

Of all theſe the Surgeon ſhall make choice according to the minde and judgment of the Phyſician, ſuch as hee ſhall think fit and proper to everie ulcer or wound, or to each wounded and ulcerated part, according to the condition of the time, the temper of the patient, and kinde or nature of the diſeaſ. You may make drinks not onely of the decoctions of theſe, but alſo of their juices in white wine, or *æxomel*, which are good not onely to purifie the

the maſs of the blood, to cleanſ ſanious, virulent, filthie and dyſſenterious ulcers, but alſo to drive away putrefaction, ſcale-bones, diſſolv clotted blood in bruiſes, to draw, pluck out and exterminate all ſtrange bodies, as I have often obſerved to my great admiration. They are compoſed uſually after this manner. ℞. *ſavic. bugul. ſcabioſ. beton. ſcord. nepet. an.* m.ß. *uvar. mund. ſem. hyper. & card. ben. an.* ℥i. *trium flor. cord. an.* p.ii. *coquantur completè in aq. communi; poſtea in fine adde vini alb. mel. roſ. & cinnam. quod ſufficit, fiat decoctio, coletur per manicam.* Let him drink ℥iii. in the morning 3. hours before dinner. You may alſo with good ſucceſs make injections with the ſame liquor into fiſtulous and ſinuous ulcers, as alſo to waſh the ſordid ulcers therewith. You may alſo boil the ſame ſimples, as herbs, flowers and ſeeds in the patient's broths, that ſo they may acquire a medicinable and nouriſhing facultie. For the time of the affect, wherein you may with good ſucceſs make uſe of theſe, wee have read in *Guido*, that hee uſed not to preſcribe theſe potions to his patients when as they were newly wounded, for that they commonly are compoſed of things hot and opening, which heat and attenuate the blood, whence there would bee danger of a defluxion, upon the affected part. Wherefore when the matter is com to ſuppuration, when as there nothing remain's, but to cleanſ the ulcer, and fill it with fleſh, no inflammation as now remaining in the part, I judg theſe potions may then bee uſed with good ſucceſs.

The form of a vulnerarie potion.

In what time of the diſeaſ they are chiefly to bee uſed.

CHAP. XXIX.

Of Tetters, Ring-worms, or Chops occaſioned by the Lues Venerea.

UPon the cure of the *Lues Venerea*, uſually Tetters and Chops happen thereupon, which make furrows in the palms of the hands and ſoles of the feet. They acquire their matter from ſalt phlegm, or aduſt choler, or the reliques of the venereous virulencie ſent thither. The cure, eſpecially when as the diſeaſ is grown old, is difficult; by reaſon that the humor hath long accuſtomed to flow that way, and for that it hath corrupted the habit of the part by the continual defluxion; but the cure is more eaſie, if the diſeaſ bee newly bred. Now you may know it is newly bred by the redneſs, accompanied by a great itching, and not onely a drineſs of the skin, but alſo a thickneſs and denſneſs thereof. That which is old, beſides theſe fore-recited ſigns, have ſcalelie and bran-like hardneſſes conjoyned therewith, which by ſcratching and rubbing caſt off ſcales. For general medicines, the diſtemper of the liver, and habit of the bodie muſt bee corrected, which by the occaſion of the former diſeaſ and remedies apt to inflame the blood, cannot but much ſwerv from their native temper. This may bee don by diet conveniently appointed, by purgeing and altering medicines, bleeding, batheing, applying of cupping-glaſſes and horns. For topick or particular medicines, waſh ſuch as are newly or lately bred with the following water which drie's, and is of ſubtil parts. ℞. *aq. roſ. & pariet. an.* ℥i. *aq. alum.* ℥ii. *calc.* ℥ii. *alum.* ℥iii. *pul ſubl.* ℈iv. *fiat lent. & minim. ebul. in baln. mar.* This water ſhall bee made more or leſs forcible, according to the condition of the diſeaſ. Or, ℞. *ol. tart.* ℥ii. *ſep. com.* ℥iv. *miſc. fiat unguent. ad uſum.* If the Phyſician ſhall think good, let the patient uſe a decoction of *Guaicum*, but that verie weak. But old Tetters and Chops muſt bee ſoftned with emollient, attenuating and inciding decoctions, as alſo with liniments, ointments and plaſters haveing the ſame effect. Then let the reſidue of the cure bee performed by fumigations, ſuch as this which follow's. ℞. *pul. cinab* ℥ii. *lad. aſſ. odor. ſtirac. cal. an.* ℥ß. *olib. maſtic. an.* ℥iii. *olei tart. & theriac. q. ſ. fiant trochiſci*; uſe at each time ſom ℥ß. of them, and let onely the affected parts receiv the ſmoak. Som commend the rubbing of the hands with the following medicine. Take the aſhes of wine-lees, make thereof a lee, and ſtrain it through an hypocraſs-bag, then put thereto ſom rennet, let them bee well mixed together in a mortar, and herewith let the hands bee rubbed or waſhed. Or, ℞. *unguent. enul.* ℥iii. *fugit.* ℥ii. Or elſ, ℞. *reſ. pini*, ℥i. *ceruſ.* ℥ß. *argent. viv.* ℥iii. *ſucci citri & lapath. acut. an.* ℥ß. Let them bee incorporated, and make a liniment to bee uſed to the part. If to this you add *ſublimate* ſo waſhed and prepared, as women uſe for their faces, you ſhall make it more effectuall. Others take burnt alum made into powder, and incorporated with the yolk of an egg, the juice of citrons, and a little aloës diſſolved in *oxymel ſcilliticum*.

CHAP. XXX.

Of cureing the Lues Venerea *in infants and little children.*

INfants oftimes conceiv the ſeeds of this diſeaſ in the wombs of their mothers, and are born infected there-withall, puſtles preſently ariſeing over all the bodies, infecting with the like diſeaſ as manie nurſes as give them ſuck; they ſcarce ever recover thereof, for that they contracted the diſeaſ from their firſt confirmation. But ſuch as are ſomwhat bigger, if they chance to catch the diſeaſ after they are born by ſucking ſom infected nurſ, or by anie other occaſion or kinde of contagion, often times receiv cure.

The cure. For firſt, you ſhall cauſ the nurſ to uſe the *aqua theriacalis* here-under deſcribed, for the ſpace of twentie or more daies, that ſo ſhee may the better arm her ſelf againſt the contagion of this diſeaſ, and yield milk which may have the facultie both of meat and medicine; ſhee ſhall bee careful as often as ſhee giv's the childe ſuck, to waſh and drie her teat or pap, leſt the virulencie that the childe breath'es out at his mouth, bee impact in the little holes of the teat through which the milk flow's out. Now the puſtles of little children ſhall bee annointed with ſom ointment that receive's *argentum vivum* in ſom ſmall quantitie, as *unguentum enulatum cum mercurio*, or the like. Then ſhall it bee ſwathed or bound up in ſwathes and clothes aired with the formerly deſcribed fumigations. For the reſt, it ſhall bee kept as warm as you can in ſom warm place. Theſe and the like muſt bee don not in one continued courſ, but at ſeveral ſeaſons, otherwiſe it is to bee feared, that it would cauſ ulcers to ariſe in the mouth, or elſ ſalivation. If anie ulcers ariſe in the mouth, and ſpread therein, they ſhall bee touched with the formerly deſcribed waters, but made ſomwhat weaker, haveing regard to the tender age of the patient; if the infant ſhall get this diſeaſ of its nurſ, let the nurſ bee preſently changed, for it beeing otherwiſe nouriſhed with tainted and virulent blood, can never bee healed. Manie have by theſe means recovered; but ſuch as have periſh't, have not periſh't by the default of medicines, but by the malignitie and vehemencie of the diſeaſ.

A deſcription of the Aqua Theriaçalis, *or treacle-water formerly mentioned.*

A treacle-water. ℞ *raſor. interior. ligni ſanctii gummoſi*, ℔ii. *polypod. querni*, ℥iv. *vini albi dulcedinis expertis* ℔ii. *aquæ fontan. puriſſ.* ℔viii. *aquar. cichor. & fumar. an.* ℥iv. *ſem. junip. heder. & baccar. lauri an.* ℥ii. *caryophyl. & macis, an.* ℥ß. *cort. citri ſaccaro condit. conſerv. anthos, cichor. bugloſ. borag. an.* ℥ß. *conſ. enulæ camp. theriac. vet. & mithrid. an.* ℥ii. diſtil them all in *balneo Mariæ*, after the following manner.

The manner of makeing it. Let the *Guaicum* bee infuſed in equal parts of wine, and the fore-mentioned waters for the ſpace of twelv hours, and the reſidue of the things in that which remain's of the ſame wine and waters for ſix hours ſpace, beating ſuch things as may require it, then let them bee mixed altogether, that ſo the liquor may bee endued with all their faculties. Which that it may bee the more effectually performed, let them bee boiled, put up in glaſs-bottles, cloſely ſtopped for ſom three or four hours ſpace, in a large kettle filled with boiling water, then let them bee put into a glaſs alembick, and ſo diſtilled. Give ℥iv. of this diſtilled liquor at once, beeing aromatized with ʒi. of cinnamon, and ℈i. of *Diamargariton*, and ℥ß. of ſugar, to give it a pleaſing taſte. Such a drink doth not onely retund the virulencie of the *Lues Venerea*, but ſtrengthen's the noble parts. *Rondeletius* make's an *aqua theriacalis* after this manner. ℞ *theriac. vet.* ℔i *aceto ſ.* m. iii. *rad gram.* ℥iii. *puleg. card. ben. an.* m. ii. *flor. chamam.* p. ii. *temperentur omnia in vino albo, & diſtillentur in vaſe vitrio*: reſerv the water for uſe; whereof let the patient take ℥ii. with ℥iii. of ſorrel and bugloſs-water: hee wiſheth this to bee don when hee ſhall enter into bed or a ſtove; for ſo this diſtilled liquor will cauſ ſweat more eaſily, and mitigate pain, whether given by it ſelf, or with a decoction of grommel, or of *chyna*, or burdock-roots; yet if the patient bee of a phlegmatick conſtitution, hee ſhall uſe a decoction of *Guaicum* in ſtead of a decoction of *chyna*, for it penetrate's more ſpeedily, by reaſon of its ſubtiltie of parts, and alſo expell's the dolorifick matter.

Rondeletius his treacle-water.

The end of the nineteenth Book.

Of the *Small Pocks* and *Meazles*: As alſo of *Worms*, and the *Leproſie*.

The twentieth Book.

CHAP. I.

Of the cauſes of the Small Pocks and Meazles.

FOR that the ſmall Pocks and Meazles are diſeaſes, which uſually are forerunners and fore-tellers of the Plague, not onely by the corruption of humors, but oftimes by default of the air; moreover, for that worms are oftimes generated in the plague, I have thought good to write of theſe things, to the end that by this treatiſe the young Surgeon may bee more amply and perfectly inſtructed in that peſtilent diſeaſ. Alſo I have thought good to treat of the Leproſie as beeing the off-ſpring of the higheſt corruption of humors in the bodie. Now the ſmall Pocks are puſtles, and the Meazles ſpots, which ariſe in the top of the skin by reaſon of the impuritie of the corrupt blood ſent thither by the force of nature. Moſt of the Antients have delivered that this impuritie is the reliques of the menſtruous blood remaining in the bodie of the infant, beeing of that matter from whence it drew nouriſhment in the womb, which lying ſtill or quiet for ſom ſpace of time, but ſtirred up at the firſt opportunitie of a hotter Summer, or a ſoutherlie or rainie ſeaſon, or a hidden malignitie in the air, and boiling up, or working with the whole maſs of the blood, ſpread or ſhew themſelvs upon the whole ſurface of the bodie. An argument hereof is, there are few or none who have not been troubled with this diſeaſ, at leaſt once in their lives, which when it begin's to ſhew it ſelf, not content to ſet upon ſom one, it commonly ſeazeth upon more: now commonly there is as much difference between the ſmall pocks and meazles, as there is between a Carbuncle and a peſtilent *Bubo*. For the ſmall pocks ariſe of a more groſs and viſcous matter, to wit, of a phlegmatick humor. But the meazles of a more ſubtil and hot; that is, a cholerick matter, therefore this yeeld's no marks thereof, but certain ſmall ſpots without anie tumor, and theſe either red, purple, or black. But the ſmall pocks are extuberateing puſtles, white in the mid'ſt, but red in the circumference, an argument of blood mixed with choler, yet they are ſcarce known at the beginning, that is on the firſt or ſecond daie they appear; but on the third and fourth daie they bunch out and riſe up into a tumor, becomming white before they turn into a ſcab; but the meazles remain ſtill the ſame. Furthermore the ſmall pocks prick like needles by reaſon of a certain acrimonie, and cauſ an itching; the meazles do neither, either becauſ the matter is not ſo acrid and biteing, or elſ for that it is more ſubtil, it eaſily exhale's, neither is it kept ſhut up under the skin. The patients often ſneez when as theſe matters ſeek paſſage out, by reaſon of the putrid vapors aſcending from the lower parts upwards to the brain. They are held with a continual Fever, with pains in their backs, itching of their noſe, head-ach, and a vertiginous heavineſs, and with a kinde of ſwounding or fainting, a nauſeous diſpoſition, and vomiting, a hoarſneſs, difficult and frequent breathing, an inclination to ſleep, a heavineſs of all the members, their eies are fierie and ſwollen, their urine red and troubled. For prognoſticks, wee may truely ſay thus much, That the matter whence this affect take's its original, partake's of ſo malign, peſtilent and contagious a qualitie, that not content to mangle and ſpoil the fleſhie part, it alſo eat's and corrupt's the bones like the *Lues Venerea*, as I obſerved not onely in *Anno Dom.* 1568. but alſo in diverſ other yeers, whereof I think it not amiſs to ſet down this notable example.

What the ſmal Pocks and Meazles are. Their matter.

Why the Meazles do not itch.

Prognoſticks.

The daughter of *Claude Piqué* a book-ſeller, dwelling in S. *James* his ſtreet at *Paris*, beeing ſom four or five yeers old, haveing been ſick of the ſmall pocks for the ſpace of a month, and nature could not overcom the malignitie of the diſeaſ, there roſe abſceſſes upon the *ſternon* and the joints of the ſhoulders, whoſe eating and virulent matter, corroded the bones of the *ſternon*, and divided them in ſunder; alſo it conſumed a great part of the top of the ſhoulder-bone, and the head of the blade-bone: of this thing I had witneſſes with me, *Marcus Myron* Phyſician of *Paris*, and at this preſent the King's chief Phyſician, *John Doreau* Surgeon to the *Conte de Bryane*, the bodie being diſſected in their preſence. Alſo you may obſerv in manie killed by the malignitie of this diſeaſ, and diſſected, that it cauſeth ſuch impreſſion of corruption

An hiſtorie.

What grievous and pernitious ſymptoms may happen by the ſmall Pocks.

ruption in the principall parts, as bring's the dropſie, ptiſick, a hoarſneſs, *Aſthma*, bloody flux ulcerating the guts, and at length bringing death, as the puſtles have raged or raigned over theſe or theſe entrails, as you ſee them to do over the ſurface of the body; for they do not onely moleſt the external parts, by leaving the impreſſions & ſcars of the puſtles and ulcers, rooting themſelvs deep in the fleſh, but alſo oft times they take away the facultie of motion, eating aſunder, and weakning the joints of the elbow, wreſt, knee and ancle. Moreover ſundry have been deprived of their ſight by them, as the Lord *Guymenay*; others have loſt their hearing, and otherſom their ſmelling, a fleſhy excreſcence growing in the paſſages of the noſe and ears. But if anie reliques of the diſeaſ remain, and that the whole matter thereof bee not expelled by the ſtrength of nature, then ſymptoms afterwards ariſe, which ſavor of the malignitie of the humor, yea and equall the harm of the ſymptoms of the *Lues Venerea*.

CHAP. II.

Of the cure of the Small Pocks and Meazles.

The cure.

THe cure of this diſeaſ uſeth to bee divers, according to the condition of the humor free from, or partaker of the venenate qualitie. For if it partake of malignitie, and the childe bee a ſucking childe, ſuch things ſhall bee given to the Nurſ as may infringe and overcom the ſtrength of the malignitie, as wee ſhall ſhew more at large, when wee com to treat of the cure of children which are ſick of the Plague; howſoever it bee, the childe muſt bee kept in a warm room free from winde, and muſt be wrapped and covered with ſcarlet cloaths, untill the pocks com forth. There ſhall bee provided for the Nurſ medicated broths with purſlain, lettuce, ſorrell, ſuccory, borage, and French barly bound up in a cloth. Shee ſhall ſhun all ſalt, ſpiced and baked meats, and in ſtead of wine drink a decoction of liquorice, raiſons and ſorrel roots. Shee ſhall alſo take purgeing medicins, as if ſhee were ſick of the ſame diſeaſ, that ſo her milk may becom medicinable. Laſtly, ſhee ſhall obſerv the ſame diet as is uſually preſcribed to ſuch as have the plague. You ſhall give the childe no pap, or if you give it anie, let it be verie little. But if the childe bee weaned, let him abſtain from fleſh, until the feaver have left him, and the pocks bee fully com forth: in ſtead of fleſh let him feed on barly and almond creames, chicken broths, wherein the fore-named herbs have been boyled, panadoes, gellies, culaſſes, prunes and raiſons. Let his drink bee a ptiſan made of French barlie, graſs & ſorrel roots, or with a nodula containing the four cold ſeeds, the pulp of prunes and raiſons, with the ſhaveings of Ivorie and hartſ-horn; between meals the ſame decoction may bee mixed with ſom ſyrup of violets, but not of roſes or any other aſtringent ſyrup, leſt wee hinder the courſ and inclination of the humor outwards.

The childe muſt have no pap.

How ſound ſleep doth harm in this diſeaſ.

Of purgeing, bleeding and ſudorificks

Let his ſleep bee moderate, for too ſound ſleep draws back the matter to the center, and increaſeth the fever; you muſt neither purge, nor draw blood the diſeaſ increaſing or beeing at the height, unleſs paradventure there bee a great plenitude, or elſe the diſeaſ complicate with other, as with a pleuriſie, inflammation of the eyes, or an ſquinancie which require it, leſt the motion of nature ſhould be diſturbed; but you ſhall think it ſufficient to looſe the bellie with a gentle glyſter: but when the height of the diſeaſ is over, and in the declenſion thereof, you may with *Caſſia* or ſom ſtronger medicine evacuate part of the humors and the reliques of the diſeaſ. But in the ſtate and increaſ it is better to uſe ſudorificks, which by attenuating the humors and relaxing the pores of the skin may drive the cauſ of the diſeaſ fom the center to the circumference, which otherwiſe refideing in the bodie might bee a cauſ of death; as I and *Richard Hubert* obſerved in two maids, whereof one was four, and the other ſeventeen yeers old; for wee diſſecting them both beeing dead, found their entrails covered with ſcabbie or cruſted puſtles, like thoſe that break forth upon the skin. Wee muſt not think that a bleeding at noſe at the beginning of the diſeaſ, or in the firſt four or five daies ſhould carrie away the matter and original of the diſeaſ, for nevertheleſs the pocks will com forth; but for that this is a true and natural *criſis* of this diſeaſ, as that which is carried to the ſurface & circumference of the bodie, ſuch bleeding muſt not be ſtopped, unleſs you fear it will cauſ ſwounding. The matter ſhall bee drawn out with a decoction of figs, husked lentils, citron-ſeeds, the ſeeds of fennel, parſlie, ſmallage, roots of graſs, raiſons and dates. For ſuch a decoction, certainly if it have power to cauſ ſweat, hath alſo a facultie to ſend forth unto the skin the morbifick humor; the ſeeds of fennel and the like opening things relax and open the pores of the skin; figs lenifie the acrimonie of the matter, and gently cleanſ, the lentils keep the jaws and throat, and all the inward parts from puſtles, and hinder a flux by reaſon of their moderate aſtriction, but haveing their husks on, they would binde more then is required in the diſeaſ; dates are thought to comfort the ſtomach, and citron-ſeeds to defend the heart from malignitie, licoriſh to ſmooth the throat, and hinder hoarſneſs and cauſ ſweat. But theſe things ſhall bee given long after meat, for it is not fit to ſweat preſently after meat; ſom there bee who would have the childe wrapped in linnen clothes ſteep'd in this decoction beeing hot, and afterwards hard wrung forth. Yet I had

An hiſtorie.

A ſudorifick decoction.

When it is beſt to procure ſweat.

rather

rather to uſe bladders or ſpunges, or hot bricks for the ſame purpoſe; certainly a decoction of millet, figs and raiſons, with ſom ſugar, cauſeth ſweat powerfully. Neither is it amiſs whil'ſt the patient is covered in all other parts of the bodie, and ſweat's, to fan his face, for thus the native heat is kept in and ſo ſtrengthned, and fainting hindred, and a greater excretion of excrementitious humors cauſed. To which purpoſe you may alſo put now and then to the patient's noſe a *nodulus* made with a little vineger and water of roſes, camphire, the powder of ſanders, and other odoriferous things which have a cooling facultie, this alſo will keep the noſe from puſtles.

CHAP. III.

What parts muſt bee armed againſt, and preſerved from the Pocks.

THe eies, noſe, throat, lungs and inward parts ought to bee kept free'r from the eruption of puſtles then the other parts; for that their nature and conſiſtence is more obnoxious to the malignitie of this virulencie, and they are eaſilyer corrupted and bleniſhed. Therefore leſt the eies ſhould bee hurt, you muſt defend them when you firſt begin to ſuſpect the diſeaſ, with the eie-lids, alſo moiſtning them with roſe-water, verjuce or vineger, and a little camphire. There are ſom alſo who for this purpoſe alſo make a decoction of Sumach, berberie-ſeeds, pomgranate-pills, aloës, and a little ſaffron; the juice of ſowr pomgranates, and the water of the whites of eggs dropped in with roſe-water are good for the ſame purpoſe; alſo woman's milk mixed with roſe-water and often renewed; and laſtly all ſuch things or have a repercuſſive qualitie. Yet if the eies bee much ſwoln and red, you ſhall not uſe repercuſſives alone, but mix therewith diſcuſſers and cleanſers, ſuch as are fit by a familaritie of nature to ſtrengthen the ſight; and let theſe bee tempered with ſom fennel or eie-bright water. Then the patient ſhall not look upon the light or red things for fear of pain and inflammation; wherefore in the ſtate of the diſeaſ, when the pain and inflammation of the eies are at their height, gently drying and diſcuſſive things properly conduceing to the eies are moſt convenient, as waſhed aloës, tuttie and Antimonie in the water of fennel, eie-bright and roſes. The formerly mentioned *nodulus* will preſerv the noſe, and linnen clothes dipped in the fore-ſaid aſtringent decoction, put into the noſtrils and outwardly applied. Wee ſhall defend the jaws, throat, and throtle, and preſerv the integritie of the voice by a gargle of oxycrate, or the juice of ſowr pomgranates, holding alſo the grains of them in their mouths, and often rouling them up and down therein, as alſo by nodula's of the ſeeds of *pſilium*, quinces and the like cold and aſtringent things. Wee muſt provide for the lungs and reſpiration by ſyrups of jubes, violets, roſes, white poppies, pomgranates, water-lillies, and the like. Now when as the Pocks are throughly com forth, then may you permit the patient to uſe ſomwhat a free'r diet, and you muſt wholly buſie your ſelf in ripening and evacuateing the matter, drying and ſcaleing them. But for the Meazles, they are cured by reſolution onely, and not by ſuppuration; the Pocks may bee ripened by annointing them with freſh butter, by fomenting them with a decoction of the roots of mallows, lillies, figs, line-ſeeds and the like. After they are ripe, they ſhall have their heads clipped off with a pair of ſciſſers, or elſ bee opened with a golden or ſilver-needle, leſt the matter contained in them, ſhould corrode the fleſh that lie's thereunder, and after the cure, leav the prints or pock-holes behinde it, which would cauſſom deformitie; the *pus*, or matter beeing evacuated, they ſhall bee dried up with *unguent. roſat.* adding thereto ceruſs, litharge, aloës and a little ſaffron in powder; for theſe have not onely a facultie to drie, but alſo to regenerate fleſh; for the ſame purpoſe the flowr of barlie and lupines are diſſolved and mixed with roſe-water, and the affected parts annointed therewith with a fine linnen rag; ſom annoint them with the ſward of bacon boiled in water and wine, then preſently ſtrow upon them the flowr of barlie or lupines, or both of them. Others mix crude honie newly taken from the comb, with barlie-flowr, and therewithall annoint the puſtles ſo to drie them; beeing dried up like a ſcurf or ſcab, they annoint them with oil of roſes, violets, almonds, or elſ with ſom cream, that they may the ſooner fall away, the puſtles beeing broken; tedious itchings ſollicit the patients to ſcratch, whence happen's excoriation and filthie ulcers, for ſcratching is the occaſion of greater attraction. Wherefore you ſhall binde the ſick childe's hand, and foment the itching parts with a decoction of marſh-mallows, barlie and lupines, with the addition of ſom ſalt. But if it bee alreadie excoriated, then ſhall you heal it with *unguent. album camphorat.* adding thereto a little powder of aloës or *Cinnabaris*, or a little *deſiccativum rubrum*. But if notwithſtanding all your application of repelling medicines, puſtles nevertheleſs break forth at the eies, then muſt they bee diligently cured with all manner of *collyria*, haveing a care that the inflammation of that part grow not to that bigneſs, as to break the eies, and that which ſomtimes happen's to drive them forth of their proper orbs. If anie cruſtie ulcers ariſe in the noſtrils, they may bee dried and cauſed to fall away by putting up of ointments. Such as ariſe in the mouth, palate

Remedies for excoriation.

late and throat, with hoarſneſs and difficultie of ſwallowing, may bee helped by gargariſms made with barlie-water, the waters of plantain and chervil, with ſom ſyrup of roſes, or *Diamoron* diſſolved therein; the patient ſhall hold in his mouth ſugar of roſes or the tablets of *Elect. diatragacanth. frigid.* The Pock-arrs left in the face, if they bunch out undecently, ſhall bee clipped away with a pair of ſciſſers, and then annointed with freſh *unguent. citrin.* or elſ with this liniment. ℞. *amyli triticei, & amygdalarum excorticatarum, an.* ℥ij. *gum. tragacanth* ℥ß. *ſeminis melonum, fabarum ſiccarum excorticat. farinæ hordei, an.* ℥iiii. Let them all bee made into fine powder, and then incorporated with roſe-water, and ſo make a liniment, wherewith annoint the face with a feather; let it bee wiped away in the morning, waſhing the face with ſom water and wheat-bran; hereto alſo conduceth *lac virginale*; Gooſ, duck's and capon's greaſ are good to ſmooth the roughneſs of the skin, as alſo oil of lillies; hares-blood of one newly killed and hot, is good to fill and plain, as alſo whiten the pock-holes, if they bee often rubbed therewith. In ſtead hereof manie uſe the ſward of Bacon rubbed warm thereon; alſo the diſtilled waters of bean flowers, lillie-roots, reed-roots, egg-ſhels, and oil of eggs are thought verie prevalent to waſte and ſmooth the Pock-arrs.

For the ulcers of the mouth and jaws.

To help the unſightlie ſcars of the face.

A Diſcourſ of certain monſtrous creatures which breed againſt nature in the bodies of men, women, and little children, which may ſerv as an inductiion to the enſuing diſcourſ of worms.

As in the *macrocoſmos* or bigger world, ſo in the *microcoſmos* or leſſer world there are windes, thunders, earth-quakes, ſhowrs, inundations of waters, ſterilities, fertilities, ſtones, mountains & ſundrie ſorts of fruits & creatures thence ariſe. For whocan denie but that there is winde contained ſhut up in flatulent abſceſſes, and in the guts of thoſe that are troubled wᵗʰ the colick? Flatulencies make ſo great a noiſ in diverſ women's bellies, if ſo bee you ſtand near them, that you would think you heard a great number of frogs croaking on the night-time: That water is contained in waterie abſceſſes, & the bellie of ſuch as have the dropſie, is manifeſted by that cure which is performed by the letting forth of the water; in fits of Agues the whole bodie is no otherwiſe ſhaken & tremble's, then the earth when it is heard to bellow, and felt to ſhake under our feet. Hee which ſhall ſee the ſtones which are taken out of the bladder, and com from the kidnies and diverſ other parts of the bodie, cannot denie but that ſtones are generated in our bodies. Furthermore wee ſee both men and women who in their face or ſom other parts, ſhew the impreſſion, or imprinted figure of a cherrie, plumb, ſervice, fig-mulberrie and the like fruit; the cauſ hereof is thought to bee the power of the imagination concurring with the formative facultie, and the tenderneſs of the yeelding and wax-like *embryon*, eaſie to bee brought into anie form or figure by reaſon of the proper and native humiditie. For you ſhall finde that all their mothers whil'ſt they went with them have earneſtly deſired or longed for ſuch things, which, whil'ſt they have too earneſtly agitated in their mindes, they have tranſ-ferred the ſhape unto the childe, whil'ſt that they could not enjoy the things themſelvs. Now who can denie but that the bunches of the back and large wens reſemble mountains? Who can gain-ſay, but that ſqualid ſterilitie may bee aſſimilated to the hectick drineſs of waſted and conſumed perſons? and fertilitie deciphered by the bodie diſtended with much fleſh and fat; ſo that the legs can ſcarce ſtand under the burden of the bellie? But that diverſ creatures are generated in one creature, that is in man, and that in ſundrie parts of him, the following hiſtories ſhall make it evident.

A compariſon between the bigger and leſſer world.

The generation of winde in man's bodie.

Of water.

Of ſtones.

Of fruits from the firſt conformation.

Hollerius tell's that a certain Italian by frequent ſmelling to the herb Baſil, had a Scorpion bred in his brain, which cauſſed long & vehement pain, and at length death; therefore I have here expreſt the figure of that Scorpion, found, when as his brain was opened.

Lib. de morb. intercap. 1.

The figure of a Scorpion.

It make's *Hollerius* conjecture of the cauſ and original of this Scorpion, probable for that *Chryſippus*, *Dyophanes* and *Plinie* write, that of baſil beaten between two ſtones, and laid in the ſun, there will com Scorpions.

Fernelius write's that in a certain ſouldier, who was flat noſed, upon the too long reſtraint or ſtoppage of a certain filthie matter that flowed out of the noſe, that there were generated two hairie worms of the bigneſs of ones finger, which at length made him mad, hee had no manifeſt fever, and hee died about the twentieth day: this was their ſhape, by as much as wee can gather by *Fernelius*'s his words.

Lib. 5. de part. morbis cap. 7.

The

The effigies of worms mentioned by Fernelius.

Lewis Duret, a man of great learning & credit, told me that he had com forth with his urine, after a long and difficult diſeaſe, a quick creature, of color red, but otherwiſe like in ſhape a Millepes, that is, a Cheſlop, or Hog-louſe. An hiſtorie.

The ſhape of a Millepes caſt forth by urine.

Count *Charls* of *Mansfeldt*, laſt Summer troubled with a grievous and continual fever, in the Duke of *Guiſes* place caſt forth a filthie matter at his yard, in the ſhape of a live thing almoſt juſt in this form. An hiſtorie.

The ſhape of a thing caſt forth by urine.

Monſtrous creatures alſo of ſundrie forms are alſo generated in wombs of women; ſometimes alone, otherwhiles with a *mole*, and ſometime with a childe naturally and well made; as frogs, toads, ſerpents, lizzards: which therefore the Antients have termed the Lumbard's brethren, for that it was uſual with their women, that together with their natural and perfect iſſue they brought into the world worms, ſerpents, and monſtrous creatures of that kinde generated in their wombs, for that they alwaies more reſpected the decking of their bodies, then they did their diet. For it happened whileſt they fed on fruits, weeds and traſh, and ſuch things as were of ill juice, they generated a putrid matter, or certainly verie ſubject to putrefaction and corruption, and conſequently opportune to generate ſuch unperfect creatures. *Joubertus* telleth that there were two Italian women, that in one month brought forth each of them a monſtrous birth; the one that married a Tailor, brought forth a thing ſo little, that it reſembled a Rat without a tail; but the other a Gentlewoman, brought forth a larger, for it was of the bigneſs of a Cat; both of them were black, and as ſoon as they came out of the womb, they ran up high on the wall, and held faſt thereon with their nails. *Lycoſthenes* write's that in *Anno Dom.* 1494. a woman at *Cracovia*, in the ſtreet which taketh name from the holie Ghoſt, was delivered of a dead childe, who had a ſerpent faſtned upon his back, which fed upon this dead childe, as you perceiv by this following figure. *Nicolaus Flor. God. lib. 7. c. 18.* *Lib. error popul.*

The figure of a ſerpent faſtned to a childe.

Levinus Lemnius tell's a verie ſtrange hiſtorie to this purpoſe. Som few yeers agone (ſaith hee) a certain woman of the Iſle in Flanders, which being with childe by a Sailor, her belly ſwelled *Lib. de ſtirp. nat. mir. cap. 8.*

ſwelled up ſo ſpeedily, that it ſeemed ſhee would not bee able to carrie her burden to the term preſcribed by nature; her ninth month beeing ended ſhee call's a midwife, and preſently after ſtrong throws and pains, ſhee firſt brought forth a deformed lump of fleſh, haveing as it were two handles on the ſides, ſtretched forth to the length and manner of arms, and it moved and panted with a certain vital motion, after the manner of ſpunges and ſea-nettles; but afterwards there came forth of her womb a monſter with a crooked noſe, a long and round neck, terrible eies, a ſharp tail, and wonderful quick of the feet, it was ſhaped much after this manner.

The ſhape of a monſter that came forth of a woman's womb.

As ſoon as it came into the light it filled the whole room with a noiſe & hiſſing, running to everie ſide to finde out a lurking hole wherein to hide its head, but the women which were preſent, with a joint conſent fell upon it, and ſmothered it with cuſhions, at length the poor woman wearied with long travel, was delivered of a boie, but ſo evilly entreated and handled by this monſter, that it died as ſoon as it was chriſtened.

Lib. de divinis natur. Characteriſmis.

Cornelius Gemma a Phyſician of *Lovain*, telleth that there were manie verie monſtrous and ſtrange things caſt forth both upwards and downwards out of the bellie of a certain maid of *Lovain*, of the age of fifteen years. Amongſt the reſt, ſhee caſt forth at her fundament, together with her excrements, a liveing creature ſom foot & half long, thicker then ones thumb, verie like an eel, but that it had a verie hairie tail; I have here given you the figure of the monſter as it was expreſſed by him.

The figure of a monſter that came forth of a maid's bellie.

An hiſtorie.

Maſter *Peter Barque* and *Claude le grand*, Surgeons of *Verdun*, lately affirmed to mee that they cured the wife of a certain Citizen of *Verdun*, which out of an Abſceſs broken in the bellie, caſt forth a great number of worms, together with the quittur; and theſe were of the thickneſs of ones finger, with ſharp heads, which ſo gnawed hee guts, that the excrements for a long time came forth at the ulcer, but now ſhee is perfectly recovered.

An hiſtorie.

Anthonie Benenius a Phyſician of *Florence* telleth; that one *John Menuſierus*, a man of fortie yeers of age, troubled with continual pains at his ſtomach, was often at the point of death, neither found hee anie help by the counſels of manie Phyſicians which hee uſed. At length comming to have his advice, hee gave him a vomit, by means whereof hee caſt up a great quantitie of corrupt and putrid matter, yet was hee not thereby eaſed of his pain. Therefore hee gave him another vomit, by force whereof hee caſt up much matter like to the former, and together therewith a worm of four fingers long, haveing a red round head, of the bigneſs of a great peaſ, covered over the bodie with a ſoft downineſs, with a forked tail, in manner of an half moon, going upon four feet, two before, and two behinde.

The figure of a worm caſt forth by vomit.

The

Why should I mention the prodigious bodies which are found in abscesses, as stones, chalk, sand, coles, snail-shells, strawes, hay, thorns, hairs, and manie kindes of living and dead creatures? For there is nothing in the generation of these things (caused by corruption, preceded by much alteration) which may make us admire, or hold us in suspence, especially if wee shal consider that nature, the fruitful parent of all things, hath put divers portions and particles of the universal matter whereof the greater world is composed into this *microcosmos*, or little world, man; whereby hee might the rather seem to bee made to the resemblance and form of the greater. Wherefore it so dispose's it self here, that it may counterfeit and resemble all the actions and motions which it useth to perform in the scene of the greater world, in this little one, if so bee that matter bee not wanting.

The efficient and material causes of such things as are preternaturally generated in our bodies.

CHAP. IIII.

Of the worms which use to breed in the guts.

Grosse, viscid and crude humor is the material caus of worms, which having got the beginning of corruption in the stomach, is quickly carried into the guts, and there it putrefie's, having notwithstanding acquired the form of laudable *Chylus* in the first concoction. This, for that it is viscid, tenaciously adhere's to the guts, neither is it easily evacuated with the other excrements; therefore by delay it further putrefies, and by the efficacie of heat, it turn's into the matter and nourishment for worms. This alimentarie humor being consumed, unless som fresh, supplie the want thereof, which they eat their hunger, they moov themselves in the guts with great violence, they caus grievous and great pains, yea, and oftimes they creep up to the stomach, and so com forth by the mouth, and sometimes they ascend into the holes of the palate, and com forth at the nose. Worms are of three sorts; for som are round and long, others broad and long, others short and slender. The first are called by the Antients *Teretes*, that is, round; for that they are long and round. The second are named *Tenie*, for that their bodies are long and broad, like A sowler or swathe. The third are termed *Ascarides*, for that they commonly wrap themselves up round. Other differences of worms are taken from their colors, as red, white, black, ash-colored, yellowish. Som also are hairie, with a great head like the little fish which the French call *Chabot*, wee, a *Miller's-thumb*; in som diseases manie worms are generated and cast forth by the fundament, as small as haire, and usually of color white, and these are they which are called *Ascarides*. The diversitie of colors in worms proceedeth not from the like distinct diversitie of humors whereof they are generated. For the melancholick and cholerick humor by their qualities are wholly unfit to generate worms. But this manifold varietie in color, is by reason of the different corruption of the *chylus* or phlegmatick humor whereof they are bred. The long and broad worms are oftentimes stretched alongst all the guts, being like to a mucous or albuminous substance, and verily I saw one voided by a woman, which was like to a serpent, and som six foot long; which ought not to seem strange, seeing it is noted by the Antients, that they have seen worms so long, as the length of the whole guts, that is, seven times the length of ones bodie. *Wierus* write's, that hee saw a countrie-man who voided a worm eight foot and one inch long, in head and mouth resembling a Duck, which therefore I have thought good here to expresse.

How worms are generated.

The reason that they sometimes com forth at the mouth.

The differences of worms.

An historie.

An historie.

The figure of a worm, generated in, and cast forth of the guts.

Valeriola affirmeth, that hee saw a worm above nine foot long. Now as worms differ in shape, so are their places of generation also different. For the round and long worms are commonly generated in the smaller guts, the rest in the greater, but especially the *Ascarides*:

In observat.

In what places of the bellie worms are generated.

none breed in the ſtomach, as that which is the place of the firſt concoction. There truly the matter which breedeth theſe worms, get's the firſt rudiment of corruption, but com's to perfection onely in the guts; they breed in ſom infants in their mothers bellies, by the pravitie and corrupt nature of the humor flowing from the mother for the nouriſhment of the childe, which for that then they do not expell it by ſiege, it by delay putrefieth the more, and yield's fit matter for the breeding of worms, as ſom have obſerved out of *Hippocrates*. Laſtly, worms breed in people of anie age that are Bellie-gods, and given to gluttonie, as alſo in ſuch as feed upon meats of ill juice, and apt to corrupt, as crude ſummer-fruits, cheeſ, and milk-meats. But to know in what part of the guts the worms do lurk, you muſt note, that when they are in the ſmall guts, the patients complain of a pain in their ſtomach, with a dog-like appetite, whereby they require manie and ſeveral things without reaſon, a great part of the nouriſhment beeing conſumed by the worms lying there; they are alſo ſubject to often fainting, by reaſon of the ſympathie which the ſtomach, beeing a part of moſt exquiſite ſenſ, hath with the heart, the noſe itches, the breath ſtink's, by reaſon of the exhalations ſent up from the meat corrupting in the ſtomach; through which occaſion they are alſo given to ſleep, but are now and then waked there-from by ſudden ſtartings and fears; they are held with a continued and ſlow fever, a drie cough, a winking with their eie-lids, and often changeing of the color of their faces. But long and broad worms, beeing the innates of the greater guts, ſhew themſelvs by ſtools repleniſhed with manie ſloughs, here and there reſembling the ſeeds of a Musk-melon or Cucumber. *Aſcarides* are known by the itching they cauſ in the fundament, cauſſing a ſenſ as if it were Ants running up and down; cauſſing alſo a *tenaſmus*, and falling down of the fundament. This is the cauſ of all theſe ſymptoms; their ſleep is turbulent and often clamorous, when as hot, acrid and ſubtil vapors, raiſed by the worms from the like humor and their food, are ſent up to the head; but ſound ſleep by the contrarie, as when a miſtie vapor is ſent up from a groſs and cold matter. They dream they eat their ſleep, for that while the worms do more greedily conſume the *chylous* matter in the guts, they ſtir up the ſenſ of the like action in the phantaſie. They grate or gnaſh their teeth by reaſon of a certain convulſifick repletion, the muſcles of the temples and jaws beeing diſtended by plentie of vapors. A drie cough com's by the conſent of the vital parts ſerving for reſpiration, which the natural, to wit, the *Diaphragma*, or midriff, ſmit upon by acrid vapors, and irritated as though there were ſom humor to bee expelled by coughing. Theſe ſame acrid fumes aſſailing the orifice of the ventricle, cauſ either an hickerting, or alſa fainting, according to the condition of their conſiſtence, groſs or thin; theſe carried up to the parts of the face cauſ an itching of the noſe, a darkneſs of the ſight, and a ſudden changeing of the color in the cheeks. Great worms are worſ then little ones, red then white, living then dead, manie then few, variegated then thoſe of one color, as thoſe which are ſigns of a greater corruption. Such as are caſt forth bloodie and ſprinkled with blood, are deadlie, for they ſhew that the ſubſtance of the guts is eaten aſunder; for oftimes they corrode and perforate the bodie of the gut wherein they are contained, and thence penetrate into divers parts of the bellie, ſo that they have com forth ſomtimes at the navel, haveing eaten themſelvs a paſſage forth, as *Hollerius* affirmeth. When as children troubled with the worms draw their breath with difficultie, and wax moiſt over all their bodies, it is a ſign that death is at hand. If at the beginning of ſharp fevers, round worms com forth alive, it is a ſign of a peſtilent fever, the malignitie of whoſe matter they could not endure, but were forced to com forth. But if they bee caſt forth dead, they are ſigns of greater corruption in the humors, and of a more venenate malignitie.

CHAP. V.

What cure to bee uſed for the Worms.

The general indications of cureing the worms.

IN this diſeaſ there is but one indication, that is, the excluſion or caſting out of the worms, either alive or dead, forth of the bodie, as beeing ſuch that in their whole kinde are againſt nature; all things muſt bee ſhunned which are apt to heap up putrefaction in the bodie by their corruption, ſuch as are crude fruits, cheeſ, milk-meats, fiſhes, and laſtly, ſuch things as are of a difficult and hard digeſtion, but prone to corruption. Pap is fit for children, for that they require moiſt things, but theſe ought to anſwer in a certain ſimilitude to the conſiſtence and thickneſs of milk, that ſo they may the more eaſily bee concocted and aſſimilated, and ſuch onely is that pap which is made with wheat-flower, not crude, but baked in an oven, that the pap made therewith may not bee too viſcid nor thick, if it ſhould onely bee boiled in a pan as much as the milk would require; or elſ the milk would bee too terreſtrial, or too waterish, all the fatrie portion thereof beeing reſolved, the cheeſie and whayiſh portion remaining, if it ſhould boil ſo much as were neceſſarie for the ful boiling of the crude meat;

meat; they which uſe meal otherwiſe in pap yeeld matter for the generateing of groſs and viſcid humors in the ſtomach, whence happen's obſtruction in the firſt veins and ſubſtance of the liver; by obſtruction worms breed in the guts, and the ſtone in the kidnies and bladder. The patient muſt bee fed often, and with meats of good juice, leſt the worms through want of nouriſhment, ſhould gnaw the ſubſtance of the guts. Now when as ſuch things breed of a putrid matter, the patient ſhall bee purged, and the putrefaction repreſt by medicines mentioned in our Treatiſe of the Plague. For the quick killing and caſting of them forth, ſyrup of ſuccorie, or of lemmons with rubarb, a litle treacle or methridate is a ſingular medicine, if there bee no fever; you may alſo for the ſame purpoſe uſe this following medicine. Wherfore, and wherwith, ſuch as have the worms, muſt bee purged.

℞. *cornu cervi, pul. raſuræ horis, an.* ℥iſs. *ſem. tanacet. & contrà verm. an.* ℥i. *fiat decoctio pro parvâ doſi in colaturâ infunde rhei optimi* ℥i. *cinam.* ℈ii *diſſolve ſyrupi de abſinthio* ℥ſs. make a potion, give it in the morning three hours before anie broth. Oil of Olives drunk, kill's worms; as alſo water of knot-graſs drunk with milk; and in like manner all bitter things. Yet I could firſt wiſh them to give a glyſter made of milk, honie and ſuger, without oils and bitter things, leſt ſhunning therof, they leav the lower guts, and com upwards; for this is natural to worms, to ſhun bitter things, and follow ſweet things. Whence you may learn, that to the bitter things which you give by the mouth, you muſt alwaies mix ſweet things, that allured by the ſweetneſs, they may devour them more greedily, that ſo they may kil them. Therefore I would with milk and ſuger, mix the ſeeds of centaurie, Rue, wormwood, aloes and the like: hartſhorn is verie effectual againſt worms, wherefore you may infuſe the ſhaveings thereof in the water or drink that the patient drink's, as alſo to boil ſom thereof in his broths. So alſo treacle drunk or taken in broth, killeth the worms; purſlain boiled in broths, and diſtilled and drunk, is alſo good againſt the worms; as alſo ſuccorie and mints; alſo a decoction of the leſſer houſ-leek and ſebeſtens given with ſuger before meat; it is no leſs effectual to put wormſeeds in their pap, and in roſted apples, and ſo to give them it. Hartſ-horn good againſt the worms.

Alſo you may make ſuppoſitories after this manner, and put them up into the fundament. Suppoſitories againſt the *Aſcarides*.

℞. *coralli ſubalbi, raſuræ eboris, cornu cervi uſti, ireos an.* ℈ii. *mollis albi* ℥iſs. *aquæ centaurdiæ q. ſ. ad omnia concorporanda, fiant Glandes*: let one bee put up everie daie, of the weight of ℥ii. for children; theſe ſuppoſitories are chiefly to bee uſed for *Aſcarides*, or thoſe which adhere to the right gut. To ſuch children as can take nothing by the mouth, you ſhall applie cataplaſms to their navels made of the powder of cummin-ſeeds, the flowr of lupines, worm-wood, ſouthern-wood, tanſie, the leavs of artichokes, *Rue*, the powder of *coloquintida*, citron-ſeeds, aloes, arſ-ſmart, horſ-mint, peach-leavs, *Coſtus amarus, Zedoaria*, ſope and ox-gall. Such cataplaſms are oftimes ſpred over all the bellie, mixing therewith aſtringent things for the ſtrengthening of the part, as oil of myrtles, Quinces and maſtich; you may alſo applie a great onion hollowed in the mid'ſt, and filled with aloes and treacle, and ſo roſted in the members, then beaten with bitter almonds, and an ox-gall. Alſo you may make emplaſters of bitter things, as this which follow's. A plaſter againſt the worms.

℞. *fellis bubuli, ſucci abſinthii, an.* ℥ii. *galbyn.* ℥i. *terantur & miſcentur ſimul, incorporentur cum farinâ lupinorum*: make hereof an emplaſter to bee laid upon the Navel.

Liniments and ointments may bee alſo made for the ſame purpoſe to annoint the bellie, you may alſo make plaſters for the navel of *pillule ruf.* annointing in the mean time the fundament with honie and ſuger, that they may bee chaſed from above with bitter things, and allured downwards with ſweet things. Or elſ take worms that have been caſt forth, drie them in an Iron-pan over the fire, then powder them, and give them with wine or ſom other liquor to bee drunk, for ſo they are thought quickly to kill the reſt of the worms. Hereto alſo conduceth the juice of citrons, drunk with the oil of bitter almonds, or ſallet-oil. Alſo ſom make bathes againſt this affect of worm-wood, galls, peach-leavs boiled in water, and then bathe the childe therein.

But in cureing the worms, you muſt obſerv that this diſeaſ is oftimes entangled with another more grievous diſeaſ, as an acute and burning fever, a flux or ſcouring, and the like, in which (as for example ſake) a fever beeing preſent and conjoined therewith, if you ſhall give worm-ſeeds, old Treacle, myrrh, aloes, you ſhall increaſ the fever and flux, for that bitter things are verie contrarie to theſe affects. But if, on the contrarie, in a flux whereby the worms are excluded, you ſhall give corral, and the flowr of Lentils, you ſhall augment the fever, makeing the matter more contumacious by drie and aſtringent things. Therefore the Phyſician ſhall bee careful in conſidering whether the fever bee a ſymptom of the worms, or on the contrarie it bee eſſential, and not ſymptomatick; that this being knowen, hee may principally inſiſt in the uſe of ſuch medicines as reſiſt both affects, as purgeing and [illegible] in a fever and worms, but bitter and ſomwhat aſtrictive things in the worms and [illegible]. A fever ſomtimes a ſymptom, and ſomtimes a diſeaſ.

CHAP. VI.

A ſhort deſcription of the Elephantiaſis *or Leproſie, and of the cauſſes thereof.*

THis diſeaſ is termed *Elephantiaſis*, becauſ the skin of ſuch as are troubled therewith is rough, ſcabious, wrinkled and unequal, like the skin of an Elephant. Yet this name may ſeem to bee impoſed thereon by reaſon of the greatneſs of the diſeaſ. Som from the opinion of the Arabians have termed it *Lepra*, or Leproſie (but unproperly, for the *Lepra* is a kinde of ſcab and diſeaſ of the skin, which is vulgarly called *Malum ſancti maria*) which word for the preſent wee will uſe, as that which prevail's by cuſtom and antiquitie. Now the Leproſie (according to *Paulus*) is a Cancer of the whole bodie, the which (as *Aviten* add's) corrupt's the complexion, form and figure of the members. *Galen* think's the cauſ ariſeth from the error of the tanguifying faculti, through whoſe default the aſſimilation in the fleſh and habit of the bodie is depraved, and much changed from it ſelf, and the rule of nature. But *ad Glauconem*, hee define's this diſeaſ, An effuſion of troubled or groſs blood into the veins and habit of the whole bodie. This diſeaſ is judged great, for that it partake's of a certain venenate virulencie, depraveing the members and comlineſs of the whole bodie. Now it appear's, that the Leproſie partake's of a certain venenate virulencie by this, that ſuch as are melancholick in the whole habit of their bodies, are not leprous. Now this diſeaſ is compoſed of three differences of diſeaſes: Firſt, it conſiſt's of a diſtemper againſt nature, as that which at the beginning is hot and drie, and at length the ebullition of the humors ceaſing, and the heat diſperſed, it becom's cold and drie, which is the conjunct cauſ of this ſympcom. Alſo it conſiſt's of an evil compoſition or conformation, for that it deprave's the figure and beautie of the parts. Alſo it conſiſt's of a ſolution of continuitie, when as the fleſh and skin are cleft in divers parts with ulcers and chops. The Leproſie hath for the moſt part three general cauſſes, that is, the primitive, antecedent, and conjunctive: The primitive cauſ is either from the firſt conformation, or com's to them after they are born. It is thought to bee in him from the firſt conformation, who was conceived of depraved and menſtruous blood, and ſuch as inclined to melancholie; who was begot of the leprous ſeed of one or both his parents, for leprous perſons generate leprous, becauſ the principal parts beeing tainted and corrupted with a melancholick and venenate juice, it muſt neceſſarily follow, that the whole maſs of blood and ſeed that fall's from it, and the whole bodie ſhould alſo bee vitiated. This cauſ happen's to thoſe that are alreadie born, by long ſtaying and inhabiting in maritime countries, whereas the groſs and miſtie air, in ſucceſs of time, induceth the like fault into the humors of the bodie; for that, according to *Hippocrates*, ſuch as the air is, ſuch is the ſpirit, and ſuch the humors. Alſo long abideing in verie hot places, becauſ the blood is torrified by heat, but in cold places, for th at they incraſſate, and congealing the ſpirits do after a manner ſtupifie, may bee thought the primitive cauſſes of this diſeaſ. Thus in ſom places of Germanie there are divers leprous perſons; but they are more frequent in Spain, and over all Africa, then in all the world beſide, and in Languedoc, Provence and Guyenne, are more then in whole France beſides. Familiaritie, copulation, and cohabitation with leprous perſons may bee reckoned amongſt the cauſſes thereof, becauſ they tranſer this diſeaſ to their familiars by their breath, ſweat and ſpittle left on the edges of the pots or cups. This diſeaſ is alſo cauſſed by the too frequent uſe of ſalt, ſpiced, acrid and groſs meats, as the fleſh of Swine, Aſſes, Bears, puls, milk-meats; ſo alſo groſs and ſtrong wines, drunkenneſs, gluttonie, a laborious life, full of ſorrow and cares, for that they incraſſate, and as it were burn the blood. But the retention of melancholick excrements, as the ſuppreſſion of the hemorrhoids, courſes, ſmall pocks and meazles, as alſo a quartain fever accuſtomed to com at ſet-times; the drying up of old ulcers, for that they defile the maſs of the blood with a melancholick droſs and filth. Now you muſt underſtand, that the cauſ of the Leproſie by the retention of the ſuperfluities, happen's, becauſ the corrupt blood is not evacuated, but regurgitate's over the whole bodie, and corrupt's the blood that ſhould nouriſh all the members; wherefore the aſſimilative faculti cannot well aſſimilate by reaſon of the corruption and default of the juice; and thus in concluſion the Leproſie is cauſſed. The antecedent cauſſes are the humors diſpoſed to aduſtion and corruption into melancholie, by the torrid heat; for in bodies poſſeſſed with ſuch heat, the humors by aduſtion eaſily turn into melancholie, which in time acquiring the malignitie and corruption of a virulent and venenate qualitie, yield's a beginning and eſſence to the Leproſie. The conjunct cauſſes are the melancholick humors, which are now partakers of a venenate and malign qualitie, and ſpread over the whole habit of the bodie, corrupteing and deſtroying it firſt by an hot and drie diſtemper, and then by a cold and drie, contrarie to the beginnings of life. For hence inevitable death muſt enſue, becauſ our life conſiſt's in the moderation of heat and moiſture.

CHAP. VII.

The ſigns of a Leproſie, breeding, preſent, and alreadie confirmed.

THe diſpoſition of the bodie and humors to a Leproſie is ſhewed by the change of the native and freſh color of the face, by that affect of the face, which is commonly called *Gutta roſacea*, red and blackiſh ſuffuſions and puſtles, the falling away of the hairs, and a great thirſt, and a drineſs of the mouth both by night and day, a ſtinking breath, little ulcers in the mouth, the change of the voice to hoarſneſs, a deſire of venerie above nature and cuſtom. Now there are four times of this diſeaſ, the beginning, increaſ, ſtate and declenſion. The beginning is, when as the malignitie hath not gon further then the inner parts and bowels, wherupon the ſtrength muſt need's bee more languid. The increaſ is, when as the virulencie com's forth, and the ſigns and ſymptoms are everie day increaſed in number and ſtrength. The ſtate is, when as the members are exulcerated. The declenſion is, when as the aſpect of the face is horrid, the extreme parts fall away by the profunditie and malignitie of the ulcers, ſo that none, no not of the common ſort of people, can doubt of the diſeaſ. According to the doctrine of the Antients, wee muſt in ſearching out of the ſigns of this diſeaſ beeing preſent, have chief regard to the head. For the ſigns of diſeaſes more properly and truly ſhew themſelvs in the face, by reaſon of the ſoftneſs and raritie of the ſubſtance thereof, and the tennitie of the skin that cover's it; wherefore a black and aduſt humor diffuſed there-under, eaſily ſhew's it ſelf, and that not onely by the mutation of the color, but alſo of the character and bulk, and oftimes by manifeſt hurting it. Wherefore you muſt obſerv in the head whether it have ſcauls, and whether in the place of thoſe hairs that are fallen away, others more tender, ſhort and rare grow up, which is likely to happen through defect of fit nouriſhment to preſerv and generate hairs, through corruption of the hairie ſcalp that ſhould bee ſtored with ſuch nouriſhment, and of the habit it ſelf, and through the unfitneſs thereof to contain hairs: laſtly, by the acrimonie of the vapors ſent up from the aduſt humors and entrails, fretting aſunder the roots of the hairs. But if not onely the hair, but alſo ſom portion of the skin and fleſh about the roots of the hair, com away by pulling, it is an argument of perfect corruption: let this therefore be the firſt ſign of a Leproſie. A ſecond and verie certain ſign is, a numerous and manifeſt circumſcription of round and hard puſhes or puſtles under the eie-brows, and behinde the ears, and in ſeveral places of the face, reſembling round and hard kernels, occaſioned by the default of the aſſimulating facultie. The cauſ of this default is the groſneſs of the flowing nouriſhment, by which means it beeing impact, and ſtopping in the ſtraitneſs of the way, it grow's round, as it were compaſſed about in the place whereas it ſtick's, and by the means of the cruditie, for that it is not aſſimulated, and by delay, it is further hardned. The third ſign is, the more contract and exact roundneſs of the ears, their groſneſs, and as it were grainie ſpiſſitude or denſneſs; the cauſ of their roundneſs is the conſumption of the flaps and fleſhie part through want of nouriſhment, and exceſs of heat; but the occaſion of their grainie ſpiſſitude is the groſneſs of the earthie nouriſhment flowing thither. The fourth ſign is a Lion-like wrinkling of the fore-head, which is the reaſon that ſom term this diſeaſ *morbus Leoninus*; the cauſ hereof is the great drineſs of the habit of the bodie, which alſo is the reaſon that the bark of an old oak is rough and wrinkled. The fifth is, the exact roundneſs of the eies, and their fix't and immoovable ſteddineſs; verily the eies are naturally almoſt round, yet they appear obtuſe, and ſomwhat broad on the fore-ſide, but end in a *Conus* on the hind part, by reaſon of the concourſ and figure of the muſcles and fat inveſting them. Therefore theſe beeing conſumed either through defect of laudable nouriſhment, or elſ by the acrimonie of the flowing humor, they are reſtored to their proper figure and roundneſs. Now the muſcles which mooved the eies beeing conſumed, and the fat which facilitated their motion waſted, it com's to paſs that they ſtand ſtiff and unmoovable, beeing deſtitute of the parts yeelding motion, and the facilitie thereof. The ſixth ſign is, the noſtrils flat outwardly, but inwardly ſtraight and contracted, that is, an earthie and groſs humor forced from within outwards, which ſwel's the ſides or edges of the noſtrils; whence it is, that the paſſages of the noſe appear as it were obſtructed by the thickneſs of this humor; but they are depreſſed and flatted by reaſon of the reſt of the face and all the neighboring parts ſwoln more then their wont; add hereto that the partition is conſumed by the acrimonie of the corrodeing and ulcerateing humor. The ſeventh is, the lifting up, thickneſs and ſwelling of the lips, the filthineſs, ſtinch and corroſion of the gums by acrid vapors riſeing to the mouth; but the lips of leprous perſons are more ſwoln by the internal heat burning and incraſſateing the humors, as the outward heat of the Sun doth in the Moors. The eighth ſign is, the ſwelling and blackneſs of the tongue, and as it were varicous veins lying under it; becauſ the tongue, beeing by nature ſpongeous and rare, is eaſily ſtored with excrementitious humors, ſent from the inner parts into the habit of the bodie; which ſame is the cauſ why the grandules placed about the tongue above and below, are ſwoln hard & round, no otherwiſe then ſcrophulous or meazled ſwine. Laſtly, all their face riſeth in red

bunches or puſhes, and is over-ſpread with a duskie and obſcure redneſs; the eies are fierie, fierce and fixed, by a melancholick chachectick diſpoſition of the whole bodie, manifeſt ſigns whereof appear in the face by reaſon of the fore-mentioned cauſſes, yet ſom leprous perſons have their faces tinctured with a yellowiſh, others with a whitiſh color, according to the condition of the humor, which ſerv's for a *baſis* to the leprous malignitie. For hence Phyſicians affirm that there are three ſorts of Leproſies; one of a reddiſh black color, conſiſting in a melancholick humor; another of a yellowiſh green, in a cholerick humor; another in a whitiſh yellow, grounded upon aduſt phlegm. The ninth ſign is a ſtinking of the breath, as alſo of all the excrements proceeding from leprous bodies, by reaſon of the malignitie conceived in the humors. The tenth is, a hoarſneſs, a ſhakeing, harſh and obſcure voice, comming as it were out of the noſe, by reaſon of the lungs, recurrent nervs, and muſcles of the throttle tainted with the groſneſs of a virulent and aduſt humor; the fore-mentioned conſtriction and obſtruction of the inner paſſage of the noſe; and laſtly, the aſperitie and inequalitie of the weazon by immoderate drineſs, as it happen's to ſuch as have drunk plentifully of ſtrong wines without anie mixture. This immoderate drineſs of the muſcles ſerving for reſpiration make's them to bee troubled with a difficultie of breatheing. The eleventh ſign is verie obſervable, which is a morphew or defedation of all the skin, with a drie roughneſs and grainie inequalitie, ſuch as appear's in the skins of plucked geeſ, with manie tetters on everie ſide, a filthie ſcab, and ulcers not caſting off onely a brain-like ſcurf, but alſo ſcales and cruſts. The cauſ of this drie ſcab is the heat of the burning bowels and humors unequally contracting and wrinkling the skin, no otherwiſe then as leather is wrinkled by the heat of the ſun or fire. The cauſ of the filthie ſcab and ſerpiginous ulcers, is the eating and corrodeing condition of the melancholick humor, and the venenate corruption, it alſo beeing the autor of corruption, ſo that it may bee no marvell if the digeſtive facultie of the liver beeing ſpoiled, the aſſimilative of a malign and unfit matter ſent into the habit of the bodie cannot well nor fitly perform that which may bee for the bodie's good. The twelfth is, the ſenſ of a certain pricking, as it were of goads or needles over all the skin, cauſſed by an acrid vapor hindred from paſſing forth, and intercepted by the thickneſs of the skin. The thirteenth is a conſumption and emaciation of the muſcles which are between the thumb and fore-finger, not onely by reaſon that the nouriſhing and aſſimilating faculties want fit matter wherewith they may repair the loſs of theſe parts, for that is common to theſe with the reſt of the bodie; but becauſ theſe muſcles naturally riſe up unto a certain mountainous tumor, therfore their depreſſion is the more manifeſt. And this is the cauſ that the ſhoulders of leprous perſons ſtand out like wings; to wit, the emaciation of the inward part of the muſcle *Trapezites*. The fourteenth ſign is, the diminution of ſenſ, or a numneſs over all the bodie by reaſon that the nervs are obſtructed by the thickneſs of the melancholick humor hindring the free paſſage of the animal ſpirit, that it cannot com to the parts that ſhould receiv ſenſ, theſe in the *interim* remaining free which are ſent into the muſcles for motion's ſake, and by this note I chiefly make trial of leprous perſons, thruſting a ſom-what long and thick needle ſom-what deep into the great tendon endued with moſt exquiſite ſenſ, which run's to the heel, which, if they do not well feel, I conclude, that they are certainly leprous. Now, for that they thus loſe their ſenſ, their motion remaining entire, the cauſ hereof is, that the nervs which are diſſeminated to the skin are more affected, and thoſe that run into the muſcles are not ſo much; and therefore when as you prick them ſomwhat deep, they feel the prick, which they do not in the ſurface of the skin. The fifteenth is, the corruption of the extreme parts poſſeſſed by putrefaction and a gangrene, by reaſon of the corruption of the humors ſent thither by the ſtrength of the bowels, infecting with the like tainture the parts wherein they remain: add hereto that the animal ſenſitive facultie is there decaied, and as often as anie facultie hath forſaken anie part, the reſt preſently after a manner neglect it. The ſixteenth is, they are troubled with terrible dreams, for they ſeem in their ſleep to ſee divels, ſerpents, dungeons, graves, dead bodies, and the like, by reaſon of the black vapors of the melancholick humor troubling the phantaſie with black and diſmal viſions, by which reaſon alſo ſuch as are bitten of a mad dog fear the water. The ſeventeenth is, that at the beginning and increaſ of the diſeaſ they are ſubtil, craftie and furious by reaſon of the heat of the humors and blood; but at length in the ſtate and declenſion they becom craftie and ſuſpicious, the heat and burning of the blood and entrails decaying by little and little; therefore then fearing all things whereof there is no cauſ, and diſtruſting of their own ſtrength, they endeavor by craft maliciouſly to circumvent thoſe with whom they deal, for that they perceiv their powers to fail them. The eighteenth is, a deſire of venerie above their nature, both for that they are inwardly burned with a ſtrange heat, as alſo by the mixture of flatulencies therewith (for whoſe generation the melancholick humor is moſt fit) which are agitated, and violently carried through the veins and genital parts by the preternatural heat; but at length, when this heat is cooled, and that they are fallen into an hot and drie diſtemper, they mightily abhor venerie; which then would bee verie hurtful to them, as it alſo is at the beginning of the diſeaſ, becauſ they have ſmall ſtore of ſpirits and native heat, both which are diſſipated by venerie. The nineteenth is,

IX. X. XI. XII. XIII. XIV. XV. XVI. XVII. XVIII. XIX.

is, the ſo great thickneſs of their groſs and livid blood, that if you waſh it, you may finde a ſandie matter therein, as ſom have found by experience, by reaſon of the great aduſtion and aſſation thereof. The twentieth is, the languidneſs and weakneſs of the pulſ (by reaſon of the oppreſſion of the vital and pulſifick faculties by a cloud of groſs vapors.) Herewith alſo their urine ſomtimes is thick and troubled, like the urine of carriage-beaſts, if the urinarie veſſels bee permeable and free; otherwiſe it is thin, if there bee obſtruction, which onely ſuffer's that which is thin to flow forth by the urinarie paſſages; now the urine is oftentimes of a pale aſh-color, and oftimes it ſmell's like as the other excrements do in this diſeaſ. Verily there are manie other ſigns of the Leproſie, as the ſlowneſs of the bellie by reaſon of the heat of the liver, often belchings by reaſon that the ſtomach is troubled by the reflux of a melancholick humor, frequent ſneeſing by reaſon of the fulneſs of the brain; to theſe, this may bee added moſt frequently, that the face and all the skin is unctuous or greaſie, ſo that water poured thereon, will not in anie place adhere thereto: I conceiv it is by the internal heat diſſolving the fat that lie's under the skin, which therefore alwaies look's as if it were greaſed or annointed therewith in leprous perſons. Now of theſe fore-mentioned ſigns, ſom are univocal, that is, which truly and neceſſarily ſhew the Leproſie: other-ſom are equivocal or common, that is, which conduce as well to the knowledg of other diſeaſes as this. To conclude, that aſſuredly is a Leproſie which is accompanied with all, or certainly the moſt part of theſe fore-mentioned ſigns.

XX.

Why their faces ſeem to bee greaſie.

CHAP. VIII.

Of Prognoſticks in the Leproſie; and how to provide for ſuch as ſtand in fear thereof.

THe Leproſie is a diſeaſ which paſſeth to the iſſue, as contagious almoſt as the Plague, ſcarce cureable at the beginning, incureable when as it is confirmed, becauſ it is a *Cancer* of the whole bodie; now if ſom one *Cancer* of ſome one part ſhall take deep root therein, it is judged incureable. Furthermore, the remedies which to this day have been found out againſt this diſeaſ, are judged inferior and unequal in ſtrength thereto. Beſides, the ſigns of this diſeaſ do not outwardly ſhew themſelvs before that the bowels bee ſeized upon, poſſeſſed and corrupted by the malignitie of the humor, eſpecially in ſuch as have the white Leproſie, ſundrie of which you may ſee about Burdeaux, and in little Brittain, who notwithſtanding inwardly burn with ſo great heat, that it will ſuddenly wrinkle and wither an apple held a ſhort while in their hand, as if it had laid for manie daies in the ſun. There is another thing that increaſeth the difficultie of this diſeaſ, which is an equal pravitie of the three principal faculties whereby life is preſerved. The deceitful and terrible viſions in the ſleep, and numneſs in feeling, argue the depravation of the animal facultie; now the weakneſs of the vital facultie is ſhewed by the weakneſs of the pulſ, the obſcuritie of the hoarſ and jarring voice, the difficultie of breatheing, and ſtinking breath; the decay of the natural is manifeſted by the depravation of the work of the liver in ſanguification, whence the firſt and principal cauſ of this harm ariſeth. Now becauſ wee cannot promiſe cure to ſuch as have a confirmed Leproſie; and that wee dare not do it to ſuch as have been troubled therewith but for a ſhort ſpace, it remain's that wee briefly ſhew how to free ſuch as are readie to fall into ſo fearful a diſeaſ. Such therefore muſt firſt of all ſhun all things in diet and courſ of life, whereby the blood and humors may bee too vehemently heated, wherof wee have formerly made ſom mention. Let them make choice of meats of good or indifferent juice, ſuch as wee ſhall deſcribe in treating of the diet of ſuch as are ſick of the plague; purgeing, bleeding, batheing, cupping, to evacuate the impuritie of the blood, and mitigate the heat of the liver, ſhall bee preſcribed by ſom learned Phyſician. *Valeſius de Taranta* much commend's gelding in this caſe, neither do I think it can bee diſliked. For men ſubject to this diſeaſ may bee effeminated by the amputation of their teſticles, and ſo degenerate into a womaniſh nature, and the heat of the liver boiling the blood, being extinguiſhed, they becom cold and moiſt, which temper is directly contrarie to the hot and drie diſtemper of leprous perſons; beſides the leprous being thus deprived of the facultie of generation, that contagion of this diſeaſ is taken away which ſpreadeth, and is diffuſed amongſt mankinde by the propagation of their iſſue.

Why the Leproſie is incureable.

The one and twentieth Book.

CHAP. I.

The cauſ of writeing this Treatiſe of Poiſons.

Five reaſons have principally mooved mee to undertake to write this Treatiſe of Poiſons, according to the opinion of the Antients. The firſt is, that I might inſtruct the Surgeon what remedies muſt preſently bee uſed to ſuch as are hurt by poiſons, in the *interim* whil'ſt greater means may bee expected from a Phyſician. The ſecond is, that hee may know by certain ſigns & notes ſuch as are poiſoned or hurt by poiſonous means, and ſo make report thereof to the Judges, or to ſuch as it may concern. The third is, that thoſe Gentlemen and others who live in the countrie, and far from Cities, and ſtore of greater means, may learn ſomthing by my labors by which they may help their friends bitten by an Adder, mad Dog, or other poiſonous creature, in ſo dangerous, ſudden and uſual a caſe. The fourth is, that everie one may beware of poiſons, and know their ſymptoms when preſent, that beeing known, they may ſpeedily ſeek for a remedie. The fifth is, that by this my labor all men may know what my good will is, and how well minded I am towards the common-wealth in general, and each man in particular, to the glorie of God. I do not here ſo much arm malicious and wicked perſons to hurt, as Surgeons to provide to help and defend each man's life againſt poiſon; which they did not underſtand, or at leaſt ſeemed not ſo to do, which takeing this my labor in evil part, have maliciouſly interpreted my meaning.

But now at length, that wee may com to the matter; I will begin at the general diviſion of poiſons, and then handle each *ſpecies* thereof ſeverally: but firſt let us give this rule, That poiſon is that which either outwardly applied or ſtruck in, or inwardly taken into the bodie, hath power to kill it, no otherwiſe, then meat well dreſt is apt to nouriſh it. For *Conciliator* write's, that the properties of poiſon are contrarie to nouriſhments in their whole ſubſtance; for as nouriſhment is turned into blood, and in each part of the bodie whereto it is applied to nouriſh, by perfect aſſimilation is ſubſtituted in the place of that portion which flow's away each moment. Thus on the contrarie poiſon turn's our bodies into a nature like it ſelf and venenate, for as everie agent imprint's the force and qualities thereof in the ſubject patient, thus poiſon by the immoderation of faculties in their whole nature contrarie to us, changeth our ſubſtance into its nature, no otherwiſe then fire turneth chaff in a moment into its own nature, and ſo conſume's it. Therefore it is truly delivered by the Antients, who have diligently pried into the faculties of natural things, that it is poiſon that may kill men by deſtroying and corrupting their temper, and the compoſure and conſtitution of the bodie. Now all poiſons are ſaid to proceed either from the corrupt air, or from living creatures, plants and minerals, or by an artificial malignitie in diſtilling, ſubliming and diverſly mixing of poiſonous and fuming things. Hence ariſe ſundrie differences of poiſons; neither do they all work after the ſame manner: for ſom corrupt our nature by the unmeaſureableneſs of the manifeſt and elementarie qualities wherepf they conſiſt, others from a ſpecifick and occult propertie. Hence it is that ſom kill ſooner then other-ſom; neither is it true, that all of them preſently aſſail the heart, but others are naturally at deadlie ſtrife with other parts of the bodie, as *Cantharides* with the bladder, the ſea-Hare with the lungs, the *Torpedo* with the hands, which it ſtupefieth, though the fiſhers rod bee betwixt them. Thus of medicines, there are ſom which are apt preſently to comfort and ſtrengthen the heart; others the brain, as *ſiechon*; others the ſtomach, as cinnamon: Alſo there are ſom poiſons which work both waies, that is, by manifeſt and occult qualities, as *Euphorbium*; for that both by the exceſſive heat and the whole ſubſtance, or the diſcord of the whole ſubſtance with ours, corrupt's our nature. An argument hereof is, that Treacle, which by its qualitie is manifeſtly hot, infringeth the force thereof, as alſo of all others of an occult propertie. Poiſons which work by an occult and ſpecifick propertie, do not therefore

What is to bee accounted poiſon.

The differences of poiſon.

All poiſons have not a peculiar antipathie with the heart.

fore do it, becauſ they are too immoderately hot, cold drie, moiſt; but for that they are abſolutely ſuch, and have that eſſence from the ſtarrs and celeſtial influence, which is apt to diſſolv and deſtroie the ſtrength of man's bodie, becauſ being taken, but even in a ſmal quantitie, yet are they of ſo pernicious a qualitie, that they kill almoſt in a moment. Now poiſons do not onely kill being taken into the bodie, but ſom being put or applied outwardly; neither do venemous creatures onely harm by their ſtinging and biteing, but alſo by their excrements, as ſpittle, blood, the touch and breath.

CHAP. II.

How poiſons being ſmall in quantitie, may by their onely touch cauſ ſo great alterations.

IT ſeemeth ſtrange to manie, how it may com to paſe, that poiſon taken or admitted in a ſmall quantitie, may almoſt in a moment produce ſo pernicious effects over all the bodie, and all the parts, faculties, and actions, ſo that being admitted but in a little quantitie, it ſwell's up the bodie into a great bigneſs. Neither ought it to ſeem leſs ſtrange, how Antidotes and Counterpoiſons, which are oppoſed to poiſon, can ſo ſuddenly break and weaken the great and pernicious effects thereof, beeing it is not likely that ſo ſmall a particle of poiſon or Antidote can divide it ſelf into ſo manie, and ſo far ſever'd particles of our bodie. There are ſom (ſaith *Galen*) who think that ſom things by touch onely, by the power of their qualitie, may alter thoſe things which are next to them; and that this appear's plainly in the fiſh *Torpedo*, as that which hath ſo powerful a qualitie, that it can ſend it along'ſt the fiſher's rod to the hand, and ſo make it becom torped or numb. But on the contrarie, Philoſophers teach, that accidents, ſuch as qualities are, cannot without their ſubjects remove and diffuſe themſelvs into other ſubjects. Therefore *Galen's* other anſwer is more agreeable to reaſon, that ſo manie and great affects of poiſons and remedies ariſe either from a certain ſpirit or or ſubtil humiditie; not truly, for that this ſpirit and ſubtil humiditie may bee diſperſed over the whole bodie and all the parts thereof which it affect's, but that little, which is entred the bodie, as caſt in by the ſtroak of a Spider, or the ſting of a Scorpion, infect's and corrupt's all the next parts by contagion with the like qualitie, theſe others that are next to them, until from an exceeding ſmall portion of the blood, if the ſtroak ſhall light into the veins, it ſhall ſpread over the whole maſs of blood; or of phlegm, if the poiſon ſhall chance to com to the ſtomach, and ſo the force thereof ſhall bee propagated and diffuſed over all the humors and bowels. The doubt of Antidotes is leſs, for theſe beeing taken in greater quantitie, when they ſhall com into the ſtomach, warmed by the heat of the place, they becom hot, and ſend forth vapors, which ſuddenly diffuſed over the bodie by the ſubtiltie of their ſubſtance, do by their contrarie forces dull and weaken the malignitie of the poiſon. Wherefore you may often ſee when as Antidotes are given in leſs quantitie then is fit, that they are leſs prevalent, neither do they anſwer to our expectation in overcomming the malignitie of the poiſon; ſo that it muſt neceſſarily follow that theſe muſt not onely in qualities, but alſo in quantitie bee ſuperior to poiſons.

Cap. 5. lib. 6. de loc. affect.

The true reaſon of the wondrous effects of poiſons.

CHAP. III.

Whether there bee anie ſuch poiſons as will kill at a ſet time?

TO the propounded queſtion; whether there may bee poiſons which within a certain and definite time (put caſe a month or yeas) may kill men. *Theophraſtus* thus anſwer's; of poiſons, ſom more ſpeedily perform their parts, others more ſlowly; yet may you finde no ſuch as will kill in ſet limits of time, according to the will and deſire of men. For that ſom kill ſooner or later then others; they do not this of their own or proper nature, as Phyſicians rightly judg, but becauſ the ſubject upon which they light, doth more or leſs reſiſt or yeeld to their efficacie. Experience ſheweth the truth hereof; for the ſame ſort of poiſon in the ſame weight and meaſure given to ſundrie men of different tempers and complexions, will kill one in an hour, another in ſix hours, or in a daie, and on the contrarie will not ſo much as hurt ſom third man. You may alſo obſerv the ſame in purgeing medicines. For the ſame purge given to diverſ men in the ſame proportion, will purge ſom ſooner, ſom later, ſom more ſparingly, others more plentifully, and otherſom not at all; alſo with ſom it will work gently, with otherſom with pain and gripeings. Of which diverſitie, there can no other cauſ bee aſſigned, then men's different natures in complexion and temper, which manie can ſo craftily know and comprehend, as to have certain knowledg thereof, as how much and how long the native heat can reſiſt and labor againſt the ſtrength of the poiſon, or how pervious or open the paſſages of the bodie may bee, whereby the poiſon may arrive at the heart and principal parts. For in ſuch (for example

No poiſons kill in a ſet time.

How poiſons com ti kill ſooner or later.

xample ſake) as have the paſſages of their arteries more large, the poiſon may more readily & ſpeedily enter into the heart together wᵗʰ the air that is continually drawn into the bodie.

CHAP. IV.

Whether ſuch creatures as feed upon poiſonous things bee alſo poiſonous; and whether they may bee eaten ſafely and without harm.

Such things as feed upon poiſon may bee eaten without danger.

DUcks, Storks, Herns, Peacocks, Turkies, and other birds, feed upon Toads, Vipers, Aſps, Snakes, Scorpions, Spiders, Caterpillers, and other venemous things. Wherefore it is worthie the queſtioning, whether ſuch like creatures nouriſhed with ſuch food, can kill or poiſon ſuch perſons as ſhall afterward eat them? *Matthiolus* write's that all late Autors, who have treated of poiſons, to bee abſolutely of this opinion, That men may ſafely and without anie danger feed upon ſuch creatures, for that they convert the beaſts into their nature after they have eaten them, and on the contrarie are not changed by them. This reaſon though verie probable, yet doth it not make theſe beaſts to bee wholly harmleſs, eſpecially if they bee often eaten or fed upon. *Dioſcorides* and *Galen* ſeem to maintain this opinion, whereas they write, that the milk, which is nothing elſ then the relented blood of ſuch beaſts as feed upon ſcammonie, hellebore and ſpurge, purgeth violently. Therefore Phyſicians, deſireous to purge a ſucking childe, give purges to the nurſes, whence the milk becomming purgeing, becom's both meat and medicine to the childe. The fleſh of thruſhes, which feed upon Juniper-berries, ſavor's of Juniper. Birds that are fed with worm-wood or garlick, either taſte bitter, or have the ſtrong ſent of garlick. Whiteings taken with garlick, ſo ſmell thereof, that they will not forego that ſmell or taſte by anie ſalting, frying or boiling; for which ſole reaſon, manie who hate garlick, are forced to abſtain from theſe fiſhes. The fleſh of Rabbits that feed upon pennie-royal and juniper, ſavor of them; Phyſicians wiſh that Goats, Cows and Aſſes whoſe milk they would uſe for Conſumptions or other diſeaſes, ſhould bee fed ſom ſpace before, and everie daie wᵗʰ theſe or theſe herbs wᶜʰ they deem fit for the cureing of this or that diſeaſ. For *Galen* affirm's that hee doubt's not, but that in ſucceſs of time the fleſh of creatures will bee changed by the meats whereon they feed, and at length ſavor thereof. Therefore I do not allow that the fleſh of ſuch things as feed upon venemous things, ſhould bee eaten for food, unleſs it bee ſom long ſpace after they have diſuſed ſuch repaſte, and that all the venom bee digeſted and overcom by the efficacie of their proper heat, ſo that nothing thereof may remain in taſte, ſmell or ſubſtance, but bee all vaniſhed away. For manie die ſuddenly, the cauſ of whoſe deaths are unknown, which peradventure was from nothing elſ, but the ſympathie and antipathie of bodies, for that theſe things cauſ death and diſeaſ to ſom, that nouriſh otherſom [according to our vulgar Engliſh proverb; *That which is one man's meat, is another man's poiſon.*]

Lib. de ſimp. facult.

The occaſion of ſudden death in manie.

CHAP. V.

The general ſigns of ſuch as are poiſoned.

Common ſigns of ſuch as are poiſoned.

WEe will firſt declare what the general ſigns of poiſon are, and then wee will deſcend to particulars, whereby wee may pronounce that one is poiſoned with this or that poiſon. Wee certainly know that a man is poiſoned, when as hee complain's of a great heavineſs of his whole bodie, ſo that he is wearie of himſelf; when as ſom horrid and loathſom taſte ſweat's out from the orifice of the ſtomach to the mouth and tongue, wholly different from that taſte; that meat, howſoever corrupted, can ſend up: when as the color of the face changeth ſuddenly, ſomwhiles to black, ſom times to yellow, or anie other color, much differing from the common cuſtom of man; when nauſeouſneſs with frequent vomiting, troubleth the patient, and that hee is moleſted with ſo great unquietneſs, that all things may ſeem to bee turned upſide down. Wee know that the poiſon work's by the proper, and from the whole ſubſtance, when as without anie manifeſt ſenſ of great heat or coldneſs, the patient ſwound's often with cold ſweats, for uſually ſuch poiſons have no certain and diſtinct part wherewith they are at enmitie, as *cantharides* have with the bladder. But as they work by their whole ſubſtance, and an occult proprietie of form; ſo do they preſently and directly aſſail the heart, our eſſence and life, and the fortreſs and beginning of the vital faculties. Now will wee ſhew the ſighs whereby poiſons, that work by manifeſt and elementarie qualities, may bee known. Thoſe who exceed in heat, burn or make an impreſſion of heat in the tongue, the mouth, throat, ſtomach, guts, and all the inner parts, with great thirſt, unquietneſs, and perpetual ſweats. But if not their exceſs of heat they bee accompanied with a corrodeing and putrefying qualitie, as Arſenick, *Sublimate*, Roſe-ager or Ratſ-bane, Verdegreace, Orpiment, and the like, they then cauſ in the ſtomach

Signs of hot poiſons.

ſtomach and guts intolerable pricking pains, rumblings in the bellie, and continual and intolerable thirſt. Theſe are ſucceeded by vomitings, with ſweats ſomwhiles hot, ſomwhiles cold, with ſwoundings, whence ſudden death enſue's. Poiſons that kill by too great coldneſs, induce a dull or heavie ſleep, or drowzineſs, from which you cannot eaſily rouz or waken them; ſomtimes they ſo trouble the brain, that the patients perform manie undecent geſtures and antick tricks with their mouths and eies, arms and legs, like as ſuch as are frantick; they are troubled with cold ſweats, their faces becom blackiſh or yellowiſh, alwaies ghaſtlie, all their bodies are benummed, and they die in a ſhort time unleſs they bee helped; poiſons of this kinde are Hemlock, Poppie, Night-ſhade, Henbane, Mandrag. Drie poiſons are uſually accompanied by heat with moiſture, for although *ſulphur* bee hot and drie, yet hath it moiſture, to hold the parts togecther, as all things which have a conſiſtence have; yet are they called drie, by reaſon that drineſs is predominant in them: ſuch things make the tongue and throat drie and rough, with unquenchable thirſt; the bellie is ſo bound, that ſo much as the urine cannot have free paſſage forth; all the members grow ſqualid by drineſs, the patients cannot ſleep: poiſons of this kinde are Lytharge, Ceruſs, Lime, ſcales of Braſs, fileings of Lead, prepared antimonie. On the contrarie, moiſt poiſons induce a perpetual ſleep, a flux or ſcouring the reſolution of all the nervs and joints, ſo that not ſo much as the eies may bee faithfully contained in their orbs, but will hang as readie to fall out; the extreme parts, as the hands, feet, noſe and ears corrupt and putrefie, at which time they are alſo troubled with thirſt by reaſon of their ſtrong heat, alwaies the companion of putrefaction, and oftimes the autor thereof: now when this commeth to paſs, death is at hand. Verie manie denie that there can bee anie moiſt poiſons found, that is, ſuch as may kill by the efficacie of their humiditie, becauſ there are no ſuch things to bee found, as may com to the fourth degree of moiſture. Yet there is an example that averr's the contrarie, which was of one, who ſleeping on the night, was bitten by a Serpent, as *Gilbertus Anglicus* affirmeth; for dying thereof, when as his ſervant, deſirous to awaken his Maſter out of his ſleep, took him by the arm, all the fleſh beeing putrefied, fell off, and preſently the bones alſo fell aſunder, beeing deprived of their fleſh, which could not happen, unleſs by exceſs of the venemous humiditie which lay hidden in the teeth and ſpittle of the ſerpent. Alſo wee have found it noted by *Hippocrates*, that in a rainie, humid and ſoutherly conſtitution of the year, it happened by the malign violence of the venenate and putrefying humiditie, that the fleſh of the arms and legs becomming rotten, fell away by peeces-meal, and the bones remained bare; yea alſo and the bones themſelvs in ſom putrefied and fell away; neither doth the *Lues Venerea* kill by anie other means, then by a fretting and putrefying force of humiditie, by whoſe efficacie the ſoliditie of the bones is diſſolved; then much more the fleſh may bee tainted and conſumed by putrefaction.

Signs of cold poiſons.

Signs of drie poiſons.

Signs of moiſt poiſons.

An hiſtorie.

Sect. 3. lib. 3 epid.

The *Lues Venerea* kill's by exceſs of moiſture.

To theſe and ſuch poiſons which work by a manifeſt and elementarie faculties, when as they ſhall bee received into the bodie after what manner ſoever, you ſhall forthwith oppoſe their contraries, and if by chance it bee not manifeſt, what, and of what diſtinct kinde of poiſon that is, you muſt know that ſuch poiſons as work by occult properties, it is not by reaſon as yet found out how they will affect the bodie, but onely by experience. Therefore to theſe you muſt oppoſe their like antidotes, which may by their whole ſubſtance ſtrengthen the heart and vital faculties, and withſtand the ſtrength of the poiſon. But to this our diſtinction of poiſons, working by a manifeſt and elementarie qualitie, their opinion is contrarie, who affirm that the venom of all poiſonous beaſts are therefore cold, for that ſuch as are bitten or ſtung with them, are forthwith felt to bee colder then a ſtone. And that ſerpents for fear of cold, when as winter is at hand, keep themſelvs in holes and dens under ground, or elſ, as vipers uſe to do, lie under ſtones; under which, you may often finde them ſtiff and numb, and ſo unapt for motion, that you may eaſily take them up in your hand. But the coldneſs that is perceived or felt in ſuch as are bitten or ſtung, is not occaſioned by the coldneſs of the poiſon, but by the abſence of the natural heat, withdrawing it ſelf in the verie inſtant of the ſtroak, from the ſurface into the center of the bodie, both for the defence of the heart, as the principal part; as alſo for that there is nothing which ſo much diſſipate's, or ſo much oppugn's the vital heat, as poiſon, of what kinde ſoever it bee, doth.

All poiſons are not cold.

Why ſuch, as are poiſoned or ſtung, are cold.

CHAP. VI.

How, or by what meanes to ſhun, or eſchew Poiſons.

IT is a matter of much difficultie to avoid poiſons, becauſ ſuch as at this time temper them, are ſo throughly prepared for deceit and miſchief, that they will deceiv even the moſt warie and quick-ſighted; for they ſo qualifie the ingrate taſte and ſmell, by the admixture of ſweet and well-ſmelling things, that they cannot eaſily bee perceived even by the skilful. Therefore ſuch as fear poiſoning, ought to take heed of meats cooked with much art, verie ſweet, ſalt, ſowr, or notably endued with anie other taſte. And when they are oppreſt with hunger or thirſt, they

What, ſuch as fear poiſoning, muſt obſerv in their diet.

they must not eat nor drink too greedily, but have a diligent regard to the taste of such things as they eat or drink; besides, before meat let them take such things as may weaken the strength of the poisons; such as is the fat broth of good nourishing flesh-meats; in the morning let them arm themselves with treacle or mithridate, and conserv of roses, or the leavs of rue, a walnut and drie figs; besides, let him presently drink a little draught of muskedine or som other good wine; when one suspects hee hath taken any poison in meat or drink, let him forbear sleeping. For besides that the forces of poison is oft times so rapid, that it consume's our life in a short space, as fire doth stubble, as also for that it is drawn more inwardly into the secret passages of the bodie by sleep. Wherefore in such a case it is better to procure vomit by drinking *Hydreleum* warm, or butter dissolved in warm oil, or a decoction of line, or fenugreek-seeds, or fat broth, for thus the received poison is also cast forth therewith, or elf the acrimonie thereof retunded, and the bellie loosed.

Why sleep is hurtfull.

Why and how vomit must bee procured.

You may see this by dailie experience, for casticks, vesicatories, and the like acrid things beeing applied to an anointed part, will not blister nor exulcerate the part. Neither doth the vomit conduce onely in this, that it excludeth the poison, but it shew's either by the taste, smell, or color, the kinde of the taken-poison; so that then by useing the proper Antidote, it may bee the more easily and speedily resisted, yet notwithstanding if you conceiv that the poison have descended deeper in the Guts, you may with a glyster draw away the rest thereof which adher's to the coats of the Guts. But if the patient cannot vomit, then shall som purgeing medicine bee given him forthwith, and such as are thought more particularly to resist poison, such as are Agarick, Aloes, the lesser Centaurie, Rubarb and other things, according to the direction of the learned Physician. Then shall you administer glysters made with *Cassia*, fattie decoctions, sheep-suet, or butter or Cowe-milk, with the mucilages of Line-seed, *psilium*-seeds, quince-seeds, and other such things as are usually given in a Dysenterie, or bloodie flux, that such things may hinder the adhesion of the poison to the coats of the Guts, and by their unctuousnes retund the acrimonie of the poison, and mitigate if anie thing shall alreadie bee ulcerated, and absolutely defend the sound parts from the malign effects of the poison. But let this bee a perpetual rule, That the poison bee speedily drawn back by the same way it entred into the bodie; as, if it entred by smelling in at the nostrils, let it bee drawn back by sneesing, if by the mouth into the stomach, let it bee excluded by vomit; if by the fundament into the bellie, then by glyster; if by the privities into the womb, then by *metrenchites* or injections made thereinto; if by a bite, sting or wound, let revulsion bee made by such things as have a powerful attractive facultie; for thus wee make diversions, that by these wee may not onely hinder the poison from assailing the heart, but also that by this means wee may draw it from within outwards. Wherefore strong ligatures cast about the arms, thighs and legs, are good in this case. Also large cupping glasses applied with flame to sundrie parts of the bodie are good. Also bathes of warm water, with a decoction of such things as resist poison, southern-wood, calamint, rue, betonie, horehound, pennie-royall, bayes, *scordium*, smallage, scabious, mints, valerian, and the like, are good in this case. Also sweats are good, beeing provoked so much as the strength of the patient can endure. But if hee bee verie wealthie, whom wee suspect poisoned, it will bee safer to put him into the bellie of an ox, horse or mule, and then presently into another assoon as the former is cold, that so the poison may bee drawn forth by the gentle and vaporous heat of the new killed beast; yet do none of these things without the advice of a Physician, if it may conveniently bee had.

When and wherewith they shall bee purged.

The cure of poisoned wounds.

CHAP. XIIII.

How the corrupt or venemous Air may kill a Man.

By how manie, and what means the air may bee infected.

THE air is infected and corrupted by the admixture of malign vapors, either arising from the unburied bodies of such as are slain in great conflicts, or exhaleing out of the earth after earth-quakes, for the air, long pent up in the cavities and bowels of the earth, and deprived of the freedom & commerce of the open air, is corrupted, and acquires a malign qualitie, which it presently transferreth unto such as meet therewith. Also there is a certain malignitie of the air, which accompanieth thunders, and lightnings, which savours of a sulphureous virulencie, so that whatsoever wilde beasts shall devour the creatures killed therewith, they becom mad, and die immediately; for the fire of lightning hath a far more rapid, subtil, and greater force then other fires, so that it may rightly bee termed a Fire of Fires.

How thunders and lightnings may infect the air.

An argument hereof is, that it melteth the head of a spear, not harming the wood, and silver and gold, not hurting the purs wherein it is contained. Also the air is infected by fumigations, which presently admitted into the bodie and bowels by the mouth and nose in respiration, by the skin and arteries in perspiration, doth easily kill the spirits and humors beeing first infected, and then within a shore space after, the solid substance of the principal parts, and chiefly of the heart beeing turned into their nature, unless the man bee first provided

provided for by ſneeſing, vomiting, ſweating, purgeing by the bellie, or ſom other excretion. For that poiſon which is carried into the bodie by ſmell, is the moſt rapid and effectuall, by ſo much as a vapor or exhalation is of more ſubtil and quicklier-piercing eſſence then an humor. Yet notwithſtanding, wilt thou ſay, it is not credible, that anie bee kill'd by anie vapor raiſed by the force of fire, as of a torch, or a warming-pan, for that the venenate qualitie of the thing that is burnt, is diſſipated and conſumed by the force of the fire, purgeing and cleanſing all things. This reaſon is falſly feigned to the deſtruction of the lives of careleſs people; for ſulphureous brands kindled at a clear fire, do notwithſtanding caſt forth a ſulphureous vapor. Whether do not *Lignum aloës* and Juniper, when they are burnt in a flame, ſmell leſs ſweetly?

Whether the vapor that ariſeth from a burnt thing may poiſon one.

Pope *Clement*, the ſeventh of that name, the uncle of our Kings mother, was poiſoned by the fume of a poiſonous torch that was carried lighted before him, and died thereof. *Mathiolus* telleth, that there were two Mountebanks in the market-place of *Sienna*, the one of which but ſmelling to a poiſoned gillie-flower given him by the other, fell down dead preſently.

An hiſtorie.

A certain man not long ago, when hee had put to his noſe, and ſmelled a little unto a pomander, which was ſecretly poiſoned, was preſently taken with a *Vertigo*, and all his face ſwelled, and unleſs that hee had gotten ſpeedie help by ſternutatories and other means, hee had died ſhortly after of the ſame kinde of death that Pope *Clement* did.

The ſafeſt preſervative againſt ſuch poiſons is, not to ſmell to them: moreover, ſom affirm, that there are prepared ſom poiſons of ſuch force, that beeing annointed but on the ſaddle, they will kill the rider, and others, that if you but annoint the ſtirrups therewith, they will ſend ſo deadlie poiſonous a qualitie into the rider, through his boots, that hee ſhall die thereof within a ſhort time after: which things, though they bee ſcarce credible, becauſ ſuch poiſons touch not the naked skin, yet have they an example in nature, whereby they may defend themſelvs. For the *Torpedo* ſend's a narcotick, and certainly deadly force into the arm, and ſo into the bodie of the fiſher, the cords of the net beeing between them.

CHAP. VIII.

That everie kinde of poiſon hath its proper and peculiar Signs and Effects.

AS poiſons are diſtinct in *ſpecies*, ſo each *ſpecies* differ's in their ſigns and effects; neither is it poſſible to finde anie one kinde of poiſon, which may bee accompanied or produce all the ſigns and effects of all poiſons, otherwiſe Phyſicians ſhould in vain have written of the ſigns and effects of each of them, as alſo of their proper remedies and antidotes. For what kinde of poiſon ſhall that bee, which ſhall cauſ a burning heat in the ſtomach, bellie, liver, bladder and kidnies, which ſhall cauſ a hicketting, which ſhall cauſ the whole bodie to tremble and ſhake, which ſhall take away the voice and ſpeech, which ſhall cauſ convulſions, ſhall weaken the pulſifick facultie, which ſhall intercept the freedom of breathing, which ſhall ſtupefie and caſt into a dead ſleep, which ſhall together, and at once cauſ a *Vertigo* in the head, dimneſs in the ſight, a ſtrangling, or ſtoppage of the breath, thirſt, bleeding, fever, ſtoppage of the urine, perpetual vomiting, redneſs, lividneſs, and paleneſs of the face, reſolutions of the powers, and manie other things, all which are cauſſed by all ſorts of poiſon. Laſtly, no bodie will denie but that hot poiſons may kill more ſpeedily then cold, for that they are more ſpeedily actuated by the native heat.

Hot poiſons kill ſooner then cold.

CHAP. IX.

The Effects of poiſons from particular venemous things, and what Prognoſticks may thence bee made.

IT is the opinion of *Cornelius Celſus*, and almoſt of all the Antients, that the bite of everie beaſt had ſom virulencie, but yet ſom more then other-ſom. They are moſt virulent that are inflicted by venemous beaſts, as Aſps, Vipers, Waterſnakes, and all kindes of Serpents, Baſilisks, Dragons, Toads, mad Dogs, Scorpions, Spiders, Bees, Waſps, and the like. They are leſs malign, which are of creatures wanting venom, as of Horſes, Apes, Cats, Dogs not mad, and manie other things, which though of their own nature they are without poiſon, yet in their bites there is ſomthing more dolorifick and ill natured, then in common wounds inflicted by other occaſions: I beleev, that in their ſlaver or *ſanies*, there is ſomthing, I know not how to term it, contrarie to our nature, which imprint's a malign qualitie in the ulcer, which alſo you may obſerv in the tearings and ſcratchings of ſuch creatures as have ſharp claws, as Lions and Cats. Moreover manie affirm, that they have found by experience, that the bites of men are not altogether without virulencie, eſpecially of ſuch as are red-haired & freckled, chiefly when

Lib. 2. cap. 27. The bites of all wilde beaſts are virulent.

The bites of a red-haired man virulent.

when as they are angred; it is probable that the bites of other perſons want this malignitie, ſeeing that their ſpittle will cure ſmall ulcerations. Wherefore, if there ſhall happen difficultie of cure in a wound, cauſſed by a man's biteing, which is neither red haired nor freckled, neither angrie; this happen's not by means of the ſpittle, nor by anie malign qualitie, but by reaſon of the contuſion, cauſſed by the bluntneſs of the teeth, not cutting, but bruiſing the part, for beeing not ſharp, they cannot ſo eaſily enter the fleſh, unleſs by bruiſing and tearing, after the manner of heavie and blunt ſtrokes and weapons, wounds beeing occaſioned by ſuch are more hard to bee cured, then ſuch as are made by cutting and ſharp weapons. But of the fore-ſaid biteings of venemous creatures, there are few which do not kill in a ſhort ſpace, and almoſt in a moment, but principally if the poiſon bee ſent into the bodie by a live creature, for in ſuch poiſon there is much heat; alſo there is therein a greater tenuitie, which ſerv's as *vehicles* thereto into what place or part ſoever of the bodie they tend, the which the poiſons taken from dead creatures are defective of. Wherefore ſom of theſe kill a man in the ſpace of an hour, as the poiſon Aſpa, Baſiliaks and Toads; others not unleſs in two or three daies ſpace, as of water-Snakes; a Spider, and Scorpion require more time to kill, yet all of them admitted but in the leaſt quantitie, do in a ſhort ſpace cauſ great and deadlie mutations in the bodie, as if they had breathed in a peſtiferous air, and with the like violence, taint and change into their own nature all the members and bowels, by which theſe ſame members do in the time of perfect health change laudable meats into their nature and ſubſtance. The place whereas theſe poiſonous creatures live, and the time, conduce to the perniciouſneſs of the poiſon, for ſuch as live in drie, mountanous, and ſun-burnt places kill more ſpeedily then ſuch as bee in moiſt and mariſh grounds; alſo they are more hurtful in winter then in ſummer; and the poiſon is more deadly which proceed's from hungrie, angrie and faſting creatures, then that which com's from ſuch as are full and quiet; as alſo that which proceed's from young things, chiefly when as they are ſtimulated to venerie, is more powerful then that which com's from old and decrepit; from femals worſ then from males; from ſuch as have fed upon other venemous things, rather then from ſuch as have abſtained from them, as from ſnakes which have devoured toads, vipers which have fed upon ſcorpions, ſpiders and Caterpillers. Yet the reaſon of the efficacie of poiſons depend's from their proper, that is, their ſubtil or groſs conſiſtence, and the greater or leſs aptneſs of the affected bodie to ſuffer. For hot men that have larger and more open veins and arteries, yeeld the poiſon freer paſſage to the heart. Therefore they which have more cold and ſtraight veſſels, are longer ere they die of the like poiſon; ſuch as are full, are not ſo ſoon harmed as thoſe that are faſting: for meats, beſides that by filling the veſſels, they give not the poiſon ſo free paſſage, they alſo ſtr engthen the heart by the multiplication of ſpirits, ſo that it more powerfully reſiſt's pernicious venom. If the poiſon work by an occult and ſpecifick propertie, it cauſſeth the cure and prognoſtick to bee difficult, and then muſt wee have recourſ to Antidotes, as theſe which in their whole ſubſtance reſiſt poiſons; but principally to treacle, becauſ there enter into the compoſition thereof medicines which are hot, cold, moiſt and drie: whence it is, that it retund's and withſtand's all poiſons, chiefly ſuch as conſiſt of a ſimple nature, ſuch as theſe which com from venemous creatures, plants and minerals; and which are not prepared by the deteſtable art of empoiſoners.

Contuſed wounds harder to heal then ſuch as are cut.

Why treacle retund's the force of all ſimple poiſons.

CHAP. X.

What cure muſt bee uſed to the biteings and ſtingings of venemous beaſts.

CUre muſt ſpeedily bee uſed without anie delaie to the bites and ſtingings of venemous beaſts, which may by all means diſperſ the poiſon, and keep it from entering into the bodie; for when the principal parts are poſſeſſed, it boot's nothing to uſe medicines afterwards. Therefore the Antients have propounded a double indication to lead us to the findeing out of medicines in ſuch a caſe, to wit, the evacuation of the virulent and venenate humor, and the change or alteration of the ſame and the affected bodie. But ſeeing evacuation is of two ſorts, to wit, *univerſal*, which is by the inner parts; and *particular*; which is by the outward parts. Wee muſt begin at the particular, by ſuch to pick medicines as are fit to draw out, and retund the venom; for wee muſt not alwaies begin a cure with general things, as ſom think, eſpecially in external diſeaſes, as wounds, fractures, diſlocations, venemous bites and punctures. Wherefore hereto as ſpeedily as you may, you ſhall applie remedies fit for the bites and punctures of venemous beaſts; as for example, the wounds ſhall bee preſently waſhed with urine, with ſea-water, *aqua vitæ*, or wine, or vineger wherein old treacle or muſtard ſhall bee diſſolved. Let ſuch waſhing bee performed verie hot, and ſtrongly chafed in, and then leav upon the wound and round about it, linnen rags, or line ſteeped in the ſame liquor. There bee ſom who think it not fit to lay treacle thereto, becauſ, as they ſay, it drive's the poiſon in. But the authoritie of *Galen* convinceth that opinion, for hee writeth that if treacle bee applied to this kinde of wounds before

A double indication in the cure of venemous bites.

Lotions fit for venemous bites.

Lib. de theriaca ad

before that the venom shal arrive at the noble parts, is much conduceth. Also reason confutes it; for viper's flesh enters the composition of treacle which attracts the venom by the similitude of substance, as the Load-stone draweth iron, or Amber straws. Moreover, the other simple medicines which enter this composition, resolv and consume the virulencie and venom, and being inwardly taken, it defendeth the heart and other noble parts, and corroborateth the spirits. Experience teacheth that mithridate fitly given in the stead of treacle worketh the like effect. The medicines that are taken inwardly and applied outwardly for evacuation, must bee of subtil parts, that they may quickly insinuate themselvs into everie part to remund the malignitie of the poison; wherefore garlick, onions, leeks, are verie good in this case, for that they are vaporous; also *scordium*, *Rue*, *dittamus*, the lesser Centaurie, hore-hound, *Rocket*, the milkie juice of unripe figs, and the like, are good; there is a kinde of wilde bugloss amongst all other plants, which hath a singular force against venemous bites, whence it is termed *Echium* and *viperinum*, and that for two causes; the first is, becaus in the purple flowers that grow amongst the leav's, there is a resemblance to the head of a viper or adder. Another reason is, becaus it heal's the biting of a viper not onely applied outwardly, but also helpeth such as are bitten, being drunk in wine, yea, and will not suffer those that have lately drunk thereof to bee bitten at all. Wilde *Time* hath the like effect; though these oft-times agree with the poison in qualitie as in heat, yet do they help in discussing and resolving it; yet, as much as wee may, wee must labor to have evacuation and alteration together. It is most convenient, if the part affected will permit, to applie large cupping-glasses with much flame and horns; also sucking is good, the mouth being first washed in wine wherein some treacle is dissolved, and with oil, left any thing should adhere thereto, for it will hinder it, if so be the mouth bee no where ulcerated. It is good also to applie horse-leeches; some wish to applie to the wound, the fundaments of hens or turkies that lay egs, for that such are openers behinde, first putting salt upon them that they may gape the wider, shutting their beaks and opening them now and then left they should bee stifled, and ever and anon to substitute others instead of such as die or are suffocated; for thus it is thought the poison is drawn forth, and passeth into the bird by the fundament. There bee others which had rather applie to the wound live birds cut asunder in the midst, and so laid to hot, for that they ghess these resist poison by a natural discord. But certainly it is by their heat whereby they do not onely digest toads, aspe, vipers, scorpions and other venemous things, but also wear asunder and soften sand, shorts, and most drie and stronie seeds in their gizzards; wherefore wee must think them very good to draw out the poison and dissipate it. But nothing is so forcible to disperse and remund the venom, as the impression of cauteries, especially actual, for a hot iron works most effectually and speedily, and causeth an ulcer which will remain open a longer time. Wherefore to caus the speedier falling away of the Eschar, you shall scarifie it to the quick, and then plentifully annoint the places. For thus the poison will the sooner pas forth. But this must bee done before the poison enter's far into the bodie, for otherwise Cauteries will not onely do no good, but further torment the patient, and weaken him to no purpose. Let drawing plasters bee laid to the wound and neighboring parts, made of *Galbanum*, turpentine, black pitch and other gummie and resinous things. After the falling away of the Eschar, *basilicon* shall bee applied, quickned with a little *Precipitate*, for it is very effectual in these cases, for that it draweth forth the virulent *sanies* out of the bottoms of the wound, neither doth it suffer the wound to bee closed speedily. To which purpose they put in a piece of a sponge, or a root of Gentian or Hermodactyl, or som acrid medicine, as *egyptiacum*, or *Precipitate* mixed with the powder of Alum, or a caustick beaten to powder. But you must alwaies observ this, that with your ointments you must alwaies mix som Treacle or Mithridate, or the juice of *hypericon*, or the like, which have power to attract and disperse the poison, and cleans the ulcer; yet if too vehement heat shall caus such pain as is likely to bring a gangren by the dissipation of the spirits, then neglecting the cure of the proper ulcer for a time, you must labor to correct the symptom. But in this case you must observ this rule, that you let no blood, give no purging medicine, nor glyster, nor vomit, nor use no bath, but other things that may procure sweat, untill three dais bee past after the bite or sting. In the mean space let the patient shun all manner of labor, but chiefly venerie, left by causing agitation of the humors, the poison get sooner to the heart. Therefore then it is time to use universal evacuations, when as you shall suspect that the poison is diffused over the veins and whole inner part of the bodie besides. Before you shall give nothing, unless mediatines of Treacle or Mithridate and the like things, which have a faculdie to resist poison, and strengthen the whole bodie by their benign and vital vapor, although their substance go no further then the stomach. Thus pills when they are swallowed, though they go no further then the stomach, yet do they draw humor out of the joints and head, but strong glysters, though they pas no further then the guts, yet by their qualitie diffused further with the vapor, they draw from the most distant parts; yet you must give an Antidote, not onely more powerfull then the poison in qualitie, but also greater in quantitie, that so it may the more easily overcom and expell the poison. Wherefore you must give it twice in a day; and

Treacle outwardly applied and inwardly taken good against venemous bites.

The force of *Echium*.

The efficacie of Cauteries against venemous bites.

The force of *Precipitate* against venemous wounds.

When hot things are not convenient for poisoned wounds.

Antidotes must bee given in great quantities.

and continue it ſo long untill you ſhall know that the ſtrength of the poiſon is weakned and overcom by the remiſſion and decay of the maligh ſymptoms. Yet in the mean while, you muſt not neglect the diſtemper cauſſed in the part by the poiſon, but muſt rather correct it by the application of the remedies contrarie to the diſtemper, as by cold things, if great heat afflict the affected part and whole bodie; by hot things on the contrarie, if it ſeem as cold as a ſtone, which oft-times happen's. And let thus much ſuffice for the general cure of poiſons: now will wee com to their particular cure.

CHAP. XI.

Why dogs ſooner becom mad then other creatures, and what bee the ſigns thereof.

Dogs naturally ſubject to madneſs.

DOgs becom mad ſooner then other creatures, becauſ naturally they injoy that temper and condition of humors which hath an eaſie inclination to that kinde of diſeaſ, and as it were a certain diſpoſition, becauſ they feed upon carrion and corrupt, putrid and ſtinking things, and lap water of the like condition; beſides the trouble and vexation of loſing their maſters, maketh them to run everie waie, painfully ſearching and ſmelling to everie thing, and neglecting their meat. A heating of the blood enſue's upon this pain, and by this heat it is turned into a melancholie, whence they becom mad. But yet dogs do not alwaies becom mad by means of heat, but alſo by occaſion of cold, that is, by contrarie cauſſes; for they fall into this diſeaſ not onely in the dog-daies, but alſo in the depth of winter. For dogs abound with melancholik humors, to wit cold and drie. But ſuch humors as in the ſummer through exceſs of heat, ſo in the depth of winter by conſtipation and the ſuppreſſion of fuliginous excrements, they eaſilie turn into melancholie. Hence follow's a verie burning and continual feaver, which cauſſeth or bringeth with it a madneſs. Add hereto, that in the depth of winter the heat which is contained within is redoubled, and in like manner as the ſcorching heat in ſummer, it breed's and turn's the humors into melancholie. Alſo dogs becom mad by contagion, as ſuch as are bitten by another mad dog. A mad dog hath ſparkling and fierie eies, with a fixed look, cruel and a ſquint, hee carrie's his head heavily, hanging down towards the ground, and ſomwhat on one ſide, hee gape's, and thruſt's forth his tongue, which is livid and blackiſh; and beeing ſhort breathed, caſt's forth much filth at his noſe, and much foaming matter at his mouth; in his gate, as if hee ſuſpected and feared all things, hee keepeth no one or certain path, but run's one while to this ſide, another while to that, and ſtumbling like one that is drunk, hee oft-times falleth down on the ground; hee violently aſſail's whatſoever hee meet's withall, whether it bee man, tree, wall, dog, or any thing elſ; other dogs ſhun him, and preſently ſent him a far off. But if another unawars chance to fall foul on him, hee yeeld's himſelf to his mercy, fawn's upon him, and privily labor's to get from him, though hee bee the ſtronger and greater. Hee is unmindful of eating and drinking, hee bark's not, yet hee bite's all hee meet's without anie difference, not ſparing his maſter, as who at this time hee know's not from a ſtranger or enemie. For it is the propertie of melancholie to diſturb the underſtanding, ſo that ſuch perſons as are melancholick, do not onely rage againſt, and uſe violence to their friends and parents, but alſo upon themſelvs. But when as hee ſee's water, hee tremble's and ſhake's, and his haires ſtand up on end.

Dogs becom mad, not onely in the heat of ſummer, but alſo in the depth of winter.

Why melancholick perſons hurt themſelvs.

CHAP. XII.

By what ſigns wee may know a man is bitten by a mad dog.

The bite of a mad dog not verie painful at the firſt.

IT is not ſo eaſie at the firſt to know a man that is bitten with a mad dog, and principally for this reaſon, becauſ the wound made by his teeth cauſſeth no more pain then other wounds uſually do; contrarie to the wounds made by the ſting or bite of other poiſonous creatures, as thoſe which preſently after they are inflicted, cauſ ſharp pain, great heat, ſwelling and abundance of other malign accidents, according to the nature of the poiſons; but the malignitie of the bite of a mad dog appear's not before that the venom ſhall invade the noble parts. Yet when you are ſuſpicious of ſuch a wound, you may acquire a certain knowledg and experience thereof by putting a piece of bread into the quitture that come's from the wound. For if a hungrie dog neglect, yea more flie from it, and diſdain not ſo much as ſmell thereto, it is thought to bee a certain ſign that the wound was inflicted by a mad dog. Others add, That if anie give this piece of bread to hens, that they will die the ſame daie they have eaten it; yet this later, I making experiment thereof, failed, for devouring this virulent bread, they became not a jot the worſe. Wherefore I think the former ſign to bee the more certain, for dogs have a wonderful and ſure ſmelling faculcie, whereby they ſent and perceiv the malignitie of the like creature. But when as the raging

Signs of the bite of a mad dog.

virulencie hath invaded the noble parts, then the patients, becomming ſilent and ſorrowful, think of manie things, and at the beginning make a noiſe with their teeth; they make no anſwer to the purpoſe, they are more teſtie then ordinarie, and in their ſleeps they are troubled with dreams, and ſtrange phantaſies, and fearful viſions: and laſtly, they becom affraid of the water. But after that the poiſon hath fixed it ſelf into the ſubſtance of the noble parts, then all their faculties are diſturbed, all the light of their memorie, ſenſes, reaſon and judgment is extinguiſhed. Wherefore becomming ſtark mad, they know not ſuch as ſtand by them, nor their friends, no nor themſelvs, falling upon ſuch as they meet withall and themſelvs with their teeth, and nails, and feet. Often twitchings like convulſions do ſuddenly riſe in their limbs; I judg them occaſioned by extraordinarie drineſs, which hath as it were wholly drunk up all the humiditie of the nervous parts; there is a great drineſs of the mouth with intolerable thirſt, yet without anie deſire of drink, becauſ the minde beeing troubled, they becom unmindful and negligent of ſuch things as concern them, and are needful for them; the eies look fierie and red, and all the face is of the ſame color; they ſtill think of dogs, and ſeem to ſee them, yea and deſire to bark and bite juſt after the manner of dogs: I conjecture, that the virulent humor hath changed all the humors and the whole bodie into the like nature, ſo that they think themſelvs alſo dogs; whence their voice becom's hoarſ by much endeavouring to bark, haveing forgot all decencie, like impudent dogs, to the great horror of the beholders. For their voice grow's hoarſ by reaſon of the great drineſs of the *aſpera arteria*; they ſhun the light, as that which is enemie to melancholie, wherewith the whole ſubſtance of the brain is repleniſhed: on the contrarie, they deſire darkneſs, as that which is like and friendly to them. But they are affraid of the water (though good to mitigate their great diſtemper of heat and drineſs) and they flie from looking-glaſſes, becauſ they imagin they ſee dogs in them, whereof they are much affraid, by reaſon whereof they ſhun the water, and all polite and clear bodies which may ſupplie the uſe of a looking-glaſs; ſo that they throw themſelvs on the ground, as if they would hide themſelvs therein, leſt they ſhould bee bitten again: for they affirm, that hee which is bitten by a mad dog, alwaies hath a dog in his mind, and ſo remain's fixed in that ſad cogitation. Wherefore thinking that hee ſee's him in the water, hee tremble's for fear, and therefore ſhun's the water. Others write, that the bodie by madneſs becommeth wondrous drie, wherefore they hate the water, as that which is contrarie thereto, beeing abſolutely the moiſteſt element, and ſo they ſay that this is the reaſon of their fearing the water. *Ruffus* write's, that madneſs is a kinde of melancholie, and that fear is the proper ſymptom thereof, according to *Hippocrates*; wherefore this or that kinde of melancholie beget's a fear of theſe or theſe things, but chiefly of bright things, ſuch as looking-glaſſes and water, by reaſon that melancholick perſons ſeek darkneſs and ſolitarineſs by reaſon of the black corruption of the humor wherewith they abound. They fall into cold ſweats, a ſomie, ſtinking and greeniſh matter flow's from the ulcer, by reaſon of the heat of the antecedent cauſ and ulcerated part. The urine moſt commonly appear's watriſh, by reaſon that the ſtrainers, as it were, of the kidnies, are ſtraightned by the heat and drineſs of the venom. Yet ſomtimes alſo it appear's more thick and black, as when nature powerfully uſing the expulſive facultie, attempt's to drive forth by urine the melancholick humor, the ſeat of the venom. Alſo ſomtimes it is wholly ſuppreſt, beeing either incraſſated by hot drineſs, or elſ the minde beeing carried other-wales, and forgetful of its own dutie, until at length the patients, vexed by the crueltie of ſo manie ſymptoms, and overcom by the bitterneſs of pain, die frantick, by reaſon that medicines have not been ſpeedily and fitly applied. For few of thoſe who have uſed remedies in time, have periſhed of this diſeaſ.

Signs, by which you may gather that the noble parts are tainted.

Why men becomming mad bark like dogs.

Why they ſhun the light.

Why they are affraid of the water.

Aphor. 25. ſect. 6.

The bite of a mad dog taken in hand in time, is for the moſt part cureable.

CHAP. XIII.

Prognoſticks.

The venom of a mad dog applied outwardly onely may cauſ madneſs.

SEe cannot ſo eaſily ſhun the danger wee are incident to by mad dogs, as that of other beaſts, by reaſon hee is a domeſtick creature, and houſed under the ſame roof with us. The virulencie that reſide's in his foam or ſlaver is hot and drie, malign, venenate and contagious, ſo that it cauſſeth a diſtemper like to it ſelf, in the bodie whereto it ſhall applie it ſelf, and ſpread it ſelf over the whole bodie by the arteries; for it doth not onely hurt when as it is taken in by a bite or puncture, but even applied to the skin, unleſs it bee forthwith waſhed away with ſalt water or urine. Neither doth this venom hurt equally, or at all times alike, for it harm's more or leſs, according to the inclination of the air to heat or cold, the depth of the wound, the ſtrength of the patient's bodie, and the ill humors thereof, and their diſpoſition to putrefaction, the freedom and largeneſs of the paſſages. Now malign ſymptoms happen ſooner or later, as in ſom about the fortieth day, in others about ſix moneths, and in others a year after. There bee ſom who thereupon are troubled with the falling-ſickneſs, and at length grow mad: ſuch as fall into a fear of the water, never recover. Yet *Aetius* think's their caſe is not deſperate, if

Whether the *Hidrophobia* or fear of water bee incurable.

if as yet they can know their face in a glaſs; for hence you may gather, that all the animal faculties are not yet overthrown, but that they ſtand in need of ſtrong purgations, as wee ſhall ſhew hereafter. *Aëtius* tell's, that there was a certain Philoſopher, who taken with this diſeaſ, and a fear of water, when as hee deſcended with a great courage unto the bath, and in the water beholding the ſhape of the dog that bit him, hee made a ſtand, but aſhamed thereof, hee forthwith cried out, *Quid canì cum Balneo? i.e.* What hath a dog to do with a Bath? which words beeing uttered, hee threw himſelf forcibly into the Bath, and fearleſly drank of the water thereof, and ſo was freed from his diſeaſ together with his erroneous opinion. It is a deadlie ſign to tumble themſelvs on the ground, to have an hoarſ voice, for that is an argument that the weazon is becom rough by reaſon of too exceſſive drineſs. Finally, the principal parts beeing poſſeſſed, there is no recoverie or life to bee hoped for. Men may well fall mad, though they bee not bit by a mad dog. For as the humors are often inflamed of themſelvs, and cauſ a *Cancer* or Leproſie, ſo do they alſo madneſs in melancholick perſons. The bites of vipers and other venemous creatures cauſ not like ſymptoms to theſe that com by the biteing of a mad dog; becauſ they die before ſuch can com forth or ſhew themſelvs. Great wounds made by mad dogs are not equally ſo dangerous as little, for from the former, great plentie of venemous matter flow's out; but in the later, it is almoſt all kept in.

An hiſtorie.

CHAP. XIV.

What cure muſt bee uſed to ſuch as are bitten by a mad dog.

An hiſtorie.

THis caſe alſo require's ſpeedie remedies; for ſuch things are in vain which com long after the hurt. The Lawyer *Baldus* experienced this to his great harm; for beeing by chance lightly bit in the lip by a little dog wherewith hee was delighted, not knowing that hee was mad, and neglecting the wound, by reaſon of the ſmalneſs thereof, after ſom four moneths ſpace, hee died mad, haveing then in vain aſſaied all manner of medicines. Wherefore obſerving theſe things both for evacuation, as alſo for alteration, which wee have formerly mentioned in the general cure of wounds inflicted by the bite or ſting of venemous creatures, and by all the means there ſpecified, wee muſt draw forth the venom; and if the wound bee large, then ſuffer it to bleed long and much, for ſo ſom part of the poiſon will bee exhauſted; if it bee not great, it ſhall bee enlarged by ſcarification, or an occult cauterie, neither ſhall it bee healed or cloſed up at the ſooneſt, till fourtie daies bee paſſed. Sorrel beaten and applied to the wound, and the decoction thereof taken inwardly, is verie effectual in this caſe, as *Aëtius* affirm's. To the ſame purpoſe you may with good ſucceſs make a lotion and friction with muſtard diſſolved in urine or vineger, leaving upon the wound a double cloth moiſtned in the ſame decoction: laſtly, all acrid, biteing, and verie attractive medicines are convenient in this caſe. Wherefore ſom applie rocket boiled and beaten with butter and ſalt; others take the flower of *Orobus*, and temper it with honie, ſalt and vineger, and applie it hot. Horſ-dung boiled in ſharp vineger, or brimſtone beaten to powder, and tempered with ones ſpittle, is good. Alſo black pitch melted with ſom ſalt, and a little *Euphorbium* mixed therewith, and ſo applied, is good. Som write, that the hairs of the dog, whoſe bite cauſſed the madneſs, applied by themſelvs, by their ſympathie or ſimilitude of ſubſtance draw the venom from within outwards; for ſo a Scorpion beaten and applied to the place whereas it ſtung, by drawing out the poiſon that it ſent in, reſtore's the patient to health, both theſe by often experience are affirmed to have certain event. Others chaw unground wheat, and lay it upon the wound, others roſte beans under hot embers, then husk them, and cleav them, and ſo applie them. Alſo the wound may bee wholſomly waſhed and fomented with a decoction of Docks, and then the herb beaten may bee applied thereto; alſo the patient may drink the decoction; and by this one remedie *Aëtius* affirm's that hee hath recovered divers; for thus it move's urine plentifully, which is thought much to conduce to the cure of this diſeaſ. There bee ſom who applie the leavs of betonie and nettles beaten with common ſalt; others make a medicine to the ſame purpoſe and after the ſame manner of an Onion, the leavs of rue and ſalt. Yet the reſt are exceeded by treacle diſſolved in *aqua vitæ* or ſtrong wine, and rubbed hard upon the part, ſo that the blood may follow, laying upon the wound when you have wiped it, cloths dipped in the ſame medicine, then preſently applie garlick or onions beaten with common ſalt and turpentine: by this onely remedie I free'd one of the daughters of *Madamoiſelle de Gron* from the ſymptoms of madneſs, & healed the wound, when as a mad dog had bit her grievouſly in the calf of the right leg. Alſo it is good preſently to eat garlick with bread, and then to drink after it a draught of good wine, for garlick by its ſpirituous heat will defend the noble parts from poiſon. There bee ſom who wiſh to eat the roſted liver of the dog that hurt them, or elſ the liver of a goat, of which remedies as yet I have had no experience. Others preſcribe a dram of the ſeeds of *Agnus caſtus* to bee drunk with wine and butter. Others the powder of river-crabs, burnt and drunk in wine. Or, R. *rad. gent.* ʒii. *aſtacorum fluviat. in fumo combuſt. & in pollinem redact.* ʒiii. *terræ ſigil.* ʒß. *miſce.* Give ʒi. of this

An hiſtorie.

this ſame powder in the decoction of river-crabs, and let them drink thereof oft at ſundrie times. Manie have caſt themſelvs into the ſea, neither have they thence had anie help againſt madneſs, as *Ferrand Pozet* the Cardinal teſtifieth in his book of poiſons; wherefore you muſt not relie upon upon that remedie, but rather you muſt have recourſ to ſuch things as are ſet in the books of Phyſicians, and approved by certain and manifold experience. But ſeeing that no poiſon can kill, unleſs it bee taken or admitted into the bodie, wee muſt not fear anie harm by ſprinkling our bodies with the *ſanies* of a mad dog, viper, toad, or anie other ſuch like venemous creature, if ſo bee that it bee preſently wiped or waſhed clean away.

Leaping into the ſea no certain remedie againſt madneſs.

CHAP. XV.

What cure muſt bee uſed to ſuch as fear the water, but yet are able to know themſelus in a glaſs.

SUch as have not their animal facultie as yet o'recom by the malignitie of the rageing venom, muſt have ſtrong purgations given them. Wherefore, if in anie caſe Antimonie bee uſeful, then is it in this, as that which cauſeth ſweats, looſeth the bellie, and procure's vomiting. For it is a part of extreme and dangerous madneſs to hope to overcom the cruel malignitie of this poiſon alreadie admitted into the bowels, by gentle purgeing medicines. Aſſuredly, ſuch and ſo great danger is never overcom without danger. Bathes alſo conduce, which may diſperſ and draw forth the poiſon by cauſling ſweats. Alſo manie and frequent treacle-potions are good to retund the venom, and ſtrengthen the bowels; alſo it will bee fitting to give them water and all other liquid things, which they ſo much abhor, in a cup with a cover. Alwaies let ſuch as are poiſoned, or bitten, or ſtung by a mad dog or other venemous beaſt, keep themſelvs in ſom warm and light place, that the poiſon which by coldneſs is forced in, may bee the readilyer drawn out by the means of heat, and the ſpirits bee recreated by the brightneſs of the air, and therefore moov from the center to the circumference of the bodie, and let the room bee perfumed with ſweet things. To eat verie hot and ſalt things preſently at the beginning, as onions, leeks, all ſpiced meats, and ſtrong wine not allaied, ſeem' not to bee beſides reaſon; becauſ ſuch things by their ſpirituous heat hinder the diffuſion of the poiſon over the bodie, and ſtrengthen the filled entrails. There bee ſom alſo that would have them to feed upon groſs and viſcous meats, which by obſtructing the veſſels, may hinder the paſſage of the poiſon to the heart and other parts; and by the ſame reaſon it will bee better to fill themſelvs with meat to ſatietie then otherwiſe, becauſ the malignitie of humors is encreaſed by hunger, then which nothing can bee more hartful to venemous wounds. Yet within a ſhort while after, as within five or ſix daies, they muſt return to a mediocritie, and uſe all things temperate, boiled meats rather then roſted, and that in a decoction of opening things, ſo to moov urine. Laſtly, they muſt keep ſuch a diet as melancholick perſons ought to do; neither ſhall they let blood, leſt ſo the poiſon ſhould bee further drawn into the veins; but it is good that the patient's bodie bee ſoluble from the verie firſt. Let their drink bee wine indifferently allaied with water, *oxymel ſimplex*, or the ſyrup of the juice of Citron with boiled water; or elſ this following Julip. ℞. *ſucci limonum, & malorum citri, an* ℥ß. *ſuc. gran. acid.* ℥ii. *aquæ acetoſæ, min. & roſ. an.* ℥i. *aq. font. coct. quantum ſufficit, fiat julep, ut artis eſt.* Sleep is to bee avoided until the force of the poiſon is abated; for by ſleep the humors flow back into the bowels. All things that reſiſt poiſon muſt bee given anie waie whatſoever, as lemons, oranges, *angelica*-roots, gentian, tormentil, burnet, vervin, *cardunus benedictus*, borage, bugloſs, and the like. Let all things that are afterwards ſet before the patient bee meats of good juice, ſuch as are veal, kid, mutton, partridg, pullets, capons, and the like.

The force of Antimonie againſt madneſs.

Why ſleep is hurtful to ſuch as are bitten by a mad dog, and all ſuch as are poiſoned.

CHAP. XVI.

Of the biteing of a Viper or Adder, and the ſymptoms and cure thereof.

THe remedies that were formerly mentioned againſt the biteings of mad dogs, the ſame may bee uſed againſt all venemous bites and ſting, yet nevertheleſs each poiſon hath his peculiar antidote. Vipers or Adders (as wee vulgarly term them) have in their gums, or the ſpaces between their teeth, little bladders filled with a virulent *ſanies*, which is preſſed out into the part that they bite with their teeth. There forthwith ariſeth a pricking pain, the part at the firſt is much ſwollen, and then the whole bodie, unleſs it bee hindred: groſs and bloodie filth ſweat's out of the wound, little blifters riſe round about it, as if it were burn't, the wound gnaw's, and as it were feed's upon the fleſh, great inflammation poſſeſſeth the liver and the gums, and the whole bodie becom's verie drie, becomming of a pale or yellowiſh color, with thirſt unquenchable; the bellie is griped by fits, a choleric vomiting moleſteth them, the ſtomach is troubled with a hicketting, the patients are taken with often ſwoundings, with cold ſweat, the fore-runner of death, unleſs you provide by fit medicines for the noble parts, before the

The bites of vipers how virulent.

The ſymptoms

An hiſtorie. the poiſon ſhall invade them. *Matthiolus* tell's that hee ſaw a countrie-man, who, as hee was mowing a meadow, by chance cut an Adder in two with his ſithe, which when hee thought it was dead, hee took the one half whereon the head remained, without anie fear in his hand, but the enraged creature, turning about her head, cruelly bit him by one of his fingers, which finger, as men uſually do (eſpecially when as they think of no ſuch thing) hee put into his mouth, and ſucked out the blood and poiſon, and preſently fell down dead.

An hiſtorie. When as *Charls* the ninth was at *Montpelier*, I went into the ſhop of one *Farges* an Apothecarie, who then made a ſolemn diſpenſation of Treacle, where not ſatisfying my ſelf with the looking upon the vipers which were there in a glaſs, readie for the compoſition, I thought to take one of them in my hands, but whil'ſt that I too curiouſly and ſecurely handled her teeth which were in her upper jaw, covered with a skin, as it were a caſe to keep the poiſon in, the beaſt catched hold of the verie end of my fore-finger, and bit mee in the ſpace which is between the nail and the fleſh; whence preſently there aroſe great pain, both by reaſon of the part endued with moſt exquiſite ſenſe, as alſo by the malignitie of the poiſon: forthwith I exceeding ſtraitly bound my finger above the wound, that ſo I might preſs forth the blood and poiſon, leſt they ſhould diffuſe themſelvs further over the bodie. I diſſolved old treacle in *aqua vitæ*, wherein I dipped and moiſtned cotton, and ſo put it to the wound, and within a few daies I throwly recovered by this onely medicine. You may uſe in ſtead of Treacle, Methridate and ſundrie other things, which by reaſon of their heat are powerful drawers, as a quill roſted in hot embers, garlick and leeks beaten and applied, barlie flowr tempered with vineger, honie, and goats-dung, and ſo applied like a pultis. Som think it ſufficient forthwith to waſh and foment the wound with vineger, ſalt, and a little honie. *Galen* write's that the poiſon inflicted by the bite of a viper, may bee drawn forth by applying to the wound the head of a viper, but otherſom applie the whole viper beaten to maſh.

Remedies for the bite of a viper.

Lib. de theriac.

CHAP. XVII.

Of the Serpent called Hæmorrhous.

The *Hæmorrhous* why ſo called. THe Serpent *Hæmorrhous* is ſo called, becauſ by biteing hee cauſeth blood to drop out of all the paſſages of the wounded bodie; hee is of a ſmall bodie, of the bigneſs of a viper, with eies burning with a certain fierie brightneſs, and a moſt beautiful skin. The back of him (as *Avicen* write's) is ſpotted with manie black ſpots, his neck little, and his tail verie ſmall: the part which hee bite's forthwith grow's blackiſh, by reaſon of the extinction of of the native heat, which is extinguiſhed by ſuch poiſon which is contrarie thereto in its whole ſubſtance. Then follow's a pain of the ſtomach and heart, theſe parts beeing touched with the peſtiferous qualitie of the poiſon. Theſe pains are ſeconded by vomiting, the orifice of the ventricle beeing relaxed by a *Diarrhœa*, the retentive facultie of all the parts of the bellie beeing weakned, and the veins which are ſpred through the guts, not beeing able to retain the blood contained in them. For the blood is ſeen to flow out, as in ſtreams, from the noſe, mouth, ears, fundament, privities, corners of the eies, roots of the nail, and gums, which putrefie, the teeth falling out of them. Moreover there happen's a difficultie of breathing, and ſtoppage of the urine, with a deadlie convulſion.

Wonderfull bleedings.

The cure is forthwith to ſcarifie, and burn the bitten part, or elſ to cut it quite off, if that it may bee don without danger of life, and then to uſe powerfullie drawing Antidotes.

CHAP. XVIII.

Of the Serpent called Seps.

The reaſon of the name, and deſcription of the *Seps*. THe Serpent *Seps* is ſo called, becauſ it cauſeth the part which it bite's, forthwith to putrefie, by reaſon of the cruel malignitie of its poiſon. It is not much unlike the *Hæmorrhous*, but that it curl's or twine's up the tail in divers circles. *Pauſanias* write's that this ſerpent is of an aſh-colour, a broad head, ſmall neck, big bellie, writhen tail, and as hee goe's, hee run's aſide like a crab. But his skin is variegated and ſpotted with ſeveral colors, like to Tapiſtrie. By the crueltie of his cauſtick

and

and putrefying venom, hee burn's the part which hee hath bit, with most bitter pain; hee causeth the shedding of the hairs, and as *Aetius* addeth, the wound at the first casteth forth manifest blood, but within a little while after, stinking filth. The putrefied affected parts wax white, and the bodie all over becom's of the color of that scurf, which is termed *Alphos*, so that by the wickednes of this putrefactive poison, not onely the spirits are resolved, but also the whole bodie consumed, as by fire, a pestilent carbuncle, and other putrid tumors, arising from a hot and humid or suffocating constitution of the air. Now for the remedies, they must bee such as are formerly prescribed against the biteings of a viper. The symptoms.

The figure of the Serpent Sepa.

CHAP. XIX.

Of the Basilisk or Cockatrice.

THe Basilisk far exceed's all kindes of Serpents in the curstnes of its poison. Therefore it is affirmed by *Nicander*, that into what place soever hee com's; other venemous creatures do forthwith flie thence, for that none of them can so much as endure his hissing; for hee is thought to kill all things even with this, and not with his biteing and touch onely; besides, if anie of them hasten to get anie meat or drink, and perceiv that the Basilisk is not far from from thence, he flie's back, and neglect's the getting of nourishment necessarie for life. *Galen* write's, that the Basilisk is a yellowish serpent, with a sharp head, and three riseings distinguished with white spots, and riseing up in form of a crown, by reason whereof hee is stiled the King of Serpents. Certainly the violence of his poison in killing men is so great, that hee is therefore thought to kill men, and other creatures by his sight onely. *Solinus* affirm's, that the bodie of a dead Basilisk hath wondrous faculties. Wherefore the inhabitants of *Pergamum*, in antient times, gave a mightie price for one, to hang upon the joists of the temple of *Apollo*, so to drive away the Spiders and Birds, lest they should there weav their webs, or the other build their nests in that sacred place. Verily no ravenous creature will touch their carkass; but if constrained by hunger they do touch it, then they forthwith fall down dead in the same place: and this happen's not onely by eating their bodie, but also by devouring of the bodies of such beasts as are killed by their biteings. They kill the trees and shrubs by which they pass, not onely by their touch, but even with their breath. Among the western Æthiopians is the fountain *Nigris*, neer which there is a serpent called *Catablepas*, small in bodie, and slow, haveing a great head; which it scarce can carrie, but that it lie's alwaies upon the ground, otherwise it would kill abundance of people, for it forthwith kil's all that see's the eies thereof, the Basilisk hath the same force; hee is bred in the province of *Cyrene*, of the length of som twelv fingers, with a white spot in his head, resembling a crown; hee chaseth away all serpents with his hiss. Weasels are the destruction of such monsters: thus it pleased [illegible] that nothing should bee without its equal; they assail them in their [illegible] by the benefit or consumption of [illegible] them also by their fine, and they die, and the light of nature is ended: thus nature to the [illegible] might fear, hath opposed the weak creature the [illegible] fied and put to flight. *Erasistratus* write's, that a [illegible] such as are hurt by a Basilisk, but a blackness and [illegible] the flesh of the muscles within a while after falling away peece-meal. An antidote against this must bee made of a dram of *Castoreum*, dissolved in wine and drunken, or in the juice of poppie. But *Aetius* think's it superfluous to write remedies against the Basilisk, when as the sight and hearing onely kill's such as either see or hear her.

CHAP. XX.

Of the Salamander.

The malignitie of a Salamander.

THe Salamander kill's not onely ſuch as it bite's, by makeing a venemous impreſſion, but it alſo infect's the fruits and herbs over which it creep's, with a ſpittle or groſs moiſture which ſweat's out of all the bodie, to the great danger of the health and life of ſuch as eat theſe things at unawares: wherefore it need not ſeem ſtrange, which is received by ſom late writers, that ſom families have all died by drinking water out of the pits, whereinto a Salamander by accident was fallen. For if it ſhall creep upon a tree, it infect's all the fruit with the qualities of cold and moiſt poiſon, wherein it yield's not to Aconite.

The temper of her.

Aetius write's, that ſuch as are infected with the poiſon of a Salamander, certain parts of their bodie grow livid, ſo that they fall away often, beeing putrefied. At the firſt there appear white ſpots over the bodie, then red, afterwards black with putrefaction, and the falling away of the hairs. The cure is, to procure vomit, to loof the bellie with a glyſter, and to give them Treacle and Mithridate in potions. *Avicen* preſcribe's the ſame things againſt this kinde of poiſon as againſt *opium*, by reaſon of the cold nature of them both; the proper antidote is turpentine, *ſtyrax*, nettle-ſeeds, and cypreſs-leavs. *Dioſcorides* write's, that the Salamander is a kinde of Lizard, dull, variegated, and which is falſly reputed not to bee burnt by fire. But *Plinie* ſaith ſhee is ſo cold, that ſhee extinguiſheth the fire by her touch onely, beeing laied upon hot coals. On the contrarie, *Matthiolus* ſaith, that caſt into a great flame, they are quickly conſumed. It is eaſie out of *Aetius* to reconcile theſe diſagreeing opinions. This creature, ſaith hee, paſſeth through a burning flame, and is not hurt, the flame divideing it ſelf, and giveing her way, but if ſhee continue anie time in the fire, the cold humor beeing conſumed in her, ſhee is burnt. Now the Salamander is black, variegated, with yellow ſpots, ſtar-faſhion.

CHAP. XXI.

Of the Torpedo.

THe *Torpedo* hath his name from the effect, by reaſon that by his touch and power the members becom torpid and numb; in muddie ſhoars it live's upon fiſh, which ſhee catcheth by craft. For lying in the mud, ſhee ſo ſtupefie's thoſe that are nigh her, that ſhee eaſily prey's upon them; ſhee hath the ſame power over men, for ſhee ſend's a numneſs not onely into the arm of the fiſher-man, but alſo over all his bodie, although his fiſhers pole bee between them.

The craft of the *Torpedo*.

His ſtupefying force.

The

The effigies of a Torpedo.

CHAP. XXII.

Of the Biteings of Aſps.

THe wound which is made by an Aſp is verie ſmall, as if a needle were thruſt into the part, and without anie ſwelling. Theſe ſymptoms follow upon her bite, ſudden darkneſs cloud's their eies, much agitation in all their bodies, but gentle notwithſtanding a moderate pain of the ſtomach trouble's them, their fore-heads are continually troubled with convulſive twitchings, their cheeks tremble, and their eie-lids fall gently to reſt and ſleep; the blood which flow's from the wound is little, but black; death no longer deferred then the third part of a daie, will take them away by convulſions, unleſs you make reſiſtence with fitting remedies. The male-Aſp make's two wounds, the female four, as it alſo happen's in the biteings of vipers. Now for that that the poiſon of Aſps congeal's the blood in the veins and arteries, therefore you muſt uſe againſt it ſuch things as are hot and ſubtil of parts, as mithridate or treacle diſſolved in *aqua vitæ*, and the ſame powred into the wound; the patient muſt bee warmed by baths, frictions, walking, and the like. When as the hurt part becommeth purple, black or green, it is a ſign that the native heat is extinct and ſuffocated by the malignitie of the venom. Therefore then it is beſt to amputate the member, if the partie bee able to endure it, and there bee nothing which may hinder. *Vigo* write's, that hee ſaw a Mountebank at Florence, who, that hee might ſell the more of his Antidotes, and at the better rate, let an Aſp to bite him by the finger, but hee died thereof ſom four hours after. To the ſame purpoſe you may read *Matthiolus*, whereas hee write's that thoſe Impoſtors or Mountebanks to coſen the better, and deceiv the people, uſe to hunt and take vipers and aſps long after the ſpring, that is, then whenas they have caſt forth their moſt deadlie poiſon; then they feed them with meats formerly unuſual to them, ſo that by long keeping and care, at the length they bring it to paſs, that they put off a great of their venemous nature; neither beeing thus ſatisfied, they make them oftentimes to bite upon peeces of fleſh, that ſo they may caſt forth into them the venom which is contained in the membrane between their teeth and gums. Laſtly, they force them to bite, lick and ſwallow down an aſtringent medicine, which they compoſe and carrie about for the ſame purpoſe, that ſo they may obſtruct the paſſages by which the venom uſed to flow out, for thus as length their bites will bee harmleſs, or without great danger. This therefore is their art, that ſo they may ſell their counterfeit treacle to the people at a high rate, as that which is a moſt ſafe remedie againſt all poiſonous bites. *Chriſtopher Andrew* in his book called *Oicoiatria*, write's that the Iſlands of Spain are everie where full and ſtor'd with ſerpents, aſps, and all ſorts of venemous beaſts, againſt whoſe bites they never obſerved or found anie benefit in treacle. But the efficacie of the following Antidote is ſo certain and excellent, and approoved by ſo manifold experience, that in the confidence thereof, they will not bee affraid to let themſelvs bee bitten by an Aſp. Now this medicine is compoſed of the leave of Mullet, Avenes and red-ſtock-gilliflowrs in like quantitie, which they boil in ſharp vineger and the urine of a ſound man, and therewith foment the wounded part. Yet if hee have not taken nor uſed anie thing of a good while after the wound, it will bee better and more certain, if the patient drink three ounces of this decoction faſting two hours before meat.

Symptoms.

Cureing.

An hiſtorie.

By what means Aſps may bee made leſs hurtful.

Gal. lib. de Ther. ad piſonem.

Againſt the bites of what ſerpents treacle doth no good.

A certain remedie againſt the biteing of Aſps.

CHAP. XXIII.

Of the biteing of a Snake.

I Have thought good in a true hiſtorie to deliver the virulent malignitie of the bite of a Snake, & the remedies thereof. When as King *Charls* the ninth was at Moulins, *Monſieur La Feure*,

An hiſtorie.

Feure the King's Phyſician,& I were called to cure the Cook of the Ladie of Caſtelpers. Who gathering hops in a hedg to make a ſallet,was bit on the hand by a ſnake that there lay hid, hee putting his hand to his mouth, ſucked the wound to eaſ the pain by ſucking forth the venom. But his tongue forthwith ſwelled ſo big,that hee could not ſpeak his minde: beſides, his whole arm, even to his ſhoulder, was in like ſort much ſwelled, his pain was ſo vehement, that it made him ſwoun twice in my preſence, his face was wan and livid like to a dead bodie; and though I deſpaired of his recoverie, yet not ſuffering him to bee quite forſaken, I waſhed his mouth with treacle diſſolved in white wine,and gave him ſom thereof to drink, adding thereto ſom *aqua vitæ*. I opened his ſwoln arm with manie and deep ſcarifications, eſpecially in the place where hee was hurt, I ſuffered the blood which was wholly ſerous and ſanious,, to flow more plentifully,I waſhed the wovnds with treacle and mithridate diſſolved in *aqua vitæ*, and then I put him exceeding warm in bed, procureing ſweat, and makeing him to lie awake,leſt ſleep ſhould draw the poiſon inwards to the entrails. I by theſe means ſo far prevailed, that on the day after hee was free'd from all his malign ſymptoms. Therefore I judged, it onely remained for a perfect cure, that the wound ſhould bee long kept open and waſhed with treacle; neither was I deceived, for within a few daies hee was perfectly recovered.

The cure.

CHAP. XXIV.

Of the biteings of Toads.

The bites of Toads how harmful.

THough Toads want teeth, yet with their hard and rough gums they ſo ſtraitly preſs or pinch the part which they ſhall take hold on, that they will force their poiſon thereinto, and ſo over the whole bodie by the pores of the preſſed part. Moreover they caſt forth their venom by urine, ſpittle and vomit upon herbs, but chiefly upon Strawberries,the which they are reported greatly to affect.Hence manie ſuddenly and ignorantly catch their deaths.

An hiſtorie.

I heard from a man of verie good credit, that there were two merchants not far from the Citie *Tholous*, who whileſt dinner was provideing, walked into the Garden that belonged to the Inn, where they gathered ſom ſage leavs, and unwaſhed as they were put them into their wine. They had not as yet dined, when beeing taken with a ſudden *Vertigo*, the whole Inn ſeemed to run round, then loſing their ſight, they fell into a ſwound, intermixed now and then with convulſions. But they ſtammered with their lips and tongues becomming black; a froward and horrid look, with continual vomiting, and a cold ſweat, the fore-runner of death, which preſently ſeazed upon them,their bodies becomming exceedingly much ſwoln. But the Juſtices of the place ſuſpecting that they were poiſoned, made the Inn-keeper and the Gueſts to bee apprehended, beeeing examined they all conſtantly and with one voice anſwered, That the dead parties ate of the ſame meat and drink which the reſt did, but onely that they put ſage into their wine. A Phyſician was asked the queſtion whether ſage might bee poiſoned; hee anſwered, it might: but to com to the purpoſe, it muſt appear whether anie venemous creature hath poiſoned the plant with her ſpittle or venemous *ſanies*. This which was lightly pronouuced, and onely by conjecture, was by the eie found to bee true.For at the root thereof there was found a hole in the ground full of Toads,who got out by putting in of warm water, made it credible that the plant was poiſoned by their ſpittle and urine,whereby you may underſtand how unwiſely they do,who devour herbs and fruits newly gathered without waſhing. Alſo wee muſt take heed leſt falling aſleep in the fields, wee lie not near the holes which toads or other venemous beaſts of the ſame nature have made their habitation. For thence a venemous or deadlie air may bee drawn into the lungs. For the ſame cauſ wee muſt abſtain from eating of frogs in the month of May, becauſ then they engender with toads. Oxen in feeding ſomtimes lick up ſmall toads together with the graſs, which preſently will breed their great harm, for thereupon the oxen ſwell ſo big,that they often burſt withall. Neither is the venom of toads deadly onely beeing taken inwardly, but even ſprinkled upon the skin, unleſs they forthwith wipe the place, and waſh it with urine, water and ſalt. Such as are poiſoned by a toad turn yellow,ſwell over all their bodies, are taken with an Aſthmatick difficultie of breathing, a *Vertigo*, convulſion, ſwounding,and laſtly by death it ſelf. Theſe ſo horrid ſymptoms are judged inherent in the poiſon of toads, not onely by reaſon of the elementarie qualities thereof, coldneſs and moiſture, which are chiefly predominant therein; but much rather by the occult propertie which is apt to putrefie the humors of that bodie whereto it ſhall happen. Therefore it will bee convenient to procure vomit, eſpecially if the poiſon bee taken by the mouth, to give gliſters, and to weaken the ſtrength of the poiſon by hot and attenuateing Antidotes, as treacle and mithridate diſſolved in good wine; but in concluſion to digeſt it by bathes, ſtoves, and much and great exerciſe. *Rondeletius* in his book *de piſcibus*, affirm's the ſame things of the curſed venom of toads, as wee have formerly delivered: yet that they ſeldom bite, but that they caſt forth either their urine, the which they gather in a great quantitie in a large bladder, or elſ

The ſymptoms occaſioned by the poiſon of Toads.

May-frogs.

The cure.

elſ their venemous ſpittle or breath againſt ſuch as they meet withall, or aſſail; beſides, the herbs which are tainted by their poiſonous breath, but much more ſuch as are ſprinkled with their ſpittle or urine, are ſufficient to kill ſuch as eat them. The Antidotes are juice of betonie, plantane, mug-wurt, as alſo the blood of Tortoiſes made with flower into pills, and forthwith diſſolved in wine, and drunken. *Plinie* write's, that the hearts and ſpleens of Toads reſiſt poiſon. The vulgar opinion is falſ, who think that the Toad-ſtone is found in their heads, which is good againſt poiſon. Antidotes againſt the poiſon of Toads.

CHAP. XXV.

Of the ſtinging of a Scorpion.

A Scorpion is a ſmall creature with a round bodie in form of an egg, with manie feet, and a long tail conſiſting of manie joints, the laſt whereof is thicker, and a little longer then the reſt, at the verie end thereof is a ſting, in ſom two, hollow and replete with cold poiſon, the which by the ſting it caſt's into the obvious bodie; it hath five legs on each ſide forked with ſtrong claws, not unlike to a Crab or Lobſter, but the two foremoſt are bigger then the reſt; they are of a blackiſh or ſootie color, they go aſide, aſide; and oftimes faſten themſelvs with their mouths and feet ſo faſt to men, that they can ſcarce bee plucked there-hence. There bee ſom who have wings like the wings of Locuſts, waſteing the corn, and all green things with their biteing and burning. Such are unknown in France. Theſe flie divers countries, like winged Ants. This is likely to bee true by that which *Matthiolus* write's, that the husband-men in Caſtile in Spain, in digging the earth oftimes finde a ſwarm of Scorpions, which betake themſelvs thither againſt winter. *Plinie* write's, that Scorpions laid waſte a certain part of Æthiopia, by chaſeing away the inhabitants. The Antients made divers kindes of Scorpions, according to their varietie or difference of colors, ſom beeing yellow, others brown, reddiſh, aſh-colored, green, whitiſh, black, duskie; ſom have wings, and ſom are without. They are more or leſs deadlie, according to the countries they inhabit. In Tuſcanie and Scithia they are abſolutely deadlie, but at Trent, and in the Iland Pharos their ſtinging is harmleſs. The place ſtung by a Scorpion preſently begin's to bee inflamed, it waxeth red, grow's hard, and ſwell's, and the patient is again pained, hee is one while hot, another while cold, labor preſently wearie's him, and his pain is ſom-whiles more, and ſom-whiles leſs, hee ſweat's and ſhake's as if hee had an Ague, his hair ſtand's upright, paleneſs diſ-color's his members, and hee feel's a pain, as if hee were pricked with needles over all his skin, winde flieth out backwards, hee ſtrive's to vomit and go to ſtool, but doth nothing; hee is moleſted with a continual fever and ſwounding, which at length proov's deadlie, unleſs it bee remedied. *Dioſcorides* write's, that a Scorpion beaten and laid to the place where hee is ſtung, is a remedie thereto; as alſo eaten roſted to the ſame purpoſe. It is an uſuall, but certain remedie to annoint the ſtung place with the oil of Scorpions. There bee ſom who drop into the wound the milkie juice of figs; others applie calamint beaten, other-ſom uſe barlie-meal mixed with a decoction of *Rue*. Snails beaten together with their ſhells, and laid thereon, preſently aſſwage pain. *Sulphur vivum* mixed with Turpentine, and applied plaſter-wiſe, is good; as alſo the leavs of *Rue* beaten, and laid thereto. In like ſort alſo the herb *Scorpioides*, which thence took its name, is convenient, as alſo a bryonie-root boiled and mixed with a litile ſulphur and old oil. *Dioſcorides* affirm's, Agarick in powder, or taken in wine to bee an Antidote againſt poiſons, verily it is exceeding good againſt the ſtingings or biteings of ſerpents. Yet the continual uſe of a bath ſtand's in ſtead of all theſe, as alſo ſweat, and drinking wine ſomwhat allai'd. Now Scorpions may bee chaſed away by a fumigation of *Sulphur* and *Galbanum*; alſo oil of Scorpions dropped into their holes, hinder's their comming forth. Juice of raddiſh doth the ſame. For they will never touch one that is beſmeared with the juice of radiſh or garlick, yea verily, they will not dare to com near him.

The deſcription of a Scorpion. His tail. Winged Scorpions. Symptoms. *Lib. 2. cap. 10. & lib. 6. ca. 44.* *Lib. 3. cap. 1.* Scorpions chaſed away with the juice of Garlick or Radiſh.

CHAP. XXVI.

Of the ſtinging of Bees, Waſps, &c.

BEes, Waſps, Hornets and ſuch like, cauſ great pain in the skin wounded by their ſtinging, by reaſon of the curſtneſs of the venom which they ſend into the bodie by the wound, yet are they ſeldom deadlie, but yet if they ſet upon a man by multitudes, they may com to kill him. For thus they have ſomtimes been the death of horſes. Wherefore becauſ ſuch as are ſtung by theſe, by reaſon of the cruelſie of pain, may think they are wounded by a more virulent and deadlie creature, I think it not amiſs to ſet down what ſignes follow upon their ſtingings. Great pain preſently ariſeth, which continueth untill the ſting left in the part is taken forth, the part becom's red and ſwoln, and there riſeth a puſh or little bliſter. The cure is, forthwith to ſuck the wound verie Symptoms. The cure.

verie hard, and thereby to draw forth the ſtings, which if they cannot thus bee gotten out, the place, if nothing hinder, is to bee cut, or elſe temper aſhes with leven or oil, and ſo apply them: the part alſo may bee verie conveniently put into hot water, and there fomented for an houres ſpace, and at length waſhed in ſea-water. Creſſes beaten and applied, aſſwage the pain and diſcuſs the humor cauſſing the tumor. Onions macerated in oil and vineger, and applied hot, doth the ſame. There are ſom who applie to the part the ſame creatures beaten, as wee formerly ſaid of Scorpions; beans chawed and laid to the part aſſwage pain. Vineger, honie and ſalt applied exceeding hot, are good, if beſides, you dip a cloth therein, and lay it upon the place; *ſulphur vivum* tempered with ſpittle hath the ſame effect. The milkie juice of unripe figs incorporated with honie, is judged verie effectual, but it is much the better, mixed with treacle. Waſps will not ſting nor bite ſuch as annoint their bodies with the juice of mallows mixed with oil. They may bee quickly chaſed away with the fume of brimſtone and ſuch like things. A waſp is ſaid, if ſhee finde a viper dead, to dip her ſting in the others poiſon, and thence men learned to empoiſon the heads of their arrows. The rough and hairie worms, which are commonly called Bear-worms, eſpecially thoſe which breed about a Pine-tree, cauſe great itching, redneſs and ſwelling in the part which they bite, touch or grate upon verie hard. A remedie hereof is onions beaten with vineger, and the reſt of the things formerly mentioned.

The bites of Bear-worms.

CHAP. XXVII.

Of the bite of a Spider.

Differences of Spiders.

Spiders weav webs with various art, yet in theſe they alwaies make a lurking-hole, ſo to lie in wait to catch the intrapped flies, and ſo to prey upon them. There are manie ſorts of Spiders; one is termed *Rhagium*, round, and like a black-berrie, whence it taketh the name; it hath a verie ſmall mouth under the mid'ſt of the bellie, and moſt ſhort feet, as if they were imperfect, her bite is as painful as the ſting of a Scorpion. Another is called *Lupus*, or the Wolf-Spider, becauſe ſhee doth not onely lie in wait to catch Flies, but alſo Bees and Waſps, and all ſuch things as may flee into her web. The third is named *Myrmecion*, it is larger then an Ant, but headed like one, the bodie thereof is black, and hath white ſpots or ſtreaks running towards the back. The fourth kinde may bee called *Veſparium*, in other things reſembling a Waſp, but that it want's the wings; of a reddiſh color, and liveing onely on herbs. The Antients have thought their biteings to bee venemous. Now their poiſon is therefore thought to bee cold, becauſe the ſymptoms thence ariſeing are winde in the bellie, refrigerations of the extreme parts of the bodie, numneſs in the bitten part, with ſenſe of cold and ſhakeing. The wound muſt forthwith bee waſhed with verie hot vineger; then muſt you lay thereto Onions, and ſuch like things beaten, then procure ſweat by art, as by baths and ſtoves, yet nothing is more effectual then treacle and mithridate.

CHAP. XXVIII.

Of Cantharides *and* Bupreſtes.

The deſcription of *Cantharides*.

Cantharides ſhine as it were with a golden color, acceptable to the eie, by reaſon of the commixture of a blewiſh or greeniſh color therewith, yet their ſmell is ungrateful. They are hot and drie in the fourth degree, and ſo cauſtick, corroſive and venemous, not onely by reaſon of their cauſtick qualitie, but becauſe of a ſecret antipathie which they naturally have againſt the urinarie parts; which effects they produce not onely if they bee taken by the mouth into the bodie, but even applied outwardly to raiſe bliſters. Such as have taken them inwardly, have the taſte of pitch, or ſom thing like *cedria*, or the roſin of Cedars in their mouths; it is likely that this taſte proceed's from the humors diſſolved by the putredinous heat in the ſtomach, guts & liver, and the vapors that there-hence ariſe; for taken inwardly, they gnaw, exulcerate and burn all parts from the mouth even to the bellie, whence enſueth a bloodie-flux, excrements flowing out, which reſemble the waſhings of new-killed fleſh. Then follow's a burning fever, *vertigo*, madneſs, reſtleſneſs, the brain beeing diſturbed by the plentie of vapors lifted up from the corroded and burnt parts and humors, which therefore when as they appear, you may know the affect is uncureable. In the parts appointed for the receiving and conveiance of the urine they cauſe a burning inflammation, excoriation, ſtrong and continual erection of the yard, whence enſue's a bloodie and painful ſtrangurie, in ſtead of which there oftimes happen's or ſucceed's an *Iſcburie*, or ſtoppage of the water, whence a gangrene and mortification of the part, and ſo in concluſion of the whole bodie beſides. When as *Cantharides* are taken inwardly, the remedie is vomiting, drinking of Cows-milk to correct the heat and drineſs, good alſo to mitigate the ulcers, and ſtay the *dyſenterie*; it is good alſo to inject it into the guts by glyſter.

Enemies to the Bladder. Symptoms.

In

In ſtead thereof ſallet-oil, or oil of ſweet almond's is convenient to retund the acrimonie of the poiſon faſtned to the ſides of the ſtomach. The reſt and whole cure of this poiſon you may learn by the following hiſtorie. A certain whore, the better to enjoy the companie of a young Abbot who loved her, entertained him with a banquet, and ſprinkled divers of their cates with the powder of *Cantharides*, to incite him the more to venerie. The next day, when as the Abbot caſt forth pure blood at his fundament and yard which ſtood verie ſtiffe, hee called fom Phyſicians, who preſently by the fore-mentioned ſymptoms, which were all verie apparent in him, underſtood that hee had *Cantharides* given him: wherefore they purged him upwards with vomits, and downwards by glyſters made with French-barlie, Rice, a decoction of mallowes, ſeeds of line and fenugreek, oil of lillies, goats-ſuet: then preſently after they gave him a little treacle with a good quantitie of *conſerva's* of violets, which might draw the poiſon outwards, they gave him milk to drink, and cauſſed him to to uſe injections into the urinarie paſſage and guts made of refrigerateing things, as the juice of lettuce, purſlaine, cucumbers, gourds, melons; of tough and viſcid things, that ſo they might ſtick the more eaſily and longer to the ulcerated parts, as the mucilages of *pſilium*, mallows, quince-ſeeds, ſyrup of water-lillies, poppies and violets, freſh butter, and oil of ſweet almonds, and they made him drink onely barlie-water, or the common peiſan; they let him feed on veal, kid, and pork boiled with lettuce, purſlaine, barly and violet leaves, the which by their humiditie might relax the bellie, and by their toughneſs demiſe the roughneſs of aſperitie; they applied alſo refrigerateing things to the loines, ſhare and *perinæum* to aſſwage the heat of the urine. At length they put him into a warm bath, and to conclude, they left nothing unattempted to draw forth or weaken the poiſon. But all their endeavors were in vain, for the Abbot died, not beeing deſtitute of remedies conveniently preſcribed, but overcom by the contumacious malignitie of the poiſon. The Phyſicians pains had far better ſucceſs in a certain Gentlewoman againſt this kinde of affect; her whole face was deformed with red, fierie and filthie puſtles, ſo that all ſhunned her companie as if ſhee had been troubled with a Leproſie, and were readie to forbid her the ſocietie of men; ſhee came to *Paris*, and calling *Hollerius* and *Grealmus* Phyſicians, mee and *Caballus* beeing Surgeons, ſhee made a grievous complaint, and beſought us earneſtly for ſom remedie againſt ſo great a deformitie of her face; having diligently conſidered her caſe, wee pronounced her free from a Leproſie; but wee judged it fit to applie to her whole face a veſicatorie of *Cantharides*, three or four houres after the application whereof, the medicines beeing com to work its effect, her bladder began to burn exceedingly, and the neck of her womb to ſwell, with gripings, continual vomiting, making of water and ſcowring, a troubleſom agitation of the bodie and members, a burning and abſolutely fierie fever. I forthwith called the Phyſicians, it was decree'd that ſhee ſhould drink wine plentifully, and that it ſhould bee injected by the fundament into the guts, and by the urinarie paſſage into the bladder and the neck of the womb, and that ſhee ſhould keep her ſelf, untill the pain were mitigated, in a warm bath made of the decoction of Line-ſeeds, the roots and leaves of mallowes, marſh-mallowes, violets, henbane, purſlain and lettuce; and her loines and genitals ſhould bee anointed with *unguentum roſatum and populeon* ſtirred and incorporated with *oxycrate*. By theſe means, all the ſymptoms were mitigated. Her face in the *interim* roſe all in a bliſter, and much purulent matter came out thereof, and ſo the deformitie, wherewith ſhee was formerly troubled, vaniſhed away for ever, ſo that within a while after ſhee was married, and had manie children, and is yet living in perfect health.

A hiſtorie.

The cure.

A hiſtorie.

Cantharides applied to the head, ulcerate the bladder.

A remedie againſt Leprous puſtles.

Bupreſtes alſo are of the kinde of *Cantharides*, beeing like unto them in ſhape and facultie. If an Ox or ſheep or anie other creature ſhall in feeding devour one of them, hee will preſently ſwell up like a Tun; whence alſo they take their name. If a man take them inwardly, he ſhall endure the like ſymptoms as in taking *Cantharides*, and over and beſides both his ſtomach and his whole bellie ſhall bee wonderfully puffed up, as if hee had a Dropſie. It is probable that this inflation like a tympanie happeneth by humors diffuſed and reſolved into vapors by the fierie acrimonie of the venom: They are to bee cured after the ſame manner as ſuch as have drunk *Cantharides*. Laſtly, as in all other poiſons which are taken into the bodie, ſo alſo here, if the poiſon taken by the mouth bee thought as yet to bee in the ſtomach, you muſt then procure vomit. If it bee gotten into the guts, then muſt it bee drawn away by glyſters; if diffuſed over all the bodie, then muſt you make uſe of ſuch things as may drive the poiſon forth from the center to the circumference, ſuch as are baths and ſtoves.

The reaſon of the name.

CHAP. XXIX.

Of Horſ-leeches.

HOrſ-leeches are alſo venemous, eſpecially ſuch as live in maddie ſtinking ditches, for theſe are leſs hurtful which reſide in clear and pure waters. Wherefore, before they are

What horſ-leeches moſt virulent.

to bee uſed in caſes of phyſick, they muſt bee kept for ſom daies ſpace in clean water, that ſo they may purge themſelvs; otherwiſe they may chance to leav ulcers hard to cure in the places whereto they ſhall bee applied, and the rather, if they bee violently plucked off, becauſ they by that means leav their teeth faſtned in the part. Now hee which by chance hath ſwallowed a Horſ-leech, muſt bee asked in what part hee feeleth her, that is, the ſenſ of her ſucking. For if ſhee ſtick in the top of the throat or gullet, or in the midſt thereof, the part ſhall bee often waſhed with muſtard diſſolved in vineger. If ſhee bee near the orifice of the ventricle, it is fit that the patient by little and little ſwallow down oil with a little vineger. But if ſhee faſten to the ſtomach, or the bottom of the ventricle, the patient, by the plucking of the part, ſhall perceiv a certain ſenſ of ſucking, the patient will ſpit blood, and will for fear becom melancholick. To force her thence, hee ſhall drink warm water with oil; but if ſhee cannot ſo bee looſed, then ſhall you mix aloës therewith, or ſom thing endued with the like bitterneſs, for ſhee will by that means leav her hold, and ſo bee caſt forth by vomit. You may perceiv this by ſuch as are applied to the skin, on the external parts, for by the aſperſion of bitter things, whether they bee full or emptie, they will forſake their hold. Then ſhall the patient take aſtringent things, which may ſtop the blood flowing forth of the bitten part, ſuch is *Conſerv of Roſes*, with *terra ſigillata*, *Bole-Armenick*, and other more aſtringent things, if need ſo require. For if they ſhall adhere to ſom greater branch of ſom vein or arterie, it will bee more difficult to ſtop the flowing blood.

Divers remedies according to the diverſitie of the parts.

But for that not the earth onely, but the ſea alſo produceth venemous creatures, wee will in like ſort treat of them, as wee have alreadie don of the other, beginning with the Lampron.

CHAP. XXX.

Of the Lampron.

The deſcription of the Lampron.

THe Lampron, called in Latine *Murena*, is a ſea-fiſh ſomthing in ſhape reſembling a Lamprie, but ſhee is bigger and thicker, and hath a larger mouth, with teeth long, ſharp and bending inwards, ſhee is of a duskie color, diſtinguiſhed with whitiſh ſpots, and ſom two cubits length; the Antients had them in great eſteem, becauſ they yield good nouriſhment, and may bee kept long alive, in pools or ponds, and ſo taken as the owners pleaſ to ſerv their table, as it is ſufficiently known by the hiſtorie of the Roman *Craſſus*. Shee by her biteing induceth the ſame ſymptoms as the viper, and it may bee helped by the ſame means. Verily the Lampron hath ſuch familiaritie with the Viper, that leaving her natural element the ſea, ſhee leapeth aſhoar, and ſeeketh out the Viper in her den to join with her in copulation, as it is written by *Ælian* and *Nicander*.

The natural friendſhip of the Lampron and Viper.

CHAP. XXXI.

Of the Draco-marinus, *or ſea-Dragon.*

THe ſea-Dragon, called by the French *Viva*, for his vivacitie (and by the Engliſh a *Viver*, or as ſom ſay, a *Qua-viver*) becauſ beeing taken in fiſhing, and drawn out of the ſea, ſhee is ſaid long to ſurvive. Her pricks are poiſonous, but chiefly thoſe that are at the edges of her gils. Which is the reaſon that Cooks cut off their heads before they ſerv them up to the table; and at Roven the fiſher-men lay them not upon their ſtalls to ſell before they have cut off their heads. The wounded part of ſuch as are hurt, pain's them much with inflammation, a fever, ſwounning, gangrene and deadlie mortification, unleſs it bee quickly withſtood. Not verie long ago the wife of *Monſieur Fromaget*, Secretarie of the requeſts, was wounded with a prick of this fiſh in her middle-finger, there followed a ſwelling and redneſs of the part, without much pain; but perceiving the ſwelling to encreaſ, beeing made more warie by the miſchance of her neighbor the wife of *Monſieur Bargelonne*, Lievtenant particular in the Chaſtelet of Paris, who died not long before by the like accident beeing neglected, ſent for me. I underſtanding the cauſ of her diſeaſ, laid to her pained finger and her whole hand, beſides a pultis made of a great Onion roſted under the coles, leaven, and a little treacle. The next day I wiſhed her to dip her whole hand into warm water, ſo to draw forth the poiſon, then I diſvided the skin about it with much ſcarification, but onely ſuperficiarily; to the gaſhes I applied Leeches, which by ſucking drawing a ſufficient quantitie of blood, I put thereto treacle diſſolved in *aqua vitæ*. The next day the ſwelling was aſſwaged, and the pain eaſed, and within a few daies ſhee was perfectly well. *Dioſcorides* write's, that this fiſh divided in the midſt, and applied to the wound, will cure it.

Symptoms.

An hiſtorie.

The cure.

CHAP. XXXII.

Of the Paſtinaca marina, *or Sting-Ray, which ſom call the* Fierce-claw.

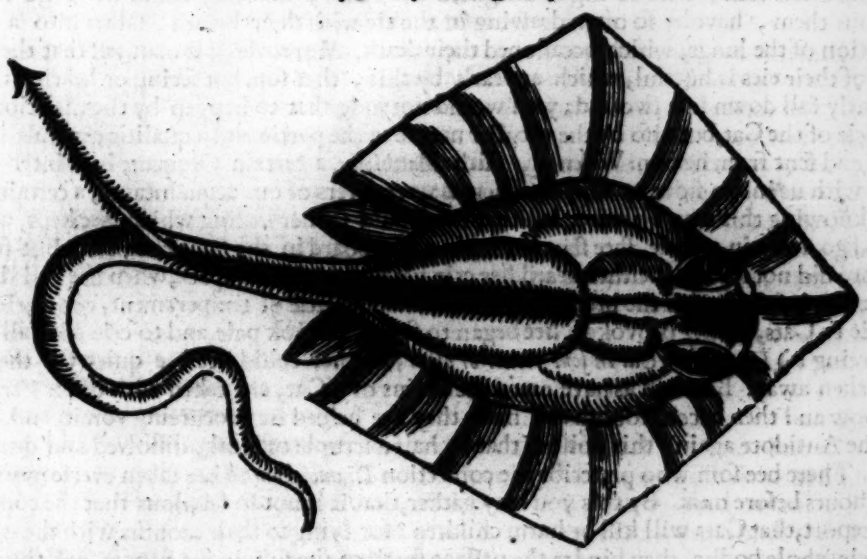
SUch as are ſtung by a Sting-Ray (as *Aetius* hath written) the place of the wound doth manifeſtly appear; there enſue's thereon lasting pain and the numneſs of the whole bodie. And ſeeing that it hath a ſharp and firm ſting, whereby the nerve by the deepneſs of the ſtroke may bee wounded, it ſo happen's that ſom die forthwith, their whole bodies ſuffering convulſions. Moreover, it will kill even the verie trees into whoſe roots it is faſtned. Yet *Plinie* affirm's, that it is good againſt the pain of the teeth, if the gums bee ſcarified therewith, yea, and it beeing made into powder with white Hellebore, or of it ſelf, will cauſ teeth to fall out without anie pain, or anie violence offered to them. This fiſh is good meat, the head and tail excepted; ſom of them have two ſtings, other-ſom but one; theſe ſtings are ſharp like a ſaw with the teeth turned towards their heads. *Oppianus* write's, that their ſtings are more poiſonous then the Perſian's arrows, for the force of the poiſon remaineth, the fiſh beeing dead, which will kill not onely living creatures, but plants alſo. Fiſher-men, when they catch this fiſh, preſently ſpoil him of his ſting, leſt they ſhould bee hurt therewith. But if by chance they bee hurt therewith, then take they forth his liver, and lay it to the wound; furthermore, the fiſh beeing burnt and made into powder, is the true antidote of his wound. The Sting-Ray live's in muddie places near the ſhoar, upon the fiſhes that hee hunteth and eateth with his ſting, haveing the teeth thereof turned towards his head for the ſame purpoſe. Hee is not unlike a Ray, and I have here given you his figure.

The ſymptoms.

Lib. 9. cap. 48.

The virulencie of her ſting.

The figure of a Sting-Ray.



CHAP. XXXIII.

Of the Lepus marinus, *or Sea-hare.*

PLinie call's the Sea-hare, a maſs or deformed piece of fleſh. *Galen* ſaith it is like a Snail taken forth of the ſhell. It is exceedingly poiſonous in the judgment of the Antients; wherefore it is not amiſs to ſet down the deſcription of it, leſt wee might eat it at unawares, too earneſtly view it, or ſmell thereto, as alſo that wee may uſe it againſt the poiſon thereof; it is an inhabitant not onely of the ſea, but alſo of lakes of ſea-water, eſpecially ſuch as are muddie; it is of the ſame color as the hair of the land-hare is, it hath a hole in the head, out of which hee putteth a certain piece of fleſh, and pluck's it back again when as hee is ſeen. *Paulus, Aetius, Plinie, Galen* and *Nicander* are of one opinion, and agree in this, that if a woman big with childe do too earneſtly look upon one, ſhee will vomit, and preſently after abort. They which have drunk this poiſon, ſaith *Dioſcorides*, are troubled with pain in the bellie, and their urine is ſtopped. If they do make water, then is it bloodie; they run down with ſtinking ſweat, which ſmell's of fiſh & cholerick vomiting ſometimes mixed with blood enſue's thereon.

The deſcription of the Sea-hare.

The earneſt beholding of a Sea-hare will cauſ abortion.

Aetius write's, that all their bodies turn yellow, their faces ſwell, and their feet, but chiefly their genital member, which is the cauſ they cannot make water freely. *Galen* write's, that it is the propertie of the Sea-hare to exulcerate the lungs. Their antidote is Aſſe's-milk, muſkadine, or honied-wine continually drunken, or a decoction of the roots and leavs of mallows.

The ſymptoms.

The antidote.

Mallows. It is good for the falling away of the hair. I have here given you the figure thereof out of *Rondeletius* his book of Fiſhes.

The figure of a Sea-Hare.

CHAP. XXXIV.

Of the poiſon of Cats.

A Cat's hair moſt ſubject to choak.

NOt onely the brain of a Cat, beeing eaten, is poiſonous and deadlie to man, but alſo their hair, their breath, yea and their verie preſence to ſom proov deadlie. For although anie hair devoured unawares, may bee enough to choak one, by ſtopping the inſtruments of reſpiration, yet the hairs of a Cat by a certain occult propertie, are judged moſt dangerous in this caſe: beſides alſo, their breath is infected with a certain hurtful malignitie. For *Matthiolus* ſaith, that hee knew ſom, who beeing ſo delighted with Cats, that they could never go to bed without them, have by ſo often drawing in the air with their breath, fallen into a conſumption of the lungs, which occaſioned their death. Moreover, it is manifeſt that the verie ſight of their eies is hurtful, which appear's by this, that ſom but ſeeing or hearing them, preſently fall down in a ſwound; yet I would not judg that to happen by the malicious virulencie of the Cat, but alſo by the peculiar nature of the partie, and a qualitie generated with him, and ſent from heaven. When as, ſaith *Matthiolus*, a certain Germane in winter-time, came with us into a ſtove to ſupper, whereas were divers of our acquaintance, a certain woman, knowing this man's nature, leſt that hee ſhould ſee her kitling which ſhee kept, and ſo ſhould go away in a chafe, ſhee ſhut her up in a cup-board in the ſame chamber. But for all that hee did not ſee her, neither heard her crie, yet within a little ſpace, when hee had drawn in the air, infected with the breath of the Cat, that qualitie of temperament, contrarie, or enemie to Cats, beeing provoked, hee began to ſweat, to look pale, and to crie out (all of us admireing it) *Here lie's a Cat in ſom corner or other*; neither could hee bee quiet till the Cat was taken away. But ſuch as have eaten the brains of a Cat, are taken with often *Vertigo's*, and now and then becom fooliſh and mad: they are helped by procureing vomit, and takeing the Antidote againſt this poiſon, that is, half a ſcruple of Musk, diſſolved and drunk in wine. There bee ſom who preſcribe the confection *Diamoſchum* to bee taken everie morning, four hours before meat. By this you may gather, that it is not ſo fabulous that the common ſort report, that Cats will kill or harm children; for lying to their mouths with the weight of their whole bodies, they hinder the paſſage forth of the fuliginous vapors, and the motion of the cheſt, and infect and ſtifle the ſpirits of tender infants, by the peſtiferous air and exhalation which they ſend forth.

The breath of a Cat moſt hurtful to the lungs.

An hiſtorie.

A wonderful antipathie between a man and a Cat.

The Antidote againſt the brains of a Cat.

Cats dangerous for children.

CHAP. XXXV.

Of certain poiſonous Plants.

Apium riſus.

HAveing deſcribed the poiſons that com from living creatures, I com to ſpeak of ſuch as are from Plants, beginning with the Sardonian herb, which is alſo called *Apium riſus*: this is a kinde of *Ranunculus*, or Crow-foot: (and, as it is thought, the round-leaved water Crow-foot, called Marſh-crow-foot, or Spear-wort) it taketh away the underſtanding of ſuch as eat there of, and by a certain diſtention of the nerve, contract's the cheeks, ſo that it make's them look as if they laughed; from this affect came that proverbial ſpeech of the *Sardonian laughter*, taken in evil part. His *Bezoar*, as one may term it, is the juice of Balm.

His Antidote.

Napellus, or Monks-hood.

The juice, fruit, and ſubſtance of *Napellus* taken inwardly, killeth a man the ſame day, or at the furtheſt in three daies: yea, and ſuch as eſcape the deadlie force thereof by the ſpeedie and convenient uſe of Antidotes, fall into an hectick fever, or conſumption, and becom ſubject to the falling-ſickneſs, as *Avicen* affirmeth. And hence it is, that barbarous people poiſon their arrows therewith. For the lips are forthwith inflamed, and the tongue ſo ſwell's, that by reaſon thereof it cannot bee contained in the mouth, but hang's out with great horror; their eies are inflamed, and ſtand forth of their head, and they are troubled with a *Vertigo* and ſwounding,

ſwounding, they becom ſo weak that they cannot ſtir their legs, they are ſwoln and puffed in their bodies, the violence of the poiſon is ſo great. The Antidote thereof is a certain little creature like a * Mouſ, which is bred, and live's on the root of *Napellus*, beeing dried and drunk in powder, to the weight of two drams. In want hereof, you may uſe the ſeed of Raddiſh or Turnips to drink, and annoint the bodie alſo with oil of Scorpions.

* Our Autor is deceived by the *Arabians*, who (it may bee) miſtook the greek word μῦια, and in ſtead thereof reade μυῶ for a Flie, a Mouſ; for there is no Mouſ to bee found, but whole ſwarms of Flies, which feed thereon: you may finde the deſcription of an Antidote made with them in *Lobel's Stirp. adverſ. pag.* 302.

Dorycinum and *Solanum Manicum*, or deadlie Night-ſhade, are not much different in their mortal ſymptoms or effects. *Dorycinum* beeing drunk, reſembleth milk in taſte, it cauſſeth continual hicketting, it troubleth the tongue with the weight of the humor, it cauſſeth blood to bee caſt forth of the mouth, and certain mucous matter out of the bellie, like that which commeth away in the bloodie flux. A remedie hereto are all ſhell-fiſhes, as well crude as roſted, alſo Sea-Lobſters and Crabs, and the broth or liquor wherein they are boiled, beeing drunk. Now the root of *Solanum Manicum* drunk in the weight of one dram in wine, cauſſeth vain and not unpleaſing imaginations, but double this quantitie cauſſeth a diſtraction or alienation of the minde for three daies; but four times ſo much kill's. The remedies are the ſame as theſe preſcribed againſt *Dorycinum*.

Dorycinum and *Solanum Manicum*, or deadlie Night-ſhade.

The ſymptoms.

Hen-bane drunken, or otherwiſe taken inwardly by the mouth, cauſſeth an alienation of the minde like drunkenneſs; this alſo is accompanied with an agitation of the bodie, and exſolution of the ſpirits like ſwounding. But amongſt others, this is a notable ſymptom, that the patients ſo dote, that they think themſelvs to bee whipped: whence their voice becom's ſo various, that ſomtimes they bray like an Aſs or Mule, neigh like an Horſ, as *Avicen* write's. The Antidote is piſtick nuts eaten in great plentie, treacle alſo and mithridate diſſolved in ſack, alſo worm-wood, *rue* and milk.

Hen-bane.

The Antidote.

Of Muſhroms, ſom are deadlie and hurtfull of their own kinde and nature, as thoſe, which broken, preſently becom of divers colours, and putrefie: (ſuch as *Avicen* ſaith thoſe are which be found of a grayiſh or blewiſh colour) others though not hurtfull in qualitie, yet eaten in greater meaſure then is fitting, becom deadlie; for ſeeing by nature they are verie cold and moiſt, and conſequently abound with no ſmall viſcoſitie, as the excrementitious phlegm of the earth or trees whereon they grow, they ſuffocate and extinguiſh the heat of the bodie, as overcom by their quantitie, and ſtrangle as if one were hanged, and laſtly kill. Verily I cannot chuſe, but pitty ing Gourmondizers, who though they know that Muſhroms are the ſeminarie and gate of death, yet do they with a great deal of doo, moſt greedily devour them; I ſay, pitty ing them, I will ſhew them, and teach them the art, how they may feed upon this ſo much deſired diſh, without the endangering of their health. Know therefore that Muſhroms may bee eaten without danger, if that they bee firſt boiled with wilde pears: but if you have no wilde pears, you may ſupplie that defect with others which are the moſt harſh, either newly gathered, or dried in the ſun. The leavs, as alſo the bark of the ſame tree, are good, eſpecially of the wilde; for pears are their Antidote: yet *Conciliator* give's another, to wit, garlick eaten crude, whereto in like ſort vineger may bee fitly added, ſo to cut and attenuate the tough, viſcous and groſs humors, heaped up, and in danger to ſtrangle one by the too plentiful eating of Muſhroms, as it is delivered by *Galen.* *In 5 epidemi.*

Muſhroms.

Their Antidote.

Ephemerum, which ſom call *Colchicum* or *Bulbus ſylveſtris*, that is, medow ſaffron, beeing taken inwardly, cauſſeth an itching over all the bodie, no otherwiſe then thoſe that are nettled, or rubbed with the juice of a Squill. Inwardly they feel gnawings, their ſtomach is troubled with a great heavineſs, and the diſeaſ encreaſing, there are ſtreaks of blood mixed with the excrements. The Antidote thereof is womans milk, Aſſes or Cows-milk drunken warm, and in a large quantitie.

Colchicum, or Medow-Saffron.

The Antidote.

Mandrag taken in great quantitie, either the root or fruit cauſſeth great ſleepineſs, ſadneſs, reſolution and languiſhing of the bodie, ſo that after many ſcritches and gripeings, the patient fall's aſleep in the ſame poſture as hee was in, juſt as if hee was in a Lethargie. Wherefore in times paſt they gave Mandrag to ſuch as were to bee diſmembred. The apples, when as they are ripe, and their ſeeds taken forth, may bee ſafely eaten, for beeing green and with their ſeeds in them, are deadlie. For there ariſeth an intolerable heat, which burn's the whole ſurface of the bodie, the tongue and mouth wax drie, by reaſon whereof they gape continually, ſo to take in the cold air; in which caſe unleſs they bee preſently helped, they die with convulſions. But they may eaſily bee helped, if they ſhall preſently drink ſuch things as are convenient therefore. Amongſt which, in *Conciliator's* opinion, excell raddiſh-ſeeds eaten with ſalt and bread for the ſpace of three daies. Sneeſing ſhall bee procured, if the former remedie do not quickly refreſh them, and a decoction of Coriander or Pennie-royall in fair water ſhall bee given them to drink warm.

Mandrag.

The cure.

The ungrateful taſte of the juice of black poppie, which is termed *Opium*, as alſo of Mandrag, eaſily hinder's them from beeing put into meat or drink, but that they may bee diſcerned, and chiefly for that neither of them can kill, unleſs they bee taken in a good quantitie. But becauſ there is danger, leſt they bee given in greater quantitie then is fitting by the ignorance of Phyſicians, or Apothecaries, you may by theſe ſigns finde the error.

Opium.

Why not uſed in poiſonings.

There

The ſymptoms.

There enſue's heavie ſleep, with a vehement itching, ſo that the patient oftimes is forced thereby to caſt off his dull ſleep wherein hee lay, yet hee keep's his eie-lids ſhut, being unable to open them. But by this agitation there flow's out ſweat, which ſmel's of *oriſum*, the bodie waxeth pale, the lips burn, the jaw-bone is relaxed, they breath little and ſeldom. When as their eies wax livid, unleſs they bee drawn aſide, and that they are depreſſed from their orb, wee muſt know that death is at hand. The remedie againſt this is two drams of the powder of *Caſtoreum* given in wine.

Hemlock.

The ſymptoms

Hemlock drunken, cauſſeth *Vertigo's*, troubleth the minde, ſo that the patients may bee taken for mad men; it darkneth the ſight, cauſſeth hicketting, and benum's the extreme parts, and laſtly ſtrangle's with convulſions, by ſuppreſſing or ſtopping the breach of the Arterie. Wherefore at the firſt, as in other poiſons, you muſt endeavor to expell it by vomit; then inject glyſters, to expell that which is got into the guts; then uſe wine without mixture, which is verie powerful in this caſe. *Peter Aponenſis* think's the Bezoar or Antidote thereof to bee a potion of two drams of Treacle, with a decoction of *Dictamnus* or *Gentian* in wine. Hee which further deſire's to enform himſelf of the effects of Hemlock, let him read *Matthiolus* his commentarie upon *Dioſcorides*, where as hee treat's of the ſame ſubject.

The Antidote.

In lib. 6. dioſc.

Aconitum.

Aconitum called of *Aconis* a town of the *Periendines*, where as it plentifully grow's. Accordind to *Matthiolus*, it kill's Wolvs, Foxes, Dogs, Cats, Swine, Panthers, Leopards, and all wilde beaſts, mixed with fleſh, and ſo devoured by them, but it kill's mice by onely ſmelling thereto. Scorpions, if touched by the root of Aconite, grow numb and torpid, and ſo die thereof; arrows or darts dipped therein, make incureable wounds. Thoſe who have drunk Aconite, their tongue forthwith waxeth ſweet with a certain aſtriction, which within a while turneth to bitterneſs; it cauſſeth a *Vertigo*, and ſhedding of tears, and a heavineſs or ſtraitneſs of the cheſt and parts about the heart; it make's them break winde downwards, and make's all the bodie to tremble. *Plintie* attribute's ſo great celeritie and violence to this poiſon, that if the genitals of female creatures bee touched therewith, it will kill the ſame daie; there is no preſenter remedie then ſpeedie vomiting after the poiſon is taken. But *Conciliator* think's *Ariſtolochia* to bee the Antidote thereof. Yet ſom have made it uſeful for man by experimenting it againſt the ſtinging of Scorpions, beeing given warm in wine. For it is of ſuch a nature, that it killeth the partie unleſs it finde ſomthing in him to kill, for then it ſtrive's thererwith as if it had found an adverſarie. But this fight is onely when as it finde's poiſon in the bodie; and this is marvelous that both the poiſons beeing of their own nature deadlie, ſhould die together, that man may by that means live. There are divers ſorts thereof, one whereof hath a flower like an helmet, as if it were armed to man's deſtruction; but the other here delineated hath leavs like to ſow's-bread, or a cucumber, and a root like the tail of a Scorpion.

Lib. 27. cap. 2.

Aconite good againſt the poiſon of Scorpions.

The differences.

The figure of a certain kinde of Aconite.

The Yew.

* This is true in ſom countries, as in Provence, Italie, Greece, &c. but it is not ſo here with us in England, as both Lobel and dailie experience can teſtifie.

Trees alſo are not without poiſon, as the Yew and Walnut tree may witneſs: Cattel if they feed on the leavs of Yew, are killed therewith. * But men, if they ſleep under it, or ſit under the ſhadow thereof, are hurt therewith, and oftimes die thereof. But if they eat it, they are taken with a bloodie flux, and a coldneſs over all their bodies, and a kinde of ſtrangling or ſtoppage of their breath. All which things the Yew cauſſeth, not ſo much by an elementarie and cold qualitie, as by a certain occult malignitie, whereby it corrupteth the humors, and ſhaveth the guts. The ſame things are good againſt this, as wee have ſet down againſt Hemlock; *Nicander* affirm's, that good wine beeing drunken is a remedie thereto. There is alſo malignitie in a Wall-nut-tree, which *Grevinus* affirm's that hee found by experience, whil'ſt hee unawares ſate under one and ſlept there in the mid'ſt of Summer. For wakeing, hee had a ſenſ of cold over all his bodie, a heavineſs of his head, and pain that laſted ſix daies. The remedies are the ſame as againſt the Yew.

The Antidote.

The Wall-nut tree.

CHAP

CHAP. XXXVI.

Of Bezoar, *and Bezoartick medicines.*

FOR that wee have made mention of *Bezoar*, in treating of the remedies of poisons, I judg I shall not do amiss, if I shall explain, what the word meanes, and the reason thereof. Poison absolutely taken is that which kill's by a certain specifick antipathie contrarie to our nature. So an Antidote or Counter-poison is by the Arabians in their mother-tongue termed *Bedenabar*, as the preservers of life. This word is unknown to the Greeks and Latines, and in use onely with the Arabians and Persians, becaus the thing it self first came from them, as it is plainly shewed by *Garcias ab horto*, Physician to the Vice-roy of the Indies, in his historie of the Spices and *Simples* of the East-Indies. In Persia (saith hee) and a certain part of India is a certain kinde of Goat called *Pazan* (wherefore in proper speaking, the stone should bee termed *Pazar*, of the word *Pazan*, that signifie's a Goat; but wee corruptly term it *Bezar* or *Bezoar*) the color of this beast is commonly reddish, the height thereof indifferent, in whose stomach concrete's the stone called *Bezoar*; it grow's by little and little about a straw or som such like substance in scales like to the scales of an onion, so that when as the first scale is taken off, the next appear's more smooth and shineing as you still take them away, the which amongst others is the sign of good *Bezoar* and not adulterate. This stone is found in sundrie shapes, but commonly it resemble's an Acorn or Date-stone; it is somtimes of a sanguin color, and otherwhiles of a honie-like or yellowish color, but most frequently of a blackish or dark green, resembling the color of mad Apples, or elf of a Civet-Cat. This stone hath no heart nor kernel in the mid'st, but powder in the cavitie thereof, which is also of the same facultie. Now this stone is light and not verie hard, but so that it may easily bee scraped or rasped like alablaster, so that it will dissolv, beeing long macerated in water; at first it was common amongst us, and of no verie great price, becaus our people who trafficked in Persia, bought it at an easie rate. But after that the facultes thereof were found out, it began to be more rare and dear, and it was prohibited by an Edict from the King of the Countrie, that no bodie should sell a Goat to the stranger-Merchants, unless hee first killed him and took forth the stone, and brought it to the King. Of the notes by which the stone is tried, (for there are manie counterfeits brought hither) the first is alreadie declared; the other is, it may bee blown up by the breath, like an oxe's hide; for if the winde break through, and do not stay in the densitie thereof, it is accounted counterfeit. They use it, induced thereto by our example, not onely against poisons, but also against the bites of venemous beasts. The richer sort of the Countrie purge twice a year, to wit, in *March* and *September*; and then, five daies together they take the powder of this stone macerated in Rose-water, the weight of ten grains at a time: for by this remedie they think their youth is preserved, as also the strength of their members. There bee som who take the weight of thirtie drams; yet the more warie exceed not twelv grains. The same Autor addeth that hee useth it with verie good succes in inveterate melancholick diseases, as the itch, scab, tetters and leprosie; therefore by the same reason it may well bee given against quartane fever. Besides, hee affirmeth for certain that the powder contained in the mid'st of the stone, put upon the bites of venemous beasts, presently free's the patient from the danger of the poison, as also applied to to pestilent Carbuncles when they are opened, it draw's forth the venom. But becaus the small pocks and meazles are familiar in the Indies, and oftimes dangerous, it is there given with good succes, two grains each daie in Rose-water. *Matthiolus* subscribeth to this opinion of *Garcias*, witnessing that hee hath found it by frequent experience, that this stone by much exceed's not onely other *simple* medicines of this kinde, but also such as are termed *theriacalia*, and what other Antidotes soever. Hereto also consent's *Abdanalarach*. Wee (saith hee) have seen the stone which they call *Bezahar*, with the sons of *Amirama* the observer of the Law of the God; with which stone heee bought a stately and almost princely houf at *Cordube*.

What poison is.

A sign of true Bezoar.

The use of Bezoar.

Lib. 5. in Dioscor. cap. 73.

Som years ago, a certain Gentleman who had one of these stones which hee brought out of Spain, bragged before King *Charls* then beeing at *Clermont in Auvern*, of the most certain efficacie of this stone against all manner of poisons. Then the King asked of mee, whether there were anie Antidote which was equally and in like manner prevalent against all poisons? I answered, that nature could not admit it; for neither have all poisons the like effects, neither do they arise from one caus; for som work from an occult and specifick propertie of their whole nature, others from som elementarie qualitie which is predominant. Wherefore each must bee withstood with its proper and contrarie antidote; as to the hot, that which is cold, and to that which wrak's by an occult proprietie of form, another which by the same force to oppugn it, and that it was an easie matter to make trial hereof on such as were condemned to bee hanged. The motion pleased the King, there was a Cook brought by the Tailor who was to have been hanged within a while after for stealing two silver-dishes out of his master's hous. Yet the King desired first to know of him, whether hee

An historie.

No one thing can bee an Antidote against all poisons.

hee would take the poiſon on this condition, that if the Antidote which was predicated to have ſingular power againſt all manner of poiſons, which ſhould bee preſently given him after the poiſon, ſhould free him from death, that then hee ſhould have his life ſaved. The Cook anſwered chearfully, that hee was willing to undergo the hazard, yea, and greater matters, not onely to ſave his life, but to ſhun the infamie of the death hee was like to be adjudged to. Therefore hee then had poiſon given him by the Apothecarie that then waited, & preſently after the poiſon, ſom of the *Bedezahar* brought from Spain, which beeing taken down, within a while after hee began to vomit, and to avoid much by ſtool with grievous torments, and to crie out that his inward parts were burn't with fire. Wherefore beeing thirſtie, and deſireing water, they gave it him; an hour after, with the good leav of the Jailor, I was admitted to him; I finde him on the ground going like a beaſt upon hands and feet, with his tongue thruſt forth of his mouth, his eies fierie, vomiting, with ſtore of cold ſweats, and laſtly, the blood flowing forth by his ears, noſe, mouth, fundament and yard. I gave him eight ounces of oil to drink, but it did him no good, for it came too late. Wherefore at length hee died with great torment and exclamation, the ſeventh hour from the time that hee took the poiſon beeing ſcarcely paſſed. I opened his bodie in the preſence of the Jailor and four others, and I found the bottom of his ſtomach black and drie, as if it had been burn't with a Cauterie; whereby I underſtood hee had *ſublimate* given him; whoſe force the Spaniſh *Bedezahar* could not repreſs, wherefore the King commanded to burn it.

The cauſtick force of *ſublimate*.

CHAP. XXXVII.

Of Mineral Poiſons.

MInerals or metals are either ſo taken forth of the bowels of the earth, or elſ from fornaces. Of theſe manie are poiſonous, as arſenick, *ſublimate*, *plaſter*, ceruſs, litharg, verdegreaſe, orpiment, filings of Iron, braſs, the load-ſtone, lime and the like. Such as have taken *ſublimate*, the tongue and jaws becom ſtraightned & rough, as if they drunk the juice of unripe *ſervices*: you cannot amend this aſperitie wth lenitive gargariſms but wth labor & time; for aſſoon as it deſcend's into the ſtomach, it ſticketh to it. Therfore preſently after it fret's & exulcerate's; it cauſſeth unquenchable thirſt, and unexplicable torments; the tongue is ſwoln, the heart faint's, the urine is ſuppreſt, the cheſt can ſcarce perform the office of breathing, the bellie is griped, and ſo great pains happen to other extreme parts, that unleſs they bee helped, the patient will die; for preſently will grow upon them, unleſs it bee ſpeedily hindered, the devouring and fierie furie of the poiſon, rending or eating into the guts and ſtomach, as if they were ſeared with an hot iron, and blood floweth out of the ears, noſe, mouth, urinarie paſſage and fundament, and then their caſe is deſperate. Theſe and who elſ ſoever ſhall take anie corrodeing poiſon, ſhall bee cured with the ſame remedies, as thoſe that have taken *Canthárides*.

The ſymptoms of ſuch as have taken *ſublimate*.

Verdegreaſ ſo ſtop's the inſtruments of reſpiration, that it ſtrangle's ſuch as have taken it. The cure is performed by the ſame remedies as help thoſe that have taken Arſenick.

Verdegreaſ.

Litharge cauſſeth a heavineſs in the ſtomach, ſuppreſſeth urine, make's the bodie ſwelled and livid. Wee remedie this, by giveing a vomit preſently, then after it pigeons-dung mixed in ſtrong wine, and ſo drunken. *Peter Aponenſis* wiſheth to give oil of ſweet almonds and figs. Alſo it is good to give relaxing and humecting glyſters, and to annoint the bellie with freſh butter, or oil of lillies.

Litharge.

The ſcales of braſs drunk by troubling the ſtomach, cauſ a caſting and ſcouring. The remedie is, if the patient forthwith vomit, if hee enter into a bath made of the decoction of Snails, if hee annoint his bellie and breſt with butter or oil of lillies, and inject laxative and humecting glyſters.

The ſcales of Braſs.

The Load-ſtone make's them mad that take it inwardly. The Antidote thereof is the powder of gold and an emerald drunk in ſtrong wine, and glyſters of milk and oil of ſweet almonds.

The Load-ſtone.

The filings of Lead, and the ſcales or *refuſe* of Iron, cauſ great torment to ſuch as take them down. The which wee help with much milk and freſh butter diſſolved therein, or with oil of ſweet almonds drawn without fire, with relaxing and humecting glyſters uſed until the pain bee perfectly aſſwaged.

Filings of Lead and ſcale of Iron.

Riſagallum, Roſe-aker or Katſ-bane, becauſ it is of a moſt hot and drie nature, induce's thirſt and heat over all the bodie, and ſo great colliquation of all the humors, that although the patient by medicines ſpeedily given eſcape death, yet can they not dureing the reſidue of their lives, uſe their members as they formerly did, beeing deſtitute of their ſtrength, by reaſon of the great drineſs and contraction of the joints. The Antidote thereof is oil of Pine-kernels ſpeedily given, and that to the quantitie of half a pinte; then procure vomit, then give much milk to drink, and glyſters of the ſame, and let them ſup up fat broths.

Arſnick, Roſe-aker or Ratſ-bane.

Unquench't-Lime and *Auripigmentum*, or Orpiment drunk, gnaw the ſtomach and guts with

with great tormenting pain, and cauſ unquenchable thirſt, an aſperitie of the jaws and throat, difficultie of breathing, ſtopping of the urine, and a bloodie flux. They may bee helped by all fat, humecting, and relaxing things which retund the acrimonie, by lenitive potions, and ſuch things as lubricate the bellie; as alſo by creams, and the mucilages of ſom ſeeds, as with a decoction of the ſeeds of *Line*, mallows, marſh-mallows and other ſuch things ſet down at large in the cure of *Cantharides*. Unquenched Lime and Orpiment.

Theſe exceeding acrid and ſtrong waters wherewith Gold-ſmiths and Chymiſts ſeparate gold from ſilver, beeing taken into the bodie, are hard to cure, becauſ they are forthwith diffuſed over all the bodie, firſt burning the throat and ſtomach. Yet it may bee helped by the means preſcribed againſt unquenched Lime and Orpiment. *Aqua fortis.*

Ceruſs cauſeth hicketting and a cough, make's the tongue drie, and the extreme parts of the bodie numb with cold, the eies heavie to ſleep. The patients verie often in the mid'ſt of the day ſee ſom vain phantaſm or apparition, which indeed is nothing; they make a black and oftimes bloodie water, they die ſtrangled unleſs they bee helped. The Antidote, in the opinion of *Aetius* and *Avicen*, is Scammonie drunk in new wine, or honie and wine, and other diuretick things, and ſuch things as procure vomit, and purge by ſtool. Ceruſs.

Plaſter, becauſ it concreteth and becommeth ſtonie in the ſtomach, cauſeth ſtrangulation, by ſtraitning and ſtopping the inſtruments that ſerv for breathing. The patients receiv cure by the ſame remedies, as thoſe who have eaten muſhorms, or drunk Ceruſs: you muſt add Goos-greaſ in the glyſters, and annoint the bellie with oil of lillies and butter. *Plaſter.*

CHAP. XXXVIII.

Of Quick-ſilver.

QUick-ſilver is ſo called becauſ it reſembleth ſilver in the color, and is in perpetual motion, as if it had a ſpirit or liveing ſoul. There is a great controverſie amongſt autors concerning it. For moſt of them affirm it hot, among whom is *Galen*, *Halyabas*, *Rhaſes*, *Ariſtotle*, *Conſtantine*, *Iſack*, *Platearius*, *Nicolas Maſſa*: they maintain their opinion by an argument drawn from things helping and hurting; beſides from this, that it is of ſuch ſubtil parts, that it penetrate's, diſſolv's and performeth all the actions of heat upon denſ and hard metals; to wit, it attenuateth, incideth, drieth, cauſeth ſalivation by the mouth, purgeth by the ſtool, mooveth urine and ſweat over all the bodie, neither doth it ſtir up the thinner humors onely, but in like ſort the groſs, tough and viſcous, as thoſe which have the *Lues Venerea* finde by expeience, uſeing it either in ointments or Plaſters. The reaſon why it is ſo called. *Lib. 4. ſimp. in 2. practic. c. 148. 3. ad almanſ. 4. Meteor.*

Others affirm it verie cold and moiſt, for that put into emplaſters and ſo applied, it aſſwageth pain by ſtupefaction, hindering the acrimonie of puſtles and cholerick inflammations. But by its humiditie it ſofteneth ſcirrhous tumors, diſſolveth and diſſipateth knots and *tophous* knobs; beſides, it cauſeth the breath of ſuch as are annointed therewith to ſtink, by no other reaſon, then that it putrefie's the obvious humor by its great humiditie. *Avicen's* experiment confirm's this opinion, who affirmeth, that the blood of an Ape that drunk Quick-ſilver, was found concrete about the heart, the carcaſs beeing opened. *Matthiolus* mooved by theſe reaſons, write's that Quick-ſilver killeth men by the exceſſive cold and humid qualitie, if taken in a large quantitie, becauſ it congeal's the blood and vital ſpirits, and at length the verie ſubſtance of the heart, as may bee underſtood by the hiſtorie of a certain Apothecarie, ſet down by *Conciliator*; who, for to quench his feveriſh heat, in ſtead of water, drunk off a glaſ of Quick-ſilver, (for that came firſt to his hands;) he died within a few hours after, but firſt hee evacuated a good quantitie of the Quick-ſilver by ſtool, the reſidue was found in his ſtomach beeing opened, and that to the weight of one pound; beſides, the blood was found concrete about his heart. Others uſe another argument to proov it cold, and that is drawn from the compoſition thereof, becauſ it conſiſt's of Lead and other cold metals. But this argument is verie weak. For unquench't Lime is made of flints and ſtonie matter, which is cold, yet nevertheleſs it exceed's in heat. *Paracelſus* affirmeth that Quick-ſilver is hot in the interior ſubſtance, but cold in the exterior, that is, cold as it com's forth of the *Mine*. But that coldneſs to bee loſt as it is prepared by art, and heat onely to appear and bee left therein, ſo that it may ſerv in ſtead of a tincture in the tranſ-mutation of metals. And verily it is taken for a rule amongſt Chymiſts, that all metals are outwardly cold, by reaſon of the waterie ſubſtance that is predominant in them, but that inwardly they are verie hot, which then appear's when when as the coldneſs together with the moiſture is ſegregated; for by calcination they becom cauſtick. Moreover manie account quick-ſilver poiſon, yet experience denie's it. For *Marianus Sanctus Boralianus* tell's that hee ſaw a woman, who for certain cauſes and effects, would at ſeveral times drink one pound and a half of quick-ſilver, which came from her again by ſtool without anie harm. Moreover hee affirmeth that hee hath known ſundrie who in a deſperate Colick (which they commonly call *miſerere mei*) have been free'd from imminent death, by drinking three pound of quick-ſilver with wa- An hiſtorie. *In l. 6. Dioſc. c. 28 Lib. 4. de nat. rerum. Tract. de cauſ & offen.*

ter

ter onely. For by the weight it open's and unfold's the twined or bound up gut, and thruſt's forth the hard and ſtopping excrements; hee addeth that others have found this medicine effectual againſt the colick, drunk in the quantitie of three ounces. *Antonius Muſa* write's, that heeuſually giveth Quick-ſilver to children readie to die of the worms. *Avicen* confirmeth this, averring that manie have drunk Quick-ſilver without anie harm, wherefore hee mixeth it in his ointments againſt ſcales and ſcabs in little children; whence came that common medicine amongſt countrie people to kill lice by annointing the head with Quick-ſilver mixed with butter or *axungia*. *Matthiolus* affirmeth that manie think it the laſt and chiefeſt remedie to give to women in travel that cannot bee delivered. I proteſt to ſatisfie my ſelf concerning this matter, I gave to a whelp a pound of Quick-ſilver, which beeing drunk down, it voided without anie harm by the bellie. Whereby you may underſtand that it is wholly without anie venemous qualitie. Verily it is the onely and true Antidote of the *Lues Venerea*, and alſo a verie fit medicine for all malign ulcers, as that which more powerfully impugn's their malignitie then anie other medicines that work onely by their firſt qualities. Beſides, againſt that contumacious ſcab, which is vulgarly called *Malum ſancti manis*, there is not anie more ſpeedie or certain remedie. Moreover *Guido* write's, that if a plate of lead bee beſmeared or rubbed there with, and then for ſom ſpace laid upon an ulcer, and conveniently faſtned, that it will ſoften the callous hardneſs of the lips thereof, and bring it to cicatrization, which thing I my ſelf have oftimes found true by experience.

Quick-ſilver good for women in travel.

For the diſeaſ called *Malum ſancti manis*.

Certainly before *Guido*, *Galen* much commended Quick-ſilver againſt malign ulcers and cancers. Neither doth *Galen* affirm that lead is poiſonous (which manie affirm poiſonous, becauſ it conſiſt's of much Quick-ſilver) but hee onely ſaith thus much, that water too long kept in leaden pipes and ciſterns, by reaſon of the droſſineſs that it uſeth to gather in lead, cauſeth bloodie fluxes, which alſo is familiar to braſs and copper. Otherwiſe manie could not without danger bear in their bodies leaden bullets dureing the ſpace of ſo manie years, as uſually they do. It is reported. It is declared by *Theodoret Herey* in the following hiſtories, how powerful Quick-ſilver is to reſolv and aſſwage pains and inflammations. Not long ſince, (ſaith hee) a certain Doctor of Phyſick his boy was troubled with *parotides*, with great ſwelling, heat, pain and beating; to him by the common conſent of the Phyſicians ther preſent, I applied an *Anodine* medicine, whoſe force was ſo great, that the tumor manifeeſtly ſubſided at the firſt dreſſing, and the pain was much aſſwaged. At the ſecond dreſſing all the ſymptoms were more mitigated. At the third dreſſing, I wondring, at the ſo great effect of an *Anodine* Cataplaſm, obſerved that there was Quick-ſilver mixed therewith, and this happened through the negligence of the Apothecarie, who mixed the ſimple *Anodine* medicine preſcribed by us, in a mortar wherein but a while before hee had mixed an ointment wherinto Quick-ſilver entred, whoſe reliqus, and ſom part thereof yet remained theeein. This which once by chance ſucceeded well, I afterwards wittingly and willingly uſed to a certain Gentle-woman troubled with the like diſeaſ, poſſeſſing all the region behinde the ears, much of the throat, and a great part of the cheek, when as nature helped by common remedies, could not evacuate neither by reſolution nor ſuppuration, the contained matter greatly vexing her with pain and pulſation. I to the medicine formerly uſed, by the conſent of the Phyſicians, put ſom Quick-ſilver, ſo within a few daies, the tumor was digeſted and reſolved. But ſom will ſay, it reſolves the ſtrength of the nerves and limbs, as you may ſee by ſuch as have been annointed therewith for the *Lues Venerea*, who tremble in all their limbs dureing the reſt of their lives. This is true, if any uſe it too intemperately without meaſure, and a diſeaſ that may require ſo great a remedie; for thus wee ſee the Gilders, Plumbers and ſuch as dig in mines, by the continual aſcent of the vapors of Quick-ſilver to the brain, the fountain of the nervs, by reſolving the ſpirits, and diſſipating the radicall and ſubſtantifick moiſture, maketh them ſubject to the trembling of their joints. Verily, if it bee killed and incorporate with hogs-greaſ, and a liſt beſmeared therewith, which may encompaſs the bodie like a girdle, it will drive away lice, fleas and *cimices*; and annointed about the navel, it kill's the worms in the guts. There are two ſorts of Quick-ſilver, the one natural, the other artificial. The natural is found running or flowing in the veins and bowels of the earth, and amongſt metals, and in the fornaces of ſilver-mines. The Artificial is made of *minium* (as it is in *Vitruvius*) and of the powder of Ivorie. Alſo it is probable that by art it may bee extracted out of all metals, but chiefly out of Lead and *Cinnabaris*. You may eaſily diſtinguiſh theſe kindes by the dull and blackiſh color, tough and groſs ſubſtance, which as it run's, leav's an impreſſion like melted greaſ, beeing as it were the excrement of lead. The beſt Quick-ſilver of all is pure, clear, thin, and verie white: it may bee cleanſed with the droſs of lead, and becom's more then beeing boiled in ſharp vineger, with *ſage*, roſemarie, *time*, lavander,. Or elſ give it by a pound at a time to a whelp, to drink down, and beeing caſt forth by it, boil it again in vineger, for thus it hath wondrous faculties, and fitly given produceth marvelous effects; nothing is more contrarie thereto then fire. For Quick-ſilver, though of its own nature ponderous, flieth upwards by the force of the fire, and forſaketh gold by that means, then which nothing is more friendlie to it.

CHAP. XXXIX.

Of the Unicorn's horn.

THere are verie manie at this daie who think themſelves excellently well armed againſt poiſon and all contagion, if they bee provided with ſom powder of Unicorns-horn, or ſom infuſion made therewith. Therefore I have thought it good to examine more diligently how much truth this inveterate, and grounded opinion hath. The better to perform this task, I will propound three heads, whereto I will direct my whole diſcourſe. The firſt ſhall bee of the ſignification of this word *Unicorn*. The ſecond, whether there bee anie ſuch thing really and truly ſo called, or whether it bee not rather imaginarie; like as the *Chimera* and *Tragelaphus*? The third, whether that which is ſaid to bee the horn of ſuch a beaſt, hath anie force or facultie againſt poiſons? For the firſt, that is, the name, it is ſomwhat more obſcure what the word (*being Licorn*) in French may ſignifie, then what the Latin or Greek word is. For the French name is further from the word and ſignification; but it is ſo clear and manifeſt, that this word *Unicornis* amongſt the Latines ſignifieth a beaſt haveing but one horn, as it is vulgarly known, the ſame thing is meant by the Greek word *Monoceros*. But now for the ſecond, I think that beaſt that is vulgarly called and taken for an Unicorn, is rather a thing imaginarie then really in the world. I am chiefly induced to believ thus, by theſe conjectures. Becauſ of thoſe who have travelled over the world, there is not one that profeſſeth that ever hee did ſee that creature. Certainly the Romans conquered the world, and beeing moſt diligent ſearchers after all things which were rare and ſo excellent, if anie where in anie corner of the world this beaſt could have been found, they would have found it out, and engraven it upon their coins, or arms, as they did Crocodiles, Elephants, Eagles, Panthers, Lions, Tigers, and other creatures unknown to theſe countries. For theſe that have written of the Unicorn, either that they have heard, or that hath bren delivered by tradition, or what they in their own mindes and fancies have conceived, you ſhall ſcaree finde two that agree together, either in the deſcription of the bodie, or in the nature and condition of her. *Plinie* write's, that Unicorns are for the faſhion of their bodies like to an Horſ; that is, as *Cardane* interpret's it, of the bigneſs of an Horſ, with the head of an Hart, the feet of an Elephant, the tail of a *Bore*, with one black horn in the mid'ſt of his fore-head, of the length of two cubits. *Munſter*, who (as *Matthiolus* jeſt's) never ſaw Unicorns beſides painted ones, doth on the contrarie affirm them not to bee of the bigneſs of an Horſ, but of an Hinde-calf of three months old, not with feet like an Elephant, but cleft like thoſe of Goats, with an horn not onely of two, but oftimes of three cubits long, of a Weazel-color, with a neck not verie long, nor verie hairie, but haveing few and ſhort hairs hanging to the one ſide of the neck, the legs are lean and ſmall, the buttocks high, but verie hairie. *Cardane* differing from both theſe, write's, that hee hath an horn in the mid'ſt of his fore-head, but that it is onely the length of three fingers. *Andrew Theve't* mention's an Unicorn ſeen by a certain Turkiſh Sangjach, which was of the bigneſs of a Bull of five or ſix moneths old, and had one horn, but that not in the mid'ſt of the fore-head, but upon the top of the crown of the head; hee was legg'd and footed like an Aſs, but longer haired, and had ears not much unlike the *Rangifer*, a beaſt not unknown in the *ſeptentrion* or northern countries.

what the name imports.

That there is no ſuch beaſt as an *unicorn*.

Lib. 8. cap. 21.

Munſters opinion concerning *unicorns*.

Tom. 1. lib. 5. Cap. 5. coſmogr.

This various therefore is the report concerning the ſhape of this Beaſt. Neither is there leſs differtnce concerning her nature and conditions. For *Plinie* write's, that the Unicorn is a moſt fierce beaſt, and hath a great bellowing voice, and that ſhee cannot therefore bee taken alive. *Cardane* render's a reaſon of this fiercenes, *Becauſ* (ſaith hee) *it inhabit's the deſerts of Æthiopia, a region ſqualid, and ſilvie, abounding with Toads, and ſuch like venemous creatures*. Others on the contrarie affirm her to bee of a moſt milde, amiable, and gentle nature of all others, unleſs one purpoſely offend her, or uſe her too harſhly; for ſeeing ſhee feed's not by ſtooping her head to the ground, becauſ ſhee is hindered therefrom by the length of her horn, ſhee muſt neceſſarily feed upon the fruit that hangeth upon trees; but of cratches or man's hand ſhee fereſtly and harmleſly taket all manner of fruits, herbs, leaves of corn, apples, pears, oranges and puſ. And herein they have proceeded ſo far, that they feign they will love Virgins, enticed by their beautie, ſo that fixed in the contemplation of them, and allured by their entizements, they by this means are often taken by hunters. In this opinion is *Lewes Vartoman*, who denies that Unicorns are wilde or fierce; for hee ſaith that hee ſaw two, which were ſent out of *Ethiopia* to the Sultan, who kept them hut up in *Tenis*, in *Mecha*, a citie of *Arabia felix*, renowned by the Sepulcher of *Mahomet*. *Theve't* traveling thither, tell's that hee diligently inquired of the inhabitants, what there opinion was of ſuch a beaſt, yet could hee never hear anie tidings thereof. Whence it is eaſie to diſcern, that ſuch beaſts have neither been in out, nor in *Vartoman's* cities. The ſo great varietie of diſtinctive opinions, eaſily inducet me to believ that this word, *Unicorn*, is not the proper name of anie beaſt in the world, and that it is a thing onely feigned by Painters, and Writers of natural things, to delight the readers and beholders. For as there is but one right waie, but

Vartomans opinion of the nature of the *unicorn*.

manie by-waies and windeings, ſo the ſpeech of truth is but one, and that alwaies ſimple and like it ſelf; but that of a lie is diverſ, and which may eaſily refel it ſelf, by the repugnancie and incongruitie of opinions, if one ſhould ſay nothing. What therefore (will ſom ſay) of what creatures are theſe horns, which wee ſee wholly different from other's, if they bee not of Unicorns? *Thevet* think's them nothing elſ then Elephants bones turned and made into the faſhion that wee ſee them; for thus in the Eaſtern Countries, ſom craftie merchants and cunning companions turn, hollow, and beeing ſoftened, draw to what length they pleaſ the teeth of the fiſh Rohard, which live's in the Red and Ethiopian Sea, and beeing ſo handled, they ſell them for Unicorn's horn. Verily that which is termed Unicorn's horn, beeing burnt, ſend's forth a ſmell like to Ivorie. Now *Cardanus* affirm's that the teeth and bones of Elephants made ſoft by art, may bee drawn forth, and brought into what form you pleaſ, like as Ox-bones are. For what is there in the world which the thirſting deſire of gold will not make men to adulterate and counterfeit? But it is time that wee com to the third ſcope. Grant there bee Unicorns, muſt it therefore follow that their horns muſt bee of ſuch efficacie againſt poiſons? If wee judg by events, and the experience of things, I can proteſt thus much, that I have often made trial thereof, yet could I never finde anie good ſucceſs in the uſe thereof againſt poiſons, in ſuch as I have had in cure. If the matter muſt bee tried by witneſſes and autorities, a great part of the Phyſicians of better note have long ſince bid it adieu, and have detracted from the divine and admirable vertues for which it formerly was ſo much deſired. And this they have don, mooved thereto by manie juſt, but two eſpecial reaſons. The firſt is of *Rondeletius*, who in this caſe affirm's that horns are endued with no taſte nor ſmell; and therefore have no effect in phyſick, unleſs it bee too drie. Neither (ſaith hee) am I ignorant that ſuch as have them, much predicate their worth, ſo to make the greater benefit and gain by them, as of the ſhaveings or ſcrapeings of Unicorn's horn, which they ſell for the weight in gold, as that which is ſingular good againſt poiſons and worms; which things, I think, Hart's-horn and Ivorie do no leſs effectually perform; which is the cauſ why, for the ſame diſeaſ, and with the like ſucceſs, I preſcribe Ivorie to ſuch as are poor, and Unicorn's horn to the rich, as that they ſo much deſire. This is the opinion of *Rondeletius*, who, without anie difference, was wont, for Unicorn's horn, to preſcribe not onely Hart's-horn or Ivorie, but alſo the bones of Horſes and Dogs, and the ſtones of Myrabalanes. Another reaſon is, that whatſoever reſiſt's poiſon is cordial, that is, fit to ſtrengthen the heart, which is chiefly aſſailed by poiſons; but nothing is convenient to ſtrengthen the heart, unleſs it bee by laudable blood or ſpirit, which two are onely familiar to the heart, as beeing the workhouſ of the arterious blood and vital ſpirits. For all things are preſerved by their like, as they are deſtroied by their contraries; for all things that generate, generate things like themſelvs. But Unicorn's horn, as it contain's no ſmell, ſo neither hath it anie aërie parts, but is wholly earthie and drie; neither can it bee converted into blood by the digeſtive facultie, for as it is without juice, ſo is it without fleſh. For as it cannot bee turned into *Chylus*, ſo neither is it fit to becom *Chymus*, that is, juice or blood. Therefore it is joined to the heart by no ſimilitude, nor familiaritie. Furthermore, there is not a word in *Hippocrates* and *Galen* concerning the Unicorn's horn, who notwithſtanding have in ſo manie places commended Hart's-horn. Therefore D. *Chapelain*, the chief Phyſician of King *Charles* the Ninth, often uſed to ſay, that hee would verie willingly take away that cuſtom of dipping a piece of Unicorn's horn in the King's cup, but that hee knew that opinion to bee ſo deeply ingraffed in the mindes of men, that hee feared, that it would ſcarce bee impugned by reaſon. Beſides (hee ſaid) if ſuch a ſuperſtitious medicine do no good, ſo certainly it doth no harm, unleſs it bee to their eſtates that buy it with gold, or elſ by accident, becauſ Princes, whil'ſt they relie more then is fitting upon the magnified virtues of this horn, neglect to arm themſelvs againſt poiſons by other more convenient means, ſo that death oftimes take's them at unawares. When as upon a time I inquired of *Lewes Duret* the Kings Phyſician and Profeſſor (by reaſon of the great opinion that all learned men juſtly had of his learning and judgment) what hee thought of this horn; Hee anſwered, that hee attributed no faculties thereto: for the confirmation whereof hee rendred the ſecond reaſon I have formerly given, but more largely and elegantly; neither feared hee to affirm it aloud, and in plain words to his auditorie of learned men, comming from all parts to hear him. But if at anie time (ore'com by the fault of the times and place) hee preſcrib'd this horn; that hee did it for no other intent, then to help faintings or ſwoundings that happen by the abundance of ſerous humors, floating in the orifice of the ventricle, which make's men ill diſpoſed, becauſ this mixed with other things endued with the like facultie, hath power to drink up the wateriſh humiditie by its earthie drieneſs. But ſom will replie, that neither the Lemnian, nor Armenian earth, have anie juice in them, neither anie ſmell, nor aërie ſpirit. It is granted; neither truly are ſuch things truly and properly called cordial, but onely by event and accident, for that by the excellent aſtrictive facultie they have, and ſtopping the paſſages of the veſſels, they hinder the poiſon from entring into the heart. This is my opinion of Unicorn's horn, which if anie do not approov of, hee ſhall do mee a favor, if for the publick good, hee ſhall freely oppoſe his; but in the *interim* take this in good part which I have don.

Of the PLAGUE.

The twentie ſecond Book.

CHAP. I.

The deſcription of the Plague.

THE Plague is a cruel and contagious diſeaſ, which everie-where, like a common diſeaſ, invadeing Man and Beaſt, kill's verie manie; being attended, and as it were aſſociated with a continual fever, botches, carbuncles, ſpots, nauſeouſneſs, vomitings, and other ſuch malign accidents. This diſeaſ is not ſo pernicious or hurtful, by anie elementarie qualitie, as from a certain poiſonous and venenate malignitie, the force whereof exceed's the condition of common putrefaction. Yet I will not denie, but that it is more hurtful in certain bodies, times and regions, as alſo manie other diſeaſes, of which *Hippocrates* make's mention. But from hence wee can onely collect, that the force and malignitie of the plague may bee encreaſed, or diminiſhed, according to the condition of the elementarie qualities concurring with it; but not the whole nature and eſſence thereof to depend thereon. What the Plague is. *Sect. 3. aphor.*

This peſtiferous poiſon principally aſſail's the vital ſpirit, the ſtore-houſ and original whereof is the heart, ſo that if the vital ſpirit proov ſtronger, it drive's it far from the heart; but if weaker, it beeing overcom and weakned by the hoſtile aſſault, flie's back into the fortreſs of the heart, by the like contagion infecting the heart, and ſo the whole bodie, beeing ſpread into it by the paſſages of the arteries. How it com's to kill.

Hence it is, peſtilent fevers are ſomtime ſimple and ſolitarie; other-whiles aſſociated with a troop of other affects, as botches, carbuncles, blanes and ſpots, of one or more colors.

It is probable ſuch affects have their original from the expulſive facultie, whether ſtrong or weak, provoked by the malignitie of the rageing matter: yet aſſuredly divers ſymptoms and changes ariſe, according to the conſtitution of the bodie of the patient, and condition of the humor in which the virulencie of the plague is chiefly inherent, and laſtly, in the nature of the efficient cauſ. The original buboes, carbuncles, &c. in the plague.

I thought good, by this deſcription, to expreſs the nature of the plague, at this my firſt entrance into this matter; for wee can ſcarce comprehend it in a proper definition. For although the force thereof bee definite, and certain in nature, yet it is not altogether certain and manifeſt in mens mindes, becauſ it never happen's after one ſort: ſo that in ſo great varietie, it is verie difficult to ſet down anie thing general and certain.

CHAP. II.

Of the Divine cauſſes of an extraordinarie Plague.

IT is a confirmed, conſtant, and received opinion in all Ages amongſt Chriſtians, that the plague and other diſeaſes, which violently aſſail the life of man, are often ſent by the juſt anger of God puniſhing our offences. The Prophet *Amos* hath long ſince taught it, ſaying, *Shall there bee affliction? ſhall there bee evil in a Citie, and the Lord hath not don it?* On which truly wee ought daily to meditate, and that for two cauſſes: The firſt is, that wee alwaies bear this in minde, that wee enjoy health, live, move, and have our beeings from God, and that it deſcend's from that Father of Light; and for this cauſ wee are alwaies bound to give him great and exceeding thanks. The other is, that knowing the calamities, by ſending whereof the Divine anger proceed's to revenge, wee may at length repent, and leaving the way of wickedneſs, walk in the paths of godlineſs. For thus wee ſhall learn to ſee in God, our ſelvs, the Heaven and Earth, the true knowledg of the cauſſes of the plague, and by a certain Divine Philoſophie teach, God to bee the beginning and cauſ of the ſecond cauſſes, which cannot well without the firſt cauſ go about nor attempt, much leſs perform anie thing. For from hence they borrow their force, order, and conſtancie of order; ſo that they ſerv as inſtruments for God, who rule's and govern's us, and the whole world, to perform all his works, by that conſtant courſ of order, which hee hath appointed unchangeable from the beginning. Wherefore all the cauſ of a plague is not to bee attributed to theſe near and inferior cauſſes or beginnings, as the Epicures and Lucianiſts commonly *Amos* 3. *Acts* 17. The ſecond cauſſes have their power from God as the firſt cauſ.

commonly do, who attributeing too much, yea all things to Nature, have left nothing to God's providence. On the contrarie, wee ought to think, and beleev in all our things, That even as God by his omnipotent Power hath created all things of nothing, ſo hee by his eternal Wiſdom preſerv's and govern's the ſame, lead's and incline's them as hee pleaſeth, yea verily at his pleaſure changeth their order, and the whole courſ of nature.

This cauſ of an extraordinarie Plague, as wee confeſs and acknowledg, ſo here wee will not proſecute it anie further, but think fit to leav it to Divines, becauſ it exceed's the bounds of Nature, in which I will now contain my ſelf. Wherefore let us com to the natural cauſſes of the Plague.

CHAP. III.

Of the Natural cauſſes of the Plague, and chiefly of the Seminarie of the Plague by the corruption of the Air.

The general cauſſes of the Plague. *Lib. 6. de loc. affectis.*

THe general and natural cauſſes of the Plague are abſolutely two, that is, the infection of corrupt air, and a preparation and fitneſs of corrupt humors to take that infection; for it is noted before out of the doctrine of *Galen*, that our humors may bee corrupted, and degenerate into ſuch an alienation which may equal the malignitie of poiſon.

How the ſeaſons of the year may bee ſaid to want their ſeaſonableneſs.

The air is corrupted, when the four ſeaſons of the year have not their ſeaſonableneſs, or degenerate from themſelvs, either by alteration, or by alienation: as if the conſtitution of the whole year bee moiſt and rainie, by reaſon of groſs and black clouds; if the Winter bee gentle and warm, without anie Northerly winde, which is cold and drie, and by that means contrarie to putrefaction; if the Spring, which ſhould bee temperate, ſhall bee faultie in anie exceſs of diſtemper; if the Autumn ſhall bee ominous by fires in the air, with ſtars ſhooting, and as it were falling down, or terrible comets, never ſeen without ſom diſaſter; if the Summer bee hot, cloudie and moiſt, and without windes, and the clouds flie from the South into the North. Theſe and ſuch like unnatural conſtitutions of the ſeaſons of the year, were never better, or more excellently handled by anie, then by *Hippocrates* in his Books *Epidemion*. Therefore the air from hence draw's the ſeeds of corruption and the peſtilence, which at length, the like exceſs of qualities beeing brought in, it ſend's into the humors of our bodies, chiefly ſuch as are thin and *ſerous*. Although the peſtilence doth not alwaies neceſſarily ariſe from hence, but ſom-whiles ſom other kinde of cruel and infectious diſeaſ.

How the air may bee corrupted.

But neither is the air onely corrupted by theſe ſuperior cauſſes, but alſo by putrid and filthie ſtinking vapors ſpread abroad through the air encompaſſing us, from the bodies and carkaſſes of things not buried, gapeings and hollowneſſes of the earth, or ſinks and ſuch like places beeing opened: for the ſea often overflowing the land in ſom places, and leaving in the mud or hollowneſſes of the earth (cauſſed by earth-quakes) the huge bodies of monſtrous fiſhes, which it hide's in its waters, hath given both the occaſion and matter of a plague. For thus in our time, a Whale caſt upon the Tuſcan ſhore, preſently cauſſed a plague over all that countrie.

But as fiſhes infect and breed a plague in the air, ſo the air beeing corrupted often, cauſeth a peſtilence in the ſea among fiſhes, eſpecially when they either ſwim on the top of the water, or are infected by the peſtilent vapors of the earth lying under them, and riſeing into the air through the bodie of the water, the later whereof *Ariſtotle* ſaith, hapneth but ſeldom. But it often chanceth, that the plague rageing in anie countrie, manie fiſhes are caſt upon the coaſt, and may bee ſeen lying on great heaps. But ſulphureous vapors, or ſuch as partake of anie other malign qualitie, ſent forth from places under the ground, by gapeings and gulfs opened by earth-quakes, not onely corrupt the air, but alſo infect and taint the ſeeds, plants, and all the fruits which wee eat, and ſo transfer the peſtilent corruption into us, and thoſe beaſts on which wee feed, together with our nouriſhment. The truth whereof *Empedocles* made manifeſt, who by ſhutting up a great gulf of the earth, opened in a vallie between two mountains, free'd all Sicilie from a plague cauſſed from thence.

Lib. 8. hiſt. anim.

If windes riſeing ſuddenly ſhall drive ſuch filthie exhalations from thoſe regions in which they were peſtiferous, into other places, they alſo will carrie the plague with them thither.

If it bee thus, ſom will ſay, it ſhould ſeem that whereſoever ſtinking and putrid exhalations ariſe, as about ſtanding-pools, ſinks and ſhambles, there ſhould the Plague reign, and ſtraight ſuffocate with its noiſom poiſon the people which work in ſuch places: but experience finde's this falſ.

Peſtiferous putrefaction is far different from ordinarie putrefaction.

Wee do anſwer, that the putrefaction of the Plague is far different, and of another kinde then this common, as that which partake's of a certain ſecret malignitie, and wholly contrarie to our lives, and of which wee cannot eaſily give a plain and manifeſt reaſon. Yet that vulgar putrefaction whereſoever it bee, doth eaſily and quickly entertain and welcom the peſtiferous contagion, as often as, and whenſoever it com's, as joined to it by a certain familiaritie,

familiaritie, and at length, it self degenerateing into a peſtiferous malignitie, certainly no otherwiſe then thoſe diſeaſes which ariſe in the plague-time, the putrid diſeaſes in our bodies, which at the firſt wanted virulencie and contagion, as Ulcers, putrid Fevers, and other ſuch diſeaſes, raiſed by the peculiar default of the humors, eaſily degenerate into peſtilence, preſently receiving the tainture of the plague, to which they had before a certain preparation. Wherefore in time of the plague, I would adviſe all men to ſhun ſuch exceeding ſtinking places, as they would the plague it ſelf: that there may bee no preparation in our bodies, or humors to catch that infection (without which, as *Galen* teacheth, the Agent hath no power over the Subject; for otherwiſe in a plague-time, the ſickneſs would equally ſeiz upon all) ſo that the impreſſion of the peſtiferous qualitie may preſently follow that diſpoſition.

In a peſtilent conſtitution of the air, all diſeaſes becom peſtilent. *Lib. 1. de differ. feb.*

But when wee ſay the air is peſtilent, wee do not underſtand that ſincere, elementarie, and ſimple as it is of its own nature, for ſuch is not ſubject to putrefaction; but that which is polluted with ill vapors riſeing from the earth, ſtanding-waters, vaults, or ſea, and degenerate's, and is changed from its native puritie and ſimplicitie. But certainly amongſt all the conſtitutions of the air, fit to receiv a peſtilent corruption, there is none more fit then an hot, moiſt and ſtill ſeaſon; for the exceſs of ſuch qualities eaſily cauſeth putrefaction. Wherefore the South winde reigning, which is hot and moiſt, and principally in places near the ſea, there fleſh cannot long bee kept, but it preſently is tainted and corrupted.

How the air may bee ſaid to putrefie.

A Southerly conſtitution of the air is the fuel of the Plague.

Further, wee muſt know, that the peſtilent malignitie which riſeth from the carkaſſes or bodies of men, is more eaſily communicated to men; that which riſeth from oxen, to oxen; and that which com's from ſheep, to ſheep; by a certain ſympathie and familiaritie of Nature: no otherwiſe then the Plague which ſhall ſeiz upon ſom one in a Familie, doth preſently ſpread more quickly amongſt the reſt of that Familie, by reaſon of the ſimilitude of temper, then amongſt others of another Familie, diſagreeing in their whole temper. Therefore the air thus altered and eſtranged from its goodneſs of nature, neceſſarily drawn in by inſpiration and tranſpiration, bring's in the ſeeds of the Plague, and ſo conſequently the Plague it ſelf, into bodies prepared and made readie to receiv it.

CHAP. IV.

Of the preparation of humors to putrefaction, and admiſſion of peſtiferous impreſſions.

HAveing ſhewed the cauſſes from which the air doth putrefie, becom corrupt, and is made partaker of a peſtilent and poiſonous conſtitution; wee muſt now declare what things may cauſ the humors to putrefie, and make them ſo apt to receiv and retain the peſtilent air and venenate qualitie.

Three cauſſes of the putrefaction of humors.

Humors putrefie either from fulneſs, which breed's obſtruction; or by diſtemperate exceſs; or laſtly, by admixture of corrupt matter and evil juice, which ill feeding doth ſpecially cauſ to abound in the bodie: For the Plague often follow's the drinking of dead and muſtie wines, muddie and ſtanding water, which receiv the ſinks and filth of a Citie; and fruits and pulſ eaten without diſcretion in ſcarcitie of other corn, as Peaſ, Beans, Lentils, Vetches, Acorns, the roots of Fern, and Graſs made into bread. For ſuch meats obſtruct, heap up ill humors in the bodie, and weaken the ſtrength of the faculties, from whence proceed's a putrefaction of humors, and in that putrefaction a preparation and diſpoſition to receiv, conceiv, and bring forth the ſeeds of the Plague: which the filthie ſcabs, malign ſores, rebellious ulcers, and putrid fevers, beeing all fore-runners of greater putrefaction and corruption, do teſtifie. Vehement paſſions of the minde, as anger, ſorrow, grief, vexation and fear, help forward this corruption of humors, all which hinder nature's diligence and care of concoction: For as in the Dog-Daies, the lees of wine ſubſideing to the bottom, are by the ſtrength and efficacie of heat drawn up to the top, and mixed with the whole ſubſtance of the wine, as it were by a certain ebullition, or working; ſo melancholick humors, beeing the dregs or lees of the blood, ſtirred up by the paſſions of the minde, defile or taint all the blood with their feculent impuritie.

Paſſions of the minde help forward the putrefaction of the humors.

Wee found that ſom years agon by experience, at the battel of S. *Denis*. For all wounds, by what weapon ſoever they were made, degenerated into great and filthie putrefactions and corruptions, with fevers of the like nature, and were commonly determined by death, what medicines, and how diligently ſoever they were applied; which cauſſed manie to have a falſ ſuſpicion that the weapons on both ſides were poiſoned. But there were manifeſt ſigns of corruption and putrefaction in the blood *let* the ſame day that anie were hurt, and in the principal parts diſ-ſected afterwards, that it was from no other cauſ, then an evil conſtitution of the air, and the mindes of the Souldiers perverted by hate, anger and fear.

CHAP. V.

What ſigns in the Air and Earth prognoſticate a Plague.

WE may know a Plague to bee at hand and hang over us, if at anie time the air and ſeaſons of the year ſwarv from their natural conſtitution, after thoſe waies I have mentioned before; if frequent and long continuing Meteors, or ſulphureous Thunders infect the air; if fruits, ſeeds and pulſ bee worm-eaten: if Birds forſake their neſts, eggs or young, without anie manifeſt cauſ; if wee perceiv women commonly to abort, by continual breathing in the vaporous air, beeing corrupted and hurtful both to the Embryon and original of life, and by which it beeing ſuffocated, is preſently caſt forth and expelled. Yet notwithſtanding, thoſe airie impreſſions do not ſolely corrupt the air, but there may bee alſo others raiſed by the Sun from the filthie exhalations and poiſonous vapors of the earth and waters, or of dead carkaſſes, which by their unnatural mixture, eaſily corrupt the air, ſubject to alteration, as which is thin and moiſt, from whence divers Epidemial diſeaſes, and ſuch as everie-where ſeiz upon the common ſort, according to the ſeveral kindes of corruptions, ſuch as that famous *Catarrh* with difficultie of breathing, which in the year 1510 went almoſt over all the world, and raged over all the Cities and Towns of France, with great heavineſs of the head (whereupon the French named it *Cucula*) with a ſtraightneſs of the heart and lungs, and a cough, a continual fever, and ſomtimes raveing.

Why aborti-ons are fre-quent in a pe-ſtilent ſeaſon.

A *Catarrh* with difficultie of breathing kil-ling manie.

This, although it ſeized upon manie more then it killed, yet becauſ they commonly died who were either let blood, or purged, it ſhewed it ſelf peſtilent by that violent and peculiar and unheard of kinde of malignitie.

The Engliſh *Sweating-ſickneſs.*

Such alſo was the Engliſh *Sweating-ſickneſs*, or *Sweating-fever*, which unuſual, with a great deal of terror invaded all the lower parts of Germanie, and the Low-Countries, from the year 1525 unto the year 1530, and that chiefly in Autumn.

As ſoon as this peſtilent diſeaſ entred into anie Citie, ſuddenly two or three hundred fell ſick on one day, then it departed thence to ſom other place. The people ſtrucken with it languiſhing, fell down in a ſwound, and lying in their beds, ſweat continually, haveing a fever, a frequent, quick, and unequal pulſ; neither did they leav ſweating, till the diſeaſ left them, which was in one or two daies at the moſt: yet free'd of it, they languiſhed long after, they all had a beating, or palpitation of the heart, which held ſom two or three years, and others all their life after.

At the firſt beginning it killed manie, before the force of it was known: but afterwards verie few, when it was found out by practice and uſe, that thoſe who furthered and continued their ſweats, and ſtrengthened themſelvs with cordials, were all reſtored. But at certain times many other popular diſeaſes ſpring up, as putrid fevers, fluxes, bloodie-fluxes, catarrhs, coughs, phrenzies, ſquinances, pleriſies, inflammations of the lungs, inflanimations of the eies, apoplexies, lithargies, ſmall pocks and meaſles, ſcabs, carbuncles, and malign puſtles. Wherefore the Plague is not alwaies, nor everie-where of one and the ſame kinde, but of divers; which is the cauſ that divers names are impoſed upon it, according to the varietie of the effects it bring's, and ſymptoms which accompanie it, and kindes of putrefaction, and hidden qualities of the air.

The Plague is not the definite name of one diſeaſ.

What ſigns in the earth fore-tell a Plague.

They affirm, when the Plague is at hand, that Muſhrooms grow in greater abundance out of the earth, and upon the ſurface thereof manie kindes of poiſonous *inſecta* creep in great numbers, as Spiders, Caterpillers, Butter-flies, Graſs-hoppers, Beetles, Hornets, Waſps, Flies, Scorpions, Snails, Locuſts, Toads, Worms, and ſuch things as are the off-ſpring of putrefaction. And alſo wilde beaſts tired with the vaporous malignitie of their dens and caves in the earth, forſake them; and Moles, Toads, Vipers, Snakes, Lizards, Aſps and Crocodiles are ſeen to flie away, and remoov their habitations in great troops. For theſe, as alſo ſom other creatures, have a manifeſt power by the gift of God, and the inſtinct of Nature, to preſage changes of weather, as raine, ſhowrs, and fair weather; and ſeaſons of the year, as the Spring, Summer, Autumn, Winter, which they teſtifie by their ſinging, chirping, crying, flying, playing, and beating with their wings, and ſuch like ſigns: ſo alſo they have a perception of a Plague at hand. And moreover, the carkaſſes of ſom of them which took leſs heed of themſelvs, ſuffocated by the peſtiferous poiſon of the ill air contained in the earth, may bee everie-where found, not onely in their dens, but alſo in the plain fields.

How peſtilent vapors may kill plants and trees.

Theſe vapors corrupted not by a ſimple putrefaction, but an occult malignitie, are drawn out of the bowels of the earth into the air, by the force of the Sun and Stars, and thence condenſed into cloude, which by their falling upon corn, trees and graſs, infect and corrupt all things which the earth produceth, and alſo kill's thoſe creatures which feed them; yet brute beaſts ſooner then men, as which ſtoop and hold their heads down towards the ground (the maintainer and breeder of this poiſon) that they may get their food from thence. Therefore at ſuch times, skilful husbandmen, taught by long experience, never drive

their

their Cattel or Sheep to paſture, before that the Sun, by the force of his beams, hath waſted and diſſipated into air this peſtiferous dew hanging and abideing upon boughs and leaves of trees, herbs, corn and fruits.

But on the contrarie, that peſtilence which proceed's from ſom malign qualitie from above, by reaſon of evil and certain conjunction of the Stars, is more hurtful to men and birds, as thoſe who are nearer to heaven.

CHAP. VI.

By uſeing what cautions in Air and diet, one may prevent the Plague.

Having declared the ſigns fore-ſhewing a Peſtilence now we muſt ſhew by what means wee may ſhun the imminent danger thereof, and defend our ſelvs from it. No prevention ſeemed more certain to the Antients, then moſt ſpeedily to remoov into places far diſtant from the infected place, and to bee moſt ſlow in their return thither again. But thoſe, who by reaſon of their buſineſs or emploiments, cannot change their habitation, muſt principally have a care of two things: The firſt is, that they ſtrengthen their bodies, and the principal parts thereof againſt the dailie immineńt invaſions of the poiſon, or the peſtiferous and venenate Air. The other, that they abate the force of it, that it may not imprint its virulencie in the bodie; which may bee don by correcting the exceſs of the qualitie inclineing towards it, by the oppoſition of its contrarie. For if it bee hoter then is meet, it muſt bee tempered with cooling things; if too cold, with heating things: yet this will not ſuffice. For wee ought beſides, to amend and purge the corruptions of the venenate malignitie diffuſed through it, by ſmels and perfumes reſiſting the poiſon thereof. The bodie will bee ſtrengthened and more powerfully reſiſt the infected Air, if it want excrementitious humors, which may bee procured by purgeing and bleeding; and for the reſt a convenient diet appointed, as ſhunning much varietie of meats, and hot and moiſt things, & all ſuch which are eaſily corrupted in the ſtomach, and cauſ obſtructions, ſuch as thoſe things which bee made by Comfit-makers; wee muſt ſhun ſatietie and drunkenneſs, for both of them weaken the powers, which are preſerved by the moderate uſe of meats of good juice.

Change of places the ſureſt prevention of the Plague.

Two things of chief account for prevention.

Diet for prevention of the Plague.

Let moderate exercciſes in a cleer Air, and free from anie venemous tainture, precede your meals.

Let the bellie have due evacuation either by Nature or Art.

Let the heart, the ſeat of life, and the reſt of the bowels bee ſtrengthened with Cordials and Antidotes applied and taken (as wee ſhall hereafter ſhew) in the form of epithemes, ointments, emplaſters, waters, pils, powders, tablets, opiates, fumigations, and ſuch like.

Make choice of a pure air, and free from all pollution, and far remote from ſtinking places, for ſuch is moſt fit to preſerv life, to recreate and repair the ſpirits; whereas on the contrarie, a cloudie or miſtie Air, and ſuch as is infected with groſs and ſtinking vapors, dull's the ſpirits, deject's the appetite, make's the bodie faint and ill colored, oppreſſeth the heart, and is the breeder of manie diſeaſes.

Diſcommodities of a cloudie or foggie Air.

The Northern winde is healthful, becauſ it is cold and drie. But on the contrarie, the Southern winde, becauſ it is hot and moiſt, weaken's the bodie by ſloth or dulneſs, open's the pores, and make's them pervious to the peſtiferous malignitie. The Weſtern winde is alſo unwholſom, becauſ it com's near to the nature of the Southern: wherefore the windows muſt bee ſhut up on that ſide of the houſ on which they blow, but opened on the North and Eaſt-ſide, unleſs it happen the Plague com from thence.

Why the South winde is peſtilent.

Kindle a clear fire in all the lodging Chambers of the houſ, and perfume the whole houſ with Aromatick things, as Frankincenſ, Myrrh, Benzoin, *Ladanum*, *Styrax*, Roſes, Mirtle-leavs, Lavander, Roſemarie, *Sage*, Savorie, wilde *Time*, Marjarum, Broom, Pine-apples, peeces of Firr, Juniper-berries, Cloves, Perfume's: and let your cloaths bee aired in the ſame.

The efficacie of fire againſt the Plague.

There bee ſom, who think it a great preſervative againſt the peſtilent Air, to keep a Goat in their houſes, becauſ the capacitie of the houſes, filled with the ſtrong *ſent* which the Goat ſend's forth, prohibit's the entrance of the venemous Air: which ſame reaſon hath place alſo in ſweet ſmels; and beſides it argue's, that ſuch as are hungrie are apter to take the Plague then thoſe who have eaten moderately: for the bodie is not onely ſtrengthened with meat, but all the paſſages thereof are filled by the vapors diffuſed from thence, by which otherwiſe the infected Air would finde a more eaſie entrance to the heart.

Moderate repletion good for prevention.

Yet the common ſort of people yeeld another reaſon for the Goat, which is, that one ill *ſent* drive's away another, as one wedg drive's forth another; which calleth to my minde that which is recorded by *Alexander Benedictus*, that there was a Scythian Phyſician, which cauſſed a Plague, ariſing from the infection of the Air, to ceaſ, by cauſing all the dogs, cats, and ſuch like beaſts which were in the Citie, to bee killed, and caſt their carcaſſes up and down the ſtreets, that ſo by the comming of this new putrid vapor as a ſtranger, the former

A ſtrange Art to drive away the Plague.

peſtiferous

The antipathie of poiſons with poiſons.

peſtiferous infection, as an old gueſt, was put out of its lodging, and ſo the Plague ceaſed. For poiſons have not onely an antipathie with their Antidotes, but alſo with ſom other poiſons.

Whil'ſt the Plague is hot, it is not good to ſtir out of door before the riſeing of the Sun: wherefore wee muſt have patience, until hee have cleanſed the Air with the comfortable light of his Beams, and diſperſed all the foggie and nocturnal pollutions, which commonly hang in the Air in dirtie, and eſpecially in low places and Vallies.

All publick and great meetings and aſſemblies muſt bee ſhunned.

Whether in the Plague-time one muſt travel by night or by daie.

If the Plague begin in Sumner, and ſeem principally to rage, beeing helped forward by the Summers-heat, it is beſt to perform a journie begun, or undertaken for neceſſarie affairs, rather upon the night-time, then on the daie; becauſ the infection take's force, ſtrength and ſubtiltie of ſubſtance, by which it may more eaſily permeate and enter in by the heat of the Sun; but by night men's bodies are more ſtrong, and all things are more groſs and denſ. But you muſt obſerv a clean contrarie courſ, if the malignitie ſeem to borrow ſtrength and celeritie from coldneſs. But you muſt alwaies eſchew the beams of the Moon, but eſpecially at the *Full*: for then our bodies are more languid and weak, and fuller of excrementitious humors. Even as trees which for that cauſ muſt bee cut down in their ſeaſon of the Moon, that is, in the decreaſ thereof.

Why the Moon is to bee ſhunned.

After a little gentle walking in your Chamber, you muſt preſently uſe ſom means that the principal parts may bee ſtrengthned by ſuſcitateing the heat and ſpirits, and that the paſſages to them may bee filled, that ſo the waie may bee ſhut up from the infection comming from without. Such as by the uſe of garlick have not their heads troubled, nor their inward parts inflamed, as Countrie-People and ſuch as are uſed to it; to ſuch there can bee no more certain preſervative and antidote againſt the peſtiferous fogs or miſts, and the nocturnal obſcuritie, then to take it in the morning with a draught of good wine; for it beeing abundantly diffuſed preſently over all the bodie, fill's up the paſſages thereof, and ſtrengthneth it in a moment.

Garlick good againſt the Plague.

What water to be made choice of in the plague-time.

For water; if the Plague proceed from the tainture of the Air, wee muſt wholly ſhun and avoid Rain-water, becauſ it cannot but bee infected by the contagion of the Air. Wherefore the water of *Springs* and of the deepeſt Wells are thought beſt. But if the malignitie proceed from the vapors contained in the earth, you muſt make choice of Rain-water. Yet it is more ſafe to digeſt everie ſort of water by boiling it, and to preſer that water before other, which is pure and clear to the ſight, and without either taſte or ſmell, and which beſides ſuddenly take's the extremeſt mutation of heat and cold.

CHAP. VII.

Of the Cordial Remedies by which wee may preſerv our bodies in fear of the Plague, and cure thoſe already infected therewith.

Aqua theriacalis good againſt the Plague both inwardly taken and outwardly applied.

Such as cannot eat without much labor, excerciſe and hunger, and who are no lovers of Break-faſts, haveing evacuated their excrements, before they go from home muſt ſtrengthen the heart with ſom Antidote againſt the virulencie of the infection. Amongſt which *Aqua Theriacalis*, or Treacle-water, two ounces, with the like quantitie of *Sack*, is much commended beeing drunk, and rubbing the noſtrils, mouth and ears with the ſame; for the Treacle-water ſtrengthen's the heart, expell's poiſon, and is not onely good for a preſervative, but alſo to cure the diſeaſ it ſelf: For by ſweat it drive's forth the poiſon contained within. It ſhould bee made in *June*, at which time all ſimple medicines, by the vital heat of the Sun, are in their greateſt efficacie.

The compoſition thereof

The compoſition whereof is thus: Take the roots of *Gentian*, *Ciperus*, Tormentil, Diptam, or *Fraxella*, Elecampane, of each one ounce; the leavs of Mullet, *Carduus Benedictus*, Divel's-bit, Burnet, Scabious, Sheeps-ſorrel, of each half a handful; of the tops of *Rue* a little quantitie; Mirtle-berries one ounce; of red Roſe-leavs, the flowers of Bugloſs, Borage and S. John's-wurt, of each one ounce: let them bee all cleanſed, dried and macerated for the ſpace of twentie-four hours in one pound of white wine or Malmſie, and of Roſe-water or Sorrel-water; then let them bee put in a veſſel of glaſs, and add thereto of Treacle and Mithridate, of each four ounces: then diſtill them in *Balneo Mariæ*, and let the diſtilled water bee received in a glaſs-Vial, and let there bee added thereto of Saffron two drams, of Bole-Armenick, *Terra ſigillata*, yellow Sanders, ſhaveings of Ivorie and Hartſ-horn, of each half an ounce; then let the glaſs bee well ſtopped, and ſet in the Sun for the ſpace of eight or ten daies. Let the preſcribed quantitie bee taken everie morning ſo oft as ſhall bee needful. It may bee given without hurt to ſucking children, & to women great with childe. But that it may be the more pleaſant, it muſt be ſtrain'd through an Hippocras-bag, adding thereto ſom ſuger & cinnamon.

Som think themſelvs ſufficiently defended with a root of Elecampane, Zedoarie, or Angelica, rowled in their mouth, or chawed between their teeth.

Others drink everie morning one dram of the root of *Gentian* bruiſed, beeing macerated for

for the ſpace of one night in two ounces of white wine.

Others take Worm-wood-wine.

Others ſup up in a rere egg one dram of *Terra Sigillata*, or of Hartſ-horn, with a little Saffron, and drink two ounces of wine after it.

There bee ſom that do infuſe Bole-Armenick, the roots of *Gentian*, Tormentil, Diptam, the berries of Juniper, Cloves, Mace, Cinnamon, Saffron, and ſuch like, in *aqua vitæ* and ſtrong white wine, and ſo diſtill it in *Balneo Mariæ*.

This Cordial water that followeth is of great vertue. Take of the roots of the long and round *Ariſtolochia*, Tormentil, Diptam, of each three drams, of Zedoarie two drams, *Lignum Aloës*, yellow Sanders, of each one dram, of the leavs of Scordium, St. John's-wurt, Sorrel, *Rue*, *Sage*, of each half an ounce, of *Bay* and Juniper-berries, of each three drams, Citron-ſeeds one dram, Cloves, *Mace*, Nutmegs, of each two drams, of Maſtich, *Olibanum*, Bole-Armenick, *Terra Sigillata*, ſhaveings of Hartſ-horn and Ivorie, of each one ounce, of Saffron one ſcruple, of the *Conſervs* of Roſes, Bugloſs-flowers, water-lillies and old Treacle, of each one ounce, of Camphire half a dram, of *aqua vitæ* half a pinte, of white wine two pintes and a half, make thereof a diſtillation in *Balneo Mariæ*. The uſe of this diſtilled water is even as Treacle water is. A Cordial water.

The Electuarie following is verie effectual. Take of the beſt Treacle three ounces, Juniper-berries and Carduus-ſeeds of each one dram and a half, of Bole-Armenick prepared half an ounce, of the power of the Electuarie *de Geminis* and *Diamargariton frigidum*, the powder of Hartſ-horn, and red Coral, of each one dram: mix them with the ſyrup of the rindes and juice of Pome-Citrons as much as ſhall ſuffice, and make thereof a liquid Electuarie in the form of an Opiate, let them take everie morning the quantitie of a Filberd, drinking after it two drams of the water of Scabious, Cherries, *Carduus Benedictus*, and of ſom ſuch like cordiall thing, or of ſtrong wine. A Cordial Electuarie.

The following Opiate is alſo verie profitable, which alſo may bee made into Tablets. Take of the roots of Angelica, *Gentian*, Zedoarie, Elecampane, of eath two drams; of Citron and Sorrel-ſeeds of each half a dram; of the dried rindes of Citrons, Cinnamon, Bay and Juniper-berrie, and Saffron, of each one ſcruple; of *conſerv* of Roſes and Bugloſs, of each one ounce; and fine hard Suger as much as is ſufficient: make thereof Tablets of the weight of half a dram, let him take one of them two hours before meat: or make thereof an Opiate with equal parts of *conſervs* of Bugloſs and *Mel Anthoſatum*, and ſo adding all the reſt drie and in powder. An Opiate. Another. Or take of the roots of Valerian, Tormentil, Diptam, of the leavs of *Rue*, of each half an ounce; of Saffron, *Mace*, Nutmegs, of each half a dram; of Bole-Armenick prepared half an ounce; of *conſerv* of Roſes and ſyrup of Lemmons as much as will bee ſufficient to make thereof an Opiate liquid enough. Another. Or take of the roots of both the *Ariſtolochia's*, of *Gentian*, Tormentil, Diptam, of each one dram and an half; of Ginger three drams; of the leavs of *Rue*, *Sage*, Mints and Pennie-royal, of each two drams; of *Bay* and Juniper-berries, Citron-ſeeds, of each four ſcruples; of *Mace*, Nutmegs, Cloves, Cinnamon, of each two drams; of *Lignum aloës*, and yellow Sanders, of each one dram; of Male-Frankincenſ, *i. Olibanum*, Maſtich, ſhaveings of Hartſ-horn and Ivorie, of each two ſcruple; of Saffron half a dram; of Bole-Armenick, *Terra Sigillata*, red Coral, Pearl, of each one dram; of *conſervs* of Roſes, Bugloſs-flowers, water-lillies and old Treacle, of each one ounce; of loaf-ſuger one pound and a quarter: a little before the end of the makeing it up, add two drams of *confectio Alkermes*, and of Camphire diſſolved in Roſe-water one ſcruple; make thereof an Opiate according to Art, the doſe thereof is from half a dram to half a ſcruple.

Treacle and Mithridate faithfully compounded, excell all Cordial medicines, adding for everie half ounce of them, one ounce and an half of *conſervs* of Roſes, or of Bugloſs, or of Violets, and three drams of Bole-Armenick prepared: Of theſe beeing mix't with ſtirring, and incorporated together, make a *conſerv*: It muſt bee taken in the morning the quantitie of a Filberd. You muſt chuſe that Treacle that is not leſs then four years old, nor above twelv: that which is ſomwhat new, is judged to bee moſt meet for cholerick perſons; but that which is old, for flegmatick and old men. For at the beginning the ſtrength of the *Opium* that enter's into the compoſition thereof, remain's in its full virtue for a year: but afterwards the more years old it waxeth, the ſtrength thereof is more aboliſhed, ſo that at length the whole compoſition becommeth verie hot.

The confection of *Alkermes* is verie effectual both for a preſervative againſt this diſeaſ, and alſo for the cure.

The quantitie of a Filberd of Rubarb, with one Clove chawed or rowled in the mouth, is ſuppoſed to repell the comming of the peſtilent Air: as alſo this compoſition following.

Take of preſerved Citron and Orange pils, of each one dram; of *conſerv* of Roſes, and of the roots of Bugloſs, of each three drams; of Citron-ſeeeds half an ounce; of Anniſ-ſeeds and Fennel-ſeeds, of each one dram; of Angelica-Roots four ſcruples; ſuger of Roſes as much as ſufficeth: Make a Confection, and cover it with leavs of Gold, and take a little of it upon a ſpoon before you go abroad everie morning. A Confection to bee taken in the morning againſt the peſtilent Air.

Or take of Pine-apple-kernels, and Fiſtick-nuts, infuſed for the ſpace of ſix hours in the water A March-pane

water of Scabious and Roſes, of each two ounces; of Almonds blanched in the fore-named waters half a pound: of preſerved Citron and Orange pills, of each one dram and an half: of Angelica-roots four ſcruples: make them according to art, unto the form of March-pane, or of anie other ſuch like confection, and hold a little piece thereof often in your mouth.

The Tablets following are moſt effectual in ſuch a caſe. Take of the roots of Diptam, Tormentil, Valerian, Elecampane, Eringoes, of each half a dram; of *Bole-Armenick*, *Terra Sigillata*, of each one ſcruple; of Camphir, Cinnamon, Sorrel-ſeeds, and Zedoarie, of each one ſcruple; of the *ſpecies* of the Electuarie *Diamargariton frigidum*, two ſcruples; of *conſerv* of Roſes, Bugloſs, preſerved-Citron-pills, Mithridate, Treacle, of each one dram; of fine Suger diſſolved in *Scabious* and *Carduus*-water, as much as ſhall ſuffice: Make thereof Tablets, of the weight of a dram, or half a dram: take them in the morning before you eat.

Pills of *Ruffus*. The pills of *Ruffus* are accounted moſt effectual preſervatives, ſo that *Ruffus* himſelf ſaith, that hee never knew anie to bee infected that uſed them: the compoſition of them is thus.

Take of the beſt Aloës half a dram, of Gum-*Ammoniacum* two drams, of Myrrh two drams and an half, of Maſtich two drams, of Safforn ſeven grains: put them all together, and incorporate them with the juice of Citrons, or the ſyrup of Limons, and make thereof a maſs, and let it bee kept in leather: Let the patient take the weight of half a dram everie morning two or three hours before meat, and let him drink the water of Sorrel after it, which through its tartneſs, and the thinneſs of its parts, doth infringe the force and power of the malignitie or putrefaction: For experience hath taught us, that Sorrel beeing eaten or chawed in the mouth, doth make the pricking of Scorpions unhurtful. And for thoſe ingredients which do enter into the compoſition of thoſe pills, Aloës doth cleanſ and purge, Myrrh reſiſt's putrefaction, Maſtich ſtrengthen's, Saffron exhilarate's and make's livelie the ſpirits that govern the bodie, eſpecially the vital and animal.

Other pills. Thoſe pills that follow are alſo much approoved. Take of Aloës one ounce, of Myrrh half an ounce, of Saffron one ſcruple, of Agarick in Trochiſces two drams, of Rubarb in powder one dram, of Cinnamon two ſcruples, of Maſtich one dram and an half, of Citron-ſeeds twelve grains: powder them all as is requiſite; and make thereof a maſs with the ſyrup of Maiden-hair: let it bee uſed as aforeſaid.

If the maſs begin to wax hard, the pills that muſt preſently bee taken, muſt bee mollified with the ſyrup of Limons.

Other pills. Take of waſhed Aloës two ounces, of Saffron one dram, of Myrrh half an ounce, of *Ammoniacum* diſſolved in white wine one ounce, of honie of Roſes, Zedoarie, red Sanders, of each one dram, of *Bole-Armenick* prepared two drams, of red Coral half an ounce, of Camphir half a ſcruple: make thereof pills according to art. But thoſe that are ſubject or apt to the hemorrhoids ought not at all, or verie ſeldom to uſe thoſe kindes of pills that do receiv much Aloës.

They ſay, that King *Mithridates* affirmed by his own writeing, that whoſoever took the quantitie of an haſel-nut of the preſervative following, and drank a little wine after it, ſhould bee free from poiſon that day. Take two Wall-nuts, thoſe that be verie drie, two Figs, twentie leavs of *Rue*, and three grains of Salt: beat them, and incorporate them together, and let them bee uſed as is aforeſaid.

This remedie is alſo ſaid to bee profitable for thoſe that are bitten or ſtung by ſom venemous beaſt, and for this onely, becauſ it hath *Rue* in the compoſition thereof. But you muſt forbid women that are with childe the uſe of this medicine; for *Rue* is hot and drie in the third degree, and therefore it is ſaid to purge the womb, and provoke the flowers, whereby the nouriſhment is drawn away from the childe. Of ſuch varietie of medicines, every one may make choice of that that is moſt agreeable to his taſte, and as much thereof as ſhall bee ſufficient.

CHAP. VIII.

Of local medicines to bee applied outwardly.

THoſe medicines that have proper and excellent virtues againſt the peſtilence, are not to bee neglected to bee applied outwardly, or carried in the hand. And ſuch are all aromatical, aſtringent, or ſpirituous things, which therefore are endued with virtue to repel the venemous and peſtiferous air from comming and entring into the bodie, and to ſtrengthen the heart and the brain. Of this kinde are *Rue*, Balm, Roſemarie, *Scordium*, *Sage*, Worm-wood, Cloves, Nut-megs, Saffron, the roots of Angelica, and Lovage, and ſuch like, which muſt bee macerated one night in ſharp Vineger and *Aqua vitæ*, and then tied in a knot as big as an egg: or rather let it bee carried in a ſponge made wet, or ſoaked in the ſaid infuſion. For there is nothing that doth ſooner and better hold the ſpirituous virtue and ſtrength of aromatick things, then a ſponge. Wherefore it is of principal uſe either to keep or hold ſweet things to the noſe, or to applie Epithems and Fomentations to the heart.

Of what nature the medicines outwardly uſed ought to bee.

Thoſe

Thoſe ſweet things ought to bee hot or cold, as the ſeaſon of the year, and kinde of the peſtilence is As for example, in the Summer you ought to infuſe and macerate Cinnamon and Cloves, beaten together, with a little Saffron in equal parts, of vineger of Roſes, and Roſe-water, into which you muſt dip a ſponge, which rowled in a fair linnen cloth, you may carrie in your hand, and often ſmell to.

Take of Worm-wood half a handful; ten Cloves, of the roots of *Gentian* and Angelica, of each two drams; of vineger and Roſe-water, of each two ounces; of Treacle and Mithridate, of each one dram; beat and mix them all well together, and let a ſponge bee dipped therein, and uſed as above-ſaid. They may alſo bee encloſed in boxes made of ſweet wood, as of Juniper, Cedar, or Cypreſs, and ſo carried for the ſame purpoſe.

But there is nothing more eaſie to bee carried then Pomanders: the form of which is thus: Take of yellow Sanders, *Mace*, Citron-pills, Roſe and Mirtle-leavs, of each two drams; of Benzoin, *Ladanum*, *Storax*, of each half a dram; of Cinnamon and Saffron, of each two ſcruples; of Camphire and Amber-Greece, of each one ſcuple; of Muſk three grains. Make thereof a Pomander, with Roſe-water, with the infuſion of Tragacanth. Or take red-Roſe-leavs, the flowers of Water-lillies and Violets, of each one ounce; of the three Sanders, Coriander-ſeeds, Citron-pills, of each half an ounce; of Camphire, one dram; let them all bee made into powder, and with Water of Roſes and Tragacanth make a pomander. Pomanders.

In the Winter it is to bee made thus. Take of *Storax*, Benzoin, of each one dram and a half; of Muſk, half a ſcruple; of Cloves, Lavander and *Ciperus*, of each two drams; of the root of Orris, *i.e. Flower-de-Luce*, and *Calamus aromaticus*, of each two drams and a half; of Amber-Greece, three drams; of Gum-Tragacanth diſſolved in Roſe-water and *aqua vitæ*, as much as ſhall ſuffice: make thereof a Pomander.

And for the ſame purpoſe you may alſo uſe to carrie about with you ſweet powders, made of Amber-Greece, *Storax*, Orris, Nutmegs, Cinnamon, *Mace*, Cloves, Saffron, Benzoin, Muſk, Camphire, Roſes, Violets, *Juncus odoratus*, Marjarum and ſuch like, of which beeing mixed together, Powders may may bee compounded and made. Sweet-powders.

Take of the roots of Orris two drams, of *Cyperus*, *Calamus aromaticus*, red Roſes, of each half an ounce; of Cloves half a dram, of *Storax*, one dram; of Muſk, eight grains: mix them, and make a powder for a bag: or take the roots of Orris two ounces; red-Roſe-leavs, white Sanders, *Storax*, of each one dram; of *Cyperus*, one ounce; of *Calamus aromaticus*, one ounce; of Marjarum, half an ounce; of Cloves, three drams; of Lavander, half a dram; of Coriander-ſeeds, two drams; of good Muſk, half a ſcruple; of *Ladanum* and Benzoin, of each a dram; of Nutmegs and Cinnamon, of each two drams: Make thereof a fine powder, and ſow it in a bag.

It will bee verie convenient alſo to applie to the *region* of the heart, a bag filled with yellow Sanders, *Mace*, Cloves, Cinnamon, Saffron and Treacle ſhaken together, and incorporated, and ſprinkled over with ſtrong vineger and Roſe-water in Summer, and with ſtrong wine and Muſkadine in the Winter. Bags.

Theſe ſweet Aromatick things thar are ſo full of ſpirits, ſmelling ſweetly and ſtrongly, have admirable virtues to ſtrengthen the principal parts of the bodie, and to ſtir up the expulſive faculties to expel the poiſon.

Contrarie-wiſe, thoſe that are ſtinking and unſavorie, procure a deſire to vomit, & diſſolution of the powers, by which it is manifeſt how fooliſh and abſurd their perſwaſion is, that counſel ſuch as are in a peſtilent conſtitution of the Air, to receiv and take in the ſtinking and unſavorie vapors of *ſinks* and *privies*, and that eſpecially in the morning. Unſavorie things to bee eſchewed.

But it will not ſuffice to carrie thoſe preſervatives alone, without the uſe of anie other thing, but it will bee alſo verie profitable to waſh all the whole bodie in Vineger of the decoction of Juniper and Bay-berries, the Roots of *Gentian*, Marigolds, S. John's-Wurt, and ſuch like, with Treacle or Mithridate alſo diſſolved in it. For vineger is an enemie to all poiſons in general, whether they bee hot or cold: for it reſiſteth and hindereth putrefaction. Neither is it to bee feared, that it ſhould obſtruct the pores, by reaſon of its coldneſs, if the bodie bee bathed in it: for it is of ſubtil parts, and the ſpices boiled in it, have virtue to open.

Whoſoever accounteth it hurtful to waſh his whole bodie therewith, let him waſh onely his arm-holes, the *region* of his heart, his *temples*, groins, parts of generation; as haveing great and marvelous ſympathie with the principal and noble parts.

If anie miſſike bathеing, let him annoint himſelf with the following Unguent. Take oil of Roſes, four ounces; oil of Spike, two ounces; of the powder of Cinnamon and Cloves, of each, one ounce and a half; of Benzoin, half an ounce; of Muſk, ſix grains; of Treacle, half a dram; of Venice-Turpentine, one dram and a half; of Wax, as much as ſhall ſuffice: make thereof a ſoft Unguent. An Unguent.

You may alſo drop a few drops of oil of Maſtich, of *Sage*, or of Cloves, and ſuch like, into the eare, with a little Civet or Muſk.

CHAP.

CHAP. IX.

Of other things to bee observed for prevention, in fear of the Plague.

Why Venerie is to bee shunned.

VENERIE is chiefly to bee eschewed, for by it the powers are debilitated, the spirits dissipated, and the breathing places of the bodie diminished, and lastly, all the strength of nature weakned. A sedentarie life is to bee shunned, as also excess in diet, for hence proceed's obstruction, the corruption of the juices, and preparation of the bodie to putrefaction and the pestilence.

Running ulcers good in time of pestilence.

Women must bee verie careful that they have their courses duely, for stopping beside the custom, they easily acquire corruption, and draw by contagion the rest of the humors into their societie. Such as have fistulous, or otherwise old ulcers, must not heal them up in a pestilent season; for it is then more convenient rather to make new ones and these in convenient and declineing places; that as by these channels, the sink of the humors of the bodie may bee emptied.

Places to bee shunned in time of plague.

The Hemerhoids, bleedings, and other the like accustomed evacuations, must not bee stopped, unless they exceed measure. Moreover, they must at such times take heed that they touch or handle not anie of these things wherein the seeds or fuell of the pestilence may lie hid; such as are hemp, flax, quilts and coverings wherein such as have had the Plague have laid; skins and all lether-things, hangings and cloaths. You must dwell far from Church-yards, especially from those wherein the corps of such as have died of the Plague are not buried dead in the ground, as in the Church of *Innocents* in *Paris*, in which place by the same reason it sundrie times happen's that the bodies are plucked up, rent and torn by dogs. Also let them dwell far from places of execution, shambles of flesh and fish, from tan-houses, tarr, tallow-chandlers, cloth-dressers, farriers, skinners, and from the places wherein metals are are cast or wrought. The filth and dung, especially of Swine, Privies, standing and muddie waters, and lastly all things of the like evil smell, must bee far remoce from your habitation; the bellie must not bee emptied into those places, into which the excrements of such as have the plague are cast.

What companie to bee avoided.

The companie of such as usually visite those sick of the plague, must bee eschewed, as of Physicians, Apothecaries, Surgeons, Nurs-Keepers, Grave-makers and Bearers. For though they have not the Plague, yet comming out of a pestilent place, they may carrie with them lying in their garments, the seeds thereof. You may gather this by such have for a little while staled in a perfumer's shop, for the perfume diffused in the air, bestow's the smell upon the garments of such persons, so that goin from thence, such as meet them, will judg them to carrie perfumes with them.

You must do nothing in a pestilent season whereby you may grow too hot.

They shall also shun long watchings found sleeping, all passions of the minde, especially anger, hunger, thirst, journying in the Sun, for that hath oftimes occasioned a diarie fever, which hath not seldom been seen to turn into a pestilent one; for by dilateing the pore of the skin, they have given entrance to the pestilent air, which by that means hath easily taken hold of the humor disposed to putrefaction.

CHAP. X.

Of the Office of Magistrates in the time of the Plague.

Why dogs and cats must bee killed in a Plague-time.

MAgistrates ought to have a special care that no filth bee heaped up, either in private or publick places: let all things bee kept neat in everie hous, and let all the streets bee kept clean, the dung and filth bee carried forth of the Citie, as also the dead carcasses of killed dogs & cats, for becaus they oftimes lick and devour the excrements of such as have the Sickness, therefore they may by their familiar entrie into found houses, there propagate the Plague. Wherefore they must either bee drive'n forth of the Citie, or killed, and so bee carried forth and buried deep in the ground. Wells, springs, and rivers themselvs, must bee free'd and cleansed from all impuritie. Care must bee had that mustie corn, tainted flesh, not drinking fish bee not for sale. Publick baths and hot-houses must bee prohibited, for that in them, men's bodies are weakned, and made more yeelding and pervious to the pestiferous air.

Why Baths and hot-houses are not then to bee allowed.

They shall commit the cure of such as have the Plague, to learned, skilful and honest Physicians and Apothecaries and Surgeons.

Such as are known to have the Plague, shall bee separated from such as are free thereof, and bee sent to such fit places as shall bee provided for them; for this is better and more humanely don then to shut up everie man in his own hous. They shall provide and fore-see that the houshold-stuff of such as have the Plague bee not set to sale. They shall set signs and noted marks upon the houses seazed upon by this diseas, lest they should unawares run into danger. Wherefore to the same purpose they shall procure that the Surgeons and others that visit the sick of the Plague may bee known by som conspicuous mark, that such as pass by them may bee admonished of the danger; they shall also take care that the bodies of the

the dead bee buried as speedily as may bee. For they sooner and more grievously putrefie in a short time, then the bodies of others of what death soever they die. Wherefore, neither birds, nor ravenous beasts dare once touch their bodies, though unburied; for by tasteing them they should quickly com to their deaths. The keepers of the gates of the Cittie shall bee admonished, that they take special care that such as are infected, or com from a visited place, do not enter into the Cittie; for from one, the evil may com to spread it self further; for one spark may set a whole Cittie on fire, and one scabbie sheep infect a whole flock. And becaus there is nothing which may more perfectly purge the air, and cleans it from all manner of noisomness and infection, then fire; they shall command that there bee kindled, and perpetually kept burning-fires, made with odoriferous and strong-smelling things, as Juniper, Turpentine, Broom, and the like.

Such as die of the Plague do quickly putrefie.

In stead hereof *Levinus* tell's, that the Souldiers of the Garrison of Tornie used in a Plague-time to discharge their Canons laded onely with powder, turning their mouths upon the Cittie, and that morning and evening; that by the vehemencie of the mooved air, the pestiferous fogs might bee chased away; and by the heat of the burned powder, the venenate and noisom qualitie of the air might bee amended. Lastly, I judg it fit to admonish Magistrates, that they have their eies and mindes attentive upon a murderous and impious kinde of Bearers and Nurs-keepers; which allured with a desire of gain (which whil'st the Plague reign's, they get abundantly) annoint the walls, doors, thresholds, knockers of gates and locks with the filth and ointments taken from such as have the Plague, that the Plague within a while after seizing upon these also, the masters of them flying away, and the familie dispersed, they may there reign alone, and freely and without punishment carrie thence what they pleas; oftimes strangling such as lie readie to die, lest recovering, they might bee their accusers. This I remember happened at *Lions, Ann Dom.* 1565.

Lib. 2. de occult. nat. mirac.

The villanie of som base people.

CHAP. XI.

What caution must bee used in chusing Physicians, Apothecaries and Surgeons, who may have care of such as are taken with the Plague.

IT is the part of Magistrates in the so great necessitie of the afflicted Commonwealth, to appoint learned, skilful, and honest Physicians, Surgeons, and Apothecaries, and such as have more regard to the Law of God then to gain, to have the care and cure of such as are visited. But principally let them not take Surgeons and Apothecaries called by proclamation with sound of trumpet, that if they will take this charge, they shall becom free without examination or reward. But let them rather bee allured by gifts and honest rewards, not onely then when as necessitie urgeth; but also after the Plague is over. For such servant-Surgeons and Apothecaries as are called by proclamation, so to gain freedom, are most commonly unskilful and unexperienced Dunces; who, conscious of their own ignorance, and fearing to undergo the examination of the Masters of their Companies, refuse no hazard, however dangerous, with desire to obtain their freedom.

It is far worse and more dangerous to fall into the hands of such, then into the hands of theevs and murderers; for these, by providence or strength, wee may chance to escape; but wee seek for and embrace the other, and haveing found them, lay our throats bare unto them, so by their unskilfulness to bee butchered. Certainly by the fault of the times, and the neglect of Magistrates, it is almost com to this pass, that if anie honest and learned Physicians and Surgeons shall undertake this cure, they are commonly forced thereto by the Magistrate for fear of punishment or fineing. Therefore becaus they do it against their wills, they shew themselves less vigilant, chearful and painful about the sick. They com unwillingly, and compelled hereto, becaus by the memorie of the fore-past time, they sufficiently know, how fordid and unfaithfully Magistrates, when the Plague hath been over-past, have been in paying the promised reward to men of their condition, who have shortly run into danger; for thence it happen's, that dureing the rest of their lives, they may sit idle at home, for that they are infamous, and feared by the people onely for this, that a while agon they visited such as had the Plague. Therefore I would have Magistrates prudent, faithful, and free in chusing honest, learned and skilful men, who may undergo this so difficult and dangerous a charge.

When cer-tain Signs of the Plague are taken.

CHAP. XII.

How such as undertake the cure of the Plague ought to arm themselves.

FIrst they must think and hold for certain, that they are not called to this office by men, but by God, so disposing the counsels and actions of men as hee thinketh fit. Therefore they shall confidently enter into the cure thereof, for that our lot, life and death

Our lots are in the hands of the Lord.

are in the hands of the Lord: but notwithstanding they ought not to neglect remedies, which are given to men for prevention, lest by neglecting the gifts of God, they may seem to neglect him also that is the giver of so manie good and excellent benefits. Therefore first let them by purgeing and bleeding evacuate the humors subject to putrefaction, and to conceiv the seeds of the pestilence. Let them make two fontanells by application of canteries, to bee as rivelets to evacuate the excrementitious humors which are daily by little and little heaped up in us; let one of them bee in the right arm a little below the muscle *Epomis*; the other the space of three fingers under the knee on the in-side of the left leg. This is found by experience a verie certain means of prevention. Let them wash their whole bodies with the following lotion. ℞. *aquæ rosacei rosati, aut sambucini, vini albi aut malvatici,* an. lb. vi. *rad. enulæ camp. angelicæ, gentian. bistortæ, zedoar.* an. ℥iii. *baccar. juniperi, & bedera,* an. ℥ii. *salviæ, roris mar. absinth. rutæ,* an. m. i. *corticis citri,* ℥ß. *theriacæ & mithridat.* an ℥i. *conquassenda conquassent, bulliant lento igni, & serventur ad usum ante commemoratum.* The epithems, unguents and bags formerly described shall bee applied to the region of the heare. I have read it noted by *John Baptist Theodosius*, that amongst other things, Arsenick may bee profitably applied to the region of the heart, that so it may by little and little accustom it self to poisons, that afterwards it may bee less harmed by their incursion, first making their assault upon it.

Where to make issues in the time of the Plague.

Cap. 8.

Epist. 2.

What to wear.

Let their garments bee made of Chamelet, Dutch-Sarge, Satin, Taffatie, or the like. Or elſ if they cannot of these, let them bee of som other handsom Stuff, but not of Cloth, Freez, or the like, that they may take the venenate air, and carrie it with them to the infection of the sound. They shall oftimes change their cloaths, shirts and other linnen, and perfume them with aromatick things; let them warily approach to the sick, more warily speak unto him, with their faces looking away from him, rather then towards him, so that they may not receiv the breath of his mouth, neither the vapor nor smell of anie of his excrements.

How to visit your patients.

An historie.

When as I upon a time beeing called to visit one that lay sick of the Plague, came too near and heedlesly to him, and presently by sudden casting off the cloaths, laid him bare, that so I might the better view a *Bubo*, that hee had in his right groin, and two Carbuncles that were on his bellie, then presently a thick, filthie and putrid vapor arising from the broken abscess of the Carbuncle, as out of a raked puddle, ascended by my nostrils to my brain, whereupon I fainted, and fell down senseless upon the ground; raised up a little after, all things seemed to mee to run round; and I was readie to fall again, but that I staied my self by takeing hold of the bed-post. But one thing comforted mee, that there appeared no signs that my heart was affected, either by pain or panting, or the strong and contumacious failing of my powers. An argument that the animal spirits were onely dissipated by a venenate vapor, and that the substance of the heart was no way wronged, was a sneesing which took mee so violently, that I sneesed ten times, and then fell a bleeding at the nose; which excretion, I believ, free'd mee from all the impression of the malignitie. Let others, warned by this mine example, learn to bee wiser and more warie in this case, lest they com to a worse mishap then befel mee.

CHAP. XIII.

Of the signs of such as are infected with the Plague.

Whence certain signs of the Plague may bee taken.

SEe must not stay so long before wee pronounce one to have the Plague, until there bee pain and a tumor under his arm-holes, or in his groin, or spots (vulgarly called *Tokens*) appear over all the bodie, or carbuncles arise: for manie die through the venenate malignitie, before these signs appear. Wherefore the chiefest and truest signs of this disease are to bee taken from the heart, beeing the mansion of life, which chiefly and first of all is wont to bee assailed by the force of the poison. Therefore they that are infected with the Pestilence, are vexed with often swoundings and fainting; their pulse is feebler and slower then other, but sometimes more frequent, but that is specially in the night-season; they feel prickings over all their bodie, as if it were the pricking of needles; but their nostrils do itch especially by occasion of the malign vapors riseing upwards from the lower and inner, into the upper parts, their breast burneth, their heart beateth with pain under the left dug, difficultie of takeing breath, ptisick, cough, pain of the heart, and such an elation or puffing up of the *Hypocondria*, or sides of the bellie, distended with the abundance of vapors raised by the force of the feverish heat, that the patient will in a manner seem to have the Tympanie. They are molested with a desire to vomit, and oftentimes with much and painful vomiting, wherein green and black matter is seen, and alwaies of divers colors, answering in proportion to the excrements of the lower parts, the stomach beeing drawn into a consent with the heart, by reason of the vicinitie and communion of the vessels; oftentimes blood alone, and that pure, is excluded and cast up in vomiting; and is not onely cast up by vomiting out of the stomach, but also verie often out of the nostrils, fundament; and in women, out of the womb; the inward parts are often burned;

The cause of vomiting in such as have the plague.

burned, and the outward parts are ſtiff with cold, the whole heat of the patient being drawn violently inward, after the manner of a Cupping-glaſs, by the ſtrong burning of the inner parts; then the eie-lids wax blew, as it were through ſom contuſion, all the whole face hath an horrid aſpect, and as it were the color of lead, the eies are burning red, and as it were ſwoln, or puffed up with blood, or anie other humor, ſhed tears; and to conclude, the whole habit of the bodie is ſomwhat changed, and turned yellow. Their looks are ſuddenly changed.

Manie have a burning fever, which doth ſhew its ſelf by the patient's ulcerated jaws, unquenchable thirſt, drineſs and blackneſs of the tongue, and it cauſeth ſuch a phrenſie by inflaming the brain, that the patients, running naked out of their beds, ſeek to throw themſelves out of windows into the pits and rivers that are in hand. In ſom the joints of the bodie are ſo weakned, that they cannot go nor ſtand; from the beginning they are as it were buried in a long ſwound and deep ſleep, by reaſon that the fever kindleth up to the brain groſs vapors from the crude and cold humors, as it were from green wood newly kindled to make a fire. Why ſom that are taken with the plague are ſleepie.

Such ſleeping doth hold him eſpecially while the matter of the ſore or carbuncle is drawn together, and beginneth to com to ſuppuration. Oftentimes when they are waked out of ſleep, there do ſpots and marks appear diſperſed over the skin, with a ſtinking ſweat. But if thoſe vapors bee ſharp that are ſtirred up unto the head, in ſtead of ſleep they cauſe great wakeing, and alwaies there is much diverſitie of accidents in the urine of thoſe that are infected with the Plague, by reaſon of the divers temperature and condition of bodies: neither is the urine at all times, and in all men of the ſame conſiſtence and color: For ſomtimes they are like unto the urine of thoſe that are found and in health, that is to ſay, laudable in color and ſubſtance; becauſ that when the heart is affected by the venemous air, that entreth in unto it, the ſpirits are more greatly grieved and molefted then the humors: but thoſe, *i.e.* the ſpirits, are infected and corrupted when theſe do begin to corrupt. Why their urines are like thoſe that are found.

But Urines onely ſhew the diſpoſitions of the humors or parts in which they are made, collected together, and through which they paſs.

This reaſon ſeemeth truer to mee then theirs which ſay, that nature terrified with the malignities of the poiſon avoid's contention, and doth not reſiſt or labor to digeſt the matter that cauſeth the diſeaſ.

Manie have their appetites ſo overthrown, that they can abſtain from meat for the ſpace of three daies together.

And to conclude, the varietie of accidents is almoſt infinite, which appear and ſpring up in this kinde of diſeaſ, by reaſon of the diverſitie of the poiſon, and condition of the bodies and grieved parts: but they do not all appear in each man; but ſom in one, and ſom in another.

CHAP. XIV.

What ſigns in the Plague are mortal.

IT is a moſt deadlie ſign in the Peſtilence, to have a continual and burning fever, to have the tongue drie, rough, and black, to breathe with difficultie, and to draw in a great quantitie of breath, but breathe out little; to talk idlely; to have phrenſie and madneſs together, with unquenchable thirſt and great watching; to have convulſions, the hicket, heart-beating, and to ſwound verie often and vehemently: further, toſſing and turning in the bed, with a loathing of meats, and dailie vomits of a green, black, and bloodie color; and the face pale, black, of an horrid and cruel aſpect, bedewed with a cold ſweat, and verie mortal ſigns.

There are ſom which at the verie beginning have ulcerous and painful wearineſs, pricking under the skin, with great torment of pain; the eies look cruelly and fiercingly, the vaſes waxeth hoarſ, the tongue rough and fluttring, and the underſtanding decaying; the patient uttereth and calketh of frivolous things. Truly thoſe are verie dangerouſly ſick, no otherwiſe then thoſe whoſe urine is pale, black, and troubled like unto the urine of carriage-beaſts, or lee, with divers colored clouds or contents; as blew, green, black, fatrie and oilie, as alſo reſembling in ſhew a Spiders web, with a round bodie ſwimming on the top. As ulcerous and painful wearineſs from the beginning ſheweth the Plague to bee deadlie.

If the fleſh of the carbuncle bee drie and black, as it were ſeared with an hot iron, if the fleſh about it bee black and blew, if the matter do flow back, and turn in, if they have a laſk with greatly ſtinking, liquid, thin, clammie, black, green or blewiſh ordure; if they avoid worms, by reaſon of the great corruption of the humors, and yet for all this the patient is never the better; if the eies wax often dim, if the noſtrils bee contracted or drawn together, if they have a grievous cramp, the mouth bee drawn aſide, the muſcles of the face being drawn or contracted equally or unequally; if the nails bee black; if they bee often troubled

with the Hicket, or have a Convulsion and resolution over all the bodie, then you may certainly prognosticate that death is at hand, and you may use cordial medicines onely, but it is too late to purge, or let blood.

CHAP. XV.

Signs of the Plague comming by contagion of the air without anie fault of the humors.

YOu shall understand, that the Pestilence proceed's from the corruption of the air, if it bee verie pantagious, and disperseth it self into sundrie places in a moment. If it kill quickly and manie, so that whil'st sundrie persons go about their usual business, walk in the places of common resort, and through the streets, they suddenly fall down and die, no sign of the disease or harm appearing, nor anie pain oppressing them; for the malignitie of the corrupt air is quick and verie speedie in infecting our spirits, overthrowing the strength of the heart, and killing the patient. The patients are not troubled with great agitation, becaus the spirits dissipated by the rapid malignitie of the poison, cannot endure that labor; besides they are taken with frequent swoundings, few of them have Bubo's, few have Blains com forth, and by the same reason their urines are like to those of sound men.

Why they have no sores.

CHAP. XVI.

Signs of the Plague drawn into the bodie by the fault and putrefaction of humors.

FOrmerly wee have reckoned up the causses of the corruption of humors from plenitude, obstruction, distemper, and the ill juice of meats. Now must wee deliver the signs of each corrupt humor which reign's in us, that it may bee reduced to soundness and perfection of nature by the opposition of its contrarie, or elss bee evacuated by physick. Therefore if the bodie bee more yellow then usual, it is a sign of choler offending in quantitie and qualitie. If more black, then of melancholie; if more pale, then of phlegm; if mowsed, with the veins swoln up and full, then of blood. Also the color of the rising blains, tumors and spots, expres's the color of the predominant humor, as also the excrements cast forth by vomit, stool and otherwise; the heavinesss and cheerfulnes's of the affected bodies; the manner of the present fever; the time of the year, age, region, diet. Such things as have ~~cutting~~, penetrateing, attenuateing, and cleansing facultie, take away obstruction. By means of obstruction fevers oftimes accompanie the Plague, and these not onely continual, but also ~~intermitting, like tertians or quartanes~~. Therefore that Plague that is fixed in the infection or corruption of a cholerick humor, shew's it self by the fore-mentioned signs of predominateing choler, to wit, the heat of the skin, blains, and excrements, as also in the quickness of killing, and vehemencie of the symptoms, bitterness of the mouth, a painful and continual endeavour of going to stool, by reason of the acrimonie of choler stimulateing and rakeing the guts in the passage forth. That which reside's in the corrupt substance of gross humors, as of blood, sheweth it self by manie and plentiful sweats, by a scouring, by which are avoided manie and various humors; and oftimes also bloodie matter that proceed's from corrupt phlegm, it invade's with more sound sleep, and causseless wearines's of all the members; when they are awakened out of their sleep, they are not seldom troubled with a trembling over all their joints, the entrance and way of the spirits into the members being obstructed by the grosness of the humors. That which is seated in the corruption of a melancholick humor, is accompanied with heavines's and pain of the head, much pensivenes's, a deep and small pulse. But the most certain sign of the Plague resideing in the corruption of the humors, is to bee taken from the urine. For the signs of the vitiated humors cannot but shew themselvs in the urines: therefore troubled urines, and such as are like those of carriage-beasts, as also black and green, give certain notice thereof. But some are much troubled with thirst, others not at all; becaus choler or phlegm sometimes onely possesse in the stomach or orifice of the ventricle; sometimes besides they will weaken the government of the natural faculties of the part, as of the appetite. But if the fever happen by the default and infection both of the air and humors; then will there bee a great confusion of the fore-mentioned signs and symptoms.

Signs of choler.

When the urine is to bee looked upon.

Why some are much troubled with thirst, others not at all.

CHAP.

CHAP. XVII.

Of the Prognostication that is to bee instituted in the Plague.

OU may well fore-tell the future motions and events of diseases, when you throughly know the nature of the disease, and accidents thereof, and the condition, function, and excellencie of the bodie and grieved parts: Although that this may bee spoken in general, That there is no certain prediction in pestilent diseases, either to health or death, for they have verie unconstant motions, sometimes swift and quick, somtimes slow, and sometimes choaking or suffocateing in a moment, while one breath's in the venemous air, as hee is going about anie of his necessarie affairs, haveing pustles rising in the skin with sharp pain, and as though the whole bodie were pricked all over with needles, or the stings of Bees. Which I have seen with mine eies in the Plague that was at *Lions* when *Charls* the French King lay there. It manie times commeth to pass that the accidents that were verie vehement and rageing a little before, are suddenly asswaged, and the patients do think themselves better, or almost perfectly sound. Which happen's to *Marie* one of the Queen-Mother her maids, in that notable pestilent constitution of the Air, that year when *Charls* the French King lay at the Castle of *Rossilion*: For when shee was infected, a great tumor or *Bubo* arose in her groin, and suddenly it went in again, so that the third day of her sickness, shee said shee was without anie grief or disease at all, but that shee was troubled with the difficultie of making water; and I think it was becaus the the bladder was enflamed by the reflux of the matter; but shee was found in minde and bodie, and walked up and down the chamber on the same day that shee died. The strangeness of which thing made the King so fearful, that hee hasted to depart thence.

No certain prediction in the Plague.

An historie.

Although this disease doth spare no man of what age, temperature, complexion, diet and condition soever, yet it assaulteth young men that are cholerick and sanguine, more often then old men that are cold and drie, in whom the moisture that is the nourisher of putrefaction by reason of their age is consumed, and the waies, passages and pores of the skin, whereby the venemous air should enter and pierce in, are more strait and narrow. And moreover, becaus old men do alwaies stay at home, but young men for their necessarie business, and also for their delight and pleasure, are alwaies more abroad in the day-time, in the air, whereby hence the pollution of the pestilence commeth more often.

Why young men sooner take the Plague then old.

That pestilence that com's by the corruption of the humors, is not so contagious as that which commeth by the default of the air. But those that are phlegmatick and melancholick, are most commonly grieved with that kinde of pestilence; becaus in them the humors are more clammie and gross, and their bodies more cold and less perspirable, for which cause the humors sooner and more speedily putrefie.

What Plague most contagious.

Men that are of an ill juice are also most apt to this kinde of pestilence, for in the naughtie qualitie of the juice there is a great preparation of the humors unto putrefaction: You may know it by this, that when the pestilence reigneth, there are no other diseases among the common people, which have their original of anie ill juice, but they all degenerate into the Plague. Therefore when they begin to appear and wander up and down, it is a token that the pestilence will shortly ceas, or is almost at an end.

But here also I would have you to unerstand those to bee of an ill juice, which have no pores in their skin, by which, as it were by rivers, the evil juice which is contrarie to nature, may bee evacuated and purged. And I have noted and observed, that those are less in danger of the pestilence which have cancerous ulcers and stinking sores in their noses, and such as infected with the French Pocks, have by reason thereof, tumors and rotten ulcers, or have the King's-evil running upon them, the Leprosie or the Scab: and to conclude, all those that have fistula's and running in their bodies.

Who leaft subject to take the Plague.

I think those that have quartane Fevers are the better priviledged for the same, becaus that by the *Fit* causing sweat, that commeth everie fourth daie, they avoid much of the evil juice that was ingendred.

This is more like to bee true, then to think that the poison that commeth from without, may bee driv'n away by that which lurketh within.

Contrariwise, women that are great with childe, as I have noted, becaus they have much ill juice, being prohibited from their accustomed evacuations, are verie apt to take this disease, and so seldom recover after they are infected.

Who subject thereto.

Black or blew impostumes, and spots and pustles of the same color, dispersed over the skin, argue that the disease is altogether incureable and mortal.

Signs the disease is incureable.

When the swelling or sore goeth or commeth before the Fever, it is a good sign; for it declareth that the malignitie is verie weak and feeble, and that nature hath overcom it, which of it self is able to drive so great portion thereof from the inner parts. But if the sore or tumor com after the Fever, it is a mortal and deadlie sign, for it is certain that it commeth of the venemous matter not translated, but dispersed, not by the victorie of nature, but through

A good sign.

A deadlie sign.

the multitude of the matter, with the weight whereof nature is overcom.

When the Moon decreaseth, those that are infected with the Pestilence are in great doubt and danger of death, becaus then the humors that were collected and gathered together before the Full of the Moon, through delay and abundance, do swell the more, and the faculties by which the bodie is governed, becom more weak and feeble, becaus of the [illegible] of the native heat, which before was nourished and augmented by the light, and consequently by the heat of the full-Moon: For as it is noted by *Aristotle*, the [illegible] of the Moon are more cold and weak: and thence it is that women have their [illegible] chiefly or most commonly at that time.

In what air most contagious.

In a gross and cloudie Air the pestilent infection is less vehement and contagious then in a thin and subtil Air; whether that thinnes of the Air proceed from the heat of the Sun, or from the North winde and cold. Therefore at *Paris*, where naturally, and also through the abundance of filth that is about the Citie, the Air is dark and gross, the pestilent infection is less fierce and contagious then it is in *Provinces*, for the subtilitie of the Air stimulates or helps forward the Plague.

But this disease is mortal and pernicious wheresoever it bee, becaus it suddenly assaulteth the heart, which is the Mansion, or as it were the fortress or castle of life: but commonly not before the signs and tokens of it appear on the bodie: and yet you shall scarce finde a man that thinketh of calling the Physician to help to preserv him from so great danger before the signs thereof bee evident to bee seen and felt: but then the heart is assaulted. And when the heart is so assaulted, what hope of life is there, or health to bee looked for.

What effects fear and confidence produce in the Plague.

Therefore becaus medicines com' oft-times too late, and this maladie is as it were a sudden and winged messenger of our death, it commeth to pas that so manie die thereof. And moreover, becaus of the first suspicion of this so dire and cruel a disease, the imagination and minde (whose force in the diversly much stirring up of the humors is great & almost incredible) is so troubled with fear of imminent death, and despair of health, that together with the perturbed humors, all the strength and power of nature falleth and sinketh down.

This you may perceiv and know, by reason that the keepers of such as are sick, and the bearers which are not fearfull, but verie confident, although they do all the basest offices which may bee for the sick, are commonly not infected, and seldom die thereof if infected.

CHAP. XVIII.

How a pestilent fever com's to bee bred in us.

THe Plague oft-times findeth fuel in our bodies, and oftimes allurements, to wit the putrefaction of humors, or aptnes to putrefie: but it never thenot hath its first originall, for that com's alwaies from the defiled air; therefore a pestilent fever is thus bred in us: The pestilent Air drawn by inspiration into the lungs and transpiration into the utmost mouths of the veines and arteries spread over the skin, the blood or elst the humors alreadie putrefying or apt to putrefie therein, are infected and turned into a certain kinde of malignitie resembling the nature of the agent. These humors, like unquench't lime when it is first sprinkled with water, send forth a putrid vapor, which carried to the principal parts and heart especially, infecteth the spirituous blood boiling in the ventricles thereof, and therewith also the vitall spirits; and hence proceed's a certain feverish heat. This heat diffused over the bodie by the arteries, together with a malign qualitie, taint's all, even the solid parts of the bones with the pestiferous venom; and besides, causseth divers symptoms, according to the nature thereof, and the condition of the bodie and the humors wherein it is. Then is the conflict of the malignitie assailing, and nature defending, manifest; in which if nature prevail, it, using the help of the expulsive faculdie, will send and drive it far from the noble parts, either by sweats, vomits, bleeding, evacuation by stool or urine, buboes, carbuncles, pustles, spots, and other such kindes of breakings out over the skin. But on the contrarie, if the malignitie prevail, and nature bee too weak, and yeeld, and that first hee bee troubled with often panting or palpitation of the heart; then presently after with frequent faintings, the patient then at length will die. For this is a great sign of the Plague or a pestilent fever, if presently at the first, with no labor, nor anie evacuation worth the speaking of, their strength fail them, and they becom exceeding faint. You may finde the other signs mentioned in our preceding discours.

The original of the Plague alwaies from the Air.

Signs that nature is orecom.

CHAP.

CHAP. XIX.

Into what place the Patient ought to betake himſelf ſo ſoon as hee finde's himſelf infected.

WEe have ſaid that the perpetual and firſt original of the peſtilence commeth of the Air, therefore ſo ſoon as one is blaſted with the peſtiferous Air, after hee hath taken ſom preſervative againſt the malignitie thereof, hee muſt withdraw himſelf into ſom wholeſom Air, that is, clean and pure from any venemous infection or contagion; for there is great hope of health by the alteration of the Air; for wee do moſt frequently and abundantly draw in the Air of all things, ſo that wee cannot want it for a minute of time: therefore of the Air that is drawn in dependeth the correction, amendment, or increaſ of the poiſon or malignitie that is received, as the Air is pure, ſincere, or corrupted. Change of the Air conduceth to the cure of the Plague.

There bee ſom that do think it good to ſhut the patient in a cloſe chamber, ſhutting the windows to prohibit the entrance of the Air as much as they are able: But I think it more convenient that thoſe windows ſhould bee open from whence that winde bloweth that is directly contrarie unto that which brought in the venemous Air: For although there bee no other cauſ, yet if the Air bee not mooved, or agitated, but ſhut up in a cloſe place, it will ſoon bee corrupted. Therefore in a cloſe and quiet place that is not ſubject to the entrance of the Air, I would wiſh the Patient to make winde, or to procure Air with a thick and great cloth dipped or macerated in water and vineger mixed together, and tied to a long ſtaff, that by toſſing it up and down the cloſe chamber, the winde or air thereof may cool and recreate the Patient. The Patient muſt everie daie bee carried into a freſh chamber, and the beds and the linnen cloaths muſt bee changed: there muſt alwaies bee a clear and bright fire in the patient's chamber, and eſpecially in the night, whereby the air may bee made more pure, clean, and void of nightly vapors, and of the filthie and peſtilent breath proceeding from the Patient, or his excrements. In the mean time, leſt (if it bee in hot weather) the Patient ſhould bee weakned or made more faint by reaſon that the heat of the fire doth diſperſ and waſte his ſpirits, the *floor* or ground of his chamber muſt bee ſprinkled or watered with vineger and water, or ſtrowed with the branches of Vines made moiſt in cold water, with the leavs and flowers of Water-lillies, or Poplar, or ſuch like. In the fervent heat of Summer hee muſt abſtain from Fumigations that do ſmell too ſtrongly, becauſ that by aſſaulting the head, they increaſ the pain. Air pen't up is apt to putrefie.

If the Patient could to that coſt, it were good to hang all the chamber where hee lieth, and alſo the bed, with thick or courſ linnen cloaths moiſtned in vineger and water of Roſes. Thoſe linnen cloaths ought not to bee verie white, but ſomwhat brown, becauſ much and great whiteneſs doth diſperſ the ſight, and by waſteing the ſpirits, doth increaſ the pain of the head: for which cauſ alſo the chamber ought not to bee verie lightſom.

Contrariwiſe, on the night ſeaſon there ought to bee fires and perfumes made, which by their moderate light, may moderately call forth the ſpirits.

Sweet fires may bee made of little peeces of the wood of Juniper, Broom, Aſh, Tamariſk, of the rinde of Oranges, Limmons, Cloves, Benzoin, gum-Arabick, Orris-roots, Myrrh, groſly beaten together, and laid on the burning coals put into a chafing-diſh. Truly the breath or ſmoak of the wood or berries of Juniper, is thought to drive ſerpents a great waie from the place where it is burn't. The vertue of the Aſh-tree againſt venom is ſo great, as *Pliny* teſtifieth, that a ſerpent will not com under the ſhadow thereof, no, not in the morning, nor evening, when the ſhadow of anie thing is moſt great and long, but hee will run from it. I my ſelf have prooved that if a circle or compaſs bee made with the boughs of an Aſh-tree, and a fire made in the midſt thereof, and a ſerpent put within the compaſs of the boughs, that the ſerpent will rather run into the fire then through the Aſh-boughs. The materials for ſweet fires. *Lib. 16. cap. 13.*

There is alſo another means to correct the Air: You may ſprinkle vineger of the decoction of *Rue*, *Sage*, Roſemarie, Bay-berries, Juniper-berries, *Ciperus*-nuts, and ſuch like, on ſtones or bricks red hot, and put in a pot or pan, that all the whole chamber where the patient lieth may bee perfumed with the vapor thereof.

Alſo Fumigations may bee made of ſom matter that is more groſs and clammie, that by the force of the fire the fume may continue the longer, as of *Ladanum*, Myrrh, Maſtich, Roſin, Turpentine, *Storax*, *Olibanum*, Benzoin, Bay-berries, Juniper-berries, Cloves, *Sage*, Roſemarie, and Marjarum, ſtamped together, and ſuch like. Perfumes.

Thoſe that are rich and wealthie may have Candles and Fumes made of wax, or Tallow mixed with ſom ſweet things. Sweet candles.

A ſponge macerated in vineger of Roſes, and Water of the ſame, and a little of the decoction of Cloves, and of Camphire added thereto, ought alwaies to bee readie at the patient's hand, that by often ſmelling unto it, the animal ſpirits may bee recreated and ſtrengthned.

The water following is verie effectual for this matter. Take of Orris four ounces; of Zedoarie, Spikenard, of each ſix drams; of *Storax*, Benzoin, Cinnamon, Nutmegs, Cloves, A ſweet water to ſmell to.

of

of each one ounce and a half; of old Treacle, half an ounce: bruiſ them into groſs powder, and macerate them for the ſpace of twelv hours in four pound of white and ſtrong wine; then diſtill them in a Limbeck of glaſs on hot aſhes, and in that liquor wet a ſponge, and then let it bee tied in a linnen cloth, or cloſed in a box, and ſo often put into the noſtrils. Or take of the vineger and water of Roſes, of each four ounces; of Camphire, ſix grains; of Treacle, half a dram: let them bee diſſolved together, and put into a vial of glaſs, which the patient may often put into his noſe.

A *Nodula* to ſmell to.

This *Nodula* following is more meet for this matter. Take of Roſe-leavs, two pugils; of Orris, half an ounce; of *Calamus aromaticus*, Cinnamon, Cloves, of each two drams; of Storax and Benzoin, of each one dram and a half; of *Cyperus*, half a dram; beat them into a groſs powder, make thereof a *Nodula* between two peeces of Cambrick or Lawn of the bigneſs of an hand-ball, then let it bee moiſtned in eight ounces of Roſe-water, and two ounces of Roſe-vineger, and let the patient ſmell to it often. Thoſe things muſt bee varied according to the time: For in the Summer you muſt uſe neither Musk nor Civet, nor ſuch like hot things: and moreover women that are ſubject to *fits* of the *Mother*, and thoſe that have Fevers or the head-ach, ought not to uſe thoſe things that are ſo ſtrong ſmelling and hot, but you muſt make choice of things more gentle: Therefore things that are made with a little Camphire and Cloves bruiſed and macerated together in Roſe-water and vineger of Roſes, ſhall bee ſufficient.

CHAP. XX.

What Diet ought to bee obſerved, and firſt of the choice of Meat.

THe order of Diet in a peſtilent diſeaſ ought to bee cooling and drying; not ſlender, but ſomwhat full; Becauſ by this kinde of diſeaſ there commeth waſteing of the ſpirits, and exſolution of the faculties, which inferreth often ſwounding, therefore that loſs muſt bee repaired as ſoon as may bee with more quantitie of meats that are of eaſie concoction and digeſtion. Therefore I never ſaw anie bee-

Why ſuch as have the plague may feed more fully.

ing infected with the peſtilence that kept a ſlender diet, that recovered his health, but died; and few that had a good ſtomach, and fed well, died.

Sweet, groſs, moiſt and clammie meats, and thoſe which are altogether, and exquiſitely of ſubtil parts, are to bee avoided; for the ſweet do eaſily take fire, and are ſoon inflamed; the moiſt will putrefie; the groſs and clammie obſtruct, and therefore engender putrefaction; thoſe meats that are ſubtil parts, over-much attenuate the humors, and inflame them; and do ſtir up hot and ſharp vapors into the brain, whereof commeth a Fever. Therefore wee muſt eſchew Garlick and Onions, Muſtard, ſalted and ſpiced Meats, and all kinde of Pulſ muſt alſo bee avoided, becauſ they engender groſs windes, which are the autors of obſtruction: but the decoction of them is not alwaies to bee refuſed, becauſ it's a provoker of urine.

Pulſ muſt bee ſhunned.

The manner of Diet.

Therefore let this bee their order of diet: let their bread bee of Wheat or Barlie, well wrought, well leavened and ſalted, neither too new, nor too ſtale: let them bee fed with ſuch meat as may bee eaſily concocted and digeſted, and may engender much laudable juice, and verie little excremental, as are the fleſh of Wether-Lambs, Kids, Leverets, Pullets, Partridges, Pigeons, Thruſhes, Larks, Quails, Black-Birds, Turtle-Doves, Moor-Hens, Phesants, and ſuch like; avoiding water-Fowls. Let the fleſh bee moiſtned in Ver-juice of unripe Grapes, Vineger, or the juice of Limmons, Oranges, Citrons, tart-Pomgranats, Barberries, Gooſ-berries, or red Currance, or of garden and wilde-ſorrel: for all theſe ſowr things are verie wholſom in this kinde of diſeaſ, for they do ſtir up the appetite, reſiſt the venemous qualitie and putrefaction of the humors, reſtrain the heat of the Fever, and prohibit the corruption of the meats in the ſtomach. Although that thoſe that have a more weak ſtomach, and are endued with a more exact ſenſ, and are ſubject to the Cough and diſeaſes of the Lungs, muſt not uſe theſe, unleſs they bee mixed with Sugar and Cinnamon.

If the patient at anie time bee fed with ſodden meats, let the brothes bee made with Lettuce, Purſlain, Succorie, Borage, Sorrel, Hops, Bugloſs: Creſſes, Burnet, Marigolds, Chervil, the cooling Seeds, French-Barlie and Oat-meal, with a little Saffron, for Saffron doth engender manie ſpirits, and reſiſteth poiſon. To theſe opening roots may bee added to avoid obſtruction; yet much broth muſt bee refuſed by reaſon of moiſture. The fruit of Capers eaten at the beginning of the Meal provoke the appetite, and prohibit obſtructions; but they ought not to bee ſeaſoned with over-much oil and ſalt, that they may alſo with good ſucceſs bee put into broths.

Fiſhes are altogether to bee avoided, becauſ they ſoon corrupt in the Stomach: but if the patient bee delighted with them, thoſe that live in ſtonie places muſt bee choſen; that is to ſay, thoſe that live in pure and ſandie water, and about rocks and ſtones, as are Trouts, Pikes, Pearches, Gudgeons and Creviſes boiled in milk, Wilks, and ſuch like. And concerning Seafiſh, he may bee fed with Giltheads, Gurnards, with all the kindes of Cod-fiſh, Whitings not ſeaſoned with ſalt, and Turbuts.

Eggs

Eggs potched and eaten with the juice of Sorrel, are verie good. Likewise Barlie-water seasoned with the grains of a tart Pomgranat, and if the Fever bee vehement, with the seeds of white Poppie. Such barlie-water is easie to bee concocted and digested, it cleanseth greatly, and moistens and mollifieth the bellie. But in somit procure's an appetite to vomit, and pain of the head, and those must abstain from it. But in stead of Barlie-water they may use pap, and bread crummed in the decoction of a Capon.

For the second course, let him have raisins of the Sun newly sodden in Rose-water with Sugar, sowr Damask-Prunes, tart Cherries, Pippins and Katharine-Pears. For the second course.

And in the later end of the *Meal*, Quinces roasted in the embers, Marmalate of Quinces, and conserves of Bugloss or of Roses, and such like, may bee taken: or elss this powder following. In the end of the *Meal*.

Take of Coriander-seeds prepared, two drams; of Pearl, Rose-leavs, shavings of Harts-horn and Ivorie, of each half a dram; of Amber, two scruples; of Cinnamon one scruple; of Unicorn's horn, and the bone in a Stagg's heart, of each half a scruple; of Sugar of Roses, four ounces: make thereof a powder, and use it after meats.

If the patient bee found the weak, hee must bee fed with Gellie made of the flesh of a Capon, and Veal sodden together in the water of Sorrel, *Cardus Benedictus*, with a little quantitie of Rose-vineger, Cinnamon, Sugar, and other such like, as the present necessitie shall seem to require.

In the night season for all events and mischances, the patient must have readie-prepared broth of meats of good digestion, with a little of the juice of Citrons or Pomgranats.

This restaurative that followeth may serve for all. Take of the *conserv* of Bugloss, Borage, Violets, Water-lillie, and Succorie, of each two ounces; of the powder of the Electuarie *Diamargaritum frigidum*, of the Trochisces of Camphir, of each three drams; of Citron-seeds, *Carduus*-seeds, Sorrel-seeds, the roots of *Dittamus*, Tormentil, of each two drams; of the broth of a young Capon, made with Lettuce, Purslain, Bugloss and Borage, boiled in it, six pintes; put them in a Limbeck of glass with the flesh of two Pullets, of so many Partridges, and with fifteen leavs of pure Gold: make thereof a distillation over a soft fire. Then take of the distilled liquor, half a pinte, strain it through a woollen bag, with two ounces of white Sugar, and half a dram of Cinnamon: Let the patient use this when hee is thirstie. Or elss put the flesh of one old Capon, and of a leg of Veal, two minced Partridges, and two drams of whole Cinnamon without anie liquor, in a Limbeck of glass, well luted and covered, and so let them boil in *Balneo Mariæ* unto the perfect concoction. For so the flesh will bee boiled in their own juice, without anie hurt of the fire; then let the juice bee pressed out there-hence with a Press: give the patient for everie dose, one ounce of the juice with som cordial waters, som *Trisantalon*, and *Diamargaritum frigidum*. A restaurative drink.

The *conservs* of sweet fruits are to bee avoided, becaus that sweet things turn into choler but the confection of tart prunes, Cherries, and such like may bee fitly used. But becaus there is no kinde of sickness that so weaken's the strength, as the plague; it is alwaies necessarie, but yet sparingly and often, to feed the patient, still haveing respect unto his custom, age, the region, and the time: for through emptines there is great danger, lest that the venemous matter that is driv'n out to the superficiall parts of the bodie, should bee called back into the inward parts, by an hungrie stomach, and the stomach it self should be filled with cholerick, hot, thin, and sharp excremental humors, whereof commeth biteing of the stomach, and gripeings in the guts.

CHAP. VII.

What drink the patient infected ought to use.

IF the fever bee great and burning, the patient must abstain from wine, unless that hee bee subject to swounding: and hee may drink the *Oxymel* following in stead thereof.

Take of fair water, three quarts; wherein boil four ounces, of honie untill the third part bee consumed, scumming it continually; then strain it, and put it into a clean vessel, and add thereto four ounces of vineger, and as much cinnamon as will suffice to give it a tast. Or elss a sugred water, as followeth. Take two quarts of fair water, of hard sugar, six ounces, of cinnamon, two ounces, strain it through a woollen bag or cloth without anie boiling; and when the patient will use it, put thereto a little of the juice of Citrons. The syrup of the juice of Citrons excelleth amongst all others that are used against the pestilence. An *Oxymel*.

The use of the Julip following is also verie wholsom. Take of the juice of Sorrel well clarified, half a pinte; of the juice of Lettuce so clarified, four ounces; of the best hard sugar, one pound; boil them together to a perfection; then let them be strained & clarified, adding a little before the end a little vineger, and so let it be used between meals with boiled water, or with equal portions of the water of Sorrel, Lettuce, Scabious and Bugloss: or take of this A Julip.

former

mer described Julip strained and clarified four ounces; let it bee mixed with one pound of the fore-named cordial waters, and boil them together a little. And when they are taken from the fire, put thereto of yellow Sanders one dram; of beaten Cinnamon half a dram; strain it through a cloth: when it is cold, let it bee given the patient to drink with the juice of Citrons.

Those that have been accustomed to drink sider, perrie, beer or ale, ought to use that drink still, so that it it bee clear, transparent, and thin, and made of those fruits that are somwhat tart; for troubled and dreggish drink doth not onely engender gross humors, but also crudities, windiness, and obstructions of the first *region* of the bodie, whereof com's a fever.

The commodities of oxycrate.

Oxycrate beeing given in manner following, doth asswage the heat of the fever, and repress the putrefaction of the humors, and the fierceness of the venom, and also expelleth the water through the veins, if so bee that the patients are not troubled with spitting of blood, cough, yexing, and altogether weak of stomach. for such must avoid tart things.

To whom hurtfull.

Take of fair water, one quart; of white or red vineger three ounces; of fine sugar, four ounces; of syrup of Roses, two ounces: boil them a little, and then give the patient thereof to drink. Or take of the juice of Limons and Citrons, of each half an ounce; of the juice of sowr Pomgranats, two ounces; of the water of Sorrel and Roses, of each an ounce; of fair water boiled, as much as shall suffice: make thereof a Julip, and use it between meals. Or take the syrup of Limmons and of red currance, of each one ounce; of the water of lillies, four ounces; of fair water boiled, half a pinte; make thereof a Julip. Or take of the syrups of water-Lillies and vineger, of each half and ounce; dissolv it in five ounces of the water of Sorrel; of fair water one pinte: make thereof a Julip.

The drinking of cold water to whom and when profitable.

But if the patient bee young, and have a strong and good stomach, and cholerick by nature, I think it not unmeet for him to drink a full & large draught of fountain-water cold; for that is effectual to restrain and quench the heat of the Fever; and contrariwise, they that drink cold water often, and a verie small quantitie at a time, as the Smith doth sprinkle water on the fire at his Forge, do increas the heat and burning, and thereby make it endure the longer. Therefore by the judgment of *Celsus*, when the disease is in the chief increas, and the patient hath endured thirst for the space of three or four daies, cold water must bee given unto him in great quantitie, so that hee may drink past his satietie, that when his bellie and stomach are filled beyond measure, and sufficiently cooled, hee may vomit.

Lib. 3. cap. 7.

Som do not drink so much thereof as may cause them to vomit, but do drink even unto satietie, and so use it for a cooling medicine; but when either of these is don, the patient must bee covered with manie cloaths, and so placed that hee may sleep; and for the most part after long thirst and watching, and after long fulness, and long, and great heat, sound sleep commeth; by which great sweat is sent out, and that is a present help.

But thirst must sometimes bee quenched with little pieces of Melons, Gourds, Cucumbers, with the leav's of Lettuce, Sorrel, and Purslain, made moist or soaked in cold water, or with a little square piece of a Citron, Limmon, or Orange macerated in Rose-water, and sprinkled with Sugar, and so held in the mouth, and then changed.

But if the patient bee aged, his strength weak, flegmatick by nature, and giv'n to wine, when the state of the Fever is somwhat past, and the chief heat beginning to asswage, hee may drink wine verie much allayed at his meat; for to restore his strength, and to supplie the want of the wasted spirits. The patient ought not by anie means to suffer great thirst, but must mitigate it by drinking, or elss allay it by washing his mouth with oxycrate and such like; and hee may therein also wash his hands and his face, for that doth recreate the strength. If the flux or lask trouble him, hee may verie well use to drink steeled water, and also boiled milk, wherein manie stones comming red hot out of the fire have been manie times quenched.

For drieness or roughness of the mouth.

For the drieness and roughness of the mouth, it is verie good to have a cooling, moistening & lenifying lotion of the mucilaginous water of the infusion of the seeds of Quinces, *psilium*, *id est*, Flea-wurt, adding thereto a little Camphir, with the Water of Plantain and Roses; then cleans and wipe out the filth, and then moisten the mouth, by holding therein a little oil of sweat Almonds mixed with a little syrup of Violets. If the roughness breed or degenerate into ulcers, they must bee touched with the water of the infusion of *sublimate*, or *Aqua fortis*.

For the Ulcers thereof.

But becaus wee have formerly made frequent mention of drinking of water, I have here thought good to speak somwhat of the choice and goodness of waters. The choice of waters is not to bee neglected, becaus a great part of our diet depend's thereon; for besides that wee use it either alone, or mixed with wine for drink, wee also knead bread, boil meat, and make broths therewith. Manie think that rain-water which falls in summer, and is kept in a cistern well placed and made, is the wholesomest of all. Then next thereto they judge that spring water which run's out of the tops of mountains, through rocks, cliffs & stones: in the third place they put Well-water, or that which riseth from the foots of hils. Also the river-water is good that is taken out of the mid'st or stream. Lake or pond-water is the worst, especially if it stand still for such is fruitfull of and stored with manie venomous creatures, as Snakes, Toads, and the like. That which com's by the melting

The choice of waters.

melting of Snow and Ice is verie ill, by reason of the too refrigerateing faculti and earthlie nature. But of spring and Well-waters these are to bee judged the best, which are insipid, without smell, and colour; such as are clear, warmish in winter, and cold in summer, which are quickly hot, and quickly cold, that is, which are most light, in which all manner of pulse, turnips, and the like, are easily and quickly boiled. Lastly, when as such as usually drink thereof, have cleare voices and shrill, their cheeks sound, and a livelie and fresh colour in their face.

Hip. lib. 3. aphor. 26.

CHAP. XXII.

Of Antidotes to bee used in the Plague.

NOw wee must treat of the proper cure of this disease, which must bee used as soon as may bee possible, becaus this kinde of poison in swiftnes exceedeth the celeritie of the medicine. Therefore it is better to err in this, that you should think every disease to bee pestilent in a pestilent season, and to cure it as the Pestilence; becaus that so long as the air is polluted with the seeds of the Pestilence, the humors in the bodie are soon infected with the vicinitie of such an air, so that there happeneth no disease void of the Pestilence, that is to say, which is not pestilent from the beginning by his owne nature, or which is not made pestilent.

Many begin the cure with blood-letting, some with purgeing, and some with Antidotes. Wee, taking a consideration of the substance of that part that is assaulted, first of all begin the cure with an Antidote; becaus that by its specifick properetie, it defends the heart from poison, as much as it is offended therewith. Although there are also other Antidotes which preserv and keep the heart and the patient from the danger of Poison and the Pestilence, not onely becaus they do infringe the power of the poison in their whole substance, but also becaus they drive and expel it out of all the bodie by sweat, vomiting, scouring, and such other kindes of evacuations.

The beginning of the cure must bee by Antidotes.

The Antidote must bee give'n in such a quantitie as may bee sufficient to overcom the poison; but becaus it is not good to use it in greater quantitie than needeth, left it should overthrow our nature, for whose preservation onely it is used; therefor that which cannot bee taken together at once, must bee taken at several times, that som portion thereof may daily bee used so long, untill all the accidents, effects and impressions of the poison bee past; and that there bee nothing to bee feared. Som of those Antidotes consist of portions of venemous things, being tempered together, and mixed in an apt proportion with other medicines, whose power is contrarie to the venom: as Treacle, which hath for an ingredientie the flesh of Vipers, that is being thereto mixed may serv as a guide to bring all the Antidote unto the place where the venenate malignitie hath made the chief impression; becaus by the similitude of nature and sympathie, one poison is suddenly snatched and carried into another. There are other absolutely poisonous; which nevertheless are Antidotes, the one unto another: as a Scorpion himself cureth the prick of a Scorpion. But Treacle and Mithridate excel all other Antidotes: for by strengthening the noblest part, and the mansion of life, they repair and recreate the wasted Spirits, and overcom the poison, not onely being taken inwardly, but also applied outwardly to the region of the heart, Boches and Carbuncles: for by an hidden properetie they draw the poisons unto them, as Amber doth Chaff, and digest it when it is drawn, and spoil and robbe of all its deadlie force; as it is declared at large by *Galen*, in his book *de Theriaca ad Pisonem* by most true reasons and experiments. But you will say that these things are hot, and this the plague is often accompanied with a burning fever. But thereto I answer, there is not so great danger in the fever, as in the pestilence, although in the giveing of Treacle, I would not altogether seem to neglect the fever, but think it good to minister or applie it mixed with cordial-cooling medicines, as with the Trochisks of Camphir, syrup of Limmons, of water-Lillies, the water of Sorrel, and such like. And for the same cause wee ought not to chuse old Treacle, but that which is of a middle age, as of one or two years old: to those that are strong, you may give half a dram; and so those that are more weak, &c. [illegible]

In what quantitie they must bee taken.

Why poisonous things are put into Antidotes.

Som poisons Antidotes to other-som.

The patient ought to walk presently after he hath taken Treacle, Mithridate, [illegible] other Antidotes; but yet as moderately as he can: not like unto mimes, which when they perceiv the spirits to bee subsided, do not cease to caper and run up and down, untill they have no strength to sustain their bodies; for so they dissolv nature, so that it cannot suffice to overcom the contagion. After moderate walking, the patient must bee put warm to bed, and covered with manie cloaths, and warm bolsters or tiles applied to the soles of his feet; or in stead thereof you may use swines bladders filled with hot water, and applie them to the groins and arm-holes, to provoke sweat: for sweating in this disease is a most excellent remedie, both for to overcom the humors in the fever, and also to drive forth the malignitie in the pestilence, although manie times being not fit for the state of health. [illegible]

Repercussives not to bee applied to Carbuncles.

Agricola

Agricola ſaith, that hee ſaw a woman at *Miſnia* in Germanie, that did ſweat ſo for the ſpace of three daies, that the blood came forth at her head and breaſt, and yet nevertheleſs ſhee died.

A ſudorifick potion.

This potion following will provoke ſweat. Take the roots of China ſhaved in thin pieces one ounce and half; of *Guaicum* two ounces; of the bark of Tamarisk one ounce; of Angelica-roots two drams; of the ſhavings of Hartſ-horn one ounce; of Juniper-berries three drams; put them into a vial of glaſs that will contain ſix quarts, put thereto four quarts of running or river-water that is pure and clear, macerate them for the ſpace of one whole night on the aſhes: and in the morning boil them all in *Balneo Mariæ*, untill the half bee conſumed, which will bee don in the ſpace of ſix hours; then let them bee ſtrained through a bag, and then ſtrained again, but let that bee with ſix ounces of ſugar of Roſes, and a little Treacle: let the patient take eight ounces or fewer of that liquor, and it will provoke ſweat.

A ſudorifick powder.

The powder following is alſo verie profitable. Take of the leav's of *Dictamnus*, the roots of Tormentil, Betonie, of each half an ounce; of Bole-Armenick prepared one ounce; of *Terra Sigillata* three drams; of Aloës and Myrrh, of each half a dram; of Saffron one dram; of Maſtich two drams: powder them all according to art, and give one dram thereof diſſolved in Roſe-water, or the water of wilde-ſorrel, and let the patient walk ſo ſoon as hee hath taken that powder; then let him bee laid in his bed to ſweat as I have ſhewed before.

A diſtilled water againſt the Plague.

The water following is greatly commended againſt poiſon. Take the roots of *Gentian* and *Cyperus*, of each three drams; of *Cardium benedictus*, Burnet, of each one handful; of Sorrel-ſeeds and Divels-bit, of each two pugils; of Ivie and Juniper-berries, of each half an ounce; of the flowers of Bugloſs, Violets, and red-Roſes, of each two pugils; powder them ſomwhat groſly; then ſoak or ſteep them for a night in white wine and Roſe-water: then add thereto of Bole-Armenick one ounce; of Treacle half an ounce; diſtill them all in *Balneo Mariæ*, and keep the diſtilled liquor in a vial of glaſs well covered or cloſe ſtopped for your uſe: let the patient tak ſix ounces thereof with Sugar and a little Ginnamon and Saffron: then let him walk, and then ſweat as is aforeſaid: the treacle and cordial-water formerly preſcribed, are verie profitble for this purpoſe. Alſo the the water following is greatly commended.

Another.

Take of Sorrel ſix hand-fuls; of *Rue* one handful: drie them and macerate them in vineger for the ſpace of four and twentie hours, adding thereto four ounces of Treacle: make thereof a diſtillation in *Balneo Mariæ*, and let the diſtilled water bee kept for your uſe; and ſo ſoon as the patient doth think himſelf to bee infected; let him take four ounces of that liquor, then let him walk and ſweat. Hee muſt leav ſweating when hee beginneth to wax faint and weak; or when the humor that run's down his bodie begin's to wax cold; then his bodie muſt bee wiped with warm cloaths, and dried. The patient ought not to ſweat with a full ſtomach; for ſo the heat is called away from performing the office of concoction: alſo hee muſt not ſleep when hee is in his ſweat; leſt the malignitie go inwardly with the heat and ſpirits unto the principal parts: but if the patient bee much inclined to ſleep, hee muſt bee kept from it with hard rubbing, and bands tied about the extreme parts of his bodie, and with much noiſ of thoſe that are about him, and let his friends comfort him with the good hope that they have of his recoverie; but if all this will not keep him from ſleep, diſſolv *Caſtoreum* in tart vineger, and *aqua vitæ*, and let it bee injected into his noſtrils: and let him bee kept continually wakeing the firſt day, and on the ſecond and third, even unto the fourth; that is to ſay, unto the perfect expulſion of the venom; and let him not ſleep above three or four hours on a daie and a night. In the mean time let the Phyſician that ſhall bee preſent conſider all things by his ſtrength: for it is to bee feared, that great watchings will diſſolv the ſtrength, and make the patient weak: you muſt not let him eat within three hours after his ſweating; in the mean ſeaſon, as his ſtrength ſhall require, let him take the rinds of a *preſerved* Citron, *conſerv* of Roſes, bread toſted and ſteeped in wine, the meat of *preſerved* Myrabolane, or ſom ſuch like thing.

What mean to bee uſed in ſweating.

CHAP. XXIII.

Of Epithems to bee uſed for the ſtrengthening of the principal parts.

Whereof they muſt bee made.

THere are alſo ſom topick medicines to bee reckoned amongſt Antidotes, which muſt bee outwardly applied as ſpeedily as may bee, as cordial and hepatick Epithems for the ſafetie of the noble parts, and ſtrengthening of the faculties, as thoſe that drive the venenate air far from the bowels: they may bee made of cordial things not only hot, but alſo cold, that they may temper the heat, and more powerfully repercuſs. They muſt bee applied warm with ſcarlet, or a double linnen cloth, or a ſoft ſponge dipped in them, if ſo bee that a Carbuncle do not poſſeſs the regions of the moſt noble parts; for it is not fit to uſe repercuſſives to a Carbuncle.

Repercuſſives not fit to bee applied to Carbuncles.

You may make Epithems after the following forms; R. *aquæ roſ. plantag. & ſolan. an.* ℥iv. *aquæ acetoſ. vini grauati & aceti, an* ℥iii. *ſantal. rub. & corall. rub. pulveriſ. an* ℥iii. *theriac. vet.* ℥ß. *camph.* ℈ii. *troci* ℈iiii. ℈ß. *miſce, fiat epithema.* Or elſ, R. *aquæ roſ. & plantag. an* ℥ß. *aceti*

acet. roſ. ℥iv. caryoph. ſant. rub. coral. rub. pulveriſ. pul. diamargarit. frigid. an. ℥iß. *caphuræ maſchi an.* ℈i. *fiat epithema.* Or, ℞. *aquar. roſar. & meliſſæ, an.* ℥iv. *aceti roſ.* ℥iii. *ſant. rub.* ℥i. *caryophil.* ℥ß. *croco* ℈ii. *caphuræ* ℈i. *boli arm. terræ ſigil. & xedoar. an.* ʒi. *fiat epithema.* Or elſ, ℞. *aceti roſ. & aquæ roſat. an.* ℔ß. *caphuræ* ℥ß. *theriac. & mithridat. an.* ʒi. *fiat epithema.* Or elſ, *aqu. roſar. nenuph. bugloſ. acetoſæ, aceti roſar. an.* ℔ß. *ſant. rub. roſ. rub. an.* ℥iii. *flor. nenuph. violar. caphur. an.* ℥ß. *methridat. & theriac an.* ℥ii. *teraatur & miſceantur ſimul omnia.* When you intend to uſe them, take ſom portion of them in a veſſel by its ſelf, wherewith let the affected bowel bee fomented warm.

CHAP. XXIV.

Whether purgeing and blood-letting bee neceſſarie in the beginning of peſtilent diſeaſes.

SO ſoon as the heart is ſtrengthened and corroborated with cordials and antidotes, wee muſt com to phlebotomie and purgeing. As concerning blood-letting in this caſe there is a great controverſie among Phyſicians. Thoſe that wiſh it to bee uſed, ſay or affirm that the peſtilent Fever doth infix it ſelf in the blood, and therein alſo the peſtilent malignitie taketh its ſeat; and therefore it will ſoon infect the other humors, unleſs that the blood bee evacuated, and the infection that remaineth in the blood bee thereby taken away. Contrariwiſe, thoſe that do not allow phlebotomie in this caſe, alledg, that it often commeth to paſs that the blood is void of malignitie when the other humors are infected with the venemous contagion. If anie man require my judgment in this doubtful queſtion, I ſay, that the peſtilence ſomtimes doth depend on the default of the Air: this default beeing drawn through the paſſages of the bodie, doth at length pierce unto the intrails, as wee may underſtand by the abſceſſes which break out one while behinde the ears, ſomtimes in the arm-holes, and ſomtimes in the groins, as the brain, heart or *liver* are infected. And hereof alſo com Carbuncles, and other collections of matter, and eruptions, which are ſeen in all parts of the bodie; by reaſon that nature uſeing the ſtrength of the expulſive faculties, doth drive forth whatſoever is noiſom or hurtful. Therefore if the Phyſician will follow this motion of nature, hee muſt neither purge nor *let* blood, leſt that by a contrarie motion, that is, by drawing in from without, the motion of nature which proceeds outwardly from within, ſhould bee troubled. So wee often ſee in thoſe who are purged or *let* blood for ſuch Buboes as com through unlawful copulation, that the matter is thereby made contumacious, and by drawing it inwardly, it ſpeedily cauſſeth the French Pocks.

Reaſons for and againſt blood-letting in the Plague.

The compoſing of this controverſie

Wherefore, when Buboes, Carbuncles, and other peſtilent eruption appear, which com through the default of the air, wee ought to abſtain from purgeing and phlebotomie; but it is ſufficient to fore-arm the heart inwardly and outwardly with Antidotes that are endued with a proper virtue of reſiſting the poiſon. For it is not to bee doubted, but that when nature is debilitated with both kindes of evacuation, and when the ſpirits together with the blood are exhauſted, the venemous air will ſoon pierce, and bee received into the emptie bodie, where it exerciſeth its tyrannie to the utter deſtruction thereof.

An hiſtorie.

In the year of our Lord God 1566. in which year there was greaat mortalitie throughout all France, by reaſon of the peſtilence and peſtilent diſeaſes, I earneſtly and diligently inquired of all the Phyſicians and Chyrurgians of all the Cities (through which King *Charls* the Ninth paſſed in his progreſs unto *Bayon*) what ſucceſs their patient had after they were *let* blood and purged; whereunto they all anſwered alike, that they had diligently obſerved, that all that were infected with the Peſtilence, and were *lett* bleed ſom quantitie of blood, or had their bodies ſomwhat ſtrongly purged, thenceforwards waxed and weaker, and ſo at length died; but others which were not *let* blood nor purged, but took cordial Antidotes inwardly, and applied them outwardly, for the moſt part eſcaped and recovered their health: for that kinde of Peſtilence took its original of the primitive and ſolitarie default of the Air, and not of the corruption of the humors.

When purging and bleeding may bee uſed.

The like event was noted in the hoarſneſs that wee ſpake of before: that is to ſay, that the patients waxed worſt and worſt by purgeing and phlebotomie; but yet I do not diſallow either of theſe remedies, if there bee great fulneſs in the bodie, eſpecially in the beginning, and if the matter have a cruel violence, whereof may bee feared the breaking in unto ſom noble part. For wee know that it is confirmed by *Hippocrates*, that what diſeaſ ſoever is cauſſed by repletion, muſt bee cured by evacuation; and that in diſeaſes that are verie ſharp, if the matter do ſwell, it ought to be remedied the ſame day, for delaie in ſuch diſeaſes is dangerous; that ſuch diſeaſes are not cauſſed or inflicted upon man's bodie by reaſon or occaſion of the peſtilence, but of the diſeaſed bodies, and diſeaſes themſelvs commixed together with the peſtilence: therefore then peradventure it is lawful to purge ſtrongly, and to *let* a good quantitie of blood, leſt that the peſtilent venom ſhould take hold of the nourſhing that is prepared, and ſo infect it with a contagion, whereby the peſtilence taketh

Aph. 22. *ſect.* 2.
Aph. 10. *ſect.* 4.

Cap. 7. lib. 3. taketh new and for greater ſtrength; eſpecially as *Celſus* admoniſheth us, where hee ſaith, that, by how much the ſooner thoſe ſudden invaſions do happen, by ſo much the ſooner remedies muſt bee uſed, yea or rather raſhly applied; therefore if the veins ſwell, the face wax fierie red; if the arteries of the *temples* beat ſtrongly; if the patient can verie hardly breath by reaſon of a weight in his ſtomach; if his ſpittle bee bloodie; then ought hee to bee let blood without delaie, for the cauſſes before-mentioned. It ſeem's beſt to open the *Liver*-vein on the left arm, whereby the heart and ſpleen may bee better diſcharged of their abundant matter; yet blood-letting is not good at all times, for it is not expedient when the bodie beginneth to wax ſtiff by reaſon of the comming of a Fever; for then by drawing back the heat and ſpirits inwardly, the outward parts beeing deſtitute of blood, wax ſtiff and cold; therefore blood cannot bee letten then without great loſs of the ſtrength, and perturbation of the humors. And it is to bee noted, that when thoſe plethorick cauſes are preſent, there is one Indication of blood-letting in a ſimple peſtilent Fever, and another in that which hath a *Bubo, id eſt*, a Botch or a Carbuncle joined therewith. For in one or both of theſe, beeing joined with a vehement and ſtrong burning Fever, blood muſt bee letten by opening the vein that is neareſt unto the tumor or ſwelling againſt nature, keeping the ſtraightneſs of the *fibres*, that this beeing open, the blood might bee drawn more directly from the part affected; for all and everie retraction of putrefied blood unto the noble parts, is to bee avoided, becauſ it is noiſom and hurtful to nature, and to the patient. Therefore, for example ſake, admit the patient bee plethorick by repletion; which is called *Ad Vaſa, id eſt*, unto the Veſſels, and *Ad Vires, id eſt*, unto the Strength: and therewithal hee hath a tumor that is peſtilent in the parts belonging unto head or neck; the blood muſt bee *let* out of the cephalick or median vein, or out of one of their branches diſperſed in the arm on the grieved ſide. But if through occaſion of fat, or anie other ſuch like cauſ, thoſe veins do not appear in the arm, there bee ſom that give counſel in ſuch a caſe to open the vein that is between the fore-finger and the thumb, the hand beeing put into warm water, whereby that vein may ſwell and bee filled with blood gathered thither by means of the heat.

Why blood muſt bee *let* on the left arm in the Plague.

If the tumor bee under the arm-hole, or about thoſe places, the *liver*-vein, or the median muſt bee opened which runneth along'ſt the hand: if it bee in the groin, the vein of the hamm, or *Saphena*, or anie other vein above the foot that appeareth well, but alwaies on the grieved ſide. And phlebotomie muſt bee performed before the third daie: for this diſeaſ is of the kinde or nature of ſharp diſeaſes; becauſ that within four and twentie hours it runneth paſt help. In letting of blood you muſt have conſideration of the ſtrength. You may perceiv that the patient is readie to ſwound, when that his forehead waxeth moiſt, with a ſmall ſweat ſuddenly ariſeing, by the akeing or pain at the ſtomach, with an appetite to vomit, and deſire to go to ſtool, gapeing, blackneſs of the lips, and ſudden alteration of the face unto paleneſs: and laſtly moſt certainly by a ſmall and ſlow pulſ: and then you muſt lay your finger on the vein, and ſtop it until the patient com to himſelf again, either by nature, or elſ reſtored by art; that is to ſay, by giveing unto him bread dipped in wine, or anie other ſuch like thing: then if you have not taken blood enough, you muſt let it go again, and bleed ſo much as the greatneſs of the diſeaſ, or the ſtrength of the patient will permit or require: which beeing don ſom of the Antidotes that are preſcribed before will bee verie profitable ro bee drunk, which may repair the ſtrength, and infringe the force of the malignitie.

CHAP. XXV.

Of purgeing medicines in a Peſtilent diſeaſ.

What purges fit in the Plague.

IF you call to minde the proper indications, purgeing ſhall ſeem neceſſarie in this kinde of diſeaſ, and that muſt bee preſcribed as the preſent caſe and neceſſitie requireth; rightly conſidering that the diſeaſ is ſudden, and doth acquire medicines that may with all ſpeed drive out of the bodie the hurtful humor wherein the noiſom qualitie doth lurk and is hidden; which medicines are divers by reaſon of the diverſitie of the kinde of the humor, and the condition or temperature of the patient. For this purpoſe ſix grains of Scammonie beaten into powder, or elſ ten grains are commonly miniſtred to the patient with one dram of Treacle. Alſo pils may bee made in this form: Take of Treacle and Mithridate, of each

Pils. one dram of *Sulphur vivum* finely powdred half a dram, of *Diagridium* foure grains: make thereof Pils. Or, take three drams of Aloes, of Myrrh and Saffron of each one dram, of white Hellebore and *Aſarabacca*, of each four ℈. make thereof a maſs with old treacle, and let the patient take four ſcruples thereof for a doſe, three hours before meat. Ruffus his pils may bee profitably given to thoſe that are weak. The antient Phyſicians have greatly commended Agarick for this diſeaſ, becauſ it doth draw the noiſom humors out of all the members and

and the virtues thereof are like unto those of Treacle; for it is thought to strengthen the heart, and to draw out the malignitie by purgeing. To those that are strong, the weight of two drams may bee given, and to those that are more weak, half a dram. It is better to give the infusion in a decoction, then in substance; for beeing elected and prepared truly into Trochisces, it may bee called a divine kinde of medicine.

Antimonium is highly praised by the experience of manie; but because I know the use thereof is condemned by the councel and decree of the School of Physicians at Paris, I will here ceas to speak of it.

Those medicines that caus sweats are thought to excel all others, when the Pestilence commeth of the venemous Air; among whom the efficacie of that which followeth hath been prooved, to the great good of manie in that Pestilence which was lately throughout all Germanie, as *Matthias Rodler* Chancellor to Duke *George* the Count Palatine signified unto mee by letters.

They do take a bundle of Mugwurt, and of the ashes thereof after it is burn't, they make a lee with four pintes of water; then they do set it over the fire, and boil it in a vessel of earth well leaded, until the liquor bee consumed, the earthie dregs falling into the bottom like unto salt, whereof they make Trochisces of the weight of a crown of gold; then they dissolv one or two of these Trochisces, according to the strength of the patient, in good Muskadine, and give it the patient to drink, and let him walk after that hee hath drunk it for the space of half an hour; then lay him in his bed, and there sweat him two or three hours, and then hee will vomit, and his bellie will bee loosed as if hee had taken Antimonie; and so they were all for the most part cured, especially all those that took that remedie betimes: and before the disease went to their heart; as I my self have prooved in som that were sick at Paris, with most happie success: Truely Mugwurt is highly commended by the Antient Physicians, beeing taken and applied inwardly or outwardly against the bitcings of venemous creatures; so that it is not to bee doubted but that it hath great virtue against the Pestilence. An effectual sudorifick and also purgeing medicine. The virtues of Mugwurt.

I have heard it most certainly reported by *Gilbertus Heroaldus* physician of *Mompilier*, that eight ounces of the pickle of Anchovis, drunk at one draught, is a most certain & approved remedie against the Pestilence, as hee and manie other have often found by experience For the Plague is no other thing but a verie great putrefaction; for the correction and amendment whereof, there is nothing more apt or fit then this pickle or substance of Anchovis, beeing melted by the Sun and force of the salt that is strewed thereon. There bee som which infuse one dram of Walwurt-seed in white wine, and affirm that it drunken wil perform the like effect as Antimonie. Others dissolv a little weight of the seed of *Rue* beeing bruised in Muskadine, with the quantitie of a bean of Treacle, and so drink it. Others beat or bruis an handful of the leavs or tops of Broom in half a pinte of white wine, and so give it to the patient to drink, to caus him to vomit, loos his bellie, and make him to sweat. Truly those that are wounded or bit with venemous beasts, If they binde broom above the wound, it will prohibit or hinder the venom from dispersing it self, or going anie further: therefore a drink made thereof will prohibit the venom from going anie nearer the heart. Som take of the root of Elecampane, *Gentian*, Tormentil, Kermes-berries and broom; of the powder of Ivorie and Hartes-horn, of each half a dram: they do bruis and beat all these, and infuse them for the space of four and twentie hours in white wine and *aqua vitæ* on the warm embers, and then strain it, and give the patient three or four ounces thereof to drink; this provoke's sweat, and infringeth the power of the poisons: and the potion following hath the same virtue. *Vide Rondelet. Lib. 7. de pis. c. 3.*

Take good Mustard half an ounce; of Treacle or Mithridate the weight of a bean; dissolv them in white wine, and a little *aqua vitæ*, and let the patient drink it, and sweat thereon with walking. You may also rost a great Onion made hollow, and filled with half a dram of Treacle and vineger under the embers; and then strain it, and mix the juice that is pressed out of it with the water of Sorrel, *Carduus Benedictus*, or anie other cordial thing, and with strong wine; and give the patient to drink thereof to provoke sweat, and to repel the malignitie. Or else take as much Garlick as the quantitie of a big Nut; of *Rue* and Celandine, of each twentie leavs; bruis them all in white wine and a little *aqua vitæ*; then strain it, and give the patient thereof to drink. There bee som that do drink the juice that is pressed out of Celandine and Mallows, with three ounces of Vineger, and half an ounce of the oil of Wall-nuts, and then by much walking do unburthen their stomach and bellie upwards and downwards, and so are helped. When the venemous air hath already crept into and infected the humors, one dram of the dried leavs of the Bay-tree macerated for the space of two daies in Vineger and drunk, is thought to bee a most soveraign medicine to provoke sweat, loosness of the bellie, and vomiting. A Potion.

Matthiolus in his Treatise *de Morbo gallico* writeth, that the powder of *Mercurie* ministred unto the patient with the juice of *Carduus Benedictus*, or with the Electuarie *de Gemmis*, will drive away the pestilence before it bee confirmed in the bodie, by provoking vomit, loos-

nes of the bellie and feet: one dram of Calchanthum or white Copperas dissolved in Rose-water, performeth the like effect in the same disease. Some do give the patient a little quantitie of the oil of Scorpions with white wine to expel the poison by vomit, and therewithal they annoint the region of the heart, the brest and the wrists of the hands. I think these verie meet to bee used often in bodies that are strong and well exercised, because weaker medicines do evacuate little or nothing at all, but onely moov the humors, whereby commeth a Fever. When a sufficient quantitie of the malignitie is evacuated, then you must minister things that may strengthen the bellie and stomach, and with-hold the agitation or working of the humors: and such is the confection of Alkermes.

CHAP. XXVI.

Of manie Symptoms which happen together with the Plague; and first of the pain of the head.

The cause of phrensie in the Plague.

IF the malignitie bee carried into the brain, and nature bee not able to expel it, it inflame's not onely it, but also the membranes that cover it: which inflammation doth one while hurt, trouble, or abolish the imagination; another while the judgment; and sometimes the memorie; according to the situation of the inflammation, whether it bee in the former, hinder, or middle part of the head; but hereof commeth alwales a Phrensie, with fierie redness of the eies and face and heavines and burning of the whole head. If this will not bee amended with Clysters, and with opening the Cephalick vein in the arm, the arteries of the *temples* must bee opened, takeing so much blood out of them, as the greatnes of the Symptoms and the strength of the patient shall require and permit. Truly the incision that is made in opening of an arterie will close and join together as readily, and with as little difficultie, as the incision of a vein. And of such an incision of an arterie, commeth present help; by reason that the tensive and sharp vapors do plentifully breath out together with the arterious blood. It were also verie good to provoke a flux of blood at the nose, if nature bee apt to exonerate herself that way. For as *Hippocrates* saith, when the head is grieved, or generally aketh, if matter, water, or blood flow out at the nostrils, mouth, or ears, it presently cure's the disease. Such bleeding is to bee provoked by strong blowing, or striveing to cleanse the nose, by scratching or picking of the inner side of the nostrils, by pricking with an horse-hair, and long holding down of the head.

The benefit of opening an arterie.

Apb. 10. *sect.* 6.

An historie.

The Lord of *Fontains*, a Knight of the Order, when wee were at *Bayon*, had a bleeding at the nose, which came naturally for the space of two daies, and thereby hee was free'd of a pestilent Fever which hee had before, a great sweat riseing therewithal, and shortly after his Carbuncles came to suppuration, and by God's grace hee recovered his health being under my cure. If the blood do flow out and cannot bee stopped when it ought, the hands, arms, and legs must bee tied with bands; and sponges wet in Oxycrate must bee put under the arm-holes, cupping-glasses must bee applied unto the dugs, the *region* of the *Liver* and Spleen; and you must put into the nostrils, the doun of the willow-tree, or anie other astringent medicine, incorporated with the hairs pluck't from the flank, bellie or throat of an Hare, Bole-Armenick, *Terra Sigillata*, the juice of Plantane and Knot-grass mixed together; and furthermore the patient must bee placed or laied in a cool place. But if the pain bee nothing mitigated notwithstanding all these fluxes of blood, wee must com to medicines that procure sleep, whose forms are these.

To stay bleeding.

Medicines to procure sleep.

Take of green Lettuce one handful; flowrs of water-Lillies and Violets, of each two pugils; one head of white-Poppie bruised; of the four cold seeds, of each two drams; of Liquorice and Raisins, of each one dram: make thereof a decoction, and in the straining dissolv one ounce and a half of *Diacodion*: make thereof a large potion to bee given when they go to rest. Also Barlie-cream may bee prepared in the water of water-Lillies and of Sorrel, of each two ounces; adding thereto six or eight grains of *Opium*: of the four cold seeds, and of white-Poppie seeds, of each half an ounce; and let the same bee boiled in broths with Lettuce and Purslain; also the pills *de Cynoglosso*, *i. e.* Hounds-tongue may bee given. Clysters that provoke sleep must bee used. which may bee thus prepared.

Take of Barlie-water half a pinte; oil of Violets and water-Lillies, of each two ounces; of the water of Plantain and Purslain, or rather of their juices, three ounces; of Camphir seven grains, and the whites of three eggs: make thereof a Clyster. The head must bee fomented with Rose-vineger, the hair beeing first shaven away, leaving a double cloth wet therein on the same, and often renewed. Sheeps-lungs taken warm out of the bodies, may bee applied to the head, as long as they are warm. Cupping-glasses with and without scarification may bee applied to the neck and shoulder-blades. The arms and legs must bee strongly bound, beeing first well rubbed to divert the sharp vapors and humors from the head. Frontals may also bee made on this manner. Take of the oil of Roses and water-Lillies, of each two ounces; of the oil of Poppie half an ounce; of *Opium*, one dram; of Rose-vineger, one ounce; of Camphir half a dram; mix them together. Also Nodules

may

may bee made of the flowrs of Poppies, Henbane, water-Lillies, Mandrags beaten in Roſe-water with a little Vineger, and a little Camphir, and let them bee often applied to the noſtrils: for this purpoſe Cataplaſms alſo may bee laid to the forehead. As, Take of the mucilage of the ſeeds of *Pſilium, id eſt*, Flea-wurt, and Quince-ſeeds extracted in Roſe-water, three ounces; of Barlie-meal four ounces; of the powder of Roſe-leavs, the flowers of water-Lillies and Violets, of each half an ounce; of the ſeeds of Poppies and Purſlain, of each two ounces; of the water and vineger of Roſes, of each three ounces: make thereof a Cataplaſm, and applie it warm unto the head. Or take of the juice of Lettuce, water-Lillies, Henbane, Purſlain, of each half a pinte; of Roſe-leavs in powder, the ſeeds of Poppie, of each half an ounce; oil of Roſes three ounces; of vineger two ounces; of Barlie-meal as much as ſhall ſuffice: make thereof a Cataplaſm in the form of a liquid Pultis. When the heat of the head is mitigated by theſe medicines, and the inflammation of the brain aſſwaged, wee muſt com unto digeſting and reſolving fomentations, wich may diſperſ the matter of the vapors. But commonly in pain of the head, they do uſe to binde the forehead and hinder part of the head verie ſtrongly, which in this caſe muſt bee avoided.

A Cataplaſm.

CHAP. XXVII.

Of the heat of the Kidnies.

THe heat of the Kidnies is tempered by annointing with *unguent. refrigerans Galen* newly made, adding thereto the whites of eggs well beaten, that ſo the ointment may keep moiſt the longer; let this liniment bee renewed everie quarter of an hour, wipeing away the reliques of the old. Or, R, *aq. roſ.* lb.ß. *ſucci plant.* ℥iv. *alb. ovorum* iv. *olei roſacei, & nenuph. an.* ℥ii. *aceti roſ.* ℥iii. *miſce ad uſum.* When you have annointed the part, lay thereon the leavs of water-Lillies or the like hold herbs, and then preſently thereupon a double linnen cloth dipped in oxycrate and wrung out again, and often changed; the patient ſhall not lie upon a fether-bed, but on a quilt ſtuffed with the chaff of Oats, or upon a Mat with manie doubled cloaths or Chamelet ſpread thereon. To the *region* of the heart may in the mean time bee applied a refrigerateing and alexiterial medicine, as this which followeth. R. *ung. roſat.* ℥iii. *olei nenupharini*, ℥ii. *acet. roſ. & aq. roſ. an.* ℥i. *theriacæ*, ℥i. *croci*, ℥ß. Of theſe melted and mixed together make a ſoft ointment, which ſpred upon a ſcarlet cloth may bee applied to the *region* of the heart. Or, R. *theriacæ opt.* ℥iß. *ſucci citri acidi, & limonii, aa* ℥ß. *coral. rub. & ſem. roſar. rub. an.* ℥ß. *caphuræ & croci, an.* gra. iiii. let them bee all mixed together, and make an ointment or liniment.

An ointmene for the reins.

An ointment for the heart.

At the head of the patient as hee lie's in his bed, ſhall bee ſet an Ewr or cock with a baſin under it to receiv the water, which by dropping may reſemble rain. Let the ſoles of the feet and palms of the hands bee gently ſcratched, and the patient lie far from noiſ, and ſo at length hee may fall to ſom reſt.

The noiſ of dropping water draw's on ſleep.

CHAP. XXVIII.

Of the Eruptions and Spots, which commonly are called by the name of Purples and Tokens.

THe skin, in peſtilent Fevers, is marked and variegated in divers places with ſpots, like unto the biteings of Fleas or Gnats, which are not alwaies ſimple, but manie times ariſe in form like unto a grain of millet. The more ſpots appear, the better it is for the patient: they are of divers colors according to the vinulencie of the malignitie, and condition of the matter, as red, yellow, brown, violet or purple, blew and black. And becauſ for the moſt part they are of a purple color, therefore wee call them purples. Others call them *Lenticulæ*; becauſ they have the color and form of Lentiles. They are alſo called *Papiliones, (i.)* Butterflies; becauſ they do ſuddenly ſeiz or fall upon divers *regions* of the bodie, like unto winged Butterflies; ſomtimes the face, ſomtimes the arms and legs, and ſomtimes all the whole bodie; oftentimes they do not onely affect the upper part of the skin, but go deeper into the fleſh, ſpecially when they proceed of matter that is groſs and aduſt. They do ſomtimes appear great and broad, affecting the whole arm, leg or face, like unto an *Eryſipelas*: to conclude, they are divers according to the varietie of the humor that offends in quantitie or qualitie.

The differences of the ſpots in the Plague:

Their ſeveral names, and the reſons of them.

If they are of a purple or black color, with often ſwounding, and ſink in ſuddenly without anie manifeſt cauſ, they fore-ſhew death.

When ſigns of death.

The cauſ of the breaking out of thoſe ſpots, is the working or heat of the blood, by reaſon of the crueltie of the venom received, or admitted. They often ariſe at the beginning of a peſtilent Fever; manie times before the breaking out of the Sore, or Botch or Carbuncle,

and manie times after: but then they shew so great a corruption of the humors in the bodie, that neither the sores nor carbuncles will suffice to receiv them; and therefore they appear as fore-runners of death. Somtimes they break out alone, without a botch or carbuncle, which if they bee red, and have no evil symptoms joyned with them, they are not wont to proov deadlie: they appear, for the most part, on the third or fourth dale of the diseas, and somtimes later, and somtimes they appear not before the patient bee dead; because the working or heat of the humors being the off-spring of putrefaction, is not as yet restrained and ceased.

Why they somtimes appear after the death of the patient.

Wherefore then principally the putrid heat, which is greatest a little before the death of the patient, drive's the excremental humors, which are the matter of the spots unto the skin; or elss, becaus nature in the last conflict hath contended with som greater endeavor then before (which is common to all things that are readie to die) a little before the instant time of death, the pestilent humor being presently driven unto the skin; and nature thus weakned by these extreme conflicts falleth down prostrate, and is quite overthrown by the remnant of the matter.

CHAP. XXIX.

Of the cure of Eruptions and Spots.

ou must first of all take heed, lest you drive in the humor that is comming outwards with repercussives: therefore beware of cold, all purgeing things, phlebotomie, and drowsie or sound sleeping. For all such things do draw the humors inwardly, and work contrarie to nature. But it is better to provoke the motion of nature outwardly, by applying of drawing medicines outwardly, and ministring medicines to provoke sweat inwardly; for otherwise by repelling and stopping the matter of the eruptions, there will bee great danger, lest the heart bee oppressed with the abundance of the venom flowing back; or elss by turning into the bellie, it inferr's a mortal bloodie flux: which discommodities that they may bee avoided, I have thought good to set down this remedie, whose efficacie I have known and prooved manie times, and on divers persons, when by reason of the weakness of the expulsive faultie, and the thickness of the skin, the matter of the spots cannot break forth, but is constrained to lurk under the skin, lifting it up into bunches and knobs.

They are to bee cured by driveing forth.

I was brought unto the invention of this remedie, by comparison of the like. For when I understood, that the essence of the French pocks (and likewise of the pestilence) consisted in a certain hidden virulencie, and venemous qualitie, I soon descended unto that opinion, that even as by the annointing of the bodie with the unguent compounded of Quick-silver, the gross and clammie humors which are fixed in the bones, and unmoovable, are dissolved, relaxed, and drawn from the center into the superficial parts of the bodie, by strengthening and stirring up the expulsive facultie, and evacuated by sweating and fluxing at the mouth; that so it should com to pass in pestilent fevers, that nature being strengthened with the same kinde of unction, might unload her self of som portion of the venemous and pestilent humor, by opening the pores and passages, and letting it break forth into spots and pustles, and into all kinde of eruptions. Therefore I have annointed manie in whom nature seemed to make passage for the venemous matter verie slowly, first loosing their bellie with a glyster, and then giveing them treacle-water to drink, which might defend the vital facultie of the heart, but yet not distend the stomach, as though they had the French pocks, and I obtained my expected purpose: in stead of the treacle-water you may use the decoction of *Guaicum*, which doth heat, drie, provoke sweat, and repel putrefaction, adding thereto also vineger, that by the subtilitie thereof, it may pierce the better, and withstand the putrefaction. This is the description of the unguent.

The indication of cureing taken from the like.

Take of Hogs-great one pound, boil it a little with the leave of *Sage*, *Time*, Rosemarie, of each half an handfull, strain it, and in the straining extinguish five ounces of Quick-silver, which hath been first boiled in vineger with the fore-mentioned herbs; of *Sal Nitrum* three drams; the yelks of three eggs boiled until they bee hard: of Treacle and Mithridate, of each half an ounce; of Venice-Turpentine, oil of Scorpions and Bays, of each three ounces; incorporate them altogether in a mortar, and make thereof an unguent, wherewith annoint the patient's arm-holes and groins, avoiding the parts that belong to the head, breast, and back-bone: then let him bee laid in his bed, and covered warm, and let him sweat there for the space of two hours, and then let his bodie bee wiped and cleansed; and if it may bee, let him bee laid in another bed, and there let him bee refreshed with the broth of the decoction of a Capon, reer eggs, and with such like meats of good juice that are easie to bee concocted and digested; let him bee annointed the second and third dale, unless the spots appear before.

An ointment to draw them forth when as they appear too slowly.

If the patient flux at the mouth, it must not be stopped: when the spots and pustles do all appear, and the patient hath made an end of sweating, it shall bee convenient to use

diuretick

diuretick medicines, for by these the remnant of the matter of the spot, which happily could not all breath forth, may easily bee purged and avoided by urine.

If any noble or gentlemen refuse to bee annointed with this unguent, let them bee enclosed in the bodie of a Mule or Horse that is newly killed, and when that is cold, let them bee laied in another; until the pustles and eruptions do break forth, being drawn by that natural heat. For so *Matthiolus* writeth that *Valentius*, the son of Pope *Alexander* the sixt, was delivered from the danger of most deadlie poison which hee had drunk. *In proem. lib. 6. Dioſc.*

CHAP. XXX.

Of a peſtilent Bubo, *or Plague-sore.*

A Peſtilent *Bubo* is a tumor at the beginning long and moveable, and in the state, and full perfection copped, and with a sharp head, unmoveable and fixed deeply in the glandules, or kernels; by which the brain enoneratc's it self of the venemous and peſtiferous matter into the kernels that are behinde the eare, and in the neck: the heart into those that are in the arm-holes; and the *Liver*, into those that are in the groin; that is, when all the matter is grosse and clammie, so that it cannot bee drawn out by spots and pustles breaking out on the skin; and so the matter of a Carbuncle is sharp, and so fervent, that it maketh an *Eſchar* on the place where it is fixed. In the beginning, while the *Bubo* is breeding, it maketh the patient to feel, as it were, a cord or rope stretched out in the place, or a hardned nerv with pricking pain: and shortly after the matter is raised up as it were into knob, and by little and little it groweth bigger, and is inflamed, these accidents before mentioned accompanying it. If the tumor be red, and increas by little & little, it is a good and salutarie sign: but if it bee livid or black, and com verie slowly unto his just bignesse, it is a deadlie sign; it is also a deadlie sign if it increas suddenly, and com to his just bignesse as it were with a swift violence, and as in a moment, have all the symptoms in the highest excesse; as pain, swelling and burning. Buboes or Sores appear sometimes of a natural color, like unto the skin, and in all other things like unto an œdematous tumor, which notwithstanding will suddenly bring the patient to destruction; like those that are livid and black, wherefore it is not good to trust too much to those kindes of tumors. What a peſtilent *Bubo* is. The signs of *Bubo*'s salutarie and deadlie.

CHAP. XXXI.

Of the cure of Buboes, *or Plague-sores.*

SO soon as the Bubo appear's, applie a Cupping-glasse with a great flame unto it, unless it bee that kinde of Bubo which will suddenly have all the accidents of burning and swelling in the highest nature; but first the skin must bee annointed with the oil of lillies, that so it being made more loose, the Cupping-glasse may draw the stronger and more powerfully; it ought to stick to the part for the space of a quarter of an hour, and bee renewed and applied again everie three quarters of an hour, for so at length the venom shall bee the better drawn forth from the noble part that is weak, and the work of suppuration or resolution, which soever nature hath assailed, will the better and sooner bee absolved and perfected: which may bee also don by the application of the following ointment. The use of cupping-glasses in cureing of a *Bubo*.

Take of *Unguentum Diathebe* one ounce and a half, oil of Scorpions half an ounce; of Mithridate dissolved in *Aqua vitæ*, half a dram: this liniment will verie well relax and loosen the skin, open the pores thereof, and spend forth portion of that matter which the Cupping-glasse hath drawn thither: in stead thereof mollifying fomentations may bee made, and other drawing and suppurating medicines, which shall bee declared hereafter.

A vesicatorie applied in a meet place below the Bubo profit's them verie much but not above; as for example. If the Bubo bee in the throat, the Vesicatorie must bee applied unto the shoulder-blade on the same side; if it bee in the arm-hole, it must bee applied in the midst of the arm, or of the shoulder-bone, on the inner side: if in the groin, in the midst of the thigh on the inner side, that by the double passage that is open for to draw out the matter, the part wherein the venom is gathered together, may bee the better emptied. A liniment.

Spunge, Grow-fote, Arsmart, Bear-foot, Bifoote, the middle bark of Traveller-joy, the rinde of Mullet, *Pimpernele* or upright Virgins-bower, are fit for raising blisters. If you cannot com by those simple medicines, yoummay applie this which followeth, which may bee prepared at all times.

Take *Cantharides*, Pepper, Euphorbium, Pellitorie of Spain, of each half a dram; of flower leaven, two drams; of [illegible], and a little Vinegar; the vinegar is added thereto to withhold or restrain the vehemencie of the Cantharides; but in want of this medicine it shall suffice to drop scalding oil or water, or a burning candle, or to lay a burning coal A compound vesicatorie.

on

on the place: for ſo you may raiſ bliſters, which muſt preſently bee cut away, and you muſt ſee that you keep the ulcers open & flowing as long as you can, by applying the leav's of red-colwurts, Beets, or Ivie dipped in warm water, and annointed with oil or freſh butter. Som applie Cauteries, but Veſicatories work with more ſpeed: for before the Eſchar of the Cauteries will fall away, the patient may die: therefore the ulcers that are made with Veſicatories will ſuffice to evacuate the peſtilent venom, becauſ that doth work rather by its qualitie then by its quantitie. Let the abſceſs bee fomented as is ſhewed before: and then let the medicine following, which hath vertue to draw, bee applied.

Why veſicatories are better then cauteries in a peſtilent *Bubo*.

Fill a great onion, beeing hollowed, with Treacle and the leav's of *Rue*, then roſt it under the hot Embers, beat it with a little Leaven, and a little Swines-greaſ, and ſo applie it warm unto the abſceſs or ſore; let it bee changed everie ſix hours. Or take the roots of Marſh-mallows and Lillies, of each half a pound; of *Line*, Fenugreek, and Muſtard-ſeeds, of each half an ounce; of Treacle one dram; ten Figs, and as much Hogs-greaſ as ſhall ſuffice: make thereof a cataplaſm according to Art. Or, take of Onions and Garlick roſted in the Embers, of each three ounces: bruiſ them with one ounce of ſowr leaven, adding thereto *Unquentum Baſilicon*, one ounce; Treacle one dram; Mithridate half a dram; of old Hogs-greaſ on ounce; of *Cantharides* in powder one ſcruple; of Pigeons-dung two drams: beat them and mix them together into the form of a cataplaſm. Hereunto old Rennet is verie profitable, for it is hot, and therefore attractive, beeing mixed with old Leaven and *Baſilicon*: you ought to uſe theſe until the abſceſs bee grown unto its full ripeneſs and bigneſs; but if preſently after the beginning there bee great inflammation, with ſharp pain, as it often happeneth, eſpecially when the abſceſſes bee of the kinde of Carbuncles; wee muſt abſtain from thoſe remedies that are hot and attractive, and alſo from thoſe that are verie emplaſtick and clammie; becauſ they do altogether cloſe the pores of the skin; or becauſ they reſolv the thinner part of the collected matter, which if it might remain, would bring the other ſooner to ſuppuration: or elſ becauſ they may perchance draw more quantitie of the hot matter then the part can bear; whereof commeth rather corruption then maturation: and laſt of all becauſ they increaſ the fever and pain, which inferreth danger of a convulſion or mortal Gangrene. Therefore in ſuch a caſe it is beſt to uſe cold and temperate local medicines, as the leavs of Henbane and Sorrel roſted under the coales, *Galen's* pultis, and ſuch like.

Strong drawing cataplaſmes.

There are manie that for fear of death, have with their own hands pulled away the *Bubo* with a pair of Smiths-pincers: others have digged the fleſh round about it, and ſo gotten it wholly out. And to conclude others have becom ſo mad, that they have thruſt an hot iron into it with their own hand, that the venom might have a paſſage forth: of all which I do not allow one; for ſuch abſceſſes do not com from without, as the biteings of virulent beaſts, but from within, and moreover becauſ pain is by theſe means increaſed, and the humor is made more malign and fierce. Therefore I think it ſufficient to uſe medicines that relax, open the pores of the skin, and digeſt portion of the venom by tranſpiration, as are theſe that follow. Take the roots of Marſh-mallows and Lillies, of each ſix ounces; of Camomil and Melilot-flowers, of each half an handful; of Lin-ſeeds half an ounce; of the leav's of *Rue* half an handful: boil them and ſtrain them, dip ſponges in the ſtraining, and therewith let the tumor bee fomented along time. Or, take the crum of hot bread, and ſprinkle it with Treacle-water, or with *aqua vitæ*, and Cows-milk or Goats-milk, and the yelks of three egs, put them all on ſtupes or flaxe, and applie them warm unto the place. Or, take of ſowr Rie-leaven four ounces; of *Baſilicon* two ounces; three yelks of egs; oil of Lillies two ounces; Treacle one dram: let bee received on ſtupes, and applied in like manner. Or, take of *Diachylon* and *Baſilicon*, of each two ounces; oil of Lillies one ounce and an half: let them bee melted and mixed together, and let it bee applied as is abovelaid. When you ſee, feel and know, according to reaſon, that the *Bubo* is com to perfect ſuppuration, it muſt bee opened with an inciſion-knife, or an actual or potential Cauterie, but it is beſt to bee don with a potential Cauterie, unleſs that happely there bee great inflammation, becauſ it doth draw the venom from beneath unto the ſuperficial parts, and maketh a larger orifice for the matter that is contained therein: neither muſt it be looked for, that nature ſhould open it of her ſelf; for then there were danger that leſt while nature doth work ſlowly, a venemous vapor ſhould bee ſtirred up, which ſtrikeing the heart by the arteries, the brain by the nerve, and the liver by the veins, ſhould cauſ a new increaſ of the venemous infection. For fear whereof there bee ſom that will not expect the perfect maturation and ſuppuration, but as it were in the mid'ſt of the cruditie and maturitie will make an orifice for it to paſs forth at: yet if it bee done before the tumor bee at his perfect maturitie, pain, a Fever, and all accidents are ſtirred up and enraged, whereof commeth a malign ulcer that often degenerat's into a Gangrene. For the moſt part about the tenth or eleventh daie the work of ſuppuration ſeemeth perfected and finiſhed; but it may bee ſooner or later by reaſon of the application of medicines, the condition of the matter, and ſtate of the part: when the matter commeth forth, you muſt yet uſe ſuppurative and mollifying medicines, to ma-

Againſt ſuch as cut away Plague-ſores.

A digeſtive fomentation.

An anodyne Cataplaſm.

Why it is beſt to open a plague-ſore with a potential cauterie.

maturate the remains thereof; in the mean while cleansing the ulcer by putting mundificatives into it, as wee shall declare in the cure of Carbuncles. But if the tumor seem to sink in, or hide it self again, it must bee revoked and procured to com forth again, by applying of Cupping-glasses with scarification, and with sharp medicines, yea, and with Cauteries both actual and potential. How to draw forth a sore that seem's to go in again.

When the Cauteries are applied, it shall bee verie good to applie a vesicatorie a little below it, that there might bee som passage open for the venom while the Eschar is in falling away. For so they that are troubled with the French-Pocks, so long as they have open and flowing ulcers, so long are they void of any pain that is worth the speaking of; which ulcers being closed and cicatrized, they do presently complain of great pain. If you suspect that the *Bubo* is more malign by reason that it is of a green, or black and inflamed color, as are those that com of a melancholick humor by adustion, turned into a grosa and rebellious melancholick humor, so that by the more copious influx thereof into the part, there is danger of a gangrene and mortification; then the places about the abscess must bee armed with repercussives, but not the abscess it self: and this may bee the form of the repercussives: Take of the juice of houf-leek, Purslain, Sorrel, Night-shade, of each two ounces; of Vineger one ounce, the whites of three eggs, of oil of Roses and water-Lillies, of each two ounces and a half: stir them together, and applie it about the *Bubo*, and renew it often: or boil a Pomgranat in vineger, beat it with *Unguentum Rosatum*, or *Populeon* newly made, and applie it as is aforesaid. If these things do not stop the influx of other humors, the abscess it self and the places about it must bee scarified round about, if the part will permit it; that the part exonerated of portion of the venom may not stand in danger of the extinction of the proper and natural heat, by the greater quantitie and malignitie of the humors that flow unto it. When repercussives may bee applied.

In scarifying you must have care of the great vessels, for fear of an irrepugnable flux of blood, which in this case is verie hard to bee stayed or resisted; both becaus the part it self is greatly inflamed, and the humor verie fierce, for the expulsion whereof, nature, careful for the preservation of the part and all the bodie besides, seemeth to labor and work. But yet you must suffer so much of the blood and humor to flow out as the patient is able to abide without the loss of his strength. Why too much bleeding is to bee feared.

Moreover, you may spend forth the superfluous portion of the malignitie, with relaxing, mollifying, and resolving fomentations: as, Take the roots of Marsh-mallows, Lillies and Elecampane, of each one pound; of Lin-seeds and Fenugreek, of each one ounce; of Fenthel-seeds and Anise-seeds, of each half an ounce; of the leave of *Rue*, *Sage*, Rosemarie, of each one handfull, of Camomil and Melilot-flowrs, of each three handfuls; boil them all together, and make thereof a decoction for a fomentation; use it with a sponge according to Art. Also after the aforesaid scarification, wee may put Hens, or Turkies that lay egs (which therefore have their fundaments more wide and open, and for the same purpose put a little salt into their fundaments) upon the sharp top of the *Bubo*, that by shutting their *bills* at several times they may draw and suck the venom into their bodies, far more strongly and better then cupping-glasses, becaus they are endued with a natural propertie against poison, for they eat and concoct Toads, Efts, and such like virulent beasts: when one Hen is killed with the poison that shee hath drawn into her bodie, you must applie another, and then the third, fourth, fift and sixt within the space of half an hour. There bee som that will rather cut them, or elss use whelps cut asunder in the mid'st, and applied warm unto the place; that by the heat of the creature that is yet scarce dead, portion of the venom may bee dissipated and exhaled. But if nevertheless there bee anie fear of a Gangrene at hand, you must cut the flesh with a deeper scarification, not onely avoiding the greater vessels, but also the nerve, for fear of convulsion: and after the scarification and a sufficient flux of blood, you must wash it with *Ægyptiacum*, Treacle and Mithridate dissolved in sea-water, *aqua vite* and Vineger. For such a lotion hath virtue to stay putrefaction, repel the venom, and prohibit the blood from concretion: but if the Grangrene cannot bee avoided so, cauteries may bee applied to the part: especially actual, becaus they do more effectually repel the force of the poison, and strengthen the part. Presently after the impression of the hot iron, the Eschar must bee cut away even unto the quick-flesh, that the venemous vapors and the humors may have a free passage forth; for it is not to bee looked for that they will com forth of themselvs. With these inunctions they are wont to hasten the falling away of the Eschar. Take of the mucilage of marsh-mallows and Lin-seeds, of each two ounces; fresh butter, or Hog's-greas one ounce; the yelks of three eggs; incorporate them together, and make thereof an ointment: butter, Swines-greas, oil of Roses, with the yelks of eggs, perform the self same thing. When the Eschar is fallen away wee must use digestives. As take of the juice of Plantane, Water-Betonie, and Smallage, of each three ounces; honie of Roses four ounces; Venice-Turpentine five ounces; Barlie-flower three drams; Aloes two drams; oil of Roses four ounces; Treacle, half a dram: make a mundificative according to Art. Or, Take of Venice-Turpentine four ounces; syrup of dried Roses and Wormwood, of each an ounce; of the powder of Aloes, Mastich, Myrrh, Barlie-flower, of each one dram; of Mithridate half an ounce; incorporate them together. This unguent that followeth is verie meet for putrefied and corroding ulcers: Linaments to hasten the falling away of the Eschar.

Against eating ulcers.

Take

Take red Orpiment one ounce; of unquenched Lime, burnt Alum, Pomgranat-pills, of each ſix drams; of *Olibanum*, *Galls*, of each two drams; of Wax and Oil as much as ſhall ſuffice, make thereof an unguent. This doth mundifie ſtrongly, conſume putrefied fleſh, and drie up virulent humidities that engender Gangrenes. But there is not a more excellent unguent then *Ægyptiacum* increaſed in ſtrength, for beſides manie other virtues that it hath, it doth conſume and waſte the proud fleſh; for there is neither oil nor wax that goeth into the compoſition thereof, with which things the virtue of ſharp medicines convenient for ſuch ulcers, is delaied, and as it were dulled and hindered from their perfect operation ſo long as the ulcer is kept open. There have been manie that beeing diſeaſed with this diſeaſe, have had much matter and venemous filth com out at their abſceſſes; ſo that it ſeemed ſufficient, and they have bin thought well recovered, yet have they died ſuddenly. In the mean while when theſe things are in doing, cordial medicines are not to bee omitted to ſtrengthen the heart. And purgations muſt bee renewed at certain ſeaſons, that nature may bee everie waie unloaded of the burthen of the venenate humors.

The praiſ of *Agyptiacum.*

CHAP. XXXII.

Of the Nature, Cauſſes and Signes of a peſtilent Carbuncle.

A Peſtilent Carbuncle is a ſmall tumor, or rather a malign puſtle, hot and rageing, conſiſting of blood vitiated by the corruption of the proper ſubſtance. It often commeth to paſs through the occaſion of this untameable malignitie, that the Carbuncle cannot bee governed or contained within the dominion of nature. In the beginning it is ſcarce ſo big as a ſeed or grain of Millet or Peaſ, ſticking firmly unto the part and immoveable, ſo that the skin cannot bee pulled from the fleſh; but ſhortly after it increaſeth like unto a *Bubo* unto a round and ſharp head, with great heat, pricking pain, as if it were with needls, burning and intolerable, eſpecially a little before night, and while the meat is in concocting, more then when it is perfectly concocted. In the midſt thereof appeareth a bladder puffed up and filled with ſanious matter. If you cut this bladder, you ſhall finde the fleſh under it parched, burned and black; as if there had bin a burning cole laid there, whereby it ſeemeth that it took the name of Carbuncle; but the fleſh that is about the place is like a Rain-Bow, of divers colours, as red, dark, geen, purple, livid, and black; but yet alwaies with a ſhineing blackneſs, like unto ſtone-pitch, or like unto the true precious ſtone which they call a *Carbuncle*, whereof ſom alſo ſay it took the name. Som call it a *Nail*, becauſ it inferreth like pain as a nail driven into the fleſh. There are manie Carbuncles which take their beginning with a cruſtie ulcer without a puſtle, like to the burning of a hot iron: and theſe are of a black colour, they increaſ quickly, according to the condition of the matter whereof they are made. All peſtilent Carbuncles have a Fever joined with them, and the grieved part ſeemeth to bee ſo heavie, as if it were covered or preſſed with lead tied hard with a ligature. there commeth mortal ſwounings, faintings, toſſing, turning, idle-talking, rageing, gangrens and mortifications; not onely to the part, but alſo to the whole bodie; by reaſon (as I think) of the oppreſſion of the ſpirits of the part, and the ſuffocation of the naturall heat, as wee ſee alſo in manie that have a peſtilent *Bubo*. For a *Bubo* and Carbuncle are tumors of a near affinitie, ſo that the one doth ſcarce com without the other, conſiſting of one kinde of matter, unleſs that which maketh the *Bubo* is more groſs and clammie, and that which cauſſeth the Carbuncle more ſharp, burning and rageing, by reaſon of its greater ſubtiltie, ſo that it maketh an Eſchar on the place where it is, as wee noted before.

What a Carbuncle is.

When ſo called.

Symptoms of Carbuncles.

How the matter of a *Bubo* and Carbuncle differ.

CHAP. XXXIII.

What Prognoſticks may bee made in peſtilent Buboes and Carbuncles.

SOm haveing the peſtilence have but one Carbuncle, and ſom more in divers parts of their bodie, and in manie it happeneth that they have the *Bubo* and Carbuncle before they have anie Fever; which giveth better hope of health, if there bee no other malign accident therewith: for it is a ſign that nature is the victor, and hath gotten the upper-hand, which excluded the peſtilent venom before it could com to aſſault the heart. But if a Carbuncle and *Bubo* com after the Fever, it is mortal; for it is a token that the heart is affected, mooved and incenſed with the furious rage of the venom; whereof preſently commeth a feveriſh heat or burning, and corruption of the humors, ſent as it were from the center unto the ſuperficies of the bodie. It is a good ſign when the patient's minde is not troubled from the beginning untill the ſeventh daie; but when the *Bubo* or Carbuncle ſinketh down again ſhortly after that it is riſen, it is a mortall ſign, eſpecially if ill accidents follow it. If after they are brought to ſuppuration they preſently wax drie without anie reaſon thereof, it is an ill ſign:

Why it is deadlie to have a ſore com after the Fever.

Thoſe

Thoſe Carbuncles that are generated of blood have a greater Eſchar then thoſe that are made of choler; becauſ that blood is of a groſs conſiſtence, and therefore occupieth a greater room in the fleſh: contrariwiſe, a cholerick humor is more ſmall in quantitie and thin, and it taketh little room in the vpper part of the fleſh onely, as you may ſee in an *Eryſipelas*. And I have ſeen Carbuncles whoſe Eſchars were as broad and as large as half the back: alſo I have ſeen others, which going up by the ſhoulders to the throat, did ſo eat away the fleſh that was under them, that the rough arterie or winde-pipe might bee ſeen bare, when the Eſchar was fallen away: I had once a Carbuncle which was in the midſt of my bellie, ſo that when the Eſchar was fallen away, I might verie plainly ſee the *Piritoneum* or Rim: and the cicatrice that remaineth is as broad as my hand: but they do not ſpread themſelvs ſo far without the great danger or death of the patient. There are alſo ſom Carbuncles which beginning at the parts under the chin, diſperſ themſelves by little and little unto the pattel-bones, and ſo ſtrangle the patient. So in manie, the *Buboes* in the groin ariſe above a great part of the muſcles of the *Epigaſtrium*. Truly of thoſe abſceſſes that are ſo large and great in quantitie, and ſo terrible to bee ſeen, there is great danger of death to the patient, or at leaſt to the grived part. For after the conſolidation, the part remaineth as if it were leprous, which aboliſheth the action of the part, as I have ſeen in manie. Oftentimes alſo the corruption of the matter is ſo great, that the fleſh leaveth the bones bare: but Carbuncles often leav the joints and ligaments quite reſolved through the occaſion of the moiſture that is ſoaked and ſunk in unto them; for they often caſt out putrefied and virulent ſanious matter: whereby eating and creeping ulcers are bred, manie bliſters and puſtles ariſing up in the parts round about it; which ſhortly breaking into one, make a great ulcer. Theſe com verie ſeldom and ſlowly unto ſuppuration, or at leaſt to caſt out laudable matter, eſpecially if they have their original of choler; becauſ the matter is ſooner burned with heat, then ſuppurated. Therefore then, if they can bee brought to ſuppuration by no medicines; if the tumor ſtill remain black; if when they are opened, nothing at all, or elſ a verie little ſharp moiſture doth com forth, they are altogether mortal; and there is ſcarce one of a thouſand who hath theſe accidents that recovereth health: diſperſed ſmall bliſters, comming of vapors ſtirred up by the matter that is under the skin, and are there ſtaied and kept from paſſage forth, do not neceſſarily fore-ſhew death in Carbuncles. But if the part bee ſwoln or puffed up, if it bee of a green or black color, and if it feel neither pricking nor burning, it is a ſign of a mortal Gangren. *Buboes* or Carbuncles ſeldom or never com without a Fever: but the Fever is more vehement when they are in the emunctories, or nervous parts, then when they are in the fleſhie parts, yet it is leſs, and all Symptoms are leſs, and more tolerable in a man that is ſtrong and of a good temperature: Carbuncles not onely affect the outward, but alſo the inward parts, and oftentimes both together. If the heart bee vexed in ſuch ſort with a Carbuncle that nothing thereof appeareth forth on the ſuperficial parts, all hope of life is paſt, and thoſe die ſuddenly, eating, drinking or walking, and not thinking anie thing of death. If the Carbuncle bee in the middriff or lungs, they are ſoon ſuffocated: If it bee in the brain, the patient becommeth frantick, and ſo dieth. If it bee in the parts appointed for the paſſage of the urine, they die of the ſuppreſſion of their water, as it happened in the Queen-mother's waiting-maide at the Caſtle of *Roſſillon*, of whom I ſpeak before. If it bee in the ſtomach, it inferreth the accidents that are ſhewed in this hiſtorie following.

Huge peſtilent Abſceſſes commonly deadlie.

Deadlie Carbuncles.

An hiſtorie.

While I was Surgeon in the Hoſpital of Paris, a young and ſtrong Monk of the order of St. *Victor*, being overſeer of the woman that kept the ſick people of that place, fell into a continual Fever verie ſuddenly, with his tongue black, drie, rough, (by reaſon of the putrefied and corrupted humors, and the vapors riſing from the whole bodie unto that place) and hanging out like unto an hound's, with unquenchable thirſt, often ſwounding and deſire to vomit. He hath convulſions over all his bodie through the vehemencie and malignitie of the diſeaſ, and ſo hee died the third day: Wherefore thoſe that kept the ſick people in the Hoſpital, thought that hee had been poiſoned, for the certain knowledg whereof the Governors of the Hoſpital commanded his bodie to bee opened.

I therefore calling to mee a Phyſician and Surgeon, wee found in the bottom of his ſtomach a point or impreſſion, as if it had been with an hot Iron or potential Cauterie, with an Eſchar or cruſt as broad as one's nail, all the reſt of his ſtomach was greatly contracted and ſhrunk up together, and as it were hornie; which wee conſidering, and eſpecially the Eſchar which was deep in the ſubſtance of the ſtomach, wee all ſaid with one voice that hee was poiſoned with *Sublimate* or Arſenick. But behold, while I was ſowing up his bellie, I perceived manie black ſpots diſperſed diverſly throughout the skin: then I asked my companie what they thought of thoſe ſpots; truly (ſaid I) it ſeemeth unto mee that they are like unto the purple ſpots or marks that are in the peſtilence. The Phyſician and the Surgeon denied it, and ſaid that they were the bitings of fleas. But I perſwaded them to conſider the number of them over all the whole bodie, and alſo of their great depth and depreſſion into the fleſh; for when wee had thruſt needls deep into the fleſh in the middeſt of them, and ſo cut away the fleſh about the needle, wee found the fleſh about the needle to bee black: moreover his noſtrils, nails, and ears were livid, and all the conſtitution of his bodie

How to diſtinguiſh purple ſpots from fleabitings.

was

was contrarie, and far unlike to the bodies of those that died of other ſickneſſes or diſeaſes. Alſo it was credibly reported unto us by thoſe that kept him, that his face was ſo altered a little before hee died, that his familiar friends could hardly know him. Wee perſwaded by theſe proofs, revoked our former opinion and ſentence, and made a *Certificate* to bee ſent unto the Governors and Maſters of the Hoſpital, ſetting our hands and ſeals unto it, to certifie them that hee died of a peſtilent Carbuncle.

CHAP. XXXIV.

Of the cure of a peſtilent Carbuncle.

Why emplaſtick, verie hot, and great drawers are not good for a Carbuncle.

BY the fore-named ſigns of a peſtilent Carbuncle, and eſpecially by the bitterneſs of the pain, malignitie of the venemous matter, and by the burning fever that is therewithal annexed, I think it manifeſt, that verie hot, emplaſtick, and drawing medicines ſhould not bee applied to this kinde of tumor; becauſ they prohibit or hinder the exhalation, or waſteing forth of the venenate malignitie; becauſ that by ſtopping the pores of the skin, they increaſ and cauſ a greater heat in the part then there was before. Therefore it is better to uſe reſolving medicines, which may aſſwage heat, and reſolv the pores of the skin. Therefore firſt the place muſt bee fomented with water and oil mixed together, wherein a little Treacle hath been diſſolved, leaving thereon *ſtupes* wet therein: you may alſo uſe the decoction of Mallows, the roots of Lillies, Line-ſeeds, Figs, with oil of *Hypericon*, for to make the skin thin, and to draw forth the matter; and the day following you muſt applie the Cataplaſm following.

A Cataplaſm for a peſtilent Carbuncle.

Another.

Take the leavs of Sorrel and Hen-bane, roſt them under the hot aſhes; afterwards beat them with four yelks of eggs, two drams of Treacle, oil of Lillies, three ounces; Barlie-meal as much as ſhall ſuffice: make thereof a Cataplaſm in the form of a liquid *pultis*; this aſſwageth heat, and furthereth ſuppuration. Or, take the roots of Marſh-mallows and Lillies, of each four ounces; Line-ſeeds half an ounce; boil them, beat them, and then ſtrain them through a cerſ, adding thereto of freſh butter one ounce and an half; of Mithridate one dram; of Barlie-meal as much as ſhall ſuffice: make thereof a Cataplaſm according to art: thoſe Cataplaſms that follow are moſt effectual to draw the venemous matter forth, and to make a perfect ſuppuration, eſpecially when the flux of the matter is not ſo great, but that the part may bear it. Take the roots of white Lillies, Onions, Leaven, of each half an ounce; Muſtard-ſeeds, Pigeon's dung, Sope, of each one dram; ſix Snails in their ſhels; of fine Sugar, Treacle and Mithridate, of each half a dram; beat them altogether, and incorporate them with the yelks of eggs: make thereof a Cataplaſm, and applie it warm. Or, take the yelks of ſix eggs; of ſalt powdered one ounce; of oil of Lillies and Treacle, of each half a dram; Barlie-meal as much as ſhall ſuffice: make thereof a Cataplaſm. Take of ordinarie *Diachylon* four ounces; of *Unguentum Baſilicon* two ounces; oil of Violets half an ounce: make thereof a medicine. Manie antient Profeſſors greatly commend Scabious grown'd, or brayed between two ſtones, and mixed with old Hog's greaſ, the yelks of eggs, and a little ſalt; for it will cauſ ſuppuration in Carbuncles: alſo an egg mixed with Barlie-meal, and oil of Violets doth mitigate pain, and ſuppurate. A Raddiſh-root cut in ſlices, and ſo the ſlices laid one after one unto a Carbuncle or peſtilent Tumor, doth mightily draw out the poiſon. The juice of Colt's-foot doth extinguiſh the heat of Carbuncles: The herb called Divel's-bit, beeing bruiſed, worketh the like effect. I have often uſed the medicine following unto the heat of Carbuncles, with verie good ſucceſs; it doth alſo aſſwage pain, and cauſ ſuppuration. Take of the ſoot ſcraped from a chimnie four ounces, of common ſalt two ounces; beat them into ſmall powder, adding thereto the yelks of two eggs, and ſtir them well together until it com to have the conſiſtence of a *pultis*, and let it bee applied warm into the Carbuncle. In the beginning, the point or head of the Carbuncle muſt bee burned, if it bee black; by dropping thereinto ſcalding hot oil, or *aqua fortis*: for by ſuch a burning the venom is ſuffocated, as touched by lightening, and the pain is much leſſened, as I have prooved often times: neither is it to bee feared, leſt that this burning ſhould bee too painful, for it toucheth nothing but the point of the Carbuncle, which by reaſon of the Eſchar that is there, is void of ſenſ. After this burning, you muſt go forward with the formerlie ſcribed medicines, until the Eſchar ſeemeth to ſeparate it ſelf from the fleſh round about it, which is a token of the patient's recoverie; for it ſignifieth that nature is ſtrong and able to reſiſt the poiſon. After the fall of the Eſchar you muſt uſe gentle mundificatives, as thoſe which wee have preſcribed in a peſtilent *Bubo*; not omitting ſomtimes the uſe of ſuppurative and mollifying medicines, that while the groſs matter is cleanſed, that which is as yet crude may bee brought to ſuppuration: for then the indication is twofold; the one to ſuppurate that which remain's as yet crude and raw in the part; and the other to cleanſ that which remain's concocted and perfectly digeſted in the ulcer.

Other Cataplaſms.

The effect of Scabious againſt a peſtilent Carbuncle.

A Raddiſh root draw's out the venom powerfully.

The top of a Carbuncle, when, why, and with what to bee burned.

The falling of the Eſchar promiſeth health.

A twofold indication.

CHAP.

CHAP. XXXV.

Of the itching and inflammation happening in peſtilent ulcers, and how to cicatrize them.

THe parts adjoyning to a peſtilent Ulcer, oft-times are ſuperficiarily excoriated by reaſon of ulcerous puſtles, which here and there with burning and great itching prick and vellicate the part. The cauſ may happen either externally or internally; internally, by a thin and biteing *ſanies*, which ſweating from the Ulcer, moiſten's the neighboring parts. But externally by the conſtipation of the pores of the skin induced by the continual application of medicines. To remedie this, the place muſt bee fomented with diſcuſſing and relaxing things, as *aqua fortis*, which the Gold-ſmiths have uſed for ſeparateing of metals, Alum-water, the water of Lime, Brine, and the like. But Ulcers left by Carbuncles and peſtilent *Bubo's*, are difficultly cicatrized by reaſon of the corrodeing *ſanies*, proceeding from the cholerick, or phlegmatick and ſalt blood, which beeing in fault by the corruption of the whole ſubſtance cauſſeth the abſceſs. Beſides, ſuch Ulcers are commonly round, and therefore hard to bee cicatrized, for that the Quitture hath no free paſſage forth; ſo the *ſanies*, of its own nature acrid and corrodeing, doth by delaie acquire greater acrimonie and introſitie; ſo by its burning touch diſſolving the adjacent fleſh, it hinder's the conjunction and unition of the lips of the Ulcer; but in the *interim*, the lips of the Ulcer becom callous, which, unleſs they bee helped by cutting, or eating medicines, the Ulcer cannot bee healed; for that by their denſitie they hinder the ſweating out of a ſufficient quantitie of the dewie glue to heal up the Ulcer. Now the Ulcer beeing plained and brought equal to the other fleſh, wee muſt uſe Epuloticks, that is, ſuch things as have a facultie to cicatrize Ulcers by condenſing and hardening the ſurface of the fleſh: of theſe there are two kindes; for ſom without much biteing binde and drie: ſuch are Pomegranat-pills, Oak-bark, *Tutia*, Litharge, burn't bones, ſcales of braſs, Galls, Cypreſs-nuts, *Minium*, Antimonie, *Bole-Armenick*, the burn't and waſhed ſhels of Oiſters, Lime nine times waſhed, and manie metalline things. Others are next to theſe, by which proud fleſh is conſumed; but ſuch muſt bee ſpareingly uſed: of this kinde is waſhed Vitriol, burn't Alum, which excelleth other Epuloticks, by reaſon of the excellent drying and aſtringent facultie conſolidateing the fleſh, which by beeing moiſtened by an excrementitious humor, grow's lank. For that the ſcar which is made, is commonly unſightly in this kinde of Ulcers, as red, livid, black, ſwoln, rough, by reaſon of the great aduſtion imprinted in the part, as by a burning cole: therefore I have thought good here to ſet down ſom means, by which this deformitie may bee corrected or amended. If the ſcar bee too big, or high, it ſhall bee plained by makeing convenient ligation and ſtraight bindeing to the part a plate of lead rubbed over with Quick-ſilver; but you may whiten it, by annointing it with Lime nine times waſhed (that ſo it may bee more gentle, and loſe the acrimonie) and incorporated with oil of Roſes. Som take two pound of Tartar or Argole, burn it, and then powder it; put it in a cloth, and ſo let it hang in a moiſt Vault or Cellar, and ſet a veſſel under it to receiv the dropping of liquor, which is good to bee rubbed for a good ſpace upon the ſcar. The ſame facultie is thought to bee in that moiſture of eggs which ſweat's through the ſhell, whil'ſt they are roſted at the coles; as alſo *unguentum citrinum*, and *Emplaſt. de ceruſſâ* newly made. The three following compoſitions are much approoved. ℞. *Axungiæ ſuillæ noniet lotæ in aceto acerrimo* ℥iv. *cinab. ſucci nitri, & alum. uſti, an.* ℥ß. *ſulphur. vivi ignem haud experti,* ʒii. *caph.* ℈ii. *fiat pulvis*; then let them all bee incorporated together, and make an ointment: it attenuate's the skin, and cleanſeth ſpots. ℞. *olei byoſ. olei ſemin. cucurb. an.* ℥i. *olei tartar.* ℥ß. *cereæ alb.* ℥iii. *liqueſiant ſimul lento igne; deinde adde ſpermat. ceti* ʒvi. *removeantur prædicta ab igne donec infrigid. poſtea adde troch. alb. Rhaſis pul.* ʒiii. *caph.* ℥i. *tandem cum mali cire; ſucco omnia diligenter commiſce, fiat linimentum.* Or elſ, ℞. *rad. ſerpent.* ℥i. *bulliat in aquâ com.* ℔i. *ad dimid. deinde adde ſulph. vivi ignem non experti, & alum. crudi, pulveriſ. an.* ℥iß. *colent. prædict. & addatur caph.* ℥i. *ſucci hyoſcyami* ʒiß. Let this medicine bee kept in a lead or glaſs-veſſel; and when you would uſe it, dip linnen cloaths therein, and lay them to the part. You may alſo uſe theſe medicines againſt the redneſs of the face; and you may fetch them off in the morning, by waſhing the face with warm water and bran.

Why the adjacent parts are troubled with itching.

A fomentation for this itch.

Why theſe Ulcers are hard to bee cicatrized.

Two ſorts of Epuloticks.

Remedies againſt the deformitie of ſcars.

Ointments to attenuate and take away ſcars.

CHAP. XXXVI.

Of ſundrie kindes of Evacuations, and firſt of Sweating and Vomiting.

THe peſtilent malignitie is not onely evacuated and ſent forth by the eruption of puſtles and ſpots, but alſo by ſweat, vomit, bleeding at noſe, at the *hæmorrhoids*, by the courſes, a flux of the bellie, and other waies; ſo that nature by everie kinde of excretion may bee free'd from the deadlie poiſon, eſpecially that which is not as yet arrived at the heart. But chief regard muſt bee had to the inclination of nature,

Why the peſtilent malignitie is not carried away by one way, but by manie.

Wee muſt have chief regard to the motion of nature.

ture, and wee muſt attend what way it chiefly aim's at, and what kinde of excretion it affect's. Yet ſuch evacuations are not alwaies critical, but uſually ſymptomatical; for that oft-times nature is ſo irritated by the untameable malignity of the matter, that it can no way digeſt it; but is forced by anie means to ſend it away crude as it is. Wherefore, if nature may ſeem by the moiſtneſs of the skin, the ſuppreſſion of urine, and other ſigns to affect a *criſis* and excretion by ſweat, you then ſhall procure it by the formerly mentioned means. It is delivered by the Antients, that all ſweats in acute diſeaſes are ſalutarie, which happin upon a critical day, which are univerſal and hot, and ſignified before the critical day. But in this rapid and deadlie diſeaſe of the Plague, wee muſt not expect a *Criſis*, but as ſoon as wee can, and by what means wee may, to free nature from ſo dire and potent an enemie.

Signs of future ſweat.

A *Criſis* muſt not bee expected in the Plague.

But oft-times the tough and groſs excrementitious humors may bee purged by ſtoole, which could not bee evacuated by ſtrong purges. Therefore alſo by this manner of extenuation may wee hope for the excluſion of the peſtilent venom, if there bee nothing which may hinder; and nature by frequent nauſeouſneſs may ſeem to affect this way: the endeavor thereof ſhall bee helped by giveing ſom half a pinte of warm water to bee drunk, with four ounces of common oil, an ounce of vineger, and a little juice of raddiſh: after the takeing of the potion, it is fit to thruſt into the throat a Goos-quill dipped in the ſame oil, or elſ a branch of Roſemarie; or elſ by thruſting in the fingers, ſo to procure vomit; alſo a potion of eight ounces of the mucilaginous water of the decoction of Line-ſeeds will procure vomit. Or elſ, R. *rad. raph. in taleol. ſect. vel ſem. ejus, & ſem. antviplicis, an.* ℥iii. *bulliant in aquæ com. quod ſufficit pro doſi. in colatura diſſolve oxym. & ſyr. acet. an.* ℥ſs. *exhibeatur potio larga & tepida.* Or elſ, R. *oxym. Gal.* ℥vi. *ol. com.* ℥ii. *paretur potio tepid.* But nature muſt not bee forc't, unleſs of its own accord it undertake this motion; for forced and violent vomitings diſtend's the nervous fibres of the ventricle, deject's the ſtrength, break's the veſſels of the lungs, whence proceed's a deadlie ſpitting of blood. Wherefore if the ſtomach ſhall trouble it ſelf with a vain and hurtful deſire to vomit, it ſhall rather bee ſtrengthened with bags of Roſes, Worm-wood, and Sanders, uſeing inwardly the juice of Quinces and Berberies, and broths made for the ſame purpoſe.

How to procure vomit.

Why vomit muſt not bee forced.

CHAP. XXXVII.

Of Spitting, Salivation, Sneeſing, Belching, Hicketting, and making of Water.

The effect of ſpitting in peſtilent diſeaſes.

That long evacuations may bee made by Spitting and Salivation, you may learn by the example of ſuch as have a plurieſie; for the matter of the plurieſie beeing turned into *pus*, the purulent matter ſuck't up by the rare and ſpongeous ſubſtance of the lungs, and thence drawn into the *aſpera arteria*, is laſtly caſt out by the mouth.

The force of Salivation.

There is none ignorant, how much ſuch as have the *Lues Venerea* are helped by Salivation and Spitting. But theſe ſhall bee procured by Maſtiuatorie of the roots of *Iren*, Pellitorie of Spain, Maſtich, and the like; the mucilage of Line-ſeeds held in the mouth will work the ſame effect.

The force of Sneeſing.

That ſuch as have a moiſt brain may expel their ſuperfluous humors by ſneeſing and blowing their noſes; the brain, by the ſtrength of the expulſive facultie, beeing ſtirred up to the excluſion of that which is harmful, may bee known by the example of old people and children which are daily purged by their noſes; the brain is ſtirred up to both kinds of excretion from cauſſes either internal or external: from the internal, as by a phlegmatick and vaporous matter, which contained in the brain, offend's it; externally, as by receiving the beams of the ſun in the noſtrils, or by tickling them with a feather, or blowing into them the powder of Hellebore, *Euphorbium*, *Pyrethrum*, Muſtard-ſeed, and the like ſternutamentories. For then the brain is ſtraightened by its own expulſive facultie, to the excretion of that which is troublous unto it. Sneeſing breaketh forth with noiſ, for that the matter paſſeth through ſtraights, to wit, by the ſtraining paſſages of the *Os cribroſum*, which is ſituated at the roots of the noſtrils. It is not fit to cauſ ſneeſing in a bodie verie plethorick, unleſs you have firſt premiſed general medicines, leſt the humors ſhould bee more powerfully drawn into the brain, and ſo cauſ an Apoplexie, *Vertigo*, or the like ſymptoms.

The commodities of Belching.

By Belching the flatulencies contained in the ventricle, beeing the off-ſpring of cruditie, or flatulent meats, are expelled; theſe by their taſte and ſmell, pleaſing, ſtinking, ſweet, bitter or tart, ſhew the condition and kinde of cruditie of the humors from whence they are raiſed: now vomiting free'th the ſtomach of crudities, but the diſtemper muſt bee corrected by contraries, as altering things to bee preſcribed by the Phyſician.

Hicketting is a contraction and extenſion of the nervous fibres of the ſtomach, to call forth ſuch things as are too contumaciouſly impact in the coats thereof; yet repletion onely is not the cauſ thereof, but ſomtimes inanition alſo; ſo oft-times a putrid vapor, from ſom other place, breaking into the ſtomach, as from a peſtilent *Bubo*, or Carbuncle, alſo all

acid

aicd and acrid things; becauſe they prick, vellicate and provoke the tunicles of the ventricle, as vineger, ſpiced things, and the like; often and contumacious hicketting after purgeing, a wound or vomiting is ill; but if a convulſion preſently happen thereon, it is deadlie.

Several remedies muſt bee uſed according to the varietie of the cauſſes: for repletion help's that hicketting that proceed's from inanition and evacuation, that which happen's by repletion: that which proceed's from a putrid and venemous vapor, is helped by Treacle and Antidotes; that which is occaſioned by acid and acrid things, is cured by the uſe of groſs, fattie, and cold things.

Now the whole bodie is oft-times purged by urine, and by this way the feveriſh matter is chiefly and properly accuſtomed to bee evacuated: not a few, beeing troubled with the *Lues Venerea*, when as they could not bee brought to ſalivation by unction, have been cured by the large evacuation of urine cauſſed by diuretick medicines. Diureticks, wherewithall you may moov urine, are formerly deſcribed in treating of the ſtone. But wee muſt abſtain from more acrid diuretickes, eſpecially when as inflammation is in the bladder; for otherwiſe the noxious humors are ſent to the affected part, whence there is danger of a deadlie Gangrene. Therefore then it is better to uſe diverſion by ſweat.

The whole bodie purged by urine.

When wee ought to abſtain from diuretick's.

CHAP. XXXVIII.

Of the Menſtrual and Hæmorrhoidal purgation.

NOt onely reaſon, but alſo manifold experience induceth us to beleev, that women, by the benefit of their menſtrual purgation, eſcape, and are free'd from great, peſtilent, and abſolutely deadlie diſeaſes; wherefore it muſt bee procured by remedies, both inwardly taken, and outwardly applied: theſe may bee taken inwardly with good ſucceſs, *Caſſia lignea*, Cinnamon, the *Bark* of the root of a Mulberrie, Safforn, Agrick, Nutmeg, Savine, *Diagridium*, and divers others. But if the affect require more vehement medicines, the roots of Tithymel, Antimonie, *Cantharides* (taken in ſmall quantitie) moov the courſes moſt powerfully; frictions and ligatures made upon the thighs and legs conduce hereto, as alſo cupping in the inner and middle part of the thighs, the opening of the vein *Saphena*, Leeches applied to the orifice of the neck of the womb, peſſaries, nodula's, glyſters, baths, fomentations made of oderiferous things, which by the fragrancie of their odor, or rather by their heat, may attenuate and cut groſs humors, open the obſtructed orifices of the veins; ſuch are the roots of Marſh-mallows, Orris, Parſlie, Fennel, Kneholn, the leavs and flowrs of Saint John's-wurt, *Aſparagus*, Rocket, Balm, Cherville, Mug-wurt, Mints, Pennie-royal, Savorie, Roſemarie, *Rue*, *Time*, *Sage*, Bay-berries, Broom, Ginger, Cloves, Pepper, Nutmegs, and the like; the vapor of the boiling whereof, let the woman, ſitting upon a perforated ſeat, receiv by a funnel into the neck of her womb, covering herſelf warm on all ſides, that ſo nothing may otherwiſe break forth. Of the ſame things may bee made baths, as well general, as particular. Alſo peſſaries are good made after this manner. R. *theriac. mithrid. an.* ʒſ. *caſſor. gum. ammoniac. an.* ʒi. *miſce cum bombace in ſucco mercurialis tincto, fiat peſſarium.* Or elſ, R. *rad. petroſelin. & fœnug. ſub cineribus cocta's, deinde contuſas cum pul. ſtaphyſag. pyreth. croco & oleo liliorum*, ſo make a peſſarie in the form of a ſuppoſitorie or nodula. Or, R. *pulv. myrrh. & aloës, an.* ʒi. *fol. ſabin. nigel. artbewiſ. an* ʒii. *rad. Helleb. nigr.* ʒi. *croci*, ℈i. *cum ſucco mercur. & melle communi*: make a peſſarie in cotton. This which follow's is more effectual. R. *ſucci rut. abſinth. an.* ʒii. *myrrh. euphorb. caſſor. ſabin. diacrid. terebinth. galban. theriac. an.* ʒi. make a peſſarie according to art; let a thred hang out of the one end of the peſſaries, that ſo you may eaſily draw them forth as you pleaſ.

How to provoke the courſes.

How aromatick things provoke the courſes.

Peſſaries to provoke the terms.

But if this menſtruous flux one provoked, flow too immoderately, it muſt bee ſtopped by uſeing meats of groſſer and more viſcid juice, by opening a vein in the arm, application of cupping-glaſſes under the dugs, frictions and ligations of the upper parts, as the arms, putting up of peſſaries, application of refrigerateing and aſtringent plaſters, to the lower bellie, *ſhare* and loins, laying the woman in a convenient place, and not upon a feather-bed.

How to ſtop the courſes flowing too immoderately.

This following injection ſtoppeth the blood flowing out of the womb. R. *aquæ plant. & fabror. an.* lbi. *nucum cupreſ. gallar. immatur. an.* ʒii. *berber. ſumach. balauſt. vitriol. rom. alum. roch. an.* ʒii. *bulliant omnia ſimul, & fiat decoctio*: of this make injection into the womb. In the performance of all theſe things, I would have the Surgeon depend upon the advice of a Phyſician, as the occaſion and place ſhall permit.

But if nature endeavor to free it ſelf of the peſtilent matter by the *hæmorrhoides*, you may provoke them by frictions and ſtrong ligatures in the lower parts, as if the thighs or legs were broken, by *ventoſes* applied with great flame to the inner ſide of the thigh, by application of hot and attractive things to the fundament, ſuch as are fomentations, emplaſters, unguents; ſuch as is uſually made of an Onion roſted under the embers, and incorporated with Treacle, and a little oil of *Rue*, after the *hæmorrhoid* veins, by theſe means, com to ſhew themſelvs, they ſhall bee rubbed with rough linnen cloths, or Fig-leavs,

How to provoke the *hæmorrhoids*.

or a raw Onion, or an Ox-gall mixt with som powder of *Colloquintida*. Lastly, you may applie Horſ-leeches, or you may open them with a lancet, if they hang much forth of the fundament, and bee swoln with much blood. But if they flow too immoderately, they may bee stai'd by the same means as the courses.

CHAP. XXXIX.

Of procureing evacuation by stool, or a flux of the bellie.

NAture often times, both by hir self, of its own accord, as also helped by laxative and purgeing medicines, casts into the bellie and guts, as into the sink of the bodie, the whole matter of a pestilent disease, whence are caused *Diarrhea's*, *Lienteries*, and *Dysenteries*; you may distinguish these kindes of fluxes of the bellie, by the evacuated excrements. For if they bee thin and sincere, that is, retain the nature of one, and that a simple humor, as of choler, melancholie, or phlegm; and if they bee cast forth in a great quantitie, without the ulceration or excoriation of the guts, vehement, or fretting pain, then it is a *Diarrhea*, which som also call *fluxus humoralis*. It is called a *Lienteria*, when as by the resolved retentive facultie of the stomach and guts caused by ill humors, either there collected, or flowing from som other place; or by a cold and moist distemper, the meat is cast forth crude, and almost as it was taken. A *Dysenteria* is, when as manie and different things, and oft-times mixt with blood, are cast forth with pain, gripeings, and an ulcer of the guts, caused by acrid choler, fretting in sunder the coats of the vessels.

What a *Diarrhea* is.

What a *Dysenteria* is.

But if in anie kinde of disease, certainly in a pestilent one, fluxes of the bellie happen immoderate in quantitie, and horrible in the qualitie of their contents, as liquid, viscous, frothie, as from melted greas, yellow, red, purple, green, ash-colored, black, and exceeding stinking. The caus is various, and manie sorts of ill humors, which taken hold of by the pestilent malignitie, turn into divers *species*, differing in their whole kinde both from their particular, as also from nature in general, by reason of the corruption of their proper substance, whose inseparable sign is stinch, which is oft-times accompanied by worms.

The caus of various and stinking excrements in the Plague.

In the camp at *Amiens*, a pestilent *Dysenteria* was over all the Camp, in this the strongest souldiers purged forth meer blood: I dissecting som of their dead bodies, observed the mouths of the *Mesaraick* veins and arteries, opened and much swollen; and whereas they entered into the guts, were just like little *Cotyledones*, out of which as I prssed them, there flowed blood. For both by the excessive heat of the Summer's sun, and the mindes of the enraged souldiers, great quantitie of acrid and choleric humor was generated, and so flowed into the bellie: but you shall know whether the greater or lesser guts bee ulcerated, better by the mixture of the blood with the excrements, then by the site of the pain; therefore in the one you must rather work by glysters; but in the other, by medicines taken by the mouth.

An historie.

Therefore, if by gripeings, a *tenesmus*, the murmuring and working of the guts, you suspect in a pestilent disease, that nature endeavor's to disburden it self by the lower parts, neither in the mean while doth it succeed to your desire, then must it bee helped forward by art, as by takeing a potion of ℥ß. of *hiera simplex*, and a dram of *Diaphanicon* dissolved in Worm-wood water.

A Potion.

Also Glysters are good in this case, not onely for that they asswage the gripeings and pains, & draw by continuation or succession from the whole bodie; but also becaus they free the *mesaraick* veins and guts from obstruction and stuffing; so that by opening, and as it were unlocking of the passages, nature may afterwards more freely free it self from the noxious humors. In such Glysters they also somtimes mix two or three drams of Treacle, that by one and the same labor they may retund the venenate malignitie of the matter.

There may also bee made for the same purpose Suppositories of boiled honie, ℥i. of *hiera picra* and common salt, of each ℥ß. or that they may bee the stronger, of honie ℥iii. of Ox-gall ℥i. of Scammonie, *Euphorbium*, and *Coloquintida* powdred, of each ℥ß. The want of these may bee supplied by *Nodula's* made in this form. ℞. *vitell. ovor.* nu. iii. *fellis bubuli, & mellis, an.* ℥ß. *salis com.* ℥ß. let them bee stirred together, and well incorporated, and so parted into linnen rags, and then bound up into *Nodula's*, of the bignes of a Fil-bird, and so put up into the fundament; you may make them more acrid, by adding som powder of *Euphorbium*, or *Coloquintida*.

Suppositories.

CHAP. XL.

Of stopping the flux of the bellie.

VIolent and immoderate scourings, for that they resolv the facultie, and lead the patient into a consumption and death; therefore if they shall appear to bee such, they must

bee

bee ſtaied in time by things taken and injected by the mouth and fundament. To this purpoſe may a pudding bee made of wheat-flowr boiled in the water of the decoction of one Pomegranat, Berberies, *Bole-Armenick*, *Terra ſigillata*, and white Poppie-ſeeds, of each ℥i. The following Almond-milk ſtrengthen'th the ſtomach, and mitigate's the acrimonie of the cholerick humor, provoking the guts to excretion. Take ſweet Almonds boiled in the water of Barlie, wherein ſteel or iron hath been quenched; beat them in a marble mortar, and ſo with ſom of the ſame water make them into an Almond-milk, whereto adding ℥i. of *Diarhodon Abbatis*, you may give it to the patient to drink.

A haſtie pudding to ſtay the lask.

This following medicine I learn'd of Dr. *Chappelain* the King's chief Phyſician, who received it of his father, and held it as a great ſecret, and was wont to preſcribe it with happie ſucceſs, to his patients. It is thus: *℞. boli armen. terræ ſigil. lapid. hæmat. an ℥ij picis navalis, ℥iß. cer. el. rub. marg. gleti arm. cervi uſt. & loti in aq. plant. an ℥i. ſacten. roſ. ℥ii. fiat pulvis.* Of this let the patient take a ſpoonful before meat, or with the yelk of an egg.

D. *Chappelain's* medicine to ſtay a ſcouring.

Chriſtopher Andrew in his *ecoiſtria*, much commendeth dog's-dung, when as the dog hath for three daies before been fed onely with bones.

Quinces roſted in embers, or boiled in a pot, the *Conſerd* of Cornelian-cherries, *Preſerved* Berberies and Myrabalans, roſted nutmeg taken before meat, ſtrengthen the ſtomach, and ſtay the lask; the patient muſt feed upon good meats, and theſe rather roſted then boiled. His drink ſhall bee *calibeate*-water of the decoction of a ſowr Pomegranat beaten, or of the decoction of a Quince, Medlars, Cervices, Mulberries, Bramble-berries, and the like things, endued with a facultie to binde and waſte the excrementitious humidities of the bodie: theſe waters ſhall bee mixed with ſyrup of red Currants, julip of Roſes, and the like.

Drink.

Let the region of the ſtomach and bellie bee annointed with oil of Maſtich, of Mallowes, Myrtles, and Quinces. Alſo a cruſt of bread newly drawn forth of the oven, and ſteeped in vineger and Roſe-water, may bee profitably applied; or elſe a plaſm of red Roſes, Sumach, Berberies, Myrtles, the pulpi of Quinces, Maſtich, Bean-flowr, and flowrs of Roſes made up with *calibeate*-water.

Ointments.

Anodyne, abſtergent, aſtringent, conſolidateing and nourifhing glyſters ſhall bee injected. These following retund the acrimonie of humors, and aſſwage pain. *℞. ſol. dulcis. depoſ. acet. roſ. portul. an m. i. flor. violar. & nenuph. an ℥iß. fiat clyſter.* Or elſ, *℞. ſem. rub. hord. mundi. ſem. plant. an. p. i. fiat decoctio, in colaturâ adde olei roſ. ℥ii. vitel. ovorum ij. fiat clyſter.* Or, *℞. decoctionis capi, cruri vitellin. & capit. vervicis, mâ cum pelle, lb. ii. in qua coquantur fol. violar. malv. morcur. plantag. an m. i. hord. mundi ℥i. quatuor ſem. frigid. major. an ℥ß. in colatura lb ß. diſſolve caſſiæ recentis extract. ℥ii. ol. viol. ℥iv. vitellor. ovor. ii. ſacch. rub. ℥i. fiat clyſter.* Or, *℞. ſtor. chamem. melil. anethi an p. i. rad. bifmal. ℥i. fiat decoctio in lactis colaturæ adde micæ panis, ſem. lin. ſenugr. extract. mirabol. melli an ℥ii. ſacchari rub. ℥i. olei chamæmel. anethi an ℥iß. vitellor. ovor. ii. fiat clyſter.*

Glyſter to ſtay a flux.

Such glyſters muſt bee long kept, that they may more readily mitigate pain. When ſhavings of the guts appear in the ſtoole, it is an argument that there is an ulcer in the guts; therefore then wee muſt uſe detergent and conſolidateing glyſters, as this which follow's. *℞. hordei integr. p. ii. decoct. ſub fin. chamæm. plantag. apii, an p. ß. fiat decoctio, in colaturâ diſſolve mellis roſat. & ſyr. de abſinth. an ℥iß. ol. viol. ℥ii.* This following glyſter conſolidateth. *℞. ſacch. plantag. centinod. & portulacæ an ℥iß. bol. armen. ſang. draconis an ℥i. ſeûl hircini diſſolve, ℥iß. fiat clyſter.* Alſo Cow's-milk boiled with Plantain, and mixed with ſyrups of Roſes, is an excellent medicine for the ulcerated guts.

A glyſter for ulcerated guts, may bee given to ſuch as are weaned.

This following glyſter binde's. *℞. corticis equini, plantaginis, polygon. an m. i. fiat decoctio in lactis uſtulato ad quartam ſ. & in colatura adde boli armen. ſigil. ſang. draconis an ℥ß. albumina duorum ovorum fiat clyſter.* Or elſ, *℞. plantaginis, centinod. portulacæ, ſedi majoris, fol. myrtill. an p. i. aquæ plantaginis quantum ſufficit pro clyſtere, addendo ſub finem boli armeni, terræ ſigil. ſang. draconis an ℥i. ol. myrtill. & roſat. an ℥ii. fiat clyſter.*

A verie aſtringent glyſter.

If pure blood flow forth of the guts, I could wish you to uſe ſtronger aſtrictives. To which purpoſe I much commend a decoction of Pomegranat-pills, of Cypreſs-nuts, red Roſe-leaves, Sumach, and Alum, and Vitriol made with Smith's water, and ſo made into glyſters, without anie oil. It will bee good with the ſame decoction to foment the fundament, *perinæum*, and the whole bellie.

Aſtringent glyſters ought not to bee uſed before that the noxious humors bee drawn away, and purged by purgeing medicines, otherwiſe by the ſtoppage hereof the bodie may chance to bee oppreſſed.

If the patient bee ſo weak, that hee cannot take or ſwallow anie thing by mouth, nutritive glyſters ſhall bee given him. *℞. decoctionis capi pinguis, & jun. vitulini, coct. cum aceroſâ, bugloſſo, borragine, pimpinellâ, lactucâ, ℥x. vel xii. in quibus diſſolve vitellos ovorum, n. iii. ſaccari roſati, & aquæ vitæ, an ℥i. butyri recentis non ſalitis, ℥iß. fiat clyſter.*

A nourifhing glyſter.

CHAP. XLI.

Of evacuation by insensible transpiration.

The pestilent maligniti̇e, as it is oftimes drawn by the pores, by transpiration into the bodie, so oftimes it is sent forth invisibly the same way again. For our native heat, that is never idle in us, dispersith the noxious humors, mutated into vapors and air through the unperceivable breathing-places of the skin. An argument hereof is, wee see that the tumors and abscesses against nature, even when they are prone to suppuration, are oftimes resolved and discussed by the onely efficacie of nature, and heat, without anie help of art. Therefore there is no doubt, but that nature, beeing prevalent, may free it self from the pestilent maligniti̇e by transpiration, som Abscess, *Bubo*, or Carbuncle beeing com forth, and som matter collected in som certain part of the bodie. For when as nature and the native heat are powerful and strong, nothing is impossible to it, especially when the passages are also in like manner free and open.

Tumors are oftimes discussed by the force of nature after they are suppurated.

CHAP. XLII.

How to cure Infants and Children taken with the Plague.

If that it happen that sucking or weaned children bee infected with the pestilence, they must bee cured after another order then is yet described. The Nurse of the sucking childe must govern her self so in diet and the use of medicines, as if shee were infected with the pestilence her self: Her diet consisteth in the use of the six things *not natural*. Therefore let it bee moderate; for the fruit or profit of that moderation in diet cannot chuse but com unto the Nurses milk, and so unto the Infant that liveth by the milk. And the Infant it self must keep the same diet as near as hee can in sleep, wakeing, and expulsion, or avoiding of superfluous humors and excrements of the bodie. Let the Nurse bee fed with those things that mitigate the violence of the feverish heat: as cooling broths, cooling herbs, and meats of a moderate temperature: shee must wholly abstain from wine, and annoint her nipples, as often as shee giveth the Infant suck, with water, or juice of Sorrel, tempered with Sugar of Roses. But the Infants heart must bee fortified against the violence of the increasing venom, by giveing it one scruple of Treacle in the Nurses milk, the broth of a Pullet, or som other cordial water. It is also verie necessarie to annoint the region of the heart, the emunctories, and both the wrists with the same medicine: neither were it unprofitable to smell often unto Treacle dissolved in Rose-water, vineger of Roses, and a little *Aqua vitæ*, that so nature may bee strengthened against the maligniti̇e of the venom. When the children are weaned, and somwhat well grown, they may take medicines by the mouth; for when they are able to concoct and turn into blood meats that are more grose and fast then milk, they may easily admit a gentle medicine. Therefore a potion must bee prepared for them of twelv grains of Treacle, dissolved with a little of the syrup of Succorie in som cordial water, or the broth of a Capon: unless that anie had rather give it with *Conserv* of Roses, in form of a bole: but Treacle must bee given to children in verie small quantitie, for if it bee taken in anie large quantitie, there is great danger, lest that by inflameing the humors, it infer a fever. Furthermore, broth may bee prepared to bee taken often, made of a Capon seasoned with Sorrel, Lettice, Purslain and cooling seeds, adding thereto *Bole-Armenick*, and *Terra sigillata*, of each one ounce, beeing tied in a rag, and sometimes pressed out from the decoction. For *Bole-Armenick*, whether it bee by its marvellous facultie of drying, or by som hidden propertie, hath this virtue, that being drunken (according as *Galen* witnesseth) it cureth those that are infected with the pestilence, if so bee that they may bee cured by physick; so that those that cannot bee cured with *Bole-Armenick*, cannot bee preserved by anie other medicines. But becaus the bodies of children are warm, moist and vaporous, they are easily delivered of som portion of the veneniate matter through the pores of the skin by provokeing sweat, with a decoction of Parsle-seeds, Prunes, Figs, and the roots of Sorrel, with a little of the powder of Hart's-horn, or Ivorie. But that the sweat may bee more abundant and copious, applie sponges dipped and pressed out in the hot decoction of *Sage*, Rosemarie, Lavender, Bays, Cammomil, Melilot and Mallows, or els Swine's bladders half filled with the same decoction, to the arm-holes, and to the groins. In the time that they sweat, let their faces bee fanned to cool them. Also let a nodule of Treacle, dissolved in vineger and water of Roses, bee applied to the nostrils; but alwaies use a moderation in sweating, becaus that children are of a substance that is easie to bee dissipated and resolved: so that oftentimes although they do not sweat, yet they feel the commodities

The nurse must bee dieted when as the childe is sick.

Medicines may bee given to such as are weaned.

Lib. 9. simp. ca. 7.

The benefit of children.

modities of ſweating, the matter of the venom beeing diſſipated by the force of the heat through the pores of the skin. But in the ſweating, while the face is fanned, and ſweet and cordial things applied to the noſtrils, nature muſt bee recreated and ſtrengthened, which otherwiſe would bee debilitated through ſweating, that ſo may bee better able to expel the venom. After that the ſweat is wiped away, it is verie profitable to take a potion of *Conſerv* of Roſes, with the powder of Hart's-horn, or of Ivorie diſſolved in the waters of Bugloſs and Sorrel, the better to cool and defend the heart. If there appear anie tumor under the armeholes, or in the groine, let it bee brought to maturation with a mollifying, relaxing, drawing, and then with a ſuppurative fomentation, or cataplaſm; alwaies uſeing and handling it as gently as you may, conſidering the tender age of the infant. If you have need to purge the patient, the purgation following may bee preſcribed with great profit. Take of Rubarb in powder one dram; infuſe it in the water of *Carduus Benedictus*, with one ſcruple of Cinnamon; in the ſtraining diſſolv two drams of *Diacatholicon*, of ſyrup of Roſes laxative three drams; make thereof a ſmall potion. This is the cure of the Peſtilence, and of the peſtilent Fever, as far as I could learn from the moſt learned Phyſicians, and have obſerved my ſelf by manifold experience by the grace and permiſſion of God: of whom alone, as the Autor of all good things that mortal men enjoy, the true and certain preſervatives againſt the Peſtilence, are to bee deſired and hoped for.

The form of a purge to bee given to a childe.

The fourth duric of a Sa-

The end of the twentie ſecond Book.

Of the Means and Manner to repair or supplie the natural or accidental defects or wants in Man's bodie.

The twentie third Book.

CHAP. I.

How the loss of the natural or true eie may bee covered, hidden or shadowed.

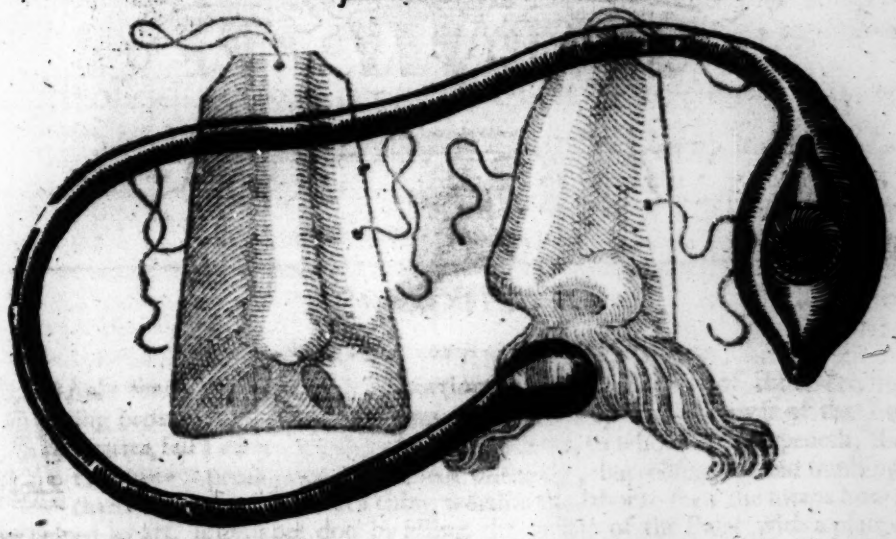
The fourth dutie of a Surgeon.

HAveing at large treated in the former Books of Tumors, Wounds, Ulcers, Fractures and Luxations, by what means things dissolved and dislocated might bee united, things united separated, and superfluities consumed or abated: Now it remain's, that wee speak of the fourth office or dutie of the Chirurgion, which is to supplie or repair those things that are wanting by nature, through the default of the first conformation, or afterwards by som mischance. Therefore, if that through anie mischance, as by anie inflammation, anie man's eie happen to bee broken or put out, and the humors spilt or wasted; or if it bee strucken out of his place or cavitie wherein it was naturally placed by anie violent stroke; or if it waste or consume by reason of a consumption of the proper substance, then there is no hope to restore the sight or function of the eie, yet you may cover the deformitie of the eie so lost (which is all you can do in such a case) by this means: If that when you have perfectly cured and healed the ulcer, you may put another eie artificially made of gold or silver, counterfeited and enamelled, so that it may seem to have the brightnes, or gemmie decencie of the natural eie, into the place of the eie that is so lost.

The forms of eies artificially made of gold or silver, polished and enamuled, shewing both the inner and outer side.

But if the patient bee unwilling, or by reason of som other means cannot wear this eie so prepared, in his head; you may make another on this wise. You must have a string or wier of iron bowed or crooked, like unto women's ear-wiers, made to binde the head harder or looser, as it pleaseth the patient, from the lower part of the head behinde above the ear, unto the greater corner of the eie; this rod or wier must bee covered with silk; and it must also bee somwhat broad at both ends, lest that the sharpnes thereof should pierce or prick anie part that it commeth unto. But that end wherewith the emptie hollowness must bee covered, ought to bee broader then the other, and covered with a thin piece of leather, that thereon the colors of the eie that is lost may bee shadowed or counterfeited. Here followeth the figure or portraiture of such a string or wier.

The form of an iron wier wherewith the deformitie of an eie that is loſt may bee ſhadowed or covered.



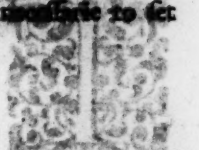
CHAP. II.

By what meanes a part of the Noſe that is cut off, may bee reſtored; or how in ſtead of the noſe that is cut off, another counterfeit noſe may bee faſtened, or placed in the ſtead.

WHen the whole Noſe is cut off from the face, or portion of the noſtrils, from the Noſe, it cannot bee reſtored or joyned again; for it is not in men, as it is in plants. For plants have a weak and feeble heat; and furthermore, it is equally diſperſed into all the ſubſtance of the plant or tree, neither is it eaſie to bee conſumed or waſted: for when the boughs or braunches of trees are broken, torn, or cut away, they live neverthelefs, and will grow again when they are ſet and grafted; neither is there any ſeat for the heat rightly prepared in them from whence the heat muſt neceſſarily run, and diſperſe it ſelf continually into all the parts thereof. But contrariwiſe, the ſeparated parts of more perfect living creatures, as of men, are inceſſantly deprived of life; becauſe they have their nouriſhment, life, ſenſe, and whole ſuſtentation not of themſelves, by faculties flowing or comming unto them from ſom other parts; neither are they governed by their own heat, as plants; but by a bourrowed heat: ſo that above or beſide the naturall faculties of the liver, another vital facultie commeth unto it from the heart.

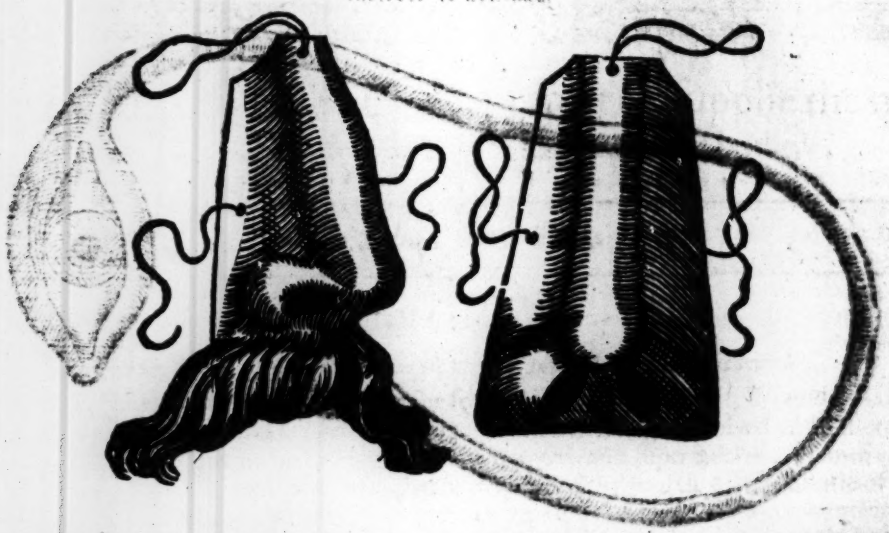
Why the parts of plants being cut off, may grow again, but thoſe of man cannot.

Wherefore in ſtead of the Noſe cut away or conſumed, it is requiſite to ſubſtitute another made by art; becauſe that nature cannot ſupplie that defect: this Noſe ſo artificially made, muſt bee of gold, ſilver, paper, or linnen clothes glewed together, it muſt bee ſo colored, counterfeited, and made both of faſhion, figure and bigneſs, that it may as aptly as is poſſible, reſemble the natural Noſe: it muſt bee bound or ſtayed with little threds or laces unto the hinder part part of the head or the hat. Alſo if there bee anie portion of the upper lip cut off with the noſe, you may ſhadow it with annexing ſom ſuch thing that is wanting unto the noſe, and cover it with the hair on his upper lip, that hee may not want anie thing that may adorn or beautifie the face. Therefore I have thought it neceſſarie to ſet down the figure or form of both theſe kindes.



The

The form of a noſe artificially made, both alone by it ſelf, and alſo with the upper-lip covered as it were with the hair of the beard.



A ſtrange cure for a cut-off noſe.

There was a Surgeon of Italie of late years which would reſtore or repair the portion of the noſe that was cut away after this manner. Hee firſt ſcarified the callous edges of the maimed noſe round about, as is uſually don in the cure of hare-lips: then hee made a gaſh or cavitie in the muſcle of the arm, which is called *Biceps*, as large as the greatneſs of the portion of the noſe which was cut away did require: and into that gaſh or cavitie ſo made, hee would put that part of the noſe ſo wounded, and binde the patient's head to his arm, as if it were to a poſt, ſo faſt that it might remain firm, ſtable and immoveable, and not lean or bow anie way; and about fortie daies after, or at that time when hee judged the fleſh of the noſe was perfectly agglutinated with the fleſh of the arm; hee cut out as much of the fleſh of the arm, cleaving faſt unto the noſe, as was ſufficient to ſupplie the defect of that which was loſt, and then hee would make it even, and bring it, as by licking, to the faſhion and form of a noſe, as near as art would permit; and in the mean while hee did feed his patient with panadoes, gellies and all ſuch things as were eaſie to bee ſwallowed and digeſted. And hee did this work of cureing the place where the fleſh was ſo cut out, onely with certain balms and agglutinative liquors. A younger brother of the familie of St. *Thom*, being wearie of a ſilver-noſe, which being artificially made, hee had worn in the place of his noſe that was cut off, went to this Chirurgian into Italie, and by the mean fore-named practice hee recovered a noſe of fleſh again, to the great admiration of all thoſe that knew him before. This thing truly is poſſible to bee don, but it is verie difficult both to the patient ſuffering, and alſo to the Chirurgian working. For that the fleſh that is taken out of the arm is not of the like temperature as the fleſh of the noſe is; alſo the holes of the reſtored noſe cannot bee made as the were before.

An hiſtorie.

CHAP. III.

Of the placeing of Teeth artificially made in ſtead of thoſe that are loſt or wanting.

IT oftentimes happeneth that the fore-teeth are mooved, broken or ſtricken out of their places by ſom violent blow, which cauſeth deformitie of the mouth, and hinder's plain pronunciation. Therefore when the jaw is reſtored (if it were luxated or fractured) and the gums brought into their former hardneſs; other teeth artificially made of bone or Ivorie may bee put in the place of thoſe that are wanting, and they muſt bee joined one faſt unto another, and alſo ſo faſtned unto the natural teeth adjoining, that are whole; and this muſt chiefly bee don with a thred of gold or ſilver, or for want of either, with a common thred of ſilk or flax, as it is declared at large by *Hippocrates*, and alſo deſcribed in this figure following.

Sect. 2. lib. de art. ſent. 25.

The

The figure of Teeth bound or fastned together.

CHAP. IIII.

Of filling the hollownesse of the Palat.

The causes and hurt that ensue's of the lost palat.

MAnie times it happeneth that a portion or part of the bone of the Palat, bee-ing broken with the shot of a gun, or corroded by the virulencie of the Lues *Venerea*, fall's away; which make's the patients, to whom this happeneth, that they cannot pronounce their words distinctly, but obscurely, and snuffling: therefore I have thought it a thing worthie the labor to shew the means how it may bee helped by art. It must bee don by filling the cavitie of the Palat with a plate of gold or silver, a little bigger then the cavitie it self is. But it must bee as thick as a French Crown, and made like unto a dish in figure; and on the upper side, which shall bee towards the brain, a little sponge must bee fastened, which, when it is moistened with the moisture distilling from the brain, will becom more swolne, and puffed up; so that it will fill the concavitie of the Palat, that the artificial Palat cannot fall down, but stand fast and firm, as if it stood of it self. This is the true figure of those instruments, whose certain use I have observed not by once or twice, but by manifold trials in the bowels fought beyond the Alps.

The figure of plates to fill or supplie the defects of the Palat.

The figure of another plate for the Palat, on whose upper side there is a button, which may bee turned when it is put into the place, with a small Raven's bill, like this whose figure is here expressed.

CHAP.

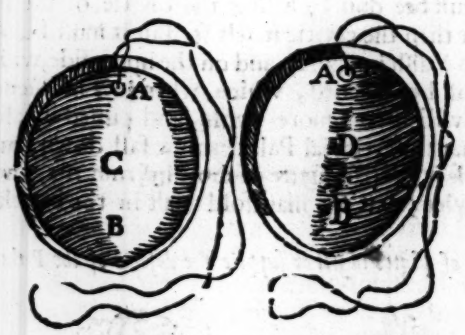
CHAP. V.

How to help ſuch as cannot ſpeak by reaſon of the loſs of ſom part of the tongue.

A remedie found out by accident. An hiſtorie.

CHance gave place and autoritie to this remedie, as to manie other in our Art. A certain man dwelling in a village named *Yvoy le Chaſteau*, being ſom twentie four miles from *Bourges*, had a great piece of his tongue cut off; by which occaſion hee remain'd dumb ſom three years. It happen'd on a time that as hee was in the fields with reapers, hee drinking in a wooden diſh, was tickled by ſom of the ſtanders by, not endureing the tickling, hee ſuddenly broke out into articulate and intelligible words. Hee himſelf wondring thereat, and delighted with the noveltie of the thing, as a miracle, put the ſame diſh to his mouth juſt in the ſame manner as before, and then hee ſpake ſo plainly and articulately, that hee might bee underſtood by them all. Wherefore a long time following hee alwaies carried this diſh in his boſom, to utter his minde, until at length neceſſitie, the miſtreſs of arts, and giver of wit inducing him, hee cauſſed a wooden inſtrument to bee neatly cut and made for him, like the which is here delineated, which hee alwaies carried hanging at his neck, as the onely interpreter of his minde, and the key of his ſpeech.

An inſtrument made to ſupplie the defect of the ſpeech when the tongue is cut off.



The uſe of the Inſtrument is this.

A. ſheweth the upper part of it which was of the thickneſs of a nine-pence, which hee did ſo hold between his cutting teeth, that it could not com out of his mouth nor bee ſeen. B. ſheweth the lower part, as thick as a ſix-pence, which hee did put hard to the reſt of his tongue, cloſe to the membranous ligament which is under the tongue. That place which is depreſt and ſomwhat hollowed, marked with the letter C. is the inner part of the inſtrument. D. ſheweth the outſide of the ſame. Hee hanged it about his neck with the ſtring that is tied thereto.

Textor the Phyſician of Bourges ſhewed mee this inſtrument: and I my ſelf made trial thereof on a young man whoſe tongue was cut off, and it ſucceeded well, and took verie good effect. And I think other Surgeons in ſuch caſes may do the like.

CHAP. VI.

Of covering or repairing certain defects or defaults in the face.

IT oftentimes happeneth, that the face is deformed by the ſudden flaſhing of Gun-powder, or by a peſtilent Carbuncle, ſo that one cannot behold it without great horror. Such perſons muſt bee ſo trimmed and ordered, that they may com in ſemlie manner into the companie of others. The lips if they bee either cut off with a ſword, or deformed with the eroſion or eating of a peſtilent Carbuncle or ulcerated *Cancer*, ſo that the teeth may bee ſeen to lie bare with great deformitie. If the loſs or conſumption of the lip bee not verie great, it may bee repaired by that waie which wee have preſcribed in the cure of hare-lips, or of an ulcerated *Cancer*. But if it bee great, then muſt there bee a lip of gold made for it, ſo ſhadowed and counterfeited, that it may not bee much unlike in color to the natural lip, and it muſt bee faſtned and tied to the hat or cap that the patient weareth on his head, that ſo it may remain ſtable and firm.

CHAP. VII.

Of the defects of the Ears.

SUch as want their Ears, either naturally or by misfortune, as through a wound, carbuncle, cancer, or the biteing of wilde beasts: if so bee that the Ear bee not wholly wanting, wasted, consumed, or torn away; but that som portion thereof doth yet remain, then must it not bee neglected, but must have manie holes made therein with a bodkin; and after that the holes are cicatrized, let som convenient thing, made like unto the piece of the Ear that is lost, bee tied or fastned unto it by these holes.

But if the Ear bee wholly wanting, another must bee made of paper artificially glewed together, or elſ of leather, and so fastened with laces, from the top or hinder part of the head, that it may stand in the appointed place; and so the hair must bee permitted to grow long, or elſ som cap worn under the hat, which may hide or cover the deformitie, unleſs you had rather have it to bee shadowed or counterfeited by som Painter, that thereby it may resemble the color of a natural Ear; and so retain in it the place where it ought to stand, with a rod or wier comming from the top or hinder part of the head, as wee have spoken before in the loss of the Eie; and the form thereof is this.

CHAP. VIII.

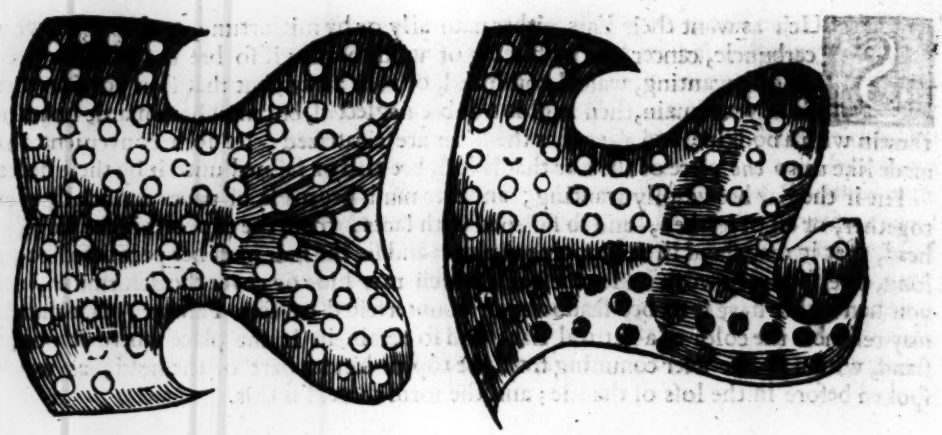
Of amending the deformitie of such as are crook-back't.

THe bodies of manie, especially young maids or girls (by reason that they are more moist and tender then the bodies of boys) are made crooked in process of time, especially by the wrenching aside and crookedness of the back-bone. It hath manie causes, that is to say, in the first conformation in the womb, and afterwards by misfortune; as a fall, bruise, or anie such like accident; but especially by the unhandsom and undecent situation of their bodies, when they are young and tender, either in carrying, sitting or standing (and especially, when they are taught to go too soon) saluting, sewing, writeing, or in doing anie such like thing. Causes of crookedness.

In the mean while, that I may not omit the occasion of crookedness, that happen's seldom to the Countrie people, but is much incident to the inhabitants of great Towns and Cities, which is by reason of the straightness and narrowness of the garments that are worn by them, which is occationed by the follie of mothers, who while they covet to have their young daughters bodies so small in the middle as may bee possible, pluck and draw their bones awrie, and make them crooked. For the ligaments of the back-bone beeing verie tender, soft and moist at that age, cannot stay it straight, and strongly; but beeing pliant, easily permit's the spondels to slip awrie inwards, outwards, or side-wise, as they are thrust or forced.

The remedie for this deformitie is to have breast-plates of iron, full of holes all over them, whereby they may bee lighter to wear: and they must bee so lined with bombaste, that they may hurt no place of the bodie. Everie three months new plates must bee made for those that are not yet arrived at their full growth; for otherwise by the dailie afflux of more matter, they would becom worse. But these plates will do them small good that are alreadie at their full growth.

The form of an iron Breaſt-plate, to amend the crookedneſs of the Bodie.



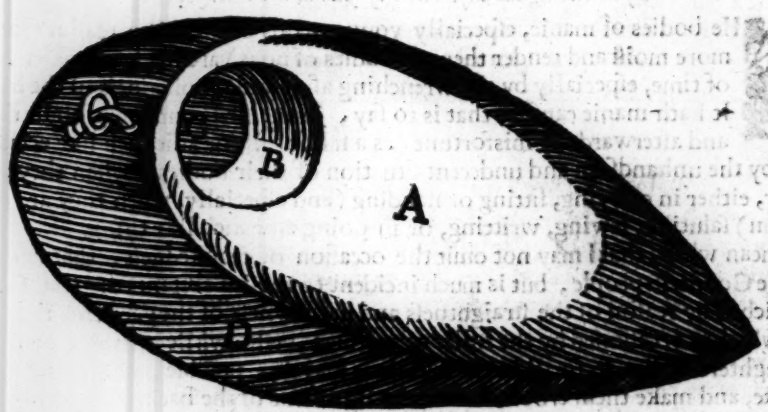
CHAP. IX.

How to reliev ſuch as have their urine flow from them againſt their wils, and ſuch as want their yards.

IN thoſe that have the Strangurie, of what cauſ ſoever that maladie cometh, the urine paſſeth from them by drops, againſt their wils and conſent. This accident is verie grievous and troubleſom, eſpecially to men that travell: and for their ſakes onely I have invented the inſtrument here beneath deſcribed. It is made like unto a cloſe breech or hoſe; it muſt bee of latin, and to contain ſom four ounces: it muſt bee put into the patient's hoſe, between his thighs, unto which it muſt bee tied with a point by the ring. Into the open and hollow mouth of this inſtrument, which is noted with the letter C. the patient muſt put his yard; and into this concavitie or hollowneſs goeth a ſtay ſomwhat deep, it is marked with the letter B. and made or placed there, both to hold or bear the end of the yard, and alſo by his cloſe joint that it muſt have unto the veſſel, to ſtay the urine from going back again, when it is once in. But the letters A. and D. do ſignifie all the inſtrument; that the former part, and this the hinder part thereof. Now this is the ſhape thereof.

An inſtrument for ſuch as cannot hold their water.

The figure of an Inſtrument, which you may call, A Baſin, *or Receptacle for the Urine.*



Thoſe that have their yards cut off cloſe to their bellies, are greatly troubled in makeing of urine, ſo that they are conſtrained to ſit down like women, for their eaſ. I have deviſed this pipe or conduit, haveing an hole through it as big as one finger, which may bee made of wood, or rather of latin.

A. and C. do ſhew the bigneſs and length of the pipe. B. ſheweth the brink on the broader end. D. ſheweth the out-ſide of the brink. This Inſtrument muſt bee applied to the lower

ower part of *os pectinis*, on the upper end it is compolled with a brink for the paſſage of the urine, for thereby it will receiv the urine better, and carrie it from the patient, as hee ſtandeth upright.

The deſcription of a pipe or conduit, ſerving in ſtead of the yard in makeing of water, which therefore wee may call an artificiall yard.

CHAP. X.

By what means the periſhed function or action of a thumb or finger may bee corrected and amended.

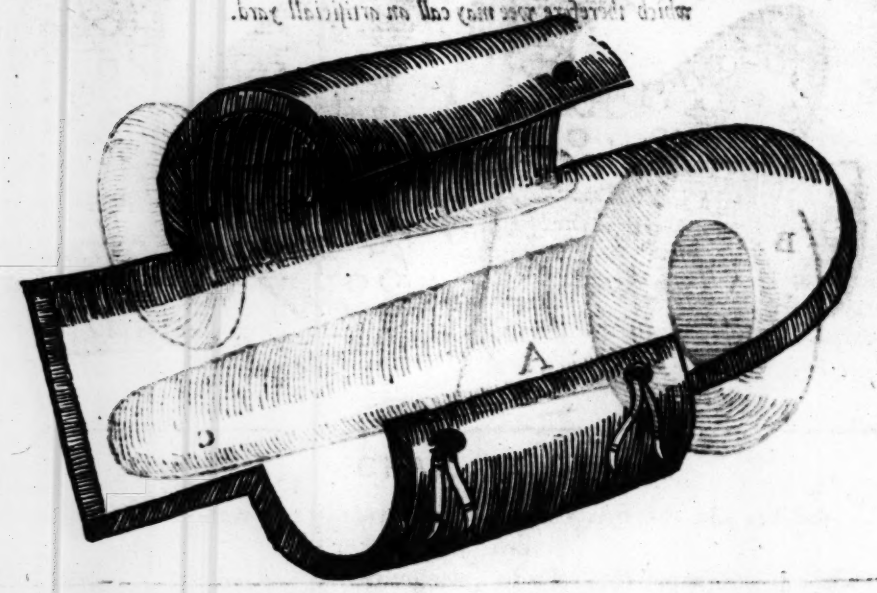
WHen a ſinew or tendon is cut clean aſunder, the action in that part, whereof it was the author, is altogether aboliſhed; ſo that the member cannot bend or ſtretch out it ſelf, unleſs it bee holpen by art: which thing I performed in a certain Gentleman belonging to *Anne* of *Montmorencie*, General of the *French* Horſ-men, who in the battle of *Dreux* received ſo great a wound with a back-ſword, upon the out-ſide of the wriſt of the right hand, that the tendons that did ereſt or draw up the thumb were cut clean in ſunder; and alſo, when the wound was throughly whole and conſolidated, the thumb was bowed inwards, and fell into the palm of the hand, ſo that hee could not extend or lift it up, unleſs it were by the help of the other hand, and then it would preſently fall down again; by reaſon whereof hee could hold neither ſword, ſpear, nor javelin in his hand, ſo that hee was altogether unprofitable for war, without which hee ſuppoſed there was no life. Wherefore hee conſulted with mee about the cutting away of his thumb, which did hinder his gripeing, which I refuſed to do, and told him, that I conceived a meane how it might bee remedied without cutting away. Therefore I cauſſed a caſe to bee made for it of latin, whereinto I put the thumb: this caſe was ſo artificially faſtened by two ſtrings that were put into two rings, made in it above the joint of the hand, that the thumb ſtood upright, and ſtraight out; by reaſon whereof hee was able afterwards to handle anie kinde of weapon. An hiſtorie.

The form of a thumb or finger-ſtall of iron or latin, to lift up or ereſt the thumb, or anie other finger that cannot bee ereſted of it ſelf.

If that in anie man the ſinews or tendons, which hold the hand upright, bee cut aſunder with a wound, ſo that hee is not able to lift up his hand, it may eaſily bee ereſted or lifted up with this Inſtrument that followeth, beeing made of an equal, ſtraight, thin, but yet ſtrong plate of latin, lined on the inner ſide with ſilk, or anie ſuch like ſoft thing, and ſo plac't in the wriſt of the hand, that it may com unto the palm, or the firſt joints of the

fingers; and it muſt bee tied above with convenient ſtaies, and ſo the diſcommoditie of the depreſſion, or hanging of the hand, may bee avoided; therefore this inſtrument may bee called the Erector of the Hand.

The Erecter of the Hand.



CHAP. XI.

Of helping thoſe that are Vari *or* Valgi, *that is, crook-legged, or crook-footed, inwards or outwards.*

What *Varus* is.

THoſe are ſaid to bee *Vari*, whoſe feet or legs are bowed or crooked inwards. This default is either from the firſt conformation in the womb, through the default in the mother, who hath her legs in like manner crooked; or becauſ that in the time when ſhee is great with childe, ſhee commonly ſit's with her legs acroſs: or elſ, after the childe is born, and that, either becauſ his legs bee not well ſwathed, when hee is lai'd into the cradle, or elſ, becauſ they bee not well pleaſed in carrying the infant; or if hee bee not well looked unto by the Nurſ, when hee learneth to go: for the bones are verie tender, and almoſt as flexible as wax.

What *Valgus* is.

But contrariwiſe, thoſe are called *Valgi*, whoſe legs are crooked or bowed outwards. This may com through the default of the firſt conformation, as well as the other; for by both, the feet alſo and the knees may bee made crooked; which thing, whoſoever will amend, muſt reſtore the bones into their proper and natural place; ſo that in thoſe that are *varous*, hee muſt thruſt the bones outwards, as though hee would make them *valgous*: neither is it ſufficient to thruſt them ſo, but they ought alſo to bee retained there in their places after they are ſo thruſt; for otherwiſe they beeing not well eſtabliſhed, would ſlip back again.

They muſt bee ſtai'd in their places, by applying of collars and bolſters on that ſide whereunto the bones do lean, and incline themſelvs; for the ſame purpoſe boots may bee made of leather, of the thickneſs of a teſtone, haveing a ſlit in the former part all along the bone of the leg, and alſo under the ſole of the foot, that beeing drawn together on both ſides, they may bee the better fitted, and ſit cloſer to the leg. And let this medicine following bee applied all about the leg.

A plaſter to hold faſt reſtored bones.

℞. *turis, maſtich. aloës, boli armeni, an.* ℥i. *aluminis roch. reſinæ pini ſiccæ, ſubtiliſſimè pulveriſ. an.* ℥iii. *farinæ volat.* ℥iſs. *album. ovor. q.ſ.* make thereof a medicine. You may alſo add a little Turpentine, leſt it ſhould drie ſooner, or more vehemently then is neceſſarie. But you muſt beware, and take great heed, leſt that ſuch as were of late *varous* or *valgous*, ſhould attempt or ſtrain themſelvs to go, before that their joints bee confirmed; for ſo the bones that were lately ſet in their places, may ſlip aſide againe. And moreover, until they are able to go without danger, let them wear high ſhoos tied cloſe to their feet, that the bones may bee ſtaied the better, and more firmly in their places; but let that ſide of the ſoal of the ſhoo bee under-lai'd whither the foot did incline before it was reſtored.

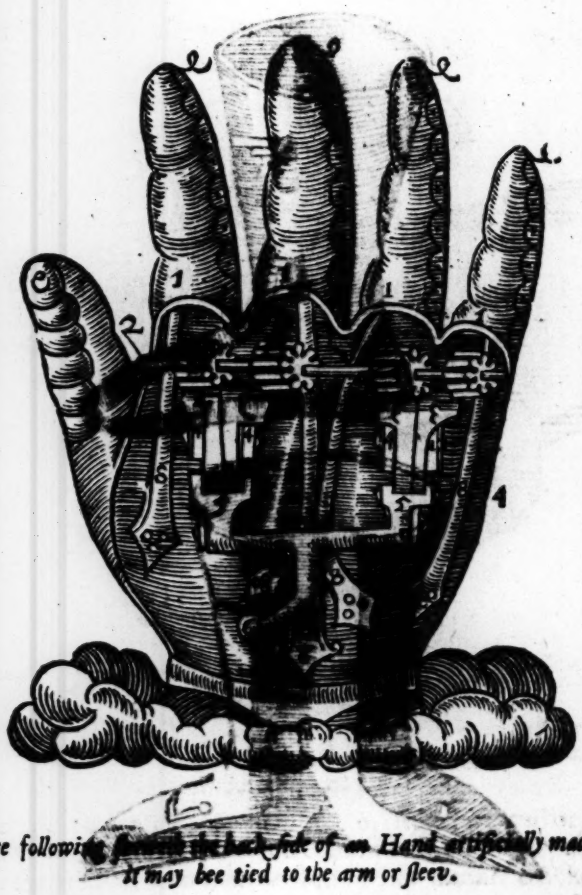
The form of little Boots, whereof the one is open, and the other shut.

CHAP. XII.

By what meane Armes, Legs, and Hands may bee made by art, and placed in stead of the natural Armes, Legs, or Hands that are cut off and lost.

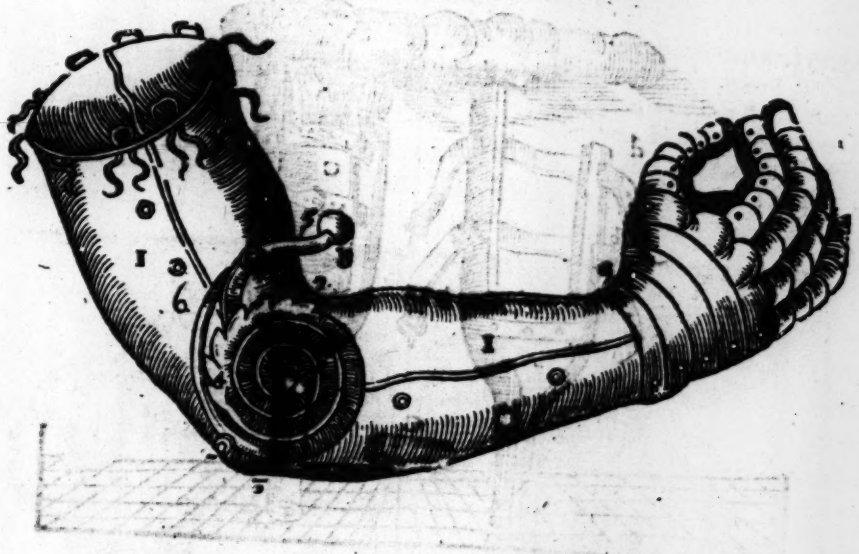
Necessitie oftentimes constrain's us to finde out the meanes whereby wee may helpe and imitate nature, and supplie the defect of members that are perished and lost. And hereof it commeth that wee may perform the functions of going, standing, and handling with armes and hands made by art, and undergo our necessarie flexions and extensions with both of them. I have gotten the forms of all those members made so by art, and the proper names of all the Engines and Instruments whereby those artificially made are called, to my great cost and charges, of a most ingenuous and excellent Smith dwelling at *Paris*, who is called of those that know him, and also of strangers, by no other name then the little *Lorain*; and here I have caused them to bee portraied, or set down, that those that stand in need of such things, after the example of them, may caus som Smith, or such like work-man to serv them in the like case. They are not onely profitable for the necessitie of the bodie, but also for the decencie and comlines thereof. And here followeth their forms.

The form of an Hand made artificially of iron.



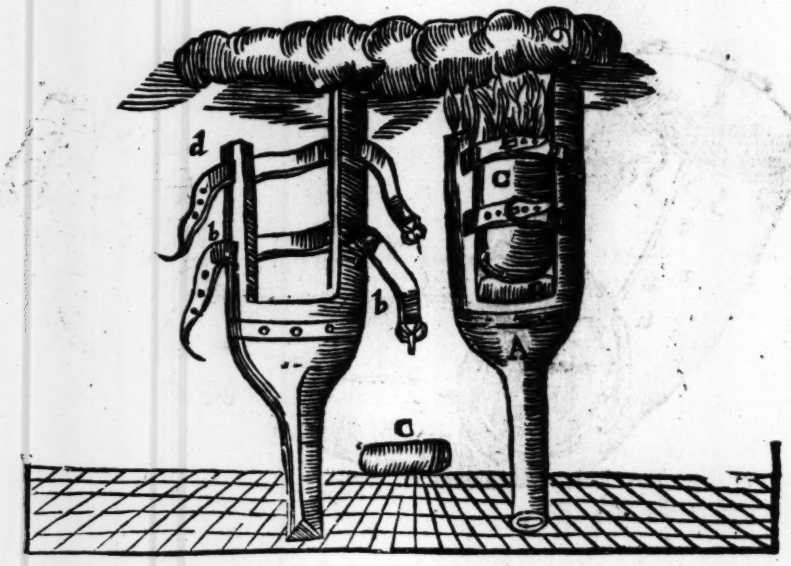
This figure following ſhewes the back ſide of an Hand artificially made, and ſo that it may bee tied to the arm or ſleev.

The form of an Arm made of iron verie artificially.



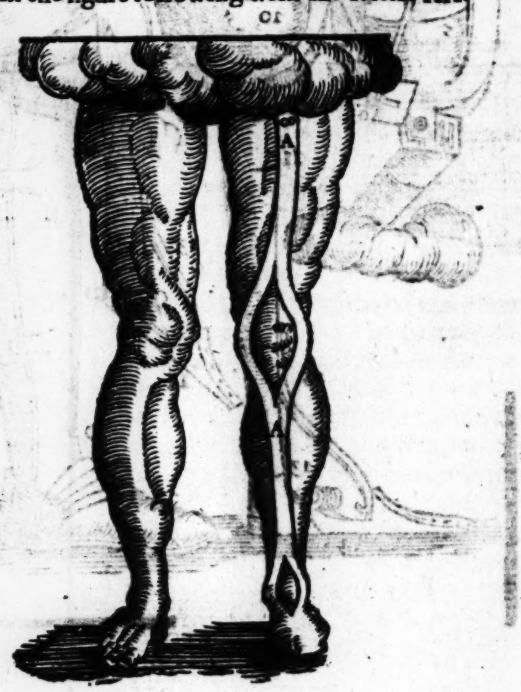
The description of Legs made artificially of iron.

The form of a woodden Leg made for poor men.



A. *Sheweth the ſtump or ſtock of the woodden Leg.* BB. *Sheweth the two ſtaies which muſt bee on both ſides of the Leg, the ſhorter of them muſt bee on the inner ſide.* CC. *Sheweth the pillow or bolſter, whereon the knee muſt reſt in the bottom between the two ſtaies, that ſo it may reſt the ſofter.* DD. *Sheweth the thongs or girths with their round buckles, put through the two ſtaies on either ſide to ſtay the knee in his place firm and immoovable, that it ſlip not aſide.* E. *Sheweth the thigh it ſelf, that you may know after what faſhion it muſt ſtand.*

It happen's alſo manie times, that the patient, that had the nervs or tendons of his Leg wounded, long after the wound is whole and conſolidated, cannot go but with verie great pain and torment, by reaſon that the foot cannot follow the muſcle, that ſhould draw it up. That this maladie may bee remedied, you ought to faſten a linnen band made verie ſtrong unto the ſhoo that the patient weareth on that his pained foot; and at the knee it muſt have a ſlit where the knee may com forth in bowing of the Leg: and it muſt bee truſſed up faſt unto the patient's middle, that it may the better lift up and erect the foot in going. This band is marked in the figure following with the letters AA.

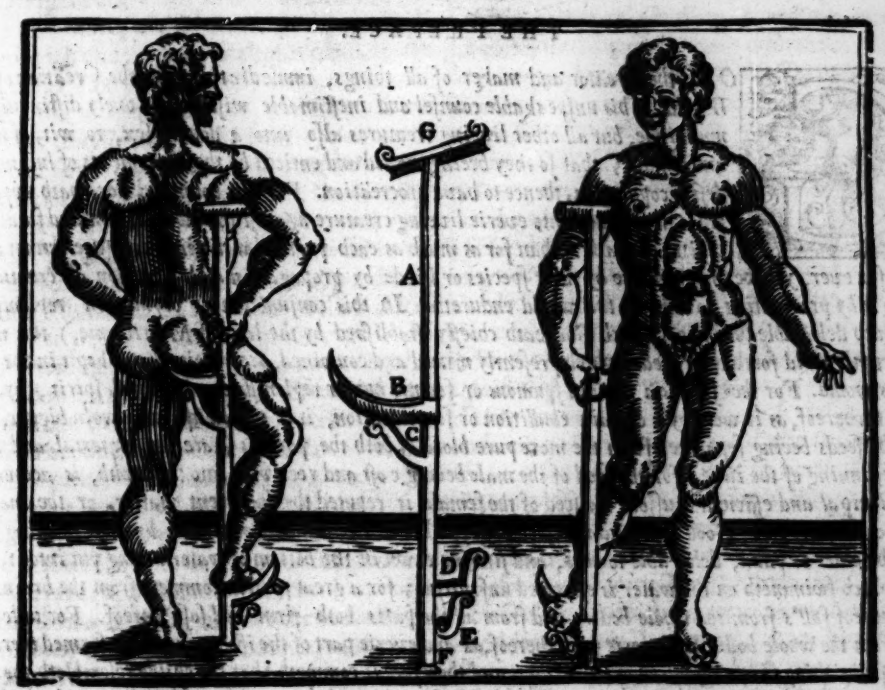


CHAP.

CHAP. XIII.

Of amending or helping lameneſs or halting.

HAlting is not onely a great deformitie, but alſo verie troubleſom and grievous. Therefore if that anie bee grieved therewith by reaſon that one of his legs is ſhorter then the other, it may bee holpen by putting under his ſhort foot this ſitting crutch, which, wee are now about to deſcribe. For by the help of this, hee ſhall not onely go upright, but alſo more eaſily and with little labor or no pain at all. It was taught mee by *Nicolas Picard* Chirurgian to the Duke of Lorain. The form thereof is this.



A. *Sheweth the ſtaff or ſtilt of this crutch, which muſt bee made of wood.* B. *Sheweth the Seat of iron whereon the thigh reſteth, juſt under the buttock.* C. *Sheweth a prop which ſtaieth up the ſeat whereon all the weight of the patient's bodie reſteth.* D. *Sheweth the ſtirrup, beeing made of iron, and bowing crooked upwards, that the foot may ſtand firm, and not ſlip off it when the patient goeth.* E. *Sheweth the prop that ſtaieth or holdeth up the ſtirrup to ſtrengthen it.* F. *Sheweth the foot of the ſtilt or crutch made of iron with manie pikes, and compaſſed with a ring or ferule, ſo to keep it from ſlipping.* G. *The croſs or head of the crutch which the patient muſt put under his arm-hole to lean upon, as it is to bee ſeen in the figure.*

The end of the twentie third Book.

Of the GENERATION of Man.

The twentie fourth Book.

THE PREFACE.

The distinction of male and female.

GOD, the Creator and maker of all things, immediately after the Creation of the World, of his unspeakable counsel and inestimable wisdom not onely distinguished mankinde, but all other liveing creatures also into a double sex, to wit, of male and female; that so they beeing moved and enticed by the allurements of lust, might desire copulation, thence to have procreation. For this bountiful Lord hath appointed it as a solace unto everie liveing creature against the most certain and fatal necessitie of death: than for as much as each particular liveing creature cannot continue for ever, yet they may endure by their species or kinde by propagation and succession of creatures, which is by procreation, so long as the world endureth. In this conjunction or copulation replenished with such delectable pleasure, (which God hath chiefly established by the law of Matrimonie,) the male and female yeeld forth their seeds, which presently mixed and conjoined, are received and kep't in the female's womb. For the seed is a certain spumous or foamie humor replenished with vitul spirit, by the benefit whereof, as it were by a certain ebullition or fermentation, it is puffed up, and swoln bigger, and both the seeds beeing separated from the more pure blood of both the parents, are the material and formal beginning of the issue; for the seed of the male beeing cast and received into the womb, is accounted the principal and efficient cause; but the seed of the female is reputed the subjecent matter, or the matter whereon it worketh. Good and laudable seed ought to bee white, shining, clammie, knottie, smelling like unto the elder or palm, delectable to bees, and sinking down in the bottom of water beeing put into it, for that which swimmeth on the water is esteemed unfruitful; for a great portion commeth from the brain, yet som thereof fall's from the whole bodie, and from all the parts both firm and soft thereof. For unless it com from the whole bodie, and everie part thereof, all and everie part of the issue cannot bee formed thereby: becaus like things are engendred of their like: and therefore it commeth that the childe resembleth the parents, not onely in stature and favor, but also in the conformation and proportion of his lims and members, and complexion and temperature of his inward parts, so that diseases are oft-times hereditarie, the weakness of this or that entral beeing translated from the parent to the childe. There are som which suppose this falling of the seed from the whole bodie not to to bee understood according to the weight and matter, as if it were a certain portion of all the blood separated from the rest; but according to the power and form, that is to say, the animal, natural and vital spirits, beeing the framers of formation and life, and also the formative facultie to fall down from all the parts into the seed, that is wrought or perfected by the Testicles; for proof and confirmation whereof, they alledg that manie perfect, sound, absolute, and well proportioned children, are born of lame and decrepit parents.

What seed is.

The conditions of good seed.

Seed falleth from all the parts of the bodie.

Wherefore manie diseases are hereditarie.

How seed is to bee understood to fall from the whole bodie.

CHAP. I.

Why the generative parts are endued with great pleasure.

What moveth a man to copulation.

A Certain great pleasure accompanieth the function of the parts appointed for generation, and before it, in liveing creatures that are of a lustie age, when matter aboundeth in those parts, there goeth a certain fervent or furious desire: the causes thereof manie, of which the chiefest is, That the kinde may bee preserved and kept for ever, by the propagation and substitution of other liveing creatures of the same kinde. For brute beasts which want reason, and therefore cannot bee solicitous for the preservation of their kinde, never com to carnal copulation, unless they bee mooved thereunto by a certain vehement provocation of unbridled lust, and as it were by the stimulation of venerie. But man, that is endued with reason, beeing a divine and most noble creature, would never yeeld nor make his minde subject to a thing so abject and filthie as is carnal copulation, but that the venereous ticklings, raised in those parts, relax the severitie of his minde; or reason admonisheth him that the memorie of his name ought not to end with his life, but to be preserved unto all generations, as far as may bee possible, by the propagation of his seed or issue. Therefore by reason of this profit or commoditie, nature hath

hath endued the genital parts with a far more exact or exquisite sense then the other parts, by sending the great sinews unto them, and moreover shee hath caused them to bee bedewed or moistned with a certain whayish humor, not much unlike the seed sent from the glandules or kernels called *prostatæ*, situated in men at the beginning of the neck of the bladder, but in women at the bottom of the womb: this moisture hath a certain sharpness or biteing, for that kinde of humors of all others can chiefly provoke those parts to their function or office, and yeeld them a delectable pleasure, while they are in execution of the same. For even so whayish and sharp humors, when they are gathered together under the skin, if they wax warm, tickle with a certain pleasant itching, and by their motion infer delight: but the nature of the genital parts or members is not stirred up or provoked to the expulsion of the seed with these provocations of the humors, abounding either in quantitie or qualitie onely, but a certain great and hot spirit or breath contained in those parts, doth begin to dilate it self more and more, which causeth a certain incredible excess of pleasure or voluptuousness, wherewith the genitals being replete, are spread forth or distended everie wale unto their full greatness. The yard is given to men whereby they may cast out their seed directly or straightly into the woman's womb, and the neck of the womb to women, whereby they may receiv that seed so cast forth, by the open or wide mouth of the same neck, and also that they may cast forth their own seed, sent through the spermatick vessels unto their testicles; these spermatick vessels, that is to say, the vein lying above, and the arterie lying below, do make manie flexions or windeings, yet one as manie as the other, like unto the tendrils of vines diverslie placed or folded together, and in these folds or bendings the blood and spirit which are carried unto the testicles, are concocted a longer time, and so converted into a white seminal substance. The lower of these flexions or bowings do end in the stones or testicles. But the testicles, forasmuch as they are loose, thin, and spongeous or hollow, receiving the humor which was begun to bee concocted in the fore-named vessels, concoct it again themselvs: but the testicles of men concoct the more perfectly for the procreation of the issue, and the testicles of women more imperfectly, becaus they are more cold, lesse, weak and feeble, but the seed becommeth white by the contact or touch of the testicles, becaus the substance of them is white. The male is such as engendreth in another, and the female in her self, by the spermatick vessels which are implanted in the inner capacitie of the womb. But out of all doubt unless nature had prepared so manie allurements, baits and provocations of pleasure, there is scarce anie man so hot or delighted in venereous acts, which considering and marking the place appointed for humane conception, the loathsomnesse of the filth which daily falleth down unto it, and wherewithall it is bumocked and moistned, and the vicinitie and nearness of the great gut under it, and of the bladder above it, but would shun the embraces of women. Nor would anie woman desire the companie of man, which once premeditate's or fore-think's with her self on the labor that shee shall sustain in bearing the burthen of her childe nine months, and of the almost deadlie pains that shee shall suffer in her deliverie.

Why the genitals are endued with a whayish moisture.

The cause of the foldings of the spermatick vessels.

Women's testicles more imperfect.

Why manie men and women abhor venereous copulation.

Men that use too frequent copulation, oftentimes in stead of seed cast forth a crude and bloodie humor, and sometimes also meer blood it self; and oft-times they can hardly make water but with great pain, by reason that the clammie and oilie moisture, which nature hath placed in the glandules called *prostatæ*, to make the passage of the urine slipperie, and to defend it against the sharpness of the urine that passeth through it, is wasted, so that afterward they shall stand in need of the help of a Surgeon to cause them to make water with ease and without pain, by injecting of a little oil out of a Syringe into the conduit of the yard. For in generation it is fit the man cast forth his seed into the womb, with a certain impetuositie, his yard beeing stiff and distended, and the woman to receiv the same without delay into her womb, beeing wide open, lest that through delay the seed wax cold, and so becom unfruitful by reason that the spirits are dissipated and consumed. The yard is distended or made stiff, when the nervous, spongeous and hollow substance thereof is replete and puffed up wth a flatulent spirit. The womb allure's or draw's the masculine seed into it self by the mouth thereof, and it receiv's the woman's seed by the horns from the spermatick vessels which com from the testicles into the hollowness or concavitie of the womb, that so it may bee tempered by conjunction, commixtion and confusion with the man's seed, and so reduced or brought unto a certain equalitie for generation or conception cannot follow without the concourse of two seeds, well and perfectly wrought in the verie same moment of time, nor without a laudable disposition of the womb both in temperature, and complexion: if in this mixture of seeds the man's seed in qualitie and quantitie exceed the woman's, it will bee a man-childe; if not, a woman-childe, although that in either of the kindes there is both the man's and woman's seed; as you may see by the dailie experience of those men who by their first wives have had boies onely, and by their second wives had girls onely: the like you may see in certain women, who by their first husbands have had males onely, and by their second husbands females onely. Moreover one and the same man is not always like affected to get a man or a woman-childe; for by reason of his age, temperature and diet, he doth sometimes yeeld forth seed endued with a masculine virtue, and sometimes with a feminine or weak

What things necessarie unto generation.

Why a male, and why a female is engendred.

weak virtue, ſo that it is no marvel if men get ſomtimes men, and ſomtimes women-children.

CHAP. II.

Of what qualitie the ſeed is, whereof the male, and whereof the female is engendred.

Why men children are ſooner formed in the womb then women.

MAle children are engendred of a more hot and drie ſeed, and women of a more cold and moiſt: for there is much leſs ſtrength in cold then in heat, and likewiſe in moiſture then in drineſs; and that is the cauſ why it will bee longer before a girl is formed in the womb then a boy. In the ſeed lieth both the procreative and the formative power: as for example, In the power of Melon-ſeed are ſituate the ſtalks, branches, leavs, flowrs, fruit, the form, color, ſmel, taſte, ſeed and all. The like reaſon is of other ſeeds; ſo Apple-grafts engrafted in the ſtock of a Pear-tree, bear Apples; and wee do alwaies finde and ſee by experience, that the tree (by virtue of grafting) that is grafted, doth convert it ſelf into the nature of the Siens wherewith it is grafted. But although the childe that is born doth reſemble or is verie like unto the father or the mother, as his or her ſeed exceedeth in the mixture; yet for the moſt part it happeneth that the children are more like unto the father then the mother, becauſ that in the time of copulation, the minde of the woman is more fixed on her husband, then the minde of the husband on, or towards his wife: for in time of copulation or conception, the forms, or the likneſſes of thoſe things that are conceived or kept in minde, are tranſported and impreſſed in the childe or iſſue; for ſo they affirm that there was a certain Queen of the Æthiopians who brought forth a white childe, the reaſon was (as ſhee confeſſed) that at the time of copulation with her King, ſhee thought on a marvelous white thing, with a verie ſtrong imagination. Therefore *Heſiod* advertiſeth all married people not to give themſelvs to carnal copulation when they return from burials, but when they com from feaſts and plaies, leſt that their ſad, heavie, and penſive cogitations, ſhould bee ſo tranſfuſed and engrafted in the iſſue, that they ſhould contaminate or infect the pleaſant joifulneſs of his life with ſad, penſive or paſſionate thoughts. Somtimes it happeneth, although verie ſeldom, the childe is neither like the father nor the mother, but in favor reſembleth his Grandfather, or anie other of his kindred, by reaſon that in the inward parts of the parents, the engrafted power and nature of the Grandfather lieth hidden: which when it hath lurked there long, not working anie effect, at length break's forth by means of ſom hidden occaſion: wherein nature reſembleth the Painter, makeing the lively portraiture of a thing, which as far as the ſubject matter will permit, doth form the iſſue lik unto the parents in everie habit; ſo that often-times the diſeaſes of the parents are transferred or participated unto the children, as it were by a certain hereditarie title: for thoſe that are crook-back't get crook-back't children, thoſe that are lame, lame; thoſe that are leprous, leprous; thoſe that have the ſtone, children having the ſtone; thoſe that have the ptiſick, children having the ptiſick; and thoſe that have the gout, children having the gout: for the ſeed follow's the power, nature, temperature and complexion of him that engendereth it. Therefore of thoſe that are in health and ſound, healthie and ſound; and of thoſe that are weak and diſeaſed, weak and diſeaſed children are begotten, unleſs happily the ſeed of one of the parents that is ſound doth correct or amend the diſeaſed impreſſion of the other that is diſeaſed, or elſ the temperate and ſound womb as it were by the gentle and pleaſant breath thereof.

When children ſhould bee begotten.

Why often-times the childe reſembleth the Grandfather.

Why ſomtimes thoſe that are diſeaſed do get ſound children.

CHAP. III.

What is the cauſ why Females of all brute beaſts, beeing great with young, do neither deſire, nor admit the males, until they have brought forth their Young.

Why the ſenſ of venereous acts is given to brute beaſts.

THe cauſ hereof is, foraſmuch as they are moovd by ſenſ onely, they applie themſelvs unto the thing that is preſent; verie little, or nothing at all perceiving things that are paſt, and to com. Therefore after they have conceived, they are unmindeful of the pleaſure that is paſt, and do abhor copulation: for the ſenſ or feeling of luſt is given unto them by nature, onely for the preſervation of their kinde, and not for voluptuouſneſs, or delectation. But the males rageing, ſwelling, and as it were ſtimulated by the provocations of the heat, or fervencie of their luſt, do then run unto them, follow and deſire copulation, becauſ a certain ſtrong odor or ſmell commeth into the air from their ſecret or genital parts, which pierceth into their noſtrils, and unto their brain, and ſo inferreth an imagination, deſire, and heat. Contrariwiſe, the ſenſ and feeling of venereous actions ſeemeth to bee given by nature to women, not onely for the propagation of iſſue and for the conſervation of mankinde, but alſo to mitigate and aſſwage the miſeries of man's life, as it were by the entiſements of that pleaſure; alſo the great ſtore of hot blood that is about the heart, wherewith men abound, maketh greatly to

Why of brute beaſts the males rageing with luſt, follow after the females.

Wherefore a woman when ſhee is with childe, deſireth copulation.

this

this purpose, which by impulsion of imagination, which ruleth the humors, being driven by the proper passages down from the heart and entrails into the genital parts, doth stir up in them a new lust.

The males of brute beasts, being provoked or mooved by the stimulations of lust, rage, and are almost burst with a *Tentigo* or extension of the genital parts, and sometimes wax mad; but after that they have satisfied their lust with the female of their kinde, they presently becom gentle, and leav off such fierceness.

CHAP. IV.

What things are to bee observed, as necessarie unto generation in the time of copulation.

How women may bee mooved to venerie & conception.

WHen the husband commeth into his wive's chamber, hee must entertain her with all kinde of dalliance, wanton behavior, and allurements to venerie; but if hee perceiv her to bee slow, and more cold, hee must cherish, embrace, and tickle her, and shall not abruptly, the nerves beeing suddenly distended, break into the field of nature; but rather shall creep in by little and little, intermixing more wanton kisses with wanton words and speeches, handling her secret parts and dugs, that shee may take fire, and bee enflamed to venerie; for so at length the womb will strive and wax fervent with a desire of casting forth its own seed, and receiving the man's seed to bee mixed together therewith. But if all these things will not suffice to enflame the woman; for women for the most part are more slow and slack unto the expulsion or yeelding forth of their seed, it shall bee necessarie first to foment her secret parts with the decoction of hot herbs made with Muscadine, or boiled in ante other good wine; and to put a little Musk or Civet into the neck or mouth of the womb: and when shee shall perceiv the effluxe of her seed to approach, by reason of the tickling pleasure, shee must advertise her husband thereof, that at the verie instant time or moment, hee may also yeeld forth his seed, that by the concourse or meeting of the seeds, conception may bee made; and so at length a childe formed and born. And that it may have the better successe, the husband must not presently separate himself from his wive's embraces, lest the air strike into the open womb, and so corrupt the seeds before they are perfectly mixed together. When the man departs, let the woman lie still in quiet, laying her legs or her thighs across, one upon another; and raising them up a little, lest that by motion or downward situation, the seed should bee shed or spilt: which is the cause why shee ought at that time not to talk, especially chiding, nor to cough, nor sneese, but give her self to rest and quietness, if it bee possible.

The meeting of the seeds most necessarie for generation.

CHAP. V.

By what signs it may bee known, whether the women have conceived, or not.

IF the seed in the time of copulation, or presently after bee not spilt, if in the meeting of the seeds the whole bodie do somwhat shake, that is to say, the womb drawing it self together for the compression and entertainment thereof, if a little feeling of pain doth run up and down the lower bellie, and about the navel, if shee bee sleepie, if shee louth the embraceings of a man, and if her face bee pale, it is a token that shee hath conceived.

In som, after conception spots or freckles arise in their face, their eies are depressed and sunk in, the white of their eies waxeth pale, they wax giddie in the head, by reason that the vapors are raised up from the menstrual blood that is stopped, sadness and heavines griev their mindes, with loathing and waiwardness, by reason that the spirits are covered with the smoakie darkness of the vapors: pains in the teeth and gums, and swounding often-times commeth; the appetite is depraved or overthrown, with aptness to vomit, and longing, whereby it happeneth, that they loath meats of good juice, and long for and desire illaudable meats, and those that are contrarie to nature, as coles, dirt, ashes, stinking salt-fish, sowre, austere and tart fruits, pepper, vinegar, and such like acrid things, and other, altogether contrarie to nature and use, by reason of the condition of the suppressed humor abounding and falling into the orifice of the stomach. This appetite so depraved or overthrown, endureth in som until the time of childe-birth; in others it commeth in the third month after their conception, when hairs do grow on the childe: and lastly, it leaveth them a little before the fourth moneth, becaus that the childe, being now greater and stronger, consumes a great part of the excrementall and superfluous humor. The suppressed or stopped terms in women that are great with childe, are divided into three parts: the more pure portion maketh the nutriment for the childe; the second ascendeth by little and little into the dugs, and the impurest of all remaineth in the womb about the infant, and maketh the secondine or after-birth, wherein the infant lieth as in a soft bed. Those women are great

Spots or specks in the faces of those that are with childe.

Why manie women beeing great with childe refuse laudable meats, and desire those that are illaudable, and contrarie to nature.

The suppressed terms divided into three parts.

with childe, whose urine is more sharp, fervent, and somwhat bloodie, the bladder not onely waxing warm by the compression of the womb; fervent, by reason of the blood contained in it, but also the thinner portion of the same blood beeing expressed, and sweating out into the bladder. A swelling and hardnes of the dugs, and veins that are under the dugs in the brests and about them, and milk comming out when they are pressed, with a certain stirring motion in the bellie, are certain infallible signs of greatnes with childe. Neither in this greatnes of childe-bearing, the veins of the dugs onely, but of all the whole bodie, appear full and swelled up, especially the veins of the thighs and legs; so that by their manifold folding and knitting together, they do appear varicous, whereof commeth sluggishnes of the whole bodie, heavines and impotencie, or difficultie of going, especially when the time of deliverance is at hand. Lastly, if you would know whether the woman have conceived or not, give unto her when shee goeth to sleep, som meed or honied water to drink; and if shee have a gripeing in her guts or bellie, shee hath conceived; if not, shee hath not conceived.

Hip. 1. de morb. mul.

Aph. 41 sect. 5.

CHAP. VI.

That the womb, so soon as it hath received the seed, is presently contracted, or drawn together.

AFter that the seeds of the male and female have both met, and are mixed together in the capacitie of the womb, then the orifice thereof doth draw it self close together, lest the seeds should fall out. There the female's seed goeth and turneth into nutriment, and the increas of the male's seed; becaus all things are nourished, and do increas by those things that are most familiar, and like unto them. But the similitude and familiaritie of seed with seed is far greater then with blood; so that when they are perfectly mixed and co-agulated together, and so wax warm by the straight and narrow inclosure of the womb, a certain thin skin doth grow about it, like unto that that will bee over unscimmed milk.

Why the female seed is nutriment for the male seed.

Moreover, this concretion or congealing of the seed, is like unto an egg laied before the time that it should: that is to say, whose membrane or tunicle that compasseth it about, hath not as yet increased or grown into a shellie hardnes about it; in folding-wise are seen manie small threds dividing themselvs, over-spread with a certain clammie, whitish or red substance, as it were with black blood. In the middest under it appeareth the navel, from whence that small skin is produced. But a man may understand manie things that appertain unto the conception of mankinde by the observation of twentie egs, setting them to bee hatched under an Hen, and takeing one everie daie and breaking it, and diligently considering it; for in so doing, on the twentieth daie you shall finde the Chick perfectly formed with the navel. That little skin that so compasseth the infant in the womb is called the secundine or *Chorion*, but commonly the after-birth.

A compendious way to understand humane conception.

This little skin is perfectly made within six daies, according to the judgment of *Hippocrates*, as profitable and necessarie not onely to contain the seeds so mixed together, but also to suck nutriment through the orifices of the vessels ending in the womb. Those orifices the Greeks do call *Cotyledones*, and the Latines *Acetabula*, for they are as it were hollowed eminences, like unto those, which may bee seen in the feet or snout of a Cuttle-fish manie times in a double order, both for the working and holding of their meat. Those eminences called *Acetabula* do not so greatly appear in women as in manie brute beasts. Therefore by these the secundine cleaveth on everie side unto the womb, for the conservation, nutrition, and increas of the conceived seed.

Lib. de nat. puer.

What the *Cotyledones* are.

CHAP. VII.

Of the generation of the navel.

AFter the woman hath conceived, to everie one of the aforesaid eminencies groweth presently another vessel, that is say, a vein to the vein, and an arterie to the arterie: these soft, and yet thin vessels, are framed with a little thin membrane, which beeing spread under, sticketh to them; for to them it is in stead of a membrane, and a ligament, and a tunicle [illegible] defence; and it is doubled with the others, and made of the vein and arterie of the navel. These new small vessels of the infant, with their orifices, do answer directly one to one to the *Cotyledons* or eminencies of the womb; they are verie small and [illegible], as it were the hairie *fibres* that grow upon roots that are in the earth; and [illegible] have continued so a longer time, they are combined toge[illegible] until that by continual connexion, all those vesse[illegible] great vessels, called the *umbilical* vessels, or the vessels [illegible] the navel, and do enter

enter into the childe's bodie by the hole of the navel. Here *Galen* doth admire the singular providence of God and Nature; becauſ that in ſuch a multitude of veſſels, and in ſo long a paſſage or length that they go or are produced, the vein doth never confound it ſelf, nor ſtick to the arterie, nor the arterie to the vein; but everie veſſel joineth it ſelf to the veſſel of its own kinde. But the umbilical vein, or navel-vein, entering into the bodie of the childe, doth join it ſelf preſently to the hollow part of the liver; but the arterie is divided into two, which join themſelvs to the two Iliack arteries along the ſides of the bladder, and are preſently covered with the *peritonæum*; and by the benefit thereof are annexed unto the parts which it goe's unto. Thoſe ſmall veins and arteries are as it were the roots of the childe; but the vein and arterie of the navel are as it were the bodie of the tree, to bring down the nutriment to nouriſh the childe. For firſt, wee live in the womb the life of a plant, and then next the life of a ſenſitive creature: and, as the firſt tunicle of the childe is called *Chorion*, or *Allantoides*; ſo the other is called *Amnios*, or *Aquina*, which doth compaſs the ſeed or childe about on everie ſide. Theſe membranes are moſt thin, yea for their thinneſs like unto the Spider's web, woven one upon another; and alſo connexed in manie places by the extremities of certain ſmall and hairie ſubſtances, which at length, by the adjunction of their like do get ſtrength; whereby you may underſtand, what is the cauſ why by divers and violent motions of the mother in going and dancing, or leaping, and alſo of the infant in the womb, thoſe membranes are not almoſt broken. For they are ſo conjoined by the knots of thoſe hairie ſubſtances, that between them nothing, neither the urine, nor the ſweat can com, as you may plainly and evidently perceiv in the diſſection of a woman's bodie that is great with childe, not depending on anie other man's opinion, bee it never ſo old or inveterate: yet the ſtrength of thoſe membranes is not ſo great, but that they may bee ſoon broken in the birth, by the kicking of the childe.

The vein never joineth it ſelf with the arterie.

Hippocrates calleth all the membranes that compaſs the infant in the womb, according to the judgment of *Galen* in his book *de uſu partium*, by the name of the *ſecundines*.

CHAP. VIII.

Of the Umbilical veſſels, or the veſſels belonging to the navel.

MAnie of the antient Writers have written that there are five veſſels found in the navel. But yet in manie, nay all the bodies I ſought in for them, I could never finde but three; that is to ſay, one vein, which is very large, ſo that in the paſſage thereof it will receiv the tag of a poinʒ and two arteries, but not ſo large, but much narrower; becauſ the childe wanteth or ſtandeth in need of much more blood for his conformation, and the nutriment or increaſ of his parts, then of vital ſpirit.

An old opinion confuted.

Theſe veſſels makeing the bodie of the navel, which, as it is thought, is formed within nine or ten daies, by their doubling and folding, make knots like unto the knots of a Franciſcan Friers girdle, that ſtaying the running blood in thoſe their knottie windeings, they might more perfectly concoct the ſame: as may bee ſeen in the ejaculatorie ſpermatick veſſels, for which uſe alſo the length of the navel is half an ell; ſo that in manie infants that are ſomwhat grown, it is found three or four times doubled about their neck or thigh.

To what uſe the knots of the childe's navel in the womb ſerveth.

As long as the childe is in his mother's womb, hee taketh his nutriment onely by the navel, and not by his mouth; neither doth hee enjoy the uſe of eies, ears, noſtrils or fundament, neither needeth hee the functions of the heart. For ſpirituous blood goeth unto it by the arteries of the navel, and into the Iliack arteries; and from the Iliack arteries unto all the other arteries of the whole bodie, for by the motion of theſe onely the infant doth breathe. Therefore it is not to bee ſuppoſed that the air is carried or drawn in by the lungs unto the heart, in the bodie of the childe; but contrariwiſe from the heart to the lungs. For neither the heart doth perform the generation or working of blood, or of the vital ſpirits. For the iſſue or infant is contenced with them as they are made and wrought by his mother. Which, until it hath obtained a full, perfect and whole deſcription of his parts and members, cannot bee called a childe; but rather an embryon, or an imperfect ſubſtance.

The childe in the womb taketh his nutriment by his navel, not by his mouth.

How the childe breatheth.

CHAP. IX.

Of the ebullition or ſwelling of the ſeed in the womb, and of the concretion of the bubbles or bladders, or the three principal entrails.

IN the ſix firſt daies of conception the new veſſels are thought to bee made and brought forth of the eminencies or *papillons* of the mother's veſſels, and diſperſed into all the whole ſeed, as they were *fibres*, or hairie ſtrings. Thoſe, as they pierce the womb, ſo do they equally and in like manner penetrate the tunicle *Chorion*. And it is carried this way, being a paſſage not onely neceſſarie for the nutriment and conſumption of the parts, but alſo into the veins diverſly woven and diſperſed into the skin *Chorion*. For thereby it commeth

to paſs, that the ſeed it ſelf boileth, and as it were fermenteth or ſwelleth, not onely through occaſion of the place, but alſo of the blood and vital ſpirits that flow unto it; and then it riſeth into three bubbles or bladders, like unto the bubbles which are occaſioned by the rain falling into a river or channel full of water. Theſe three bubbles or bladders, are certain rude, or new forms, or concretions of the three principall entrals, that is to ſay, of the liver, heart and brain. All this former time it is called ſeed, and by no other name; but when thoſe bubbles ariſe, it is called an embryon, or the rude form of a bodie until the perfect conformation of all the members: on the fourth day after that the vein of the navel is formed, it ſucketh groſſer blood, that is, of a more full nutriment out of the *Cotylidons*. And this blood, becauſ it is more groſs, eaſily congeal's and curdle's in that place, where it ought to prepare the liver fully and abſolutely made. For then it is of a notable great bigneſs above all the other parts; and therefore it is called *Parenchyma*, becauſ it is but onely a certain congealing or concretion of blood brought together thither, or in that place. From the gibbous part thereof ſpringeth the greater part or trunk of the hollow vein, called commonly *vena cava*, which doth diſperſ his ſmall branches, which are like unto hairs, into alſo the ſubſtance thereof: and then it is divided into two branches, whereof the one goeth upwards, the other downwards unto all the particular parts of the bodie.

The three bladders.

When the ſeed is called an an embryon.

Why the liver is called *Parenchyma*.

In the mean ſeaſon the arteries of the navel ſuck ſpirituous blood out of the eminencies or *Cotylidons* of the mother's arteries, whereof, that is to ſay, of the more fervent and ſpirituous blood, the heart is formed in the ſecond bladder or bubble, being endued with a more fleſhie, ſound, and thick ſubſtance, as it behooveth that veſſel to bee, which is the fountain from whence the heat floweth, and hath a continual motion.

In this the virtue formative hath made two hollow places; one on the right ſide, another on the left. In the right, the root of the hollow vein is infixed or ingraffed, carrying thither neceſſarie nutriment for the heart: in the left is formed the ſtamp or root of an arterie, which preſently doth divide it ſelf into two branches; the greater whereof goeth upwards to the upper parts, and the wider unto the lower parts, carrying unto all the parts of the bodie life and vital heat.

CHAP. X.

Of the third Bubble or Bladder, wherein the head and the brain is formed.

THe far greater portion of the ſeed goeth into this third bubble, that is to ſay, yeelding matter for the conformation of the brain, and all the head. For a greater quantitie of ſeed ought to go unto the conformation of the head and brain; becauſ theſe parts are not ſanguine or bloodie, as the heart and liver; but in a manner without blood, bonie, marrow, cartilaginous, nervous, and membranous, whoſe parts, as the veins, arteries, nerves, ligaments, panicles, and skin, are called *ſpermatick* parts; becauſ they obtain their firſt conformation almoſt of ſeed onely: although that afterwards they are nouriſhed with blood, as the other fleſhie and muſculous parts are. But yet the blood, when it is com unto thoſe parts, degenerateth, and turneth into a thing ſomwhat ſpermatick, by virtue of the aſſimulative facultie of thoſe parts. All the other parts of the head, form and faſhion themſelvs unto the form of the brain, when it is formed; and thoſe parts which are ſituated and placed about it for defence eſpecially, are hardened into bones.

Why the greater portion of ſeed goeth into generation of the head and brain.

The head, as the ſeat of the ſenſes, and manſion of the minde and reaſon, is ſituated in the higheſt place; that from thence, as it were from a loftie tower or turret, it might rule and govern all the other members, and their functions and actions that are under it: for there the ſoul or life, which is the rectreſs or governeſs, is ſituated; and from thence it floweth, and is diſperſed into all the whole bodie. Nature hath framed theſe three principall entrals, as props and ſuſtentations for the weight of all the reſt of the bodie: for which matter alſo ſhee hath framed the bones.

Why the head is placed on the top of the bodie.

The firſt bones that appear to bee formed, or are ſuppoſed to bee conformed, are the bones called *oſſa Ilium*, connexed or united by ſpondyls that are between them: then all the other members are framed and proportioned by their concavities and hollowneſſes, which generally are ſeven, that is to ſay, two of the ears, two of the noſe, one of the mouth, and in the parts beneath the head, one of the fundament, and another of the *yard* or conduit of the bladder; and furthermore in women, one of the neck of the womb, without the which they can never bee made mothers or bear children.

When all theſe are finiſhed, nature, that ſhee might poliſh her excellent work in all ſorts, hath covered all the bodie and everie member thereof with skin. Into this excellent work or *Microcoſmos* ſo perfected, God, the author of nature and all things, infuſeth or ingraffeth a ſoul or life: which St. *Auguſtine* prooveth by this ſentence of *Moſes*: *If anie man ſmite a woman with child, ſo that thereby ſhee bee delivered before her naturall time, and the child be dead, being firſt formed in the womb, let him die the death: but if the child hath not as yet obtained the ful proportion*

Exod. 20. *qu.* 52

and

and conformation of his bodie and members, let him recompence it with monie. Therefore it is not to bee thought that the life is derived, propagated or taken from *Adam* or our parents, as it were an hereditarie thing distributed unto all mankinde by their parents; but wee must believ it to bee immediately created of God, even at the verie instant time when the child is absolutely perfected in the lineaments of his bodie, and so given unto it by him.

So therefore the rude lumps of flesh called *mole* that engender in women's wombe, and monsters of the like breeding and confused bignes, although by reason of a certain quaking and shivering motion, they seem to have life, yet they cannot bee supposed to bee endued with a life or a reasonable soul: but they have their motion, nutriment and increas wholly of the natural and infixed facultie of the womb, and of the generative or procreative spirit that is ingraffed naturally in the seed.

The *mole* in the womb liveth not as the childe.

But even as the infant in the womb obtaineth not perfect conformation before the thirtieth day, so likewise it doth not move before the sixtieth day: at which time it is most commonly not perceived by women, by reason of the smalnes of the motion. But now let us speak briefly of the life or soul, wherein consisteth the principal original of everie function in the bodie, and likewise of generation.

CHAP. XI.

Of the life or soul.

THE soul entreth into the bodie, so soon as it hath obtained a perfect and absolute distinction and conformation of the members in the womb, which in male-children, by reason of the more strong and forming heat which is ingraffed in them, is about the fortieth day, and in females about the fortie fifth day; in som sooner, and in som later, by reason of the efficacie of the matter working, and pliantnes or obedience of the matter whereon it worketh. Neither doth the life or soul beeing thus inspired into the bodie presently execute or perform all his functions, becaus the instruments that are placed about it cannot obtain a firm and hard consistence necessarie for the lively, but especially for the more divine ministeria of the life or soul, but in a long proces of age or time.

The life goeth not into the mas of seed that doth engender the childe, before the bodie of the childe and each part thereof hath his perfect proportion and form.

Why the life or soul doth not presently execute all his offices.

Those instruments of the soul are vitiated either in the first conformation, as when the form or fashion of the head is shaped upwards or pyramidal; as was the head of *Thersites*, that lived in the time of the Trojan war, and of *Triboules* and *Tonus*, that lived in later yeares; or also by som casualtie, as by the violent handling of the midwife, who by compression, by reason that the scul is then tender and soft, hath caused the capacitie of the ventricles that bee under the brain to bee too narrow for them: or by a fall, stroak, disorder in diet, as by drunkennes, or a feve, which inferreth a lithargie, excessive sleepines, or phrensie.

Presently after the soul is entred the bodie, God endueth it with divers and sundrie gifts: hereof it commeth that som are endued with wisdom by the spirit; others with knowledg by the same spirit; others with the gift of healing by the same spirit; others with power, dominion and rule; others with prophesie; others with diversities of tongues; and to others other endowments, as it hath pleased the divine providence and bountie of God to bestow upon them, against which no man ought to contend or speak. *For it is not meet that the thing formed should say unto him that formed it, why hast thou made mee thus? hath not the Potter power to make of the same lump of claie one vessel to honor and another to dishonor?* it is not my purpose, neither belongeth it unto mee or anie other humane creature to search out the reason of those things, but onely to admire them with all humilitie, But yet I dare affirm this one thing, that a noble and excellent soul neglecteth elementarie and transitorie things, and is ravished and mooved with the contemplation of celestial, which it cannot freely enjoie before it bee separated from this earthlie inclosure or prison of the bodie, and bee restored unto its originall.

1 *Cor.* c. 12.

What the soul or life is.

Therefore the soul is the inward *Entelechia* or perfection, or the primitive caus of all motions and functions both natural and animal, and the true form of man. The Antients have endevoured to expres the obscure sence thereof by many descriptions. For they have called it a celestiall spirit, and a superior, incorporal, invisible, an immortal essence, which is to bee comprehended of its self alone, that is, of the minde or understanding. Others have not doubted but that wee have our souls inspired by the universal divine minde, which as they are alive, so they do bestow life on the bodies unto whom they are annexed or united. And although this life bee dispersed into all the whole bodie, and into everie portion of the same, yet is it void of all corporal weight or mixtion, and it is wholly and alone in everie several part, beeing simple and invisible, without all composition or mixture, yet endued with manie vertues and faculties; which it doth

The life is in all the whole bodie, and in everie portion thereof.

The life or soul is simple and indivisible

doth utter in divers parts of the bodie: For it feeleth, imagineth, judgeth, remembreth, understandeth, and ruleth all our desires, pleasures, and animal motions; it see'th, heareth, smelleth, tasteth, toucheth: and it hath divers names of those so manie and so great functions, one, which it performeth in divers parts of the bodie. It is called the *soul* or *life*; becaus it maketh the bodie live, which of it self is dead. It is called the *spirit* or *breath*; becaus it inspireth our bodies. It is called *reason*; becaus it discerneth truth from falshood, as it were by a certain divine rule. It is termed the *minde*; becaus it is mindeful of things past, in recalling and remembring them: And it is called the *vigor* or *courage*; becaus it giveth vigor and courage to the sluggish weight, or mass of the bodie. And lastly, it is called the *sens* and *understanding*; becaus it comprehendeth things that are sensible and intelligible. Becaus it is incorporeal, it cannot occupie a place by corporeal extension; although notwithstanding it filleth the whole bodie. It is *simple*; becaus it is but one in essence, not increased, nor diminished: for it is no less in a Dwarf then in a Giant; and it is like perfect and great in an infant as in a man, according to its own nature.

Divers names, and the reason of divers names that are given to humane forms.

But there are three kindes of bodies informed by a soul whereby they live: the first being the most imperfect, is of plants; the second of brute beasts; and the third of men. The plants live by a vegetative; beasts by a sensitive; and men by an intellective soul. And as the sensitive soul of brute beasts is endued with all the virtues of the vegetative; so the humane intellective comprehendeth the virtues of all the inferior, not separated by anie division, but by beeing indivisibly united with reason and understanding, into one humane form and soul whereon they depend. But becaus wee have said a little before, that divers functions of the life are resident, and appear in divers parts of the bodie here in this place, omitting all others, wee will prosecute those onely which are accounted the principal.

Three kindes of liveing bodies. The superior soul containeth in it self all the powers of the inferior.

The principal functions of an humane soul, according to the opinion of manie, are four in number, proceeding from so manie faculties, and consequently from one soul; they are these: The Common Sens, Imagination, Reasoning, and Memorie. And they think that the common or interior sens doth receiv the forms and images of sensible things, beeing carried by the spirit through the passage of the nerves, as an instrument of the external senses, as it were a messenger to go between them; and it serv's not onely to receiv them, but also to know, perceiv, and discern them. For the eie, wherein the external sens of seeing consisteth, doth not know white or black. Therefore it cannot discern the differences of colors, as neither the tongue taste's, nor the nose savor's, nor the ears sound, nor lastly, the hands their touching qualitie: yea, the eie doth not of it self perceiv that it see'th, nor the nose that it smelleth, nor the ears that they hear, nor the tongue that it tasteth, nor the hands that they touch. For all these things are the offices and functions of the common sens; for this sens knoweth that the eie hath seen som thing, either white, black, red, a man, horse, sheep, or som such like material thing; yea, even when the sight is gon and past; and so likewise the nose to have smelled this or that savor, the ear to have heard this or that sound, the tongue to have tasted this or that taste, and the hand to have touched this or that thing, bee they never so divers. For all the external senses, and all the functions thereof do end, and are referred to the Common sens, as it were the lines of a circle from the circumference into the center, as it is expressed in this figure.

What the common sens. The function of the common sens is double.

For what caus the internal sens is called the common sens. The common sens understandeth or knoweth those things that are simple onely.

For which caus it is called the common or principal sens; for that therein the principal power of feeling or perceiving is situated, for it useth the ministerie or service of the external senses, to know manie and divers things, whose differences it doth discern and judg; but simple things, that are of themselvs, and without anie composition and connexion, which may constitute anie thing true or falss, or anie argumentation, belongeth onely to the minde, understanding, or reason. For this was the counsel of nature, that the external senses should receiv the forms of things superficially, lightly, and gently onely; like as a glass, not to anie other end, but that they should presently send them unto the Common sens, as it were unto their center and prince, which bee (that is to say, the Common sens) delivereth to bee collected unto the understanding or reasoning faculties of the soul, which *Avicen* and *Averrois* have supposed to bee situated in the former part of the brain.

What imagination is.

Next unto the common sens followeth the phancasie or imagination, so called, becaus of it arise the forms and *Ideas* that are conceived in the minde, called of the Greeks

Phantasmata.

Phantasmata. This doth never rest but in those that sleep: neither alwaies in them, for oftimes in them it causeth dreams, and causeth them to suppose they see and perceiv such things as were never perceived by the senses, nor which the nature of things, nor the order of the world will permit. The power of this faculty of the minde is so great in us, that it often bringeth the whole bodie in subjection unto it.

For it is recorded in histories, that *Alexander* the Great sitting at Table, and hearing *Timotheus* the Musician sing a Martial sonnet unto his Cythern, that hee presently leaped from the table, and called for arms; but when again the Musician mollified his tune, hee returned to the table and sate down as before. The power of imagination caused by musical harmonie, was so great, that it subjected to it the courage of the World's conqueror, by whose various motion, it would now as it were cause him to run headlong to arms, and then pacifie and quiet him, and so cause him to return to his chair and banquetting again. And there was one whosoever it was, who some few yeare agon, seeing the Turk dance on a rope on high, with both his feet fastned in a basin, turned his eies from so dangerous a sight or spectacle, although came of purpose to see it, and stricken with such fear, that his bodie shook and heart quaked, for fear left that by sudden falling down headlong hee should break his neck. Manie looking down from an high and loftie place, are so stricken with fear, that suddenly they fall down headlong, being so overcom and bound with the imagination of the danger, that their own strength is not able to sustain them. Therefore it manifestly appeareth that God hath dealt most graciously and loveingly with us, who unto this power of imagination, hath joined another, that is, the facultie or power of reason and understanding; which discerning false dangers and perils from true, doth sustain and hold up a man that hee may not bee overthrown by them.

After this appeareth and approacheth to perform his function, the facultie of Reason, being the Prince of all the principal faculties of the soul; which bringeth together, composeth, joineth, and reduceth all the simple and divided forms or images of things into one heap, that by dividing, collecting, and reasoning it might discern and trie truth from falshood. What Reason is.

This facultie of Understanding or Reason is subject to no facultie or instrument of the bodie, but is free, and penetrateth into everie secret, intricate and hidden thing with an incredible celeritie: by which a man see'th what will follow, perceiveth the originals and causes of things, is not ignorant of the proceedings of things; hee compareth things that are past with those that are present and to com, decreeing what to follow, and what to avoid. This bridleth and with-holdeth the furious motions of the minde, bridleth the overhastie motions of the tongue, and admonisheth the speaker that before the words pass out of his mouth, hee ought with diligence and discretion to ponder and consider the thing whereof hee is about to speak. The functions of Reason.

After Reason and Judgment followeth Memorie, which keeping and conserving all forms and images that it receiveth of the senses, and which Reason shall appoint, and as a faithful keeper and conserver, receiveth all things, and imprinteth and sealeth them as well by their own virtue and power, as by the impulsion and adherence of those things in the bodie of the brain, without anie impression of the matter; that when occasion serveth, wee may bring them forth there-hence as out of a treasurie or store-hous. For otherwise, to what purpose were it to read, hear, and note so manie things, unless wee were able to keep and retain them in minde by the care and custodie of the Memorie or Brain? Therefore assuredly God hath given us this onely remedie and preservative against the oblivion and ignorance of things, which although of it self and of its own nature it bee of greater efficacie, yet by dailie and often medication it is trimmed and made more exquisite and perfect. And hence it was that the Antients termed wisdom the daughter of memorie and experience. Manie have supposed that the mansion or seat of the Memorie, is in the hinder part, or in the ventricle of the *Cerebellum*; by reason that it is apt to receiv the forms of things, becaus of the engrafted drinesse and hardnesse thereof. What memorie is. Wisdom the daughter of memorie and experience.

CHAP. XII.

Of the natural excrements in general, and especially of those that the childe or infant being in the womb excludeth.

BEfore I declare what excrements the infant excludeth in the womb and by what passages, I think it good to speak of the excrements which all men do naturally void. All that is called an excrement which nature is accustomed to separate and cast out from the laudable and nourishing juice. There are manie kindes of those excrements. What an excrement is.

The first is of the first concoction, which is performed in the stomach, which being driven down into the intestines or guts, is voided by the fundament. The excrement of the first concoction.

The second commeth from the Liver and is usually is three-fold, or of three kindes; one choler-

The excrement of the second concoction is triple.

cholerick, whereof a great portion is ſent into the bladder of the gall, that by ſweating out there-hence, it might ſtir up the expulſive facultie of the guts to expel and exclude the excrements. The other is like unto whay, which goeth with the blood into the veins, and is as it were a *vehicle* thereto to bring it unto all the parts of the bodie, and into everie capillar vein for to nouriſh the whole bodie; and after it hath performed that function, it is partly expelled by ſweat, and partly ſent into the bladder, and ſo excluded with the urine. The third is the melancholick excrement which beeing drawn by the milt, the purer and thinner part thereof goeth into the nouriſhment of the milt, and after the remnant is partly purged out downwards by the Hemorrhoidal veins, and partly ſent to the orifice of the ſtomach, to inſtimulate and provoke the appetite. The laſt commeth of the laſt concoction, which is abſolved in the habit of the bodie, and breathed out, partly by inſenſible tranſpiration, is partly conſumed by ſweating, and partly floweth out by the evident and manifeſt paſſages that are proper to everie part: as it happeneth in the brain before all other parts; for it doth unload it ſelf of this kinde of excrement by the paſſages of the noſe, mouth, eares, eies, palat-bone and ſutures of the ſcul.

The excrement of the third concoction is triple.

Therefore if anie of thoſe excrements bee ſtaied altogether, or anie longer then it is meet they ſhould, the default is to bee amended by diet and medicine. Furthermore, there are other ſorts of excrements not natural, of which wee have entreated at large in our book of the peſtilence.

The uſe of the navel-ſtring.

When the infant is *in* the mother's womb, until hee is fully and abſolutely formed in all the lineaments of his bodie, hee ſend's forth his urine by the paſſage of the navel or *urachus*. But a little before the time of childe-birth, the *urachus* is cloſed, and then the man-childe voideth his urine by the conduit of the yard, and the woman-childe by the neck of the womb. This urine is gathered together and contained in the coat *Chorion* or *Allantoides*, together with the other excrements, that is to ſay, ſweat, and ſuch whayiſh ſuperfluities of the menſtrual matter, for the more eaſie bearing up of the floteing or ſwimming childe. But in the time of childe-birth, when the infant by kicking breaketh the membranes, thoſe humors run out, which when the midwives perceiv, they take it as a certain ſign that the childe is at hand. For if the infant com forth together with thoſe waters, the birth is like to bee more eaſie, and with the better ſucceſs; for the neck of the womb and all the genitals are ſo by their moiſture relaxed and made ſlipperie, that by the endevor and ſtirring of the infant the birth will bee more eaſie, and with the better ſucceſs: contrariwiſe, if the infant bee not excluded before all theſe humors bee wholly flowed out and gon, but remaineth as it were in a drie place, preſently through drineſs the neck of the womb and all the genitals will bee contracted and drawn together, ſo that the birth of the childe will bee verie difficult and hard, unleſs the neck of the womb, to amend that default, bee annointed with oil or ſom other relaxing liquor. Moreover, when the childe is in the womb, hee voideth no excrements by the fundament, unleſs it bee when at the time of the birth, the proper membranes and receptacles are bur'ſt by the ſtriveing of the infant, for hee doth not take his meat at the mouth, wherefore the ſtomach is idle then, and doth not execute the office of turning the meats into *chylus*, nor of anie other concoction; wherefore nothing can go down from it into the guts. Neither have I ſeldom ſeen infants born without anie hole in their fundament, ſo that I have been conſtrained with a knife to cut in ſunder the membrane or tunicle that grew over and ſtopped it. And how can ſuch excrements bee engendred, when the childe beeing in the womb, is nouriſhed with the more laudable portion of the menſtrual blood? therefore the iſſue or childe is wont to yeeld or avoid two kindes or ſorts of excrements, ſo long as hee is in the womb, that is to ſay, ſweat and urine, in both which hee ſwim's; but they are ſeparated by themſelvs, by a certain tunicle called *Allantoides*, as it may bee ſeen in kids, dogs, ſheep, and other brute beaſts; for as much as in mankinde the tunicle *Chorion* and *Allantoides* or *Farciminalis*, bee all one membrane. If the woman bee great of a man-childe, ſhee is more merrie, ſtrong, and better colored, all the time of her childe-bearing: but if of a woman-childe, ſhee is ill colored, becauſ that women are not ſo hot as men.

The Children born without a paſſage in their fundament.

Aph. 42. *ſect.* 5.

The males begin to ſtir within three months and an half, but females after: if a woman conceiv a male-childe, ſhee hath all her right parts ſtronger to everie work: wherefore they do begin to ſet forwards their right foot firſt in going, and when they ariſe they lean on the right arm, the right dug will ſooner ſwell and wax hard: the male-children ſtir more in the right ſide then in the left, and the female-children rather in the left then in the right ſide.

Aph. 47. *ſect.* 5.

CHAP.

CHAP. XIII.

With what travail the Childe is brought into the world, and of the cauſe of this labor and travail.

When the natural prefixed and preſcribed time of childe-birth is com, the childe beeing then grown greater, require's a greater quantitie of food: which when hee cannot receiv in ſufficient meaſure by his navel, with great labor and ſtriving hee endeavoreth to get forth: therefore then hee is mooved with a ſtronger violence, and doth break the membranes wherein hee is contained. Then the womb, becauſe it is not able to endure ſuch violent motions, nor ſuſtain or hold up the childe anie longer, by reaſon that the conceptacles of the membranes are broken aſunder, is relaxed. and then the childe purſuing the air which hee feeleth to enter in at the mouth of the womb, which then is verie wide and gapeing, is carried with his head downwards, and ſo commeth into the world with great pain both unto it ſelf, and alſo unto his mother, by reaſon of the tenderneſs of his bodie, and alſo by reaſon of the nervous neck of his mother's womb, and ſeparation of the bone called *Os Ilium* from the bone called *Os ſacrum*. For unleſs thoſe bones were drawn in ſunder, how could not onely twins that cleav faſt together, but alſo one childe alone, com forth at ſo narrow a paſſage as the neck of the womb is? Not onely reaſon, but alſo experience confirmeth it; for I opened the bodies of women preſently after they have died of travail in childe-birth, in whom I have found the bones of *Ilium* to bee drawn the bredth of ones finger from *Os ſacrum*: and moreover, in manie unto whom I have been called, beeing in great extremitie of difficult and hard travail, I have not onely heard, but alſo felt the bones to cracle and make a noiſe, when I laid my hand upon the coccyx or rump, by the violence of the diſtention. Alſo honeſt matrons have declared unto mee that they themſelvs, a few daies before the birth, have felt and heard the noiſe of thoſe bones ſeparateing themſelvs one from another with great pain. Alſo a long time after the birth manie do feel great pain and ach about the region of the coccyx and *Os ſacrum*, ſo that when nature is not able to repair the diſſolved continuitie of the bones of *Ilium*, they are conſtrained to halt all the daies of their life after. But the bones of the ſhare called *Oſſa pubis*, I have never ſeen to bee ſeparated, as manie do alſo affirm. It is reported that in *Italie* the coccyx or rump in all maidens, that when they com to bee married thee may bear children with the leſſer travail in childe-birth; but this is a forged tale, for that bone beeing broken, is naturally and of its own accord repaired, and ioined together again with a *Callus*, whereby the birth of the childe will bee more difficult and hard.

Why the infant is born ſomtimes with his head forwards.

In the time of childe-birth the bones of *Ilium* and *Os ſacrum* are drawn and extended one from another.

An Italian fable.

CHAP. XIV.

Of the ſituation of the infant in the womb.

Reaſon cannot ſhew the certain ſituation of the infant in the womb, for I have found it altogether uncertain, variable and diverſ both in liveing and dead women: in the dead by opening their bodies preſently after they were dead; and in the liveing by helping them by the induſtrie of my hand, when they have been in danger of periſhing by travail of childe-birth: for by putting my hand into the womb, I have felt the infant comming forth, ſomtimes with his feet forwards, ſomtimes with his hands, and ſomtimes with his hands and feet turned backwards, and ſomtimes forwards as the figure following plainly deſcribeth.

The ſituation of the infant in the womb is diverſ.

I have often found them comming forth with their knees forwards, and ſomtimes with one of the feet, and ſomtimes with their bellie forwards, their hands and feet beeing lifted upwards, as the former figure ſheweth at large.

Som-

Somtimes I have found the infant comming with his feet downwards ſtrideing a-wide, and ſomtimes headlong, ſtretching one of his arms downward out at length, and that was an Hermaphrodite, as the figure following plainly declareth.

One time I obſerved in the birth of twins, that the one came with his head forwards, and the other with his feet, according as here I have thought good to deſcribe them.

In the bodies of women that died in travail of childe I have ſomtimes found children no bigger then if they had been but four months in the womb, ſituated in a round compaſs like a hoop, with their head bowed down to their knees, with both their hands under the knees, and their heels cloſe to their buttocks. And moreover, I proteſt before God that I found a childe beeing yet alive in the bodie of his mother (whom I opened ſo ſoon as ſhee was dead) lying all along ſtretched out, with his face upwards, and the palms of his hands joined together, as if hee were at praier.

CHAP. XV.

Which is the legitimate and natural, and which the illegitimate or unnatural time of childe-birth.

Mankinde hath no certain time of bringing forth young

TO all liveing creatures, except man, the time of conception and bringing forth their young is certain and definite; but the iſſue of man commeth into the world, ſomtimes in the ſeventh, ſomtimes in the eighth; and ſomtimes, which is moſt frequent, in the ninth month; ſomtimes in the tenth month; yea ſomtimes in the beginning of the eleventh month. *Maſſurius* report's that *Lucius Papyrius* the Pretor, the ſecond heir commencing a ſuit, gave the poſſeſſion of the goods away from him, ſeeing the mother of the childe affirmed that ſhee went thirteen months therewith, beeing there is no certain definite time of childe-birth. The childe that is born in the ſixt month cannot bee long-lived, becauſ that at that time all his bodie or members are not perfectly finiſhed, or abſolutely formed. In the ſeventh month it is prooved by reaſon and experience that the infant may bee long-lived. But in the eighth month it is ſeldom or never long-lived: the reaſon thereof is, as the Aſtronomers ſuppoſe, becauſ that at that time Saturn ruleth, whoſe coldneſs and drineſs is contrarie to the original of life: but yet the phyſical reaſon is more true; for the phyſicians ſay that the childe in the womb doth oftentimes in the ſeventh month ſtrive to bee ſet at libertie from the incloſure of the womb, and therefore it contendeth and laboreth greatly, and ſo with laboring and ſtriving it becommeth weak, that all the time of the eighth month it cannot recover his ſtrength again, whereby it may renew his accuſtomed uſe of ſtriving, and that ſom by ſuch laboring and ſtriving hurt themſelvs, and ſo die. Yet ſom ſtrong and luſtie women are thought to bring forth their children, beeing livelie and ſtrong, on the eighth month, as *Ariſtotle* teſtifieth of the *Egiptians*, the Poets of the inhabitants of the Iſle of *Naxus*, and manie of the Spaniards. Furthermore I cannot ſufficientjy marvel, that the womb, which all the time of childe-bearing is ſo cloſed together, that one can ſcarce put a *probe* into it, unleſs it bee by ſuperfœtation, or when it is open for a ſhort time to purge it ſelf, that preſently before the time of childe-birth, it ſhould gape and wax ſo wide, that the infant may paſs through it, anp preſently after it to cloſe again as if it had never been opened. But becauſ that the travail of the firſt time of childe-birth is wont to bee verie difficult and grievous, I think it not unmeet that all women, a little before the time of their firſt travail, annoint and uelax their privie parts with the unguent here deſcribed. ℞. *ſper. cett.* ℥iii. *ol. amygd. dul.* ℥iv. *cera alb.* *amygd.*

Why the childe is ſcarce alive in the eighth month.

Lib. 4. de hiſt. anim. cap. 7.

medul. cervin. ℥iii. *axung. anſ. & gallin. an.* ℥i. *tereb. venet.* ℥ii. make thereof an ointment to annoint the thighs, ſhare, privie parts and genitals. Furthermore, it ſhall not bee unprofitable, to make a truſs or girdle of moſt thin and gentle dog-skin, which being alſo annointed with the ſame unguent, may ſerv verie neceſſarily for the better carrying of the infant in the womb. Alſo baths that are made of the decoction of mollifying herbs, are alſo verie profitable to relax the privie parts a little before the time of the birth. That is ſuppoſed to bee a natural and eaſie birth, when the infant commeth forth with his head forwards, preſently following the flux of water; and that is more difficult, when the infant commeth with his feet forwards: all the other waies are moſt difficult. Therefore Mid-wives are to bee admoniſhed that as often as they perceiv the childe to bee comming forth none of thoſe waies, but either with his bellie or his back forwards, as it were double; or elſ with his hands and feet together, or with his head forwards, and one of his hands ſtretched out, that they ſhould turn it, and draw it out by the feet; for the doing whereof, if they bee not ſufficient, let them crave the aſſiſtance and help of ſom expert Chirurgian.

The natural and eaſie childe birth.

CHAP. XVI.

Signs of the birth at hand.

THere will bee great pain under the navel, and at the groins, and ſpreading therehence toward the *Vertebræ* of the loins, and then eſpecially when they are drawn back from the *Os ſacrum*, the bones *Ilia* and the *Coccyx* are thruſt outward, the genitals ſwell with pain, and a certain Fever-like ſhakeing invade's the bodie, the face waxeth red by reaſon of the endeavor of nature, armed unto the expulſion of the infant. And when theſe ſigns appear, let all things bee prepared readie to the childe-birth. Therefore firſt of all let the woman that is in travail bee placed in her bed conveniently, neither with her face upwards, nor ſitting, but with her back upwards and ſomwhat high, that ſhee may breath at more libertie, and have the more power or ſtrength to labor. Therefore ſhee ought to have her legs wide one from another, and crooked, or her heels ſomwhat bowed up towards her buttocks, ſo that ſhee may lean on a ſtaff that muſt bee placed overthwart the bed. There are ſom that do travail in a ſtool or a chair made for the ſame purpoſe: others ſtanding upright on their feet, and leaning on the poſt or piller of the bed. But you muſt take diligent heed that you do not exhort or perſwade the woman in travail to ſtrive or labor to expel the birth before the fore-named ſigns thereof do manifeſtly ſhew that it is at hand. For by ſuch labor or pains ſhee might bee wearied or ſo weakned, that when ſhee ſhould ſtrive or labor, ſhee ſhall have no power or ſtrength ſo to do. If all theſe things do fall out well in the childe-birth, the buſineſs is to be committed to nature, and to the Mid-wife. And the woman with childe muſt onely bee admoniſhed that when ſhee feeleth verie ſtrong pain, that ſhee preſently therewith ſtrive with moſt ſtrong expreſſion, ſtanding her mouth and noſe if ſhee pleaſ, and at the ſame time let the Midwife with her hands force the infant from above downwards. But if the birth bee more difficult and painful, by reaſon that the waters wherein the infant lay are flown out long before, and the womb bee drie, this ointment following is to bee prepared. R. *butyri recentis ſine ſalis in aquâ artemiſiæ lot.* ℥ii. *mucaginis ſeminum, ſeminis. lini & altheæ, cum aquâ ſabinæ extractæ, an.* ℥ß. *olei liliorum.* ℥i. make thereof an ointment, wherewith let the Midwife often annoint the ſecret parts. Alſo this powder following may bee prepared. R. *Cinnamon. cori. caſſiæ ſiſtul. dictamni an.* ʒiß. *ſacch. albi ad pondus omnium*: make thereof a moſt ſubtil and fine powder. Let the woman that is in extremitie by reaſon of difficult and painful travail in childe-birth, take half an ounce thereof at a time, with the decoction of lin-ſeed, or in white wine, for it will cauſ more ſpeedie and eaſie deliverance of the childe.

How the woman that travaileth in childbirth muſt bee placed in her bed.

An unction to ſupple the defect of the waters that are flowed out too long before the birth.

A powder to cauſ ſpeedie deliverance in childe-birth.

Moreover let the midwife annoint her hands with this ointment following as often as ſhee putteth them into the neck of the womb, and therewith alſo annoint the parts about it. R. *olei ex ſeminibus lini* ℥ß. *olei de caſtoreo* ʒß. *gallicæ muſchatæ* ʒiii. *ladani* ʒi. make thereof a liniment. Moreover, you may provoke sneezing, by putting a little pepper or white Helebore in powder into the noſtrils. Lin-ſeed beaten, and given in potion, with the water of Mugwurt and Savine, is ſuppoſed to cauſ ſpeedie deliverance. Alſo the medicine following is commended for the ſame purpoſe. R. *corticis caſſiæ ſiſtul. conquaſſatæ* ʒii. *croc. rubiæ* ß. *ballant cum vino albo & aquâ ſufficienti, ſub finem addendo ſabinæ* ʒii. *in colatura pro doſi adde cinnam.* ʒß. *croci* gr. vi. make thereof a potion, which being taken, let sneezing bee provoked, as it is above-ſaid, and let her ſtint or cloſe her mouth and noſtrils.

Apb. 35. & 45. *lib.* 5.

A potion cauſing ſpeedie deliverance.

Manie times it happeneth that the infant commeth into the world out of the womb, having his head covered or wrapped about with a portion of the ſecundine or tunicle wherein it is incloſed, eſpecially, when by the much, ſtrong, and happie ſtriving of the mother, hee commeth forth together with the water wherein it lieth in the womb, and then the mid-wives propheſie or fore-tell that the childe ſhall bee happie, becauſ hee is born as it were with a hood on his head. But I ſuppoſe that it doth betoken health of bodie both to the infant

fant and alſo to his mother; for it is a token of eaſie deliverance. For when the birth is difficult and painful, the childe never bringeth that membrane out with him, but it remaineth behinde in the paſſage of the gentitals or ſecret parts, becauſ they are narrow. For even ſo the Snake or Adder when ſhee ſhould caſt her skin thereby to renew her age, creepeth through ſom narrow or ſtrait paſſage. Preſently after birth, the woman ſo delivered muſt take two or three ſpoonfuls of the oil of ſweet almonds extracted without fire, and tempered with ſugar. Som will rather uſe the yelks of egs with ſugar, ſom the wine called hypocras, others cullifes or gellie: but alwaies divers things are to bee uſed, according as the patient or the woman in childe-bed ſhall bee grieved, and as the Phyſician ſhall give counſel, both to eaſ and aſſwage the furious torments and pain of the throwes, to recover her ſtrength and nouriſh her.

What a woman in travail muſt take preſently after her deliverance.

The cauſ of the after-throws.

Throws com preſently after the birth of the childe, becauſ that then the veines (nature beeing wholly converted to expulſion) caſt out the reliques of the menſtrual matter that hath been ſuppreſſed for the ſpace of nine months, into the womb with great violence, which becauſ they are groſs, ſlimie and dreggiſh, cannot com forth without great pain both to the veines from whence they com, and alſo unto the womb whereinto they go: alſo then by the converſion of that portion thereof that remaineth into winde, and by the undiſcreet admiſſion of the air in the time of the childe-birth, the womb and all the ſecret parts will ſwel, unleſs it bee prevented with ſom digeſting, repelling or mollifying oil, or by artificial rowling of the parts about the bellie.

CHAP. XVII.

What is to bee don preſently after the childe is born.

Why the ſecundine or after-birth muſt bee taken away preſently after the birth of the childe.

PReſently after the childe is born, the midwife muſt draw away the ſecundine or after-birth, as gently as ſhee can; but if ſhee cannot, let her put her hands into the womb, and ſo draw it out, ſeparateing it from the other parts; for otherwiſe if it ſhould continue longer, it would bee more difficult to bee gotten out, becauſ that preſently after the birth, the orifice of the womb is drawn together and cloſed, and then all the ſecundine muſt bee taken from the childe. Therefore the navel-ſtring muſt bee tied with a double thred an inch from the bellie. Let not the knot bee too hard, leſt that part of the navel-ſtring which is without the knot ſhould fall away ſooner then it ought, neither too ſlack or looſ, leſt that an exceeding and mortal flux of blood ſhould follow after it is cut off, and leſt that through it (that is to ſay the navel-ſtring) the cold air ſhould enter into childes-bodie. When the knot is ſo made, the navel-ſtring muſt bee cut in ſunder the bredth of two fingers beneath it with a ſharp knife. Upon the ſection you muſt applie a double linnen cloth dipped in oil of Roſes, or of ſweet Almonds, to mitigate the pain; for ſo within a few daies after, that which is beneath the knot will fall away beeing deſtitute of life and nouriſhment, by reaſon that the vein and arterie are tied ſo cloſe, that no life nor nouriſhment can com unto it: commonly all midwives do let it lie unto the bare bellie of the infant, whereof commeth grievous pain and gripeing, by reaſon of the coldneſs thereof which dieth by little and little as deſtitute of vital heat. But it were far better to roul it in ſoft cotton or lint, until it bee mortified, and ſo fall away.

The bindeing of the childes navel-ſtring after the birth.

Thoſe midwives do unadviſedly, who ſo ſoon as the infant is born do preſently tie the navel-ſtring and cut it off, not looking firſt for the voiding of the ſecundine. When all theſe things are don, the infant muſt bee wiped, cleanſed and rubbed from all filth and excrement with oil of Roſes or Myrtles. For thereby the pores of the skin will bee better ſhut, and the habit of the bodie the more ſtrengthened.

There bee ſom that waſh infants at that time in warm water and red wine, and afterwards annoint them with the fore-named oils. Others waſh them not with wine alone, but boil therein red Roſes and the leavs of Myrtles, adding thereto a little ſalt; and then uſeing this lotion for the ſpace of five or ſix daies, they not onely waſh away the filth, but alſo reſolv and digeſt, if there bee anie hard or contuſed place in the infant's tender bodie, by reaſon of the hard travail and labor in childe-birth. Their toes and fingers muſt bee handled, drawn aſunder and bowed, and the joints of the arms and legs muſt bee extended and bowed for manie daies and often; that thereby that portion of the excremental humor that remaineth in the joints, by motion may bee heated and reſolved. If there bee anie default in the members, either in conformation, conſtruction or ſocietie with thoſe that are adjoining to them, it muſt bee corrected or amended with ſpeed. Moreover, you muſt look whether anie of the natural paſſages bee ſtopped, or covered with a membrane, as it often happeneth. For if anie ſuch cover or ſtop the orifices of the ears, noſtrils, mouth, yard or womb, it muſt bee cut in ſunder by the Chirurgion, and the paſſage muſt bee kept open by putting in of tents, peſſaries or doſels, leſt otherwiſe they ſhould join together again after they are cut. If her have one finger more then her ſhould naturally, if his his fingers do cleav cloſe together, like unto the feet of a Gooſ or Duck, if the ligamental membrane that is under the tongue bee more ſhort and

The defaults that are commonly in children newly born.

The defaults of conformation muſt bee ſpeedily amended.

and ſtiffer then it ought, that the infant cannot ſuck, nor in time to com, ſpeak, by reaſon thereof; and if there bee anie other thing contrarie to nature, it muſt bee all amended by the induſtrie of ſom expert Chirurgian.

Manie times in children newly born, there ſticketh on the inner ſide of their mouth and on their tongue, a certain chalkie ſubſtance, both in color and in conſiſtence; this affect proceeding from the diſtemperature of the mouth, the French-men call it the white Cancer. It will not permit the infant to ſuck, and will ſhortly breed and degenerate into ulcers that will creep into the jawes, and even unto the throat, and unleſs it bee cleanſed ſpeedily, will bee their death. For remedie whereof, it muſt bee cleanſed by deterſives, as with a linnen cloth bound to a little ſtick, and dipped in a medicine of an indifferent conſiſtence made with oil of ſweet almonds, honie and ſugar. For by rubbing this gently on it, the filth may bee mollified, and ſo cleanſed or waſhed awaie. Remedies for the Cancer in a childe's mouth.

Moreover it will bee verie meet and convenient to give the infant one ſpoonful of oil of almonds, to make his bellie looſe and ſlipperie, to aſſwage the roughneſs of the weaſon and gullet, and to diſſolv the tough phlegm, which cauſſeth a cough, and ſomtimes difficultie of breathing. If the ele-lids cleav together, or if they bee joined together, or agglutinated to the coats *cornea* or *adnata*; if the waterie tumor called *hydrocephalos* affect the head, then muſt they bee cured by the proper remedies formerly preſcribed, againſt each diſeaſ.

Manie from their birth have ſpots or marks, which the common people of France call *Signes*, that is, marks or ſigns. Som of theſe are plain and equal with the skin, others are raiſed up in little tumors, and like unto warts, ſom have hairs upon them, manie times they are ſmooth, black or pale; yet for the moſt part red. When they riſe in the face, they ſpread abroad thereon manie times with great deformitie. Manie think the cauſ thereof to bee a certain portion of the menſtrual matter cleaving to the ſides of the womb, comming of a freſh flux, if happily a man do yet uſe copulation with the woman, or elſ diſtilling out of the veins into the womb, mixed and concorporated with the ſeeds at that time when they are congealed, infecting this or that part of the iſſue; beeing drawn out of the ſeminal bodie, with their own color. Women refer the cauſ thereof unto their longing when they are with childe; which may imprint the image of the thing they long for or deſire, in the childe or iſſue that is not as yet formed (as the force and power of imagination in humane bodies is verie great:) but when the childe is formed, no imagination is able to leav the impreſſion of anie thing in it, no more then it could cauſ horns to grow on the head of King *Chypus* as hee ſlept preſently after hee was returned from attentively beholding Bulls fighting together. Som of thoſe ſpots bee cureable, others not; as thoſe that are great, and thoſe that are on the lips, noſtrils, and ele-lids. But thoſe that are like unto warts, becauſ they are partakers of a certain malign qualitie and melancholick matter, which may bee irritated by indeavouring to cure them, are not to bee medled with at all, for beeing troubled and angered, they ſoon turn into a Cancer (which they call *Noli me tangere*). Thoſe that are cureable are ſmall, and in ſuch parts as they may bee dealt withall without danger. Therefore they muſt bee pierced through by the roots with a needle and a thread, and ſo beeing lifted up by the ends of the thread, they muſt bee cut awaie, and the wound that remaineth muſt bee cured according to the general method of wounds. An old fable of King *Chypus*. Which uncureable. Which and how they are cureable.

There are ſom that ſuppoſe the red ſpots that are raiſed up into little knobs and bunches, may bee waſhed awaie and conſumed by rubbing and annointing them often with menſtrual blood, or the blood of the ſecundine or after-birth. Thoſe that are hairie and ſomwhat raiſed up like unto a *Wart* or Mouſ, muſt bee pierced through the roots in three or four places, and ſtraightly bound, ſo that at length beeing deſtitute of life and nutriment, they may fall awaie. after they are fain awaie, the ulcer that remaineth muſt bee cured as other ulcers are. If there bee anie ſuperfluous fleſh remaining, it muſt bee taken awaie by applying *Ægyptiacum*, or the powder of Mercurie, and ſuch like: but if it bee doubted that it commeth from the root of the tumor that may happily remain, it muſt bee burned awaie by the root with oil of vitriol or *aqua fortis*.

There is alſo an other kinde or ſort of ſpots, of a livid or violet-color, comming eſpecially in the face about the lips, with a ſoft, ſlack, lax, thin, and unpainful tumor, and the veins as if they were varicous round about it. This kinde of tumor groweth greater [illegible] in ariſeth on children that are wayward and crying, and in men of riper years that are cholerick and angrie, and then it will bee of a diverſ color, like unto a lapper or flap of fleſh that hangeth over the Turkie-cock's *bill*. When they have don crying, or ceaſed their anger, the tumor will return to his own natural color again. But you muſt not attempt to cure it in people that are of theſe conditions.

CHAP. XVIII.

How to pull awaie the ſecundine or after-birth.

Why it is called the ſecundine.

I Suppoſe that they are called ſecundines, becauſ they do griev the woman that is with childe the ſecond time, as it were a ſecond birth: for if there bee ſeveral children in the womb at once, and of different ſexes, they then have everie one their ſeveral ſecundines, which thing is verie neceſſarie to bee known by all midwives. For they do manie times remain behinde in the womb when the childe is born, either by reaſon of the weakneſs of the woman in travail, which by contending and laboring for the birth of her childe, hath ſpent all her ſtrength: or elſ by a tumor riſing ſuddenly in the neck of the womb, by reaſon of the long and difficult birth, and the cold air unadviſedly permitted to ſtrike into the orifice of the womb. For ſo the liberties of the waies or paſſages are ſtopped and made more narrow, ſo that nothing can com forth: or elſ becauſ they are doubled and foulded in the womb, and the waters gon out from them with the infant, ſo that they remain as it were in a drie place: or elſ becauſ they yet ſtick in the womb by the knots of the veins and arteries, which commonly happeneth in thoſe that are delivered before their time. For even as apples which are not ripe, cannot bee pulled from the tree but by violence; but when they are ripe, they will fall off of their own accord: ſo the ſecundine before the natural time of the birth can hardly bee pulled awaie but by violence; but at the prefixed natural time of the birth, it may eaſily bee drawn awaie.

The cauſſes of the ſtaying of the ſecundines.

Accidents that follow the ſtaying of the ſecundines.

Manie and grievous accidents follow the ſtaying of the ſecundine; as ſuffocation of the womb, often ſwounding, by reaſon that groſs vapors ariſe from the putrefaction unto the midriff, heart and brain: therefore they muſt bee pulled awaie with ſpeed from the womb, gently handling the navel, if it may bee ſo poſſibly don. But if it cannot bee don ſo, the woman muſt bee placed as ſhee was wont when that the childe will not com forth naturally, but muſt bee drawn forth by art. Therefore the midwife having her hand annointed with oil, muſt put it gently into the womb, and finding out the navel-ſtring, muſt follow it untill it com unto the ſecundine, and if it do as yet cleav to the womb by the cotylidons, ſhee muſt ſhake and move it gently up and down, that ſo when it is ſhaked and looſed, ſhee may draw it out gently; but if it ſhould bee drawn with violence, it were to bee feared leſt that the womb ſhould alſo follow: for by violent attraction ſom of the veſſels, and alſo ſom of the nervous ligaments, whereby the womb is faſtened on each ſide, may bee rent, whereof followeth corruption of blood ſhed out of the veſſels, and thence commeth inflammation, an abſceſs or a mortal gangrene. Neither is there leſs danger of a convulſion by reaſon of the breaking of the nervous bodies, neither is there anie leſs danger of the falling down of the womb. If that there bee anie knots or clods of blood remaining together with the ſecundine, the Midwife muſt draw them out one by one, ſo that not anie may bee left behinde.

The manner of drawing out the ſecundines that remain after the birth.

The cauſ of the falling down of the womb.

The accidents that com of the violent pulling of the womb, together with the ſecundine.

Som women have voided their ſecundine, when it could not bee drawn forth by anie meanes, long after the birth of the childe, by the neck of their womb, piece-meal, rotten and corrupted, with manie grievous and painfull accidents. Alſo it ſhall bee verie requiſite to provoke the indeavor of the expulſive facultie by ſternutatories, aromatick fomentations of the neck of the womb, by mollifying injections: and contrariwiſe, by applying ſuch things to the noſtrils as yeeld a rank ſavor or ſmell, with a potion made of mug-wort and bay-berries taken in honie and wine mixed together, or with half a dram of the powder of ſavin, or with the hair of a womans head, burnt and beaten to powder, and given to drink; and to conclude, with all things that provoke the tearms or courſes.

CHAP. XIX.

What things muſt bee given to the infant by the mouth, before hee bee permitted to ſuck the teat or dug.

To draw fleam from the childe's mouth.

IT will bee verie profitable to rub all the inner ſide of the childe's mouth and palat gently with treacle and honie, or the oil of ſweet almonds extracted without fire, and if you can, to cauſ it to ſwallow ſom of thoſe things: for thereby much flegmatick moiſture will bee drawn from the mouth, and alſo will bee mooved or provoked to bee vomited up from the ſtomach; for if theſe excremental humors ſhould bee mixed with the milk that is ſucked, they would corrupt it, and then the vapors that ariſe from the corrupted milk unto the brain would infer moſt pernicious accidents. And you may know that there are manie excremental things in the ſtomach and guts of children by this, becauſ that ſo ſoon as they com into the world, and often before they ſuck milk or take anie other thing, they void downwards manie excrements diverſly colored, as yellow, green, and black. Therefore manie, that they may ſpeedily evacuate the matter that cauſeth the fretting of the guts, do not onely

onely minister those things fore-named, but also som laxative syrup, as that that is made of damask-Roses. But before the infant bee put to suck the mother, it is fitting to press som milk out of her brest into its mouth, that so the fibres of the stomach may by little and little accustom themselvs to draw in the milk. Milk soon corrupted in a flegmatick stomach.

CHAP. XX.

That mothers ought to nurs or give suck unto their own children.

THat all mothers would nurs their own children were greatly to bee wished: for the mother's milk is far more familiar nourishment for the infant then that of anie Nurs: for it is nothing elsbut the same blood made white in the dugs, wherewith before it was nourished in the mouth. For the mother ought not to give the childe suck for the space of a few daies after the birth, but first to expect the perfect expurgation and avoiding of the excremental humors. And in the mean time let her cause her breasts to bee sucked of another, or manie other children, or of som wholsom or sober maid, whereby the milk may bee drawn by little and little unto her breasts, and also by little and little purified. The mother's milk is most familiar for the childe.

For a certain space after the birth, the milk will bee troubled, and the humors of the bodie mooved: so that by long staying in the dugs, it will seem to degenerate from its naturall goodness, as the grossest of it is somwhat congealed, the manifest hear in touching, and the yellow color thereof testifieth evidently. Therefore it is necessarie that others should com in place thereof when it is sucked out, wherewith the infant may bee nourished. But if the mother or the Nurs chance to take anie diseas, as a Fever, Scouring, or anie such like, let her give the childe to another, to give it suck, lest that the childe chance to take the Nurses diseases. And moreover, mothers ought to nurs their own children, because for the most part they are far more vigilant and carefull in bringing up and attending their children, then hired and mercenarie Nurses, which do not so much regard the infant, as the gain they shal have by the keeping of it, for the most part. Those that do not nurs their own children, cannot rightly bee termed mothers: for they do not absolutely perform the dutie of a mother unto their childe, as *Marcus Aurelius* the Roman Emperor was wont to say. For it is a certain unnaturall, imperfect and half kinde of a mother's dutie, to bear a childe, and presently to abandon or put it awaie as if it were forsaken: to nourish and feed a thing in their womb (which they neither know nor see) with their own blood, and then not to nourish it when they see it in the world alive, a creature or reasonable soul, now requiring the help and sustentation of the mother. The diseas of the Nurs is participated unto the childe. *Gel. lib. 12. ca. 1.*

CHAP. XXI.

Of the choice of Nurses.

MAnie husbands take such pittie on their tender wives, that they provide Nurses for their children, that unto the paines that they have sustained in bearing them, they may not also add the trouble of nursing them: wherefore such a Nurs must bee chosen which hath had two or three children. For the dugs which have been alreadie sucked and accustomed to bee filled, have the veines and arteries more large and capable to receiv the more milk. In the choice of a Nurs there is ten things to bee considered verie diligently. as, her age, the habit of her bodie, her behaviour, the condition of her milk, the form, not onely of her dugs or breasts, but also of her teats or nipples, the time from her childe-birth, the sex of her last infant or childe, that shee bee not with childe, that shee bee sound and in perfect health. As concerning her age; shee ought not to bee under twentie five years, nor above thirtie five: the time that is between is the time of strength, more temperat, and more wholsom and healthie, and less abounding with excremental humors. And becaus her bodie doth not then grow or increas, shee must of necessitie have the more aboundance of blood. After thirtie five years in manie the menstrual flures do ceas, and therefore it is to bee supposed that they have the less nutriment for children. The best age of a Nurs.

The Nurs must also bee of a good habit, or square or well-set bodie, her breast broad, her color lively, not fat, nor lean, but well-made, her flesh not soft and tender, but thick, and hard or strong, whereby shee may bee the more able to indure watching and taking of pains about the childe; shee must not have a red or freckled face, but brown or somwhat shadowed or mixed with rudnes: for truly such women are more hot then those that are red in the face, by reason whereof they must needs concoct and turn their meat the better into blood. For according to the judgment of *Sextus Chæronensis*, as blackish or brown ground is more fertil then the white: even so a brown woman hath more store of milk. You must look well on her head, lest shee should have the skurf or running sores; for that her teeth bee not foul The best habit of bodie in a Nurs. *Lib. 4. Physiogn.*

foul or rotten, nor her breath ſtinking, nor no ulcer nor ſore about her bodie, and that ſhee bee not born of goutie or leprous Parents.

Of what behaviot the Nurſ muſt bee.

Shee ought to bee quick and diligent in keeping the childe neat and clean, chaſte, ſober, merrie, alwaies laughing and ſmiling on her Infant, often ſinging unto it, and ſpeaking diſtinctly and plainly, for ſhee is the onely Miſtreſs to teach the childe to ſpeak. Let her bee wel-mannered, becauſ the manners of the Nurſ are participated unto the Infant together with the milk. For the whelps of dogs, if they do ſuck Wolves or Lioneſſes, will becom more fierce and cruel then otherwiſe they would. Contrariwiſe, the Lions whelps wil leave their ſavagneneſs and fierceneſs, if that they bee brought up and nouriſhed with the milk of anie Bitch, or other tame beaſt. If a Goat give a Lamb ſuck, the ſame Lamb's-woull will bee more hard then others: contrariewiſe, if a Sheep give a Kid ſuck, the ſame Kids haie will bee more ſoft then another Kid's-hair. Shee ought to bee ſober, and the rather for this cauſ, becauſ manie Nurſes beeing overloaden with wine and banqueting, often ſet their children unto their breaſts to ſuck, and then fall aſleep, and ſo ſuddenly ſtrangle or choak them.

Why the Nurſ muſt abſtain from copulation.

Shee muſt abſtain from copulation: for copulation troubleth and mooveth the humors and the blood, and therefore the milk it ſelf; and it diminiſheth the quantitie of milk, becauſ it provoketh the menſtruall flux, and cauſeth the milk to have a certain ſtrong and virous qualitie, ſuch as wee may perceiv to breath from them that are incenſed with the fervent luſt and deſire of venerie. And moreover, becauſ that thereby they may happen to bee with childe, whereof inſueth diſcommoditie both to her own childe that is within her bodie, and alſo to the nurſ-childe: to the nurſ-childe, becauſ that the milk that it ſucketh will bee worſ and more depraved then otherwiſe it would bee, by reaſon that the more laudable blood after the conception remaineth about the womb, for the nutriment and increaſing of the infant in the womb; and the more impure blood goeth into the dugs, which breedeth impure or unclean milk: but to the conceived childe, becauſ it will cauſ it to have ſcarcitie of food; for, ſo much as the ſucking-childe ſucketh, ſo much the childe conceived in the womb wanteth.

What dugs a Nurſ ought to have.

Alſo ſhee ought to have a broad breaſt, and her dugs indifferently big, not ſlack or hanging, but of a middle conſiſtence, between ſoft and hard; for ſuch dugs will concoct the blood into milk the better, becauſ that in firm fleſh the heat is more ſtrong and compact. You may by touching trie whether the fleſh bee ſolid and firm, as alſo by the diſperſing of the veines, eaſily to bee ſeen by reaſon of their ſwelling and blewneſs, through the dugs, as it were into manie ſtreams or little rivelets; for in fleſh that is looſ and ſlack, they lie hidden. Thoſe dugs that are of a competent bigneſs, receiv or contain no more milk then is ſufficient to nouriſh the infant. In thoſe dugs that are great and hard, the milk is as it were ſuffocated, ſtopped or bound in, ſo that the childe in ſucking can ſcarce draw it out. and moreover, if the dugs bee hard, the childe putting his mouth to the breaſt, may ſtrike his noſe againſt it, and ſo hurt it, whereby hee may either refuſe to ſuck, or if hee doth proceed to ſuck, by continual ſucking, and placeing of his noſe on the hard breaſt, it may becom flat, and the noſtrils turned upwards, to his great deformitie, when hee ſhall com to age. If the teates or nipples of the dugs do ſtand ſomwhat low or depreſſed inwards on the tops of the dugs, the childe can hardly take them between its lips, therefore his ſucking will bee verie laborious. If the nipples or teates bee verie big, they will ſo fill all his mouth, that hee cannot well uſe his tongue in ſucking or in ſwallowing the milk.

What is to bee obſerved in the milk.

Wee may judg of or know the nature and condition of the milk, by the quantitie, qualitie, color, ſavor and taſte; when the quantitie of the milk is ſo little, that it will not ſuffice to nouriſh the infant, it cannot bee good and laudable; for it argueth ſom diſtemperature either of the whole bodie, or at leaſt of the dugs, eſpecially a hot and drie diſtemperature. But when it ſuperaboundeth, and is more then the infant can ſpend, it exhauſteth the juice of the Nurſes bodie; and when it cannot all bee drawn out by the infant, it cluttereth, and congealeth or corrupteth in the dugs. Yet I would rather wiſh it to abound, then to bee defective, for the ſuperabounding quantitie may bee preſſed out before the childe bee ſet to the breaſt.

The laudable conſiſtence of milk.

That milk that is of a mean conſiſtence between thick and thin, is eſteemed to bee the beſt. For it betokeneth the ſtrength and vigor of the faculties that ingendereth it in the breaſts. Therefore if one drop of the milk bee laid on the nail of ones thumb, beeing firſt made verie clean and fair, if the thumb bee not mooved, and it run off the nail, it ſignifieth that it is waterie-milk: but if it ſtick to the nail, although the end of the thumb bee bowed downwards, it ſheweth that it is too groſs and thick: but if it remain on the nail ſo long as you hold it upright, and fall from it when you hold it a little aſide or downwards by little and little, it ſheweth it is verie good milk. And that which is exquiſitely white, is beſt of all. For the milk is no other thing then blood made white.

Why the milk ought to bee verie white.

Therefore, if it bee of anie other color, it argueth a default in the blood: ſo that if it bee brown, it betokeneth melancholick blood; if it bee yellow, it ſignifieth cholerick blood; if it it bee wan and pale, it betokeneth phlegmatick blood; if it bee ſomwhat red, it argueth the weakneſs

weakneſs of the faculties that engendreth the milk. It ought to bee ſweet, fragrant, and pleaſant in ſmell; for if it ſtrike into the noſtrils with a certain ſharpneſs, as for the moſt part the milk of women that have red hair and little freckles on their faces doth, it prognoſticates a hot and cholerick nature: if with a certain ſowerneſs, it portendeth a cold and melancholick nature. In taſte it ought to bee ſweet, and as it were ſugered, for the bitter, ſaltiſh, ſharp, and ſtiptick, is naught. And here I cannot but admire the providence of nature, which hath cauſſed the blood wherewith the childe ſhould bee nouriſhed to bee turned into milk: which unleſs it were ſo, who is hee that would not turn his face from, and abhor ſo grievous and terrible a ſpectacle of the childes mouth ſo imbrued and beſmeared with blood? What mother or Nurſ would not bee amazed at everie moment with the fear of the blood ſo often ſhed out, or ſucked by the Infant for his nouriſhment? Moreover, wee ſhould want two helps of ſuſtentation, that is to ſay, Butter and Cheeſ.

Why a woman that hath red hair, or freckles on her face cannot bee a good Nurſ.

Neither ought the childe to bee permitted to ſuck within five or ſix daies after it is born, both for the reaſon before alledged, and alſo becauſ hee hath need of ſo much time to reſt quiet, and eaſ himſelf after the pains hee hath ſuſtained in his birth: in the mean ſeaſon the mother muſt have her breaſts drawn by ſom maid that drinketh no wine, or elſ ſhee may ſuck or draw them her ſelf with an artificiall inſtrument which I will deſcribe hereafter.

That Nurſ that hath born a man childe is to bee preferred before another, becauſ her milk is the better concocted, the heat of the male-childe doubling the mother's heat. And moreover, the women that are great with childe of a male-childe, are better colored, and in better ſtrength, and better able to do anie thing all the time of their greatneſs, which prooveth the ſame: and moreover the blood is more laudable, and the milk better. Furthermore, it behooveth the Nurſ to bee brought on bed, or to travail at her juſt and prefixed or natural time: for when the childe is born before his time of ſom inward cauſ, it argueth that there is ſom default lurking and hidden in the bodie and humors thereof.

Why that Nurſ that hath born a man-childe is to bee preferred before another.

Why ſhee cannot bee a good Nurſ whoſe childe was born before the time.

CHAP. XXII.

What diet the Nurſ ought to uſe, and in what ſituation ſhee ought to place the infant in the Cradle.

BOth in eating, drinking, ſleeping, watching, excerciſing and reſting, the Nurſes diet muſt bee divers, according as the nature of the childe both in habit and temperature ſhall bee: as for example, if the childe bee altogether of a more hot blood, the Nurſ both in feeding and ordering her ſelf ought to follow a cooling diet. In general, let her eat meats of good juice, moderate in quantitie and qualitie, let her live in a pure and clear air, let her abſtain from all ſpices, and all ſalted and ſpiced meats, and all ſharp things, wine, eſpecially that which is not allayed or mixed with water, and carnal copulation with a man, let her avoid all perturbations of the minde, but anger eſpecially, let her uſe moderate exerciſe, unleſs it bee the exerciſe of her armes and upper parts, rather then the leggs and lower parts, whereby the greater attraction of the blood, that muſt bee turned into milk, may bee made towards the dugs. Let her place her childe ſo in the Cradle that his head may bee higher then all the bodie, that ſo the excremental humors may bee the better ſent from the brain unto the paſſages that are beneath it. Let her ſwathe it ſo as the neck and all the back-bone may bee ſtraight and equal. As long as the childe ſucketh, and is not fed with ſtronger meat, it is better to lay him alwaie on his back, then anie other waie, for the back is, as it were the Keel in a ſhip, the ground-work and foundation of all the whole bodie, whereon the infant may ſafely and eaſily reſt, But if hee lie on the ſide, it were danger leſt that the bones of the ribs beeing ſoft and tender, not ſtrong enough, and united with ſlack bands, ſhould bow under the weight of the reſt, and ſo wax crooked, whereby the infant might becom crook-backed. But when hee beginneth to breed teeth, and to bee fed with more ſtrong meat, and alſo the bones and connexions of them begin to wax more firm and hard, hee muſt bee laied one while one this ſide, another while on that, and now and then alſo on his back. And the more hee groweth, the more let him bee accuſtomed to lie on his ſides; and as hee lieth in the Cradle, let him bee turned unto that place whereat the light commeth in, leſt that otherwiſe hee may becom pur-blinde, for the eie of its own nature is bright and light-ſom, and therefore alwaies deſireth the light, and abhoreth darkneſs, for all things are moſt delighted with their like, and ſhun their contraries. Therefore vnleſs the light com's directly into the childe's face, hee turneth himſelf everie waie beeing verie ſorrowful, and ſtriveth to turn his head and eies that hee may have the light; and that often turning and rowling of his eies at length groweth into a cuſtom that cannot bee left: and ſo it commeth to paſs that the infant doth either becom pur-blind, if hee ſet his eies ſtedfaſtly on one thing, or elſ his eies do becom trembling, alwaies turning and unſtable, if hee caſt his eies on manie things that are round about him: which is the reaſon that Nurſes, beeing taught by experience, cauſ over the head of the childe lying in the Cradle, an arch or vault of Wickers covered with cloath to bee made, thereby to reſtrain, direct, and eſtabliſh the uncertain and wandering motions of the childe's eies.

Anger greatly hurteth the Nurſ.

The exerciſe of the armes is beſt for the Nurſ. How the childe ſhould bee placed in the Cradle.

Why an arch of wickers muſt bee made over the childe's head lying in the Cradle.

Why a ſquint-eied Nurſ cauſſeth the childe to bee ſquint-eied.

If the Nurſ bee ſquint-eied, ſhee cannot look upon the childe but ſide-waies, whereof it commeth to paſs that the childe beeing moiſt, tender, flexible, and prone to anie thing with his bodie, and ſo likewiſe with his eie, by a long and dailie cuſtom unto his Nurſe's ſight, doth ſoon take the like cuſtom to look after that ſort alſo, which afterwards hee cannot leav or alter. For thoſe evil things that wee learn in our youth, do ſtick firmly by us; but the good qualities are eaſily changed into worſ. In the eies of thoſe that are ſquint-eied, thoſe two muſcles which do draw the eies to the greater or leſſer corner, are chiefly or more frequently mooved. Therefore either of theſe beeing confirmed in their turning aſide by long uſe, as the exerciſe of their proper office increaſeth the ſtrength, ſoon overcom's the contrarie or withſtanding muſcles, called the *Antagoniſts*, and bring's them into their ſubjection, ſo that, will they, nill they, they bring the eie unto this or that corner as they liſt.

How children becom left-handed.

So children becom left-handed, when they permit their right hand to languiſh with idleneſs and ſluggiſhneſs, and ſtrengthen their left hand with continual uſe and motion to do everie action therewithall, and ſo bring by the exerciſe thereof more nutriment unto that part. But if men (as ſom affirm) beeing of ripe years, and in their full growth, by dailie ſocietie and companie of thoſe that are lame and halt do alſo halt, not mindeing ſo to do, but it commeth againſt their wills, and when they think nothing thereof, why ſhould not the like happen in children, whoſe ſoft and tender ſubſtance is as flexible and pliant as wax unto everie impreſſion? Moreover, children, as they becom lame and crook-back't; ſo do they alſo becom ſquint-eied by the hereditarie default of their parents.

CHAP. XXIII.

How to make pap for children.

Three laudable conditions of pap.

PAp is a moſt meet food or meat for children; becauſ they require moiſt nouriſhment, and it muſt bee anſwerable in thickneſs to the milk, that ſo it may not bee difficult to bee concocted or digeſted. For pap hath theſe three conditions, ſo that it bee made with wheaten flower, and that not crude, but boiled: let it bee put into a new earthen pot or pipkin, and ſo ſet into an oven at the time when bread is ſet thereinto to bee baked; and let it remain there until the bread bee baked and drawn out: for when it is ſo baked, it is leſs clammie and crude. Thoſe that mix the meal crude with the milk, are conſtrained to abide one of theſe diſcommodities or other, either to give the meal groſs and clammie unto the childe, if that the pap bee onely firſt boiled over the fire in a pipkin or skellet, ſo long as ſhall bee neceſſarie for the milk; hence com obſtructions in the meſaraick veins, and in the ſmall veins of the liver, fretting and worms in the guts, and the ſtone in the reins. Or elſ they give the childe the milk, deſpoiled of its butteriſh and whayiſh portion, and the terreſtrial, and cheeſ-like, or curd-like remaining, if the pap bee boiled ſo long as is neceſſarie for the meal: for the milk requireth not ſo great, neither can it ſuffer ſo long boiling as the meal. Thoſe that do uſe crude meal, and have no hurt by it, are greatly bound to nature for ſo great a benefit. But *Galen* willeth children to bee nouriſhed onely with the Nurſe's milk, ſo long as the Nurſ hath enough to nouriſh and feed it. And truly there are manie children that are contented with milk onely, and will receiv no pap until they are three months old. If the childe at anie time bee coſtive, and cannot void the excrements, let him have a cataplaſm made with one dram of Aloës, of white and black Hellebore, of each fifteen grains, beeing all incorporated in as much of an Ox gall as is ſufficient, and extended or ſpread on Cotton like unto a *pultis*, as broad as the palm of ones hand, and ſo applie it upon the navel warm: Moreover, this cataplaſm hath alſo virtue to kill the worms in the bellie. Manie times children have fretting of the guts, that maketh them to crie, which commeth of cruditie. This muſt bee cured by applying unto the bellie ſweatie or moiſt wooll, macerated in oil of Camomil.

How the meal muſt bee prepared to make the pap withall.

Why the meal wherewith the pap muſt bee made, muſt firſt bee boiled or baked.

Lib. 1. de ſanit. tuend.

A cataplaſm to relax the childe's bellie.

For the fretting of the guts in children.

If when the childe's teeth begin to grow, hee chance to bite the nipple of the Nurſe's breaſt, there will bee an ulcer verie contumacious and hard to bee cured; becauſ that the ſucking of the childe, and the rubbing of the clothes do keep it alwaies raw; it muſt bee cured with fomenting it with Alum-water, and then preſently after the fomentation putting thereupon a cover of lead, made like unto a hat, as they are here deſcribed, with manie holes in the top, whereat both the milk, and alſo the ſanious matter that commeth from the ulcers may go out; for lead it ſelf will cure ulcers.

For the ulcers of the nipples or teats.

The

The figure of leaden Nipples to bee put upon the Nipple or Teat of the Nurſe, when it is ulcerated.

Children may bee cauſſed to ceaſe their crying four manner of waies, that is to ſay, by giveing them the teat, by rocking them in a cradle, by ſinging unto them, and by changeing the clothes and ſwathes wherein they are wrapped. They muſt not bee rocked too violently in the cradle, leſt that the milk that is ſucked ſhould bee corrupted by the too violent motion, by reaſon whereof they muſt not bee handled violently anie other way, and not altogether prohibited, or not ſuffered to crie. For by crying the breaſt and lungs are dilated, and made bigger and wider; the natural parts the ſtronger, and the brain, noſtrils, the eies and mouth are purged, by the tears and filth that com from the eies and noſtrils. But they muſt not bee permitted to crie long or fiercely, for fear of breaking the production of the *Peritoneum*, and thereby cauſſing the falling down of the guts into the cod, which rupture is called of the Greeks *Enterocele*; or of the caul, which the Greeks call *Epiplocele*.

What moderate crying worketh in the infant.

What immoderate crying cauſſeth.

CHAP. XXIV.

Of the weaning of Children.

MAnie are weaned in the eighteenth month, ſom in the twentieth; but all, or the moſt part, in the ſecond year: for then their teeth appear, by whoſe preſence nature ſeemeth to require ſom harder meat then milk or pap, wherewith children are delighted, and will feed more earneſtly thereon. But there is no certain time of weaning of children. For the teeth of ſom will appear ſooner, and ſom later; for they are prepared of nature for no other purpoſe then to chaw the meat. If children bee weaned before their teeth appear, and bee fed with meat that is ſomwhat hard and ſolid, according to the judgment of *Avicen*, they are incident to manie diſeaſes comming through cruditie; becauſ the ſtomach is yet but weak, and wanteth that preparation of the meats which is made in the mouth by chawing; which men of ripe years cannot want without offence: when the childe is two years old, and the teeth appear, if the childe more vehemently deſire harder meats, and doth feed on them with pleaſure and good ſucceſs, hee may bee ſafely weaned; for it cannot bee ſuppoſed that hee hath this appetite of hard meats in vain, by the inſtinct of nature. Yet hee may not bee weaned without ſuch an appetite, if all other things bee correſpondent, that is to ſay, his teeth and age; for thoſe things are eaten without an appetite, cannot profit. But if the childe bee weak, ſicklie, or feeble, hee ought not to bee weaned. And when the meet time of weaning commeth, the Nurſe muſt now and then uſe him to the teat, whereby hee may leav it by little and little, and then let the teat bee annointed or rubbed with bitter things, as with Aloes, water of the infuſion of *Colocynthus*, or Wormwood, or with Muſtard, or Soot ſteeped in water, or ſuch like. Children that are ſcabbie in their heads, and over all their bodies, and which void much phlegm at their mouth and noſtrils, and manie excrements downwards, are like to bee ſtrong and ſound of bodie; for ſo they are purged of excremental humors: contrariwiſe, thoſe that are clean and fair of bodie, gather the matter of manie diſeaſes in their bodies, which in proceſs of time will break forth and appear. Certainly, by the ſudden falling of ſuch matters into the back-bone, may becom crook-back't.

When children muſt bee weaned.

Why children muſt not bee weaned before their teeth appear.

How children muſt bee weaned.

What children are ſtrong and ſound of bodie.

An often cauſ of ſudden crookedneſs.

CHAP.

CHAP. XXV.

By what ſigns it may bee known whether the childe in the womb bee dead or alive.

A moſt certain ſign of the childe dead in the womb.

IF neither the Chirurgians hand, not the mother can perceiv the infant to moov, if the waters bee flowed out, and the ſecundine com forth, you may certainly affirm that the infant is dead in the womb, for this is the moſt infallible ſign of all others: for becauſ the childe in the womb doth breath but by the arterie of the navel, and the breath is received by the *Cotyledon* of the arteries of the womb, it muſt of neceſſitie com to paſs that when the ſecundine is ſeparated from the infant, no air nor breath can com unto it. Wherefore ſo often as the ſecundine is excluded before the childe, you may take it for a certain token of the death thereof: when the childe is dead, it will bee more heavie to the mother then it was before when it was alive, becauſ it is now no more ſuſtained by the ſpirits and faculties wherewith before it was governed and ruled, for ſo wee ſee dead men to bee heavier then thoſe that are alive, and men that are weak though hunger and famin to bee heavier then when they are well refreſhed, and alſo when the mother encline's her bodie anie way, the infant falleth that way alſo even as it were a ſtone. The mother is alſo vexed with ſharp pain from the privities even to the navel, with a perpetual deſire of makeing water, and going to ſtool, becauſ that nature is wholly buſied in the expulſion or avoidance of that which is dead: for that which is alive will expel the dead ſo far as it can from it ſelf, becauſ the one is altogether different from the other; but likeneſs, if anie thing, conjoin's and unite's things together: the genitals are cold in touching, and the mother complaineth that ſhee feeleth a coldneſs in her womb, by reaſon that the heat of the infant is extinguiſhed, wherewith before her heat was doubled: manie filthie excrements com from her, and alſo the mother's breath ſtinketh, ſhee ſwoundeth often, all which for the moſt part happen within three daies after the death of the childe: for the infant's bodie will ſooner corrupt in the mother's womb then it would in the open air, becauſ that, according to the judgment of *Galen*, all hot and moiſt things, beeing in like manner encloſed in a hot and moiſt place, eſpecially if by reaſon of the thickneſs or ſtraitneſs of the place they cannot receiv the air, will ſpeedily corrupt. Now by the riſeing up of ſuch vapors from the dead unto the brain and heart, ſuch accidents may ſoon follow, her face will bee clean altered, ſeeming livid and ghaſtly, her dugs fall and hang looſ and lank, and her bellie will bee more hard and ſwollen then it was before. In all bodies ſo putrefying, the natural heat vaniſheth away, and in place thereof ſucceedeth a preternatural, by the working whereof the putrefied and diſſolved humors are ſtirred up into vapors, and converted into winde, and thoſe vapors, becauſ they poſſeſs and fill more ſpace and room (for naturaliſts ſay that of one part of water ten parts of air are made) do ſo puff up the putrefied bodie into a greater bigneſs. You may note the ſame thing in bodies that are gangrenate, for they caſt forth manie ſharp vapors, yet nevertheleſs they are ſwollen and puffed up.

When the childe is dead in the womb hee is more heavie then hee was before beeing alive.

That which is alive will not ſuffer that which is dead.

Lib. de tumorib.

Why the bellie of a woman will bee more big when the childe is dead within her then it was before when it was alive.

Now ſo ſoon as the Chirurgian ſhall know that the childe is dead by all theſe fore-named ſigns, hee ſhall with all diligence endeavor to ſave the mother ſo ſpeedily as hee can, and if the Phyſicians cannot prevail with potions, baths, fumigations, ſternutatories, vomits, and liniments appointed to expel the infant, let him prepare himſelf to the work following; but firſt let him conſider the ſtrength of the woman, for if hee perceiv that ſhee bee weak and feeble by the ſmalneſs of her puls, by her ſmall, ſeldom and cold breathing, and by the altered and death-like color in her face, by her cold ſweats, and by the coldneſs of the extreme parts, let him abſtain from the work, and onely affirm that ſhee will die ſhortly; contrariwiſe, if her ſtrength bee yet good, let him with all confidence and induſtrie deliver her on this wiſe from the danger of death.

The ſigns of a woman that is weak.

CHA XXVI.

Of the Chirurgical extractions of the childe from the womb either dead or alive.

After whatſort the woman in travail muſt bee placed when the child beeing dead in her womb, muſt bee drawn out.

THerefore firſt of all the air of the chamber muſt bee made temperate, and reduced unto a certain mediocritie, ſo that it may neither bee too hot nor too cold. Then ſhee muſt bee aptly placed, that is to ſay, overthwart the bed-ſide, with her buttocks ſomwhat high, haveing a hard ſtuffed pillow or boulſter under them, ſo that ſhee may bee in a mean figure of ſituation, neither ſitting altogether upright, nor altogether lying along on her back; for ſo ſhee may reſt quietly, and draw her breath with eaſ, neither ſhall the ligaments of the womb bee extended ſo as they would if ſhee lay upright on her back, her heels muſt bee drawn up cloſe to her buttocks, and there bound with broad and ſoft linnen rowlers. The rowler muſt firſt com about her neck, and then croſ-wiſe over her ſhoulders, and ſo to the feet, and there it muſt croſs again, and ſo bee rowled about the legs thighs, and then it muſt bee brought up to the neck again, and there made faſt, ſo that ſhee

How ſhee muſt bee bound.

may

may not bee able to moov her self, even as one should be tied when he is to bee cut of the stone. But that shee may not bee wearied, or left that her bodie should yeeld or sink down as the Chirurgian draweth the bodie of the infant from her, and so hinder the work, let him cause her feet to bee set against the side of the bed, and then let four of the strong standers by hold her fast by the legs and shoulders. Then that the air may not enter into the womb, and that the work may bee don with the more decencie, her privie parts and thighs must bee covered with a warm double linnen cloth. Then must the Chirurgian, haveing his nails closely pared, and his rings (if hee wear anie) drawn off his fingers, and his arms naked, bare, and well annointed with oil, gently draw the flaps of the neck of the womb asunder, and then let him put his hand gently into the mouth of the womb, haveing first made it gentle and slipperie with much oil; and when his hand is in, let him finde out the form and situation of the childe, whether it bee one or two, or whether it bee a Mole or not. And when hee findeth that hee commeth naturally, with his head toward the mouth or orifice of the womb, hee must lift him up gently, and so turn him that his feet may com forwards, and when hee hath brought his feet forwards, hee must draw one of them gently out at the neck of the womb, and then hee must binde it with som broad and soft or silken band a little above the heel with an indifferent slick knot, and when hee hath so bound it, hee must put it up again into the womb, then hee must put his hand in again, and finde out the other foot, and draw it also out of the womb, and when it is out of the womb, let him draw out the other again whereunto hee had before tied the one end of the band, and when hee hath them both out, let him join them both close together, and so by by little and little let him draw all the whole bodie from the womb. Also other women or Midwives may help the endeavor of the Chirurgian, by pressing the patient's bellie with their hands downwards as the infant goeth out: and the woman herself by holding her breath, and closeing her mouth and nostrils, and by driveing her breath downwards with great violence, may verie much help the expulsion. I wish him to put back the foot into the womb again after hee hath tied it, becaus if that hee should permit it to remain in the neck of the womb, it would hinder the entrance of his hand when hee putteth it in to draw out the other. But if there bee two children in the womb at once, let the Chirurgian take heed lest that hee take not of either of them a leg, for by drawing them so, hee shall profit nothing at all, and yet exceedingly hurt the woman. Therefore that hee may not bee so deceived, when hee hath drawn out one foot and tied it, and put it up again, let him with his hand follow the band wherewithall the foot is tied, and so go unto the foot, and then to the groin of the childe and then from thence hee may soon finde out the other foot of the same childe: for if it should happen otherwise, hee might draw the legs and the thighs out: but it would com no further, neither is it meet that hee should com out with his arms along by his sides, or bee drawn out on that sort, but one of his arms must bee stretched out above his head, and the other down by his side, for otherwise the orifice of the womb when it were delivered of such a gross trunk, as it would bee when his bodie should bee drawn out with his arms along by his sides, would so shrink and draw it self when the bodie should com unto the neck, onely by the accord of nature requiring union, that it would strangle and kill the infant, so that it cannot bee drawn there-hence unless it bee with a hook put under, or fastned under his chin, in his mouth, or in the hollowness of his eie. But if the infant lieth as if hee would com with his hands forwards, or if his hands bee forth alreadie, so that it may seem hee may bee drawn forth easily that way, yet it must not bee so don; for so his head would double backwards over his shoulders, to the great danger of his mother. Once I was called unto the birth of an infant, whom the midwives had assaied to draw out by the arm, so that the arm had been so long forth that it was gangrenate, whereby the childe died; I told them presently that his arm must bee put in again, and hee must bee turned otherwise. But when it could not bee put back by reason of the great swelling thereof, and also of the mother's genitals, I determined to cut it off with an incision knife, cutting the muscles as near as I could to he shoulder, yet drawing the flesh upwards, that when I had taken off the bone with a pair of cutting pincers, it might com down again to cover the shivered end of the bone, lest otherwise when it were thrust in again into the womb, it might hurt the mother. Which beeing don, I turned him with his feet forwards, and drew him out as is before said. But if the tumor either naturally or by som accident, that is to say, by putrefaction, which may perchance com, bee so great that hee cannot bee turned according to the Surgeon's intention, nor bee drawn out according as hee lieth, the tumor must bee diminished, and then hee must bee drawn out as is afore-said, and that must bee don at once. As for example, if the dead infant appear at the orifice of the womb, which our midwives call the Garland, when it gapeth, is open and dilated, but yet his head beeing more great and puffed up with winde so that it cannot com forth, as caussed to bee so through that disease which the Greeks call *Hydrocephalocele*, the Surgeon must fasten a hook under his chin, or in his mouth, or else in the hole of his eie, or else, which is better and more expedient, in the hinder part of his head. For when the scull is so opened, there will bee a passage whereat the winde may pass out, and so when the tumor falleth

How the Chirurgian ought to prepare himself and his patient to the drawing out of the childe from the womb.

How the infant that is dead in the womb must bee turned, bound and drawn out.

A caution to avoid strangling of the infant in drawing out the bodie.

Why the childe must not bee drawn out with his hands forwards.

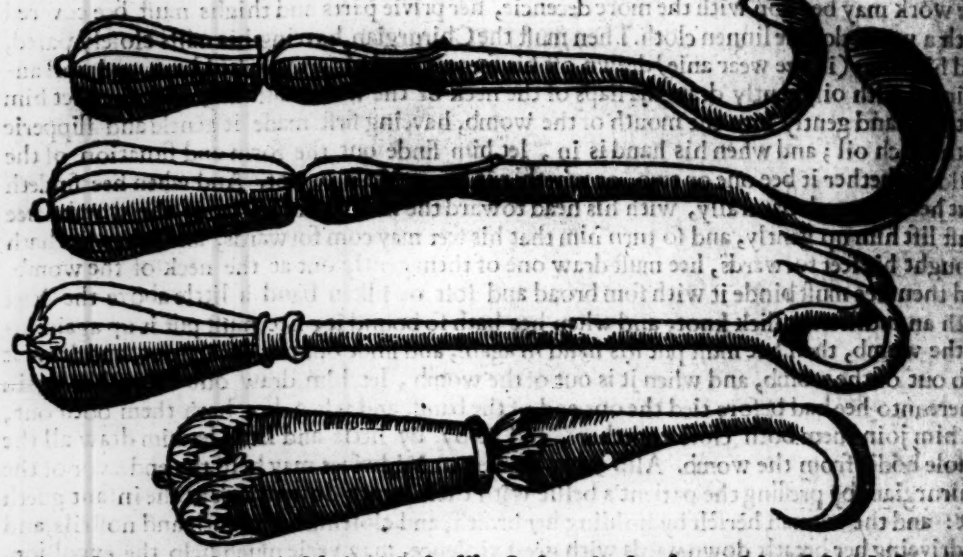
An historie.

To diminish the winde wherewith the infant beeing dead in the womb, swelleth and is puffed up that hee cannot bee gotten out of the womb.

and

and decreaſeth, let him draw the infant out by little and little; but not raſhly, leſt hee ſhould break that whereon hee hath taken hold: the figure of thoſe hooks is thus.

The forme of Hooks for drawing out the infant that is dead in the womb.



But if the breaſt bee troubled with the like fault, the hooks muſt bee faſtned about the chanel-bone: If there bee a Dropſie or a Tympanie in the bellie, the hooks muſt bee faſtned either in the ſhort ribs, that is to ſay, in the muſcles that are between the ribs, or eſpecially, if the diſeaſe do alſo deſcend into the feet, about the bones that are above the groin; or elſe putting the crooked knife here pictured into the womb with his left hand, let him make inciſion in the childe's bellie, and ſo get out all his entrals by the inciſion: for when hee is ſo bowelled, all the water that cauſſed the Dropſie will out. But the Surgeon muſt do none of all theſe things but when the childe is dead, and the woman that travelleth in ſuch danger that ſhee cannot handſomly bee holpen.

How the head of the infant, if it remain in the womb ſeparated from the bodie, may bee drawn out.

But if by any means it happeneth, that all the Infant's members bee cut away by little and little, and that the head onely remaineth behinde in the womb, which I have ſometimes againſt my will, and with great ſorrow ſeen; then the left hand, beeing annointed with oil of Lillies, or freſh Butter, muſt bee put into the womb, wherewith the Surgeon muſt finde out the mouth, putting his finger into it; then with his right hand hee muſt put up the hook (according to the direction of the left hand) gently, and by little and little, and ſo faſten it in the mouth, eie, or under the chin; and when hee hath firmly fixed or faſtened it, hee muſt therewith draw out the head by little and little, for fear of looſning or breaking the part whereon hee hath hold. In ſtead of this Hook, you may uſe the Inſtruments that are here deſcribed, which therefore I have taken out of the Surgerie of *Francis Dalechamps*; for they are ſo made, that they may eaſily take hold of a ſpherical and round bodie with the branches, as with fingers.

Gryphon's Talons, *that is to ſay, Inſtruments made to draw out the head of a dead infant that is ſeparated in the womb from the reſt of the bodie.*

But it is not verie easie to take hold on the head when it remaineth alone in the womb, by reason of the roundnes thereof, for it will slip and slide up and down, unless the bellie be pressed down, and on both sides, thereby to hold it unto the instrument, that it may with more facilitie take hold thereon.

Why the head beeing alone in the womb, is more difficult to bee out.

CHAP. XXVII.

What must bee don unto the woman in travail presently after her deliverance.

THere is nothing so great an enemie to a woman in travail, especially to her whose childe is drawn away by violence, as cold; wherefore with all care and diligence shee must bee kept and defended from cold. For after the birth, her bodie beeing void and emptie, doth easily receiv the air that will enter into everie thing that is emptie, and hence shee waxeth cold, her womb is distended and puffed up, and the orifices of the vessels thereof are shut and closed, whereof commeth suppression of the after-birth, or other after-purgations. And thereof commeth manie grievous accidents, as hysterical suffocation, painful fretting of the guts, fevers, and other mortall diseases.

Cold an enemie to women in travail.

What accidents follow the taking of cold in a woman that is delivered of childe.

What woman soever will avoid that discommoditie, let her hold her legs or thighs across, for in so doing, those parts that were separated will bee joined and close together again. Let her bellie bee also bound or rowled with a ligature of an indifferent bredth and length, which may keep the cold air from the womb, and also press the blood out that is contained in all the substance thereof. Then give her som Capon-broth or Caudle, with Saffron, or with the powder called *Pulvis ducis*, or elf bread toasted and dipped in wine wherein spice is brewed, for to restore her strength, and to keep away the fretting of the guts. When the secundine is drawn out, and is yet hot from the womb, it must bee laid warm unto the region of the womb, especially in the Winter, but in the Summer, the hot skin of a weather newlie killed must bee laid unto the whole bellie, and unto the region of the loins. But then the curtains of the bed must bee kept down, and all the windows and doors of the chamber must bee kept shut with all diligence, that no cold air may com unto the woman that travaileth, but that shee may lie and take her rest quietly. The Weather's skin must be taken away after that it hath lien five or six hours, and then all the region of her bellie must bee annointed with the ointment following.

Secundines must bee laid to the region of the womb whil'st they bee warm.

℞. *Spermatis Ceti* ℥ii. *olei amygdal. dulcium & hypericon. an.* ℥iß. *sevi bircini* ℥i. *olei myrtillor.* ℥i *ceræ novæ quantum sufficit*, make thereof an ointment, wherewith let her bee annointed twice in the daie: let a plaster of *Galbanum* bee applied to the navel, in the mid'st whereof put som few grains of Civet or Musk, so that the smel of the plaster may not strike up into her nostrils. Then let this medicine following bee applied, commonly called *Tela Gualterin*. ℞. *ceræ novæ*, ℥iv. *spermatis Ceti* ℥iß. *terebinth. ovorum in aquâ rosaceâ lotæ*, ℥ii. *olei amygdal. dulcium & hypericonis an.* ℥i. *olei mastich. & myrtini, an.* ℥ß. *axungiæ cervi*, ℥iß. melt them altogether, and when they are melted, take it from the fire, and then dip a linnen cloth therein, as big as may serv to fit the region of the bellie, whereunto it is to bee applied. These remedies will keep the external region of the bellie from wrinkling.

Unguents for the woman in travail that the region of the bellie may not bee wrinkled.

The medicine called *Tela Gualterina.*

But of all other, the medicine following excelleth. ℞. *limacum rub.* lbi. *florum anthos quart.* iiii. let them bee cut all in small peeces, and put into an earthen pot well nealed with lead, and close stopped, then let it bee set in the dung of horses for the space of fortie daies, and then bee pressed or strained, and let the liquor that is strained out bee kept in a glas well covered, and set in the Sun for the space of three or four daies, and therwith annoint the bellie of the woman that lieth in childe-bed. If shee bee greatly tormented with throwe, let the powder following bee given unto her. ℞. *anis. conditi* ℥ii. *nucis moschat. cornu cervi usti an.* ℥i. ß. *nucleorum dactyl.* nr. ℥iii. *ligni aloës & cinnamomi, an.* ℥ii. make thereof a most subtil powder, let her take ℥i. thereof at once with white wine warm. Or, ℞. *rad. consolidæ major.* ℥iß. *radicum cleorum perficorum, nucis moschat. an.* ℈ii. *carab.* ℈ß. *ambræ grossi grani iv.* make thereof a powder, let her take one dram thereof at a time with white wine, or if shee have a fever, with the broth of a Capon. Let there bee hot bags applied to the genitals, bellie and reins; these bags must bee made of millet and oats fried in a frying-pan with a little white wine.

A powder for the fretting of the guts.

But if through the violence of the extraction the genital parts bee torn, as antient writers affirm it hath com to pas, so that the two holes, as the two holes of the privie-parts and of the fundament have been torn into one, then that which is rent must bee stitched up, and the wound cured according to art. Which is a most unfortunate chance for the mother afterwards, for when shee shall travail again, shee cannot have her genital parts to extend and draw themselvs in again by reason of the scar. So that then it will bee needful that the Chirurgian shall again open the place that was cicatrized, for otherwise shee shall never bee delivered, although shee strive and contend never so much. I have don the like cure in two women that dwelt in Paris.

What must bee don when the groin is torn in childe-birth

CHAP.

CHAP. XXVIII.

What cure muſt bee uſed to the Dugs and Teats of thoſe that are brought to bed.

To drive the milk downward.

IF great ſtore and abundance of milk bee in the breaſt, and the woman be not willing to nurſ her own childe, they muſt bee annointed with the ungnent following, to repel the milk, and cauſe it to bee expelled through the womb. R. *olei roſ. myrtini an.* ℥iii. *aceti roſat.* ℥i. incorporate them together, and therewith annointing beſprinkle them with the powder of Myrtils, and then aplie the plaſter following. R. *pulv. maſtichini nucis moſchat. an.* ℥ii. *nucis cupreſſ* ℥iii. *balauſt myrtil. an.* ℥iſ℈. *Ireos, florent.* ℥ſ℈. *olei myrtini* ℥iii. *terebinth. venetæ* ℥ii. *ceræ nove quantum ſufficit*, make thereof a ſoft plaſter.

The leavs of brook-lime, creſſes and box boiled together in urine and vineger, are thought a preſent remedie for this purpoſe, that is to ſay, to draw the milk from the breaſts. And others take the clay that falleth down into the bottom of the trough wherein the grindſtone, whereon ſwords are grownd, turneth, and mix it with oil of roſes, and applie it warm unto the dugs, which in ſhort ſpace, as it is thought, will aſſwage the pain, ſtay the inflammation, and drive the milk out of the dugs. The decoction of ground-lvie, Peruwinkle, *Sage*, red Roſes, and roach Alum beeing prepared in oxycrate, and uſed in the form of a fomentation, is thought to perform the like effect: the like virtue have the lees of red wine, applied to the dugs with vineger, or the diſtilled water of unripe Pine-apples applied to the breaſts with linnen cloaths wet therein, or hemlock beaten and applied with the young and tender leavs of a gourd.

By what reaſon, and which way cupping-glaſſes beeing faſt'ned on the groin or above the navel, do draw milk out of the breaſts.

This medicine following is approoved by uſe: Take the leavs of *Sage*, Smallage, *Rue*, and Chervil, and cut or chop them verie ſmall, and incorporate them in vineger and oil of Roſes, and ſo applie it warm to the breaſt, and renue it thrice a day. In the mean time let Cupping-glaſſes bee applied to the inner ſide of the thigh and groin, and alſo above the navel. For this is verie effectual to draw the milk out of the breaſts into the womb by the veins whereby the womb communicateth with the breaſts. Moreover, they may let children or little whelps ſuck their breaſts, whereby they may draw out the milk that is fixed faſt in their dugs, in ſteed whereof wee have invented this inſtrument of glaſs, wherewith, when the broader orifice is faſt'ned or placed on the breaſt or dug, and the pipe turned upwards towards her mouth, ſhee may ſuck her own breaſts her ſelf.

The form of a little glaſs, which beeing put on the nipple, the woman may ſuck her own breaſts.

Inſtead of this inſtrument, a viol of glaſs beeing firſt made warm, and the mouth thereof applied to the nipple or teat, by reaſon of the heat and wideneſs thereof will draw the milk forth into the bottom thereof, as it were by a certain ſucking. The after-purgations beeing firſt evacuated, which is don for the moſt part within twentie daies after the birth, if the woman bee not in danger of a fever, nor have anie other accident, let her enter into a bath, made of marjerom, mint, *ſage*, roſemarie, mugwurt, agrimonie, pennyroyal, the flowrs of camomil, melilote, dill, beeing boiled in moſt pure and clear running water. All the day following let another ſuch like bath bee prepared, whereunto let theſe things following bee added. R. *farinæ faburum & aven. an.* lb. iii. *farin. orobi, lupinor. & gland. an.* ſbi. *aluminis roch.* ℥iv. *ſalis com.* ſbii. *gallarum, nucum cupreſſi, an.* ℥iii. *roſar. rub.* m.vi. *caryophyl. nucum moſchat. an.* ℥iii. boil them all in common water, then ſew them all in a clean linnen cloth, as it were in a bag, and caſt them therein into the bath wherein iron red hot hath been extinguiſhed, and let the woman that hath lately travailed ſit down therein ſo long as ſhee pleaſeth, and when ſhee commeth out let her bee laid warm in bed, and let her take ſom *preſerved* Orange-pill, or bread toaſted and dipped in Hippocras, or in wine brewed with ſpices, and then let her ſweat, if the ſweat will com forth of its own accord.

Aſtringent fomentations for the privie parts.

On the next day let aſtringent fomentations bee applied to the genitals on this wiſe prepared. R. *gallar. nucum cupreſſi, corticum granat. an.* ℥i *roſar. rub.* m i. *thymi, majoran. an.* m.ſ. *alu-minis rochæ, ſalis com. an.* ℥ii. boil them all together in red wine, and make thereof a decoction for a fomentation, for the fore-named uſe. The diſtilled liquor following is verie excellent

excellent and effectual to confirm and to draw in the dugs, or anie other loos parts. R. *caryophyl. nucis moſchat. nucum cupreſſi an.* ʒiſs. *maſtich.* ʒii. *alumin. roch.* ʒiſs. *glandium & corticis querni, an.* ℔ſs. *roſar. rubr* m.i. *cort. granat.* ʒii. *terræ ſigillat.* ʒi. *cornu cervi uſti* ʒſs. *myrtillor. ſanguinis dracon. an.* ʒi. *boli armini.* ʒii. *ireos florent.* ʒi. *ſumach. berber. Hippuris, an.* m.ſs. *conquaſſentur omnia, & macerentur ſpatio duorum dierum, in* ℔.ſs. *aquæ roſarum* ℔ii. *prunorum ſylveſtr. meſpilorum, pomorum quernorum, &* ℔.ſs. *aquæ fabrorum, aceti denique fortiſſ.* ʒiv. afterward diſtil it over a gentle fire, and keep the diſtilled liquor for your uſe, wherewith let the parts bee fomented twice in a day. And after the fomentation, let wollen cloaths or ſtupes of linnen cloth bee dipped in the liquor, and then preſſed out out and laid to the place. When all theſe things are don and paſt, the woman may again keep companie with her husband.

A diſtilled liquor for to draw together the dugs that are loos and flack.

CHAP. XXIX.

What the cauſſes of difficult and painful travail in childe-birth are.

THe fault dependeth ſomtimes on the mother, and ſomtimes on the infant or childe within the womb. On the mother, if ſhee bee more fat, if ſhee bee given to gormandize or great eating, if ſhee bee too lean or young, as *Savanarola* thinketh her to bee, that is great with childe at nine years of age, or unexpert, or more old, or weaker then ſhee ſhould bee either by nature or by ſom accident: as by diſeaſes that ſhee hath had a little before the time of childe-birth, or with a great flux of blood. But thoſe that fall in travail before the ful and prefixed time, are verie difficult to deliver, becauſ the fruit is yet unripe, and not readie or eaſie to bee delivered. If the neck or orifice of the womb bee narrow, either from the firſt conformation, or afterwards by ſom chance as by an ulcer cicatrized: or more hard and callous, by reaſon that it hath been torn before at the birth of ſom other childe, and ſo cicatrized again, ſo that if the cicatrized place bee not cut even in the moment of the deliverance, both the childe and the mother will bee in danger of death; alſo the rude handling of the midwife may hinder the free deliverance of the childe. Oftentimes women are letted in travail by ſhamefac'neſs, by reaſon of the preſence of ſom man, or hate to ſom woman there preſent.

The cauſſes of the difficult childe-birth that are in the woman that travaileth.

The paſſions of the minde hinder the birth.

If the ſecundine bee pulled away ſooner then it is neceſſarie, it may cauſ a great flux of blood to fill the womb, ſo that then it cannot perform his excluſive faculti, no otherwiſe then the bladder when it is diſtended by reaſon of over-abundance of water that is therein, cannot caſt it forth, ſo that there is a ſtoppage of the urine. But the womb is much rather hindred, or the faculti of childe-birth is ſtopped or delaied, if together with the ſtopping of the ſecundine, there bee either a Mole or ſom other bodie contrarie to nature in the womb. In the ſecundines of two women whom I delivered of two children that were dead in their bodies, I found a great quanciti of ſand like unto that which is found about the the banks of rivers, ſo that the gravel or ſand that was in each ſecundine was a full pound in weight.

Alſo the infant may bee the occaſion of difficult childe-birth, as, if too big, if it com overthwart, if it com with its face upwards, and its buttocks forwards, if it com with its feet and hands both forwards at once, if it bee dead and ſwoun by reaſon of corruption, if it bee monſtrous, if it have two bodies or two heads, if it bee manifold or ſeven-fold, as *Albucraſis* affirmeth he hath ſeen, if there bee a mole annexed thereto, if it bee verie weak, if when the waters are flowed out, it doth not moov or ſtir, or offer its ſelf to com forth. Yet notwithſtanding, it happeneth ſomtimes that the fault is neither in the mother nor the childe, but in the air, which beeing cold, doth ſo binde, congeal and make ſtiff the genital parts, that they cannot bee relaxed: or, beeing contrariwiſe too hot, it weakeneth the woman that is in travail, by reaſon that it waſteth the ſpirits, wherein all the ſtrength conſiſteth: or in the ignorant or unexpert midwife, who cannot artificially rule and govern the endeavors of the woman in travail.

The cauſſes of difficult childe-birth that are in the infant.

The external cauſes of difficult childe-birth.

The birth is wont to bee eaſie, if it bee in the due and perfixed natural time, if the childe offer himſelf luſtily to com forth with his head forwards, preſently after the waters are com forth, and the mother in like manner luſtie and ſtrong: thoſe which are wont to bee troubled with verie difficult childe-birth, ought a little before the time of the birth, to go into an half-tub filled with the decoction of mollifying roots and ſeeds, to have their genitals, womb and neck thereof to bee annointed, with much oil, and the inteſtines that are full and loaded muſt bee unburthened of the excrements, and then the expulſive faculti provoked with a ſharp glyſter, that the tumors and ſwelling of the birth concurring therewith, the more eaſie excluſion may bee made. But I like it rather better, that the woman in travail ſhould bee placed in a chair that hath the back thereof lean ing backwards, then in her bed, but the chair muſt have a hole in the bottom, whereby the bones that muſt bee dilated in the birth, may have more freedom to cloſe themſelvs again.

Which is an eaſie birth.

What conſiſteth eaſineſs of child-birth.

CHAP. XXX.

The cauſe of Abortion or untimely birth.

What Abortion is.

ABortion or untimely birth is one thing, and effluxion another. They call abortion the ſudden excluſion of the childe alreadie formed and alive, before the perfect maturitie thereof. But that is called effluxion, which is the falling down of ſeeds mixed together and coagulated but for the ſpace of a few daies, onely in the forms of membranes or tunicles, congealed blood, and of an unſhapen or deformed piece of fleſh; the Midwives of our countrie call it a falſ branch or bud. This efflux-

What Effluxion is.

ion is the cauſ of great pain and moſt bitter and cruel torment to the woman: leaving behinde it weakneſs of bodie far greater then if the childe were born at the due time. The cauſes of abortion or untimely birth, whereof the childe is called an abortive, are manie, as a great ſcouring, a ſtrangurie joined with heat and inflammation, ſharp fretting of the guts, a great and continual cough, exceeding vomiting, vehement labor in running, leaping, and dauncing, and by a great fall from on high, carrying of a great burthen, riding on a trotting-horſ, or in a Coach, by vehement, often and ardent copulation with men, or by a great blow or ſtroke on the bellie. For all theſe and ſuch like vehement and inordinate motions diſſolv the ligaments of the womb, and ſo cauſ abortion or untimely birth.

Women are in more pain by reaſon of the effluxion then at the true birth.

The cauſes of Abortion.

Alſo whatſoever preſſeth or girdeth in the mothers bellie, and therewith alſo the womb that is within it, as are thoſe Ivorie or Whale-bone buskes, which women wear on their bodies, thereby to keep down their bellies; by theſe and ſuch like things the childe is letted or hindred from growing to his full ſtrength, ſo that by expreſſion, or as it were by compulſion, hee is often forced to com forth before the legitimate and lawful time. Thundering, the noiſ of the ſhooting of great Ordnance, the ſound, and vehement noiſ of the ringing of Bells conſtrain women to fall in travell before their time, eſpecially women that are young, whoſe bodies are ſoft, ſlack and tenderer then thoſe that bee of riper years. Long and great faſting, a great flux of blood, eſpecially when the infant is grown ſomwhat great: but if it bee but two moneths old, the danger is not ſo great, becauſ then hee needeth not ſo great quantitie of nouriſhment, alſo a long diſeaſ of the mother, which conſumeth the blood, cauſeth the childe to com forth beeing deſtitute of ſtore of nouriſhment before the fit time. Moreover, fulneſs, by reaſon of the eating great ſtore of meats, often maketh or cauſeth untimely birth; becauſ it depraveth the ſtrength, and preſſeth down the childe: as likewiſe the uſe of meats that are of an evil juice, which they luſt or long for. But bath's, becauſ they relax the ligaments of the womb, and hot houſes, for that the fervent and choaking air is received into the bodie, provoke the infant to ſtrive to go forth to take the cold air, and ſo cauſ abortion.

Girding of the bellie may cauſ untimely birth.

How bathes and hot houſes cauſ untimely birth.

What women ſoever, beeing indifferently well in their bodies, travail in the ſecond or third moneth without anie manifeſt cauſ, thoſe have the Cotylidones of their womb full of filth and matter, and cannot hold up the infant, by reaſon of the weight thereof, but are broken: Moreover, ſudden or continual perturbations of the minde, whether they bee through anger or fear, may cauſ women to travail before their time, and are accounted as the cauſes of abortions, for that they cauſ great and vehement trouble in the bodie. Thoſe women that are like to travail before their time, their dugs will wax little: therefore when a woman is great with childe, if her dugs ſuddenly wax ſmall or ſlender, it is a ſign that ſhe will travail before her time; the cauſ of ſuch ſhrinking of the dugs is, that the matter of the milk is drawn back into the womb, by reaſon that the infant wanteth nouriſhment to nouriſh & ſuccour it withall. Which ſcarcitie the infant not long abiding, ſtriveth to go forth to ſeek that abroad which hee cannot have within, for among the cauſes which do make the infant to com out of the womb, thoſe are moſt uſually named with *Hippocrates*, the neceſſitie of a more large nutriment and air.

Hip. aph. 53. & 37 *ſect.* 5.

Hip. aph. 45. *ſect.* 5.

Hip. aph. 38. *ſect.* 5.

Therefore if a woman that is with childe have one of her dugs ſmall, if ſhee have two children, ſhee is like to travail of one of them before the full and perfect time: ſo that if the right dug bee ſmall, it is a man-childe, but if it bee the left dug it is a female. Women are in far more pain when they bring forth their children before the time, then if it were at the full and due time; becauſ that whatſoever is contrarie to nature, is troubleſom, painfull, and alſo oftentimes dangerous. If there bee anie error committed at the firſt time of the childe-birth, it is commonly ſeen that it happeneth alwaies after at each time of childe-birth. Therefore, to finde out the cauſes of that error, you muſt take the counſel of ſom Phyſician, and after his counſel indeavour to amend the ſame. Truly this plaſter following beeing applied to the reines doth confirm the womb, and ſtay the infant therein. R. *ladani* ʒii. *galang.* ʒi. *nucis moſchat nucis cupreſſi, boli armeni, terræ ſigil. ſanguin. dracon, balauſt. an.* ʒß, *acatiæ, pſidiorum, bipociſtid. an.* ʒi. *maſtich. myrrhæ, an.* ʒ ii. *gummi arabic.* ʒ i. *terebinthvenet.* ʒii. *picis naval.* ʒi. ß. *ceræ quantum ſufficit, fiat emplaſt. ſecundum artem:* ſpread it for your uſe upon leather. There are women that bear the childe

Women are in more pain at the untimely birth then at the due time of birth.

The error of the firſt childbirth continues afterwards.

A plaſter ſtaying the infant in the womb.

childe in their womb ten or eleven whole moneths, and such children have their conformation of much quantitie of seed: wherefore they will bee more big, great and strong, and therefore they require more time to com to their perfection and maturitie; for those fruits that are great will not bee so soon ripe as those that are small. But children that are small and little of bodie do often com to their perfection and maturitie in seven or nine moneths: If all other things accordingly correspondent in greatnesse and bignesse of bodie, it happeneth for the most part that the woman with childe is not delivered before the ninth moneth bee don, or at the leastwise in the tenge moneth. But a male childe will bee commonly born in the beginning, or a little before the beginning of the seventh moneth, by reason of his engendred heat which causeth maturitie and ripenesse. Furthermore, the infant is sooner borne to maturitie and perfection in the woman then in a cold; for it is the propertie of heat to ripen

What children are ten or eleven moneths in the womb.

A male will bee born sooner then a female.

CHAP. XXXI.

How to relieve the infant in the womb, when the mother is dead.

IF all the signs of death appear in the woman that lieth in travel, and cannot be delivered, there must then bee a Surgeon readie and at hand, which may open her upon her bellie before as little as readie, whereby the infant may bee preserved in safetie; children can it bee supposed sufficient if the mother's mouth and privie parts bee held open; for the infant being enclosed in his mother's womb, and compassed with the membranes, cannot take his breath but by the contractions and dilatations of the arterie of the nayle. But when the mother is dead, the lungs do not execute their office and function wherefore they cannot gather in the air that environeth the bodie by the mouth or *aspera arteria* into their own substance, or into the arteries that are dispersed throughout the bodie the heart; by reason whereof it cannot send it unto the heart by the vein or arterie which is called *vena cava* or *arteria magna*, to cool the heat and vapours or hot fume which is called *Ebullitio sanguinis*, the office or function whereof is to drive it from the heart: or also by reason thereof it is wanting for the nutrial of the womb, which accesse it would, if it consisted of the great arterie, whereby the air that is going from the heart is drawn in and sucked into those little ones of all the bodie, and likewise of the womb. Wherefore it must of necessitie follow that the infant is wanting to the easy seasoning of the sanguine, to the arterie of the infant navel, the iliack arteries also, and thereof unto his heart, and so unto his bodie: for the air being drawn by the mother's lungs, is attracted through the infant by the continuation of passages. Therefore because death maketh all the motions of the bodie to cease, it is behoovefull to open the bodie so soon as shee is dead, beginning the incision at the cartilage of *Xiphoides*, or breastbone, with a blade, and inciding it in a form semicircular, cutting the skinne, muscles and *peritonæum*, not touching the guts: then the womb being laid open must first bee cut, lest that otherwise the infant might perchance bee touched or hurt with the knife: for you shall often times finde the child unmoveable, as though hee were dead; but not because hee is dead indeed, but by reason that hee, being destitute of the actions of the spirits by the death of the mother, hath contracted great weakenesse: yet you may know whether hee bee dead indeed or not, by handling the arterie of the navel, for it will beat and pant if hee bee alive, otherwise not: and if there bee any life yet remaining in him, shortly after hee hath taken in the aire, and is recreated with the actes thereof, hee will turne all his members, and also all his whole bodie: in so great weakenesse, to debilitie of the strength of the childe, by cutting the navel string, but it must rather bee laid close to the region of the bellie thereof, that thereby the heate of the arteries (remaining) may bee stirred up againe. But I cannot sufficiently marvell at the insolencie of those that of late times they have seen women whose bellies and wombs have been more then often cut, and the infant taken out, which is found not otherwise bee gotten forth, and yet notwithstanding alive, which thing there is no reason can perswade to bee done, without the deceit of the mother, by reason of the heavinesse and weight of the wound which must needs bee in the muscles of the bellie, and substance of the womb. For the womb of a woman that is great with childe, by reason that it swelleth, and is distended with much bloud, must needs yield a great flux of bloud, which of necessitie must bee mortal. And to conclude, when that the wound or incision of the womb is cicatrized, it will not permit or suffer the womb to bee dilated or extended to receive or bear a new birth. For these and such like other causes, this kinde of cure, as desperate and dangerous, is not (in mine opinion) to be used.

How it may bee known whether the infant bee alive or not.

How the bellie of the woman that dieth in travel must bee cut open to save the childe.

Why it is not sufficient to preserv life in the childe to hold open the mouth and privie parts of the mother so soon as shee is dead and the childe alive in her bodie.

CHAP. XXXII.

Of superfetation.

What superfetation is.

SUperfetation is when a woman doth bear two or more children at one time in her womb, and they bee enclosed each in his severall secundines: but those that are included in the same secundine, are supposed to bee conceived at one and the same time of copulation, by reason of the great and copious abundance of seed, and these have no number of daies between their conception and birth, but all at once. For as presently after meat the stomach which is naturally of a good temper, is contracted or drawn together about the meat, to comprehend it on everie side, though small in quantitie, as it were by both hands, so that it cannot rowl neither unto this or that side; so the womb is drawn together unto the conception about both the seeds, assoon as they are brought into the capacitie thereof, and is so drawn in unto it on everie side, that it may com together into one bodie, not permitting anie portion thereof to go into anie other region or side, so that by one time of copulation the seed that is mixed together, cannot engender more children then one, which are divided by their secundines. And moreover, because there are no such cells in the womb of women, as are supposed, or rather known to bee in the wombs of beasts, which therefore bring forth manie at one conception or birth. But now if anie part of the woman's womb doth not applie and adiojn it self closely to the conception of the seed already received, lest anie thing should bee given by nature for no purpose, it must of necessitie follow that it must be filled with air, which will alter and corrupt the seeds. Therefore the generation of more then one infant at a time, having everie one his severall secundine, is on this wise. If a woman conceiv by copulation with a man as this day, and if that for a few daies after the conception, the orifice of the womb bee not exactly shut, but rather gape a little, and if shee do then use copulation again, so that at both these times of copulation there may bee an effusion or perfect mixture of the fertile seed in the womb, there will follow a new conception, or superfetation. For superfetation is no other then a certain second conception, when the woman already with childe, againuseth copulation with a man, and so conceiveth again, according to the judgment of *Hippocrates*. But there may bee manie causes alledged why the womb which did join and close doth open and unloose it self again. For there bee some that suppose the womb to bee open at certain times after the conception, that there may bee an issue for certain excremental matters that are contained therein; and therefore that the woman that hath so conceived alreadie, and shall then use copulation with a man again, shall also conceiv again. Others say that the womb of it self, and of its own nature is verie desirous of seed or copulation, or else being heated or enflamed with the pleasing motion of the man moving her thereto, doth at length unclose it self to receiv the man's seed: for likewise it happeneth manie times that the orifice of the stomach being shut after eating, is presently unloosed again, when other delicate meats are offered to bee eaten: even so may the womb unclose it self again at certain seasons, whereof com manifold issues, visible time of birth and also of conception are different. For as *Plinie* writeth, when there hath been a little space between two conceptions, they are both hastened, as is apparent in *Hortides* and his brother *Iphidius*, and in her which having two children at a birth, brought forth one like unto her husband, and another like unto the adulterer. And also in the Proconsulian slave at bond-women, who, by copulation on the same day, brought forth one like unto her master, and another like unto his steward: and in another who brought forth one at the ordinarie time of childe-bieding and another at five months end. And again in another, who bringing forth her burthen in the seventh month, brought forth two more in the months following. But this is a most manifest argument of superfetation, that as manie children as are in the womb (unless they bee twins of the same sex) so manie secundines are there, as I have often seen by experience. And it is verie likely that if they were conceived in the same moment of time, that they should all bee included in one secundine. But when a woman hath more children then two in one burden, it seemeth to bee a monstrous thing, because that more then given her first two breasts. Although wee shall hereafter rehearse manie examples of more numerous births.

The reason of superfetation.

Lib. de superfetationibus.

Why the womb after the conception of the seed, doth many times afterwards open.

Lib. 7. cap. 11.

CHAP. XXXIII.

Of the tumor called Mola, or a Mole growing in the womb of Women.

The reason of the name.

OF the Greek word *Myle*, which signifieth a Mill-stone, this tumor called *Mola* hath its name: for it is like unto a Mill-stone both in the round or circular figure, and also in hard consistence, for the which self same reason the whirl-bone of the knee is called of the Latines *Mola*, and of the Greeks *Myle*. But the tumor called *Mola*, whereof wee here entreat, is nothing elf but a certain falf conception of deformed flesh, round and hard, conceived in the womb as it were rude and unperfect,

What a *Mola* is.

and

not diſtinguiſhed into members, comming by corrupt, weak, and diſeaſed ſeed, and of the immoderate flux of the termes, as it is defined by *Hippocrates*. This is incloſed in no ſecundine, but as it were in its own skin. *Lib. de ſteril.*

There are ſom that think the *Mola* to bee ingendered of the concourſ or mixture of the womans ſeed and menſtrual blood, without the communication of the mans ſeed. But the opinion of *Galen* is, that never anie man ſaw a woman conceiv either a *Mola*, or anie other ſuch thing, without copulation of man, as a hen laieth eggs without a cock: for the onely cauſ and original of that motion is in the mans ſeed, and the mans ſeed doth onely miniſter matter for the generation thereof. Of the ſame opinion is *Avicen*, who thinketh the *Mola* to bee made by the confluxion of the mans ſeed that is unfertile, with the womans; when as it, becauſ unfruitful, onely puff's up or make's the womans ſeed to ſwell as leaven into a greater bigneſs, but not into anie perfect ſhape or form. Which is alſo of the opinion of *Fernelius*, by the decrees of *Hippocrates* and *Avicen:* for the immoderate fluxes of the courſes are conducing to the generation of the *Mola*, which overwhelming the mans ſeed, beeing now unfruitful and weak, doth conſtrain it to deſiſt from its interpriſe of conformation alreadie begun, as vanquiſhed or wholly overcom: for the generation of the *Mola* commeth not of a ſimple heat working upon a clammie and groſs humor, as worms are generated; but of both the ſeeds, by the efficacie of a certain ſpirit, after a ſort prolifical, as may bee underſtood by the membranes wherein the *Mola* is incloſed, by the ligaments whereby manie times it is faſtened or bound to the true conception or childe, engendered or begotten by ſuperfœtation; and finally, by the increaſ, and great and ſluggiſh weight. If all men were not perſwaded that the conflux of a mans ſeed muſt of neceſſitie concur to the generation of the *Mola*, it would bee no ſmall cloak or cover to women to avoid the ſhame and reproach of their light behavior. *Cap. 7. lib. 4. de uſu part.* How the *mola* is engendered.

CHAP. XXXIV.

How to diſcern a true conception from a falſ conception or Mola.

WHen the *Mola* is incloſed in the womb, the ſame things appear as in the true and lawful conception. But the more proper ſignes of the *Mola* are theſe: there is a certain pricking pain, which at the beginning troubleth the bellie as if it were the cholick, the belly will ſwel ſooner then it would if it were the true iſſue, and will bee diſtended with greater hardneſs, and is more difficult and troubleſom to carrie, becauſ it is contrarie to nature, and void of ſoul or life. Preſently after the conception the dugs ſwel and puff up, but ſhortly they fall and becom lank and lax; for nature ſendeth milk thither in vain, becauſ there is no iſſue in the womb that may ſpend the ſame. The *Mola* will move before the third month, although it bee obſcurely, but the true conception will not: but this motion of the *Mola* is not of the intellectual ſoul, but of the facultie of the womb, and of the ſpirit of the ſeed diſperſed through the ſubſtance of the *Mola*; for it is nouriſhed and increaſeth after the manner of plants, but not by reaſon of a ſoul or ſpirit ſent from above, as the infant doth. Moreover, that motion that the infant hath in its due and appointed time, differeth much from the motion of the *Mola*; for the childe is mooved to the right ſide, to the left ſide, and to everie ſide gently, but the *Mola*, by reaſon of its heavineſs, is fixed, and rowleth in manner of a ſtone, carried by the weight thereof unto what ſide ſoever the woman declineth her ſelf. The woman that hath a *Mola* in her womb doth dalie wax leaner and leaner in all her members, but eſpecially in her leggs, although notwithſtanding towards night they will ſwel, ſo that ſhee will bee verie ſlow or heavie in going, the natural heat forſaking the parts remote from the heart by little and little: and moreover, her bellie ſwel's, by reaſon that the menſtrual matter reſteth about thoſe places, and is not conſumed in the nouriſhment of the *Mola*; ſhee is ſwoln as if ſhee had the dropſie, but that it is harder, and doth not riſe again when it is preſſed with the fingers. The navel doth not ſtand out as it will do when the true iſſue is conteined in the womb, neither do the courſes flow as they ſomtimes do in the true conception; but ſomtimes great fluxes happen, which eaſ the weight of the bellie. In manie when the *Mola* doth cleav not verie faſt, it falleth awaie within three or four moneths, beeing not as yet com unto its juſt bigneſs, and manie times it cleaveth to the ſides of the womb & Cotylidons verie firmly, ſo that ſom women carrie it in their wombs five or ſix yeers, and ſom as long as they live.

The ſignes of a *mola* incloſed in the womb.

By what facultie the womb mooveth.

How the motion of the *mola* differeth from the motion of the infant in the womb.

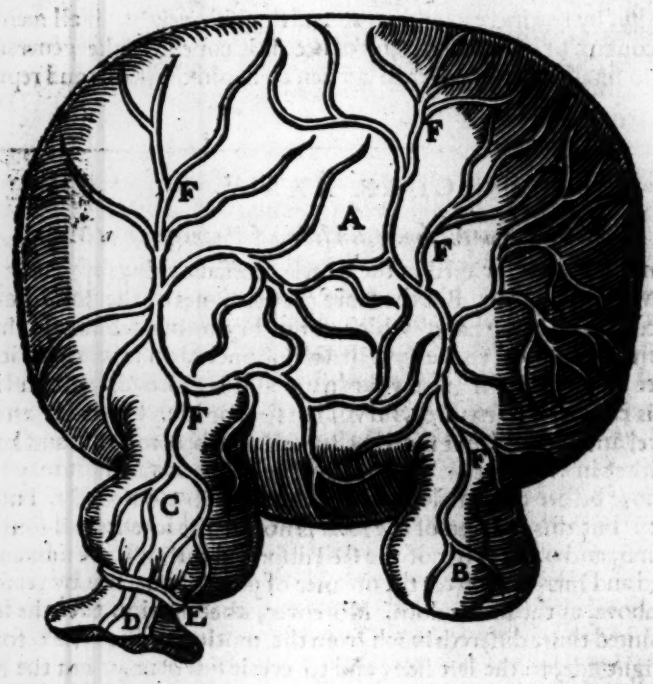
The *mola* doth turn to each ſide of the womb, as the ſituation of the bodie is.

The wife of *Guilian Roger* Pewterer, dwelling in St. *Victors* ſtreet, bore a *Mola* in her womb ſeventeen yeers, who beeing of the age of fiftie yeers, died; and I haveing opened her found the bodie of her womb to bee almoſt looſed, and not tied or bound by its accuſtomed ligatures, but as it were hanging onely by the neck, and furthermore cleaving to the Kall adjoining to it, haveing but onely one teſticle, and that on the right ſide, and that ſomwhat broader and looſer then uſual: the hornes were not to bee ſeen except it were on that ſide, the veſſels were on the neck onely, and there verie manifeſt and puffed up, it was as big as a mans head. When I had taken it out of her bodie, I brought it home unto my houſ, that at A hiſtorie,

The deſcription of a *Mola* carried ſeventeen yeers in the womb.

my leaſure I might finde out what was conteined in it ſo long; therefore, on a certain day, calling together the chief Phyſicians of Paris, as *Maſſileus*, *Alexis*, *Vigor*, *de S. Pont. Feure*, *Brovet*, *Violais*, *Grealmus*, *Ravin*, *Mareſcotius*, *Milotus*, *Hautin*, *Riolan*, *Luſſon*; and Surgeons, as *Brun*, *Cointerel*, *Guillemeau*; all theſe beeing preſent, I opened the womb, and I found it in all the bodie thereof, and in the proper tunicle, ſo ſchirrhous, and ſo hard, that I could hardly cut or make a knife to enter it: the bodie thereof was three fingers thick. In the midſt of the capacitie thereof I found a lump of fleſh as big as both my fiſts, like unto a Cow's udder, cleaving to the ſides of the womb but in certain places, of a verie thick, unequal and cloddiſh ſubſtance, with manie bodies therein, even as are commonly found in wens and griſtles, diſperſed through it as if it were bones. The judgment of all that were preſent was, that this great tumor at the firſt was a *Mola*, which in proceſs of time degenerated into a ſchirrous bodie, together with the proper ſubſtance of the womb. Moreover, in the middle of the neck of the womb, wee found a tumor as big as a Turkie's egg, of ſubſtance hard, cartilaginous and bonie, filling all the whole neck, but eſpecially the inward orifice of the womb, which the common people of France do call the *Garland*, ſo that by that paſſage nothing could go out, or enter into the womb: all that tumor weighed nine pounds and two ounces, which I, by reaſon of the noveltie of the thing, keep in my cloſer, and here I have deſcribed it.

The external form and deſcription of the fore-named womb.



A. *Sheweth the bodie of the womb.*

As long as the woman carried this *Mola* in her womb, ſhee felt moſt ſharp pain in her bellie, the region of her bellie was marvellous hard, diſtended and large, as if it were a woman that had manie children at once in her womb; ſo that manie Phyſicians, when the time of childe-birth was paſt, ſuppoſed that ſwelling of the bellie to com of the dropſie, and aſſaied to cure it as they would the dropſie; but for all the medicines they could uſe, the bellie became never the leſſer. Oftentimes the urine was ſtopped for the ſpace of three daies, and then the makeing of urine was verie painfull unto her, and manie times alſo her excrements were ſtopped for the ſpace of a week, by reaſon that the guts were preſſed by the weight of the *Mola*. At certain ſeaſons, as everie third moneth, there came exceeding great fluxes, the matter thereof could not bee carried through the capacitie of the womb, as wee ſaid before, becauſe it was exactly ſhut and ſtopped, but through the veſſels by which virgins, and alſo certain other women great with childe evacuate their menſtrual matter. If the *Mola* bee expelled or caſt out in the firſt or ſecond moneth, as manie times it ſo happeneth, it is called of women an unprofitable or falſe conception. Somtimes there are found in one womb two or three moles ſeparated one from another, and ſomtimes bound or tied to the ſound and perfect infant. As it happened in the wife of *Valleriola* the Phyſician, which was delivered of a *Mola* which ſhee had carried in her womb twelve moneths, annexed with a childe of four moneths old, which had deprived the infant both of its room and nutriment. For it is alwaies to bee certainly ſuppoſed, that the *Mola*, as a cruel beaſt, by its ſocietie, and keeping it from its nutriment and place, kil's the infant that is joined unto it.

A vain or unprofitable conception.

The *Mola* kill's the infant in the womb, when it is fattened unto it.

I remember once I opened the bodie of a dead woman, which had a *Mola* in her womb, as big as a Goos-egg, which when nature had aſſaied by manie vain endevors to caſt out, remained notwithſtanding, and at length putrefied, and therewith infected the whole womb, whereof ſhee died. There bee ſom which judging themſelvs great with childe, doe about the ninth or tenth moneth expell no other thing but ſounding blaſts of winde; whereby the womb ſuddenly falling down, and waxing more ſlender, they are ſaid in a mockerie to have been delivered of a fart. To conclude, whatſoever reſembles beeing with childe, if it bee not excluded at the due and lawful time of childe-birth by its own accord, or by the ſtrength of nature, then muſt it bee expelled by art.

CHAP. XXXV.

What cure muſt bee uſed to the Mola.

ALl things that provoke the flowers and ſecundines, and exclude the infant, beeing dead, are to bee preſcribed, given inwardly, put up, and applied outwardly, as the trochiſces

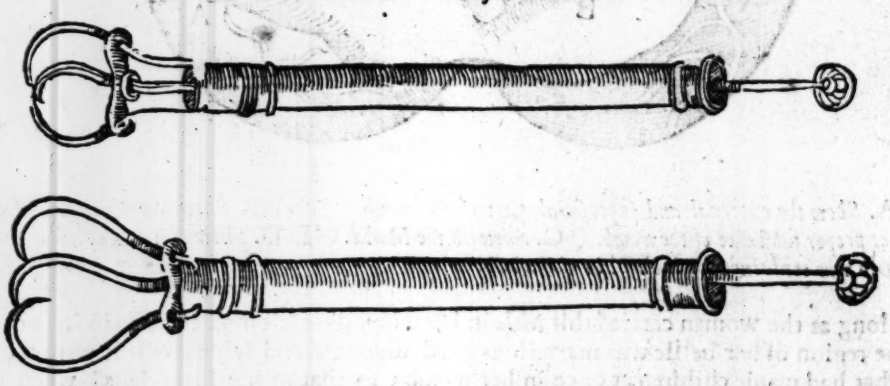
of

Thoſe things that provoke the flowrs forcibly, do alſo conſume or waſte the *mola*.

of *myrrha*, hermodactyls, and ſuch like, firſt haveing fomentations that are relaxing and mollifying alwaies applied to the places. You muſt uſe theſe medicines and phlebotomie, diet and baths then and ſo long as it ſhall ſeem neceſſarie to the Phyſician that is preſent. But if it happen's that the *mola* is ſeparated or looſed from the womb, and nature cannot expel it when it is ſo looſed, let the Chirurgian place the woman in that ſituation that wee ſaid ſhee was to bee put in, when the childe was to bee drawn from her. Then opening her genital parts, let him take hold on it by putting an inſtrument into it, which by reaſon of the likeneſs thereof is called a Gryphon's Talon, for it cannot bee taken hold on otherwiſe, by reaſon of the roundneſs thereof, for it hath no place whereon it bee may taken hold of: therefore when one taketh hold on it with his hand, it cannot bee holden faſt by reaſon of the ſlipperineſs thereof, but will run aud ſlip back into the hollowneſs of the womb, like unto a bowl or great ball; but it may bee more eaſily taken hold on with the Gryphon's Talon, if the bellie bee preſſed on both ſides that it may remain ſtill while the Gryphon's Talon take's hold on it, for when it hath taken good hold on it, it may bee eaſily drawn out. When the *mola* is drawn out, the ſame cure muſt bee uſed to the woman, as is uſed to a woman after that ſhee is delivered of childe.

The Chirurgical extraction of the *mola*.

The figure of an an inſtrument called a Gryphon's Talon, to draw out the Mola when it is looſ in the womb.



CHAP. XXXVI.

Of Tumors or ſwellings happening to the Pancreas *or ſweet-bread, and the whole Meſenterie.*

THe tumors of other places and parts in the bellie ought diligently to bee diſtinguiſhed from the *mola*, and other tumors of the womb. For when the tumors ariſe in the *glandula* called *Pancreas*, and in all the whole *Meſenterium*, manie unskilful Chirurgians take them for *mola's* or ſcirrhous tumors of the womb, and ſo go erroneouſly about to cure them, as ſhall appear by theſe hiſtories following.

An hiſtorie.

Iſabel Rolant the wife of *John Bony* dwelling in Paris in the ſtreet *Moncey* near to St. *Geruſe* his Church, beeing threeſcore years of age, departed this life in the year of our Lord 1578. on the twentie ſecond daie of October: and her bodie beeing opened in the preſence of Doctor *Milot* the Phyſician, hee, when the Meſenterie was taken out of the bodie, cauſed it to bee carried home to his houſ, that at his leaſure hee might finde out the cauſ of this mortal diſeaſ, which was alwaies ſuſpected to bee in the Meſenterie. Therefore on a time calling *Varadeus*, *Brove*, *Chappel*, *Mareſcotius*, *Arragonius*, *Baillutius*, *Reburtius*, and *Riolan*, all Doctors of Phyſick, and mee and *Pineus* Chirurgians, to his houſ to ſee the ſame. Where wee found all the Meſenterie and the *Pancreas* in the Meſenterie ſwoln and puffed up with a marvellous and almoſt incredible tumor, ſo that it weighed ten pound and a half, altogether ſcirrhous on the outſide, cleaving on the hinder part onely to the *vertebres* of the loins: but on the fore-part to the *Peritoneum*, being alſo ſcirrhous and wholly cartilaginous. Moreover, there were infinite other abſceſſes in the ſame Meſenterie, everie one cloſed in his ſeveral ciſt, ſom filled with a honie-like, ſom filled with a tallow-like, ſom with an albugineous, and ſom with a wateriſh liquor or humor, whereof ſom alſo were like unto pap; and to conclude, look how manie abſceſſes there were, ſo manie kindes or differences of matters there were. It was then eight years ſince that tumor began to grow by little and little wihout feeling and pain unto ſuch a greatneſs, becauſ that the Meſenterie it ſelf was without pain in a manner. For the woman her ſelf could do all the faculties of nature almoſt as well as if ſhee had been ſound and whole, except that two months before ſhee died, ſhee was conſtrained to keep her bed, becauſ ſhee had a continual fever, which endured ſo long as ſhee lived, and alſo becauſ that the Meſenterie, beeing as it were ſeparated or torn from its roots or ſeat, did rowl up and down in the bellie, not without the feeling of grievous pain: for, as wee ſaid before, it did ſtick but onely to the *vertebres* of the

Apoſtumes of diverſ kindes in the *Meſenterium*.

The accidents that com when the *Meſenterium* is ſeparated from the bodies adjoining.

the loins and *Peritoneum*, and nothing at all to the guts and other parts whereunto it is as it were naturally knit or joined.

Therefore becauſe the weight and heavineſs thereof depreſſed the bladder, it cauſſed a great difficultie in her making of water, and alſo becauſe it reſted on the guts, it made it verie painfull for her to go to ſtool, ſo that the excrements would not com down except ſhee took a ſharp glyſter to ſoft them: and as concerning glyſters, they could not bee put up high enough by reaſon of the greatneſs of the tumor which enclоſed and ſhut the way; and ſuppoſitories did no good at all. It was alſo verie difficult for her to take breath, by reaſon that the midriff or *diaphragma* was compreſſed with the tumor. There were ſom that did ſuſpect it to bee a *mola*, others thought that it came by reaſon of the dropſie. Aſſuredly this diſeaſe cauſſed the dropſie to enſue; neither was the cauſe thereof obſcure, for the function of the Liver was fruſtrated by reaſon that the concoction or the alexiſion of the Chylus was intercepted by occaſion of the tumor; and moreover, the Liver it ſelf had a proper diſeaſe, for it was hard and ſcirrhous, and had manie abſceſſes both within and without it, and all over it. The milt was ſcarce free from putrefaction, the guts and Kall were ſomwhat blew and ſpotted, and to bee briefe, there was nothing ſound in the lower bellie.

The dropſie comming of a tumor of the *Meſenterium*.

There is the like hiſtorie to bee read, written by *Philip Ingraſſias*, in his book of tumors, of a certain Moor that was hanged for theft, for (ſaith hee) when his bodie was publickly diſſected, in the *Meſenterium* were found ſeventie ſcrophulous tumors, and ſo manie abſceſſes were contained or enclоſed in their ſeverall cells or skins, and ſticking to the external tunicle, eſpecially of the greater guts; the matter contained in them was divers, for it was hard, knottie, clammie, glutinous, liquid and waterиſh; but the entrails, eſpecially the Liver and the milt, were found free from all manner of tainture becauſe (as the ſame Author alledgeth) nature being ſtrong, had ſent all the evil juice, and the corruption of the entrails into the *Meſenterie*: and verily this Moor, ſo long as he lived, was in good & perfect health. Without doubt the corruption of ſuperfluous humors for the moſt part is ſo great (as is noted by *Fernelius*) that it cannot be received in the receptacles that nature hath appointed for it; therefore then no ſmall portion thereof falleth into the parts adjoining, and eſpecially into the Meſenterie and *Pancreas*, which are as it were the ſink of the whole bodie. In thoſe bodies which through continual and daillie gluttonie abound with cholers, melancholie and phlegm, if it be not purged in time, nature being ſtrong and luſtie, doth depel and drive it down into the *pancreas* and the Meſenterie, which are all places of no great repute, and that eſpecially out of the Liver and Milt, by thoſe veins or branches of the *vena porta* which end or go not into the guts, but are terminated in the *Meſenterie* and *Pancreas*. In theſe places divers humors are heaped together, which in proceſs of time turn into blood and foul matter, and then if they grow bigger, into a ſtiff, hard and verie ſcirrhous tumor. Wherefore *Fernelius* affirmeth that in theſe places hee hath found the cauſſe of cholers, melancholie, ſtuxes, dyſenteries, cachexie, aſcytis, conſumptions, tedious and uncertain fevers, and laſtly of manie hidden diſeaſes, by the taking whereof ſom have received their health, that have been thought paſt cure. Moreover *Ingraſſias* affirmeth out of *Julius Pollux* that Scrophulae may bee engendred in the Meſenterie, which nothing differs from the opinion of *Galen*, who ſaith that Scrophulae are nothing elſe but induрate and ſcirrhous kernels. But the *Meſenterium* with his glandules being great and manie, making the *Pancreas*, doth eſtabliſh, ſtrengthen and confirm the diviſions of the veſſels. Alſo the *ſcirrhus* of the proper ſubſtance of the womb is to bee diſtinguiſhed from the *mola*: for in the bodies of ſom women that I have opened, I have found the womb annoied with a ſcirrhous tumor as big as a man's head, in the curing whereof Phyſicians nothing prevailed, becauſe they ſuppoſed it to bee a *mola* contained in the capacitie of the womb, and not a ſcirrhous tumor.

The cauſe why the neck of the womb ſwelleth.

The Scrophulae's in the *Meſenterium*.

A *ſcirrhus* of the womb.

CHAP. XXV.

Of the ſeed of women.

How the ſeed is unfertil.

The ſeed of the ſtuff of women.

with leſs alacritie, ſo that they yeeld themſelvs leſs prone to conception. Therefore let thoſe that would bee parents of manie children uſe a mediocritie in the uſe of venerie.

How the cutting of the veins behinde the ears maketh men barren.

The woman may perceiv that the man's ſeed hath ſom diſtemperature in it, if when ſhee hath received it into her womb, ſhee feeleth it ſharp, hot or cold, if the man bee more quick or ſlow in the act. Manie becom barren after they have been cut for the ſtone, and likewiſe when they have had a wound behinde the ears, whereby certain branches of the jugular veins and arteries have been cut, that are there, ſo that after thoſe veſſels have been cicatrized, there followed an interception of the ſeminal matter downwards, and alſo of the communitie which ought of neceſſitie to bee between the brain and the teſticls, ſo that when the conduits or paſſages are ſtopped, the ſtones or teſticles cannot anie more receiv, neither matter nor lively ſpirits from the brain in ſo great quantitie as it was wont, whereof it muſt of neceſſitie follow, that the ſeed muſt bee leſſer in quantitie, and weaker in qualitie.

Thoſe that have their teſticles cut off, or elſ compreſſed or contuſed by violence, cannot beget children, becauſ that either they want that help the teſticles ſhould miniſter in the act of generation, or elſ becauſ the paſſage of the ſeminal matter is intercepted or ſtopped with a Callus: by reaſon whereof they cannot yeeld forth ſeed, but a certain clammie humor contained in the glandules called *proſtatæ* (yet with ſom feeling of delight).

The defaults of the yard.

Moreover the defects or imperfections of the yard may cauſ barrenneſs: as, if it bee too ſhort, or if it bee ſo unreaſonable great, that it renteth the privie parts of the woman, and ſo cauſeth a flux of blood, for then it is ſo painful to the woman, that ſhee cannot void her ſeed, for that cannot bee excluded without pleaſure and delight, alſo if the ſhortneſs of the ligaqure ligament that is under the yard doth make it to bee crooked, and violate the ſtiff ſtraitneſs thereof, ſo that it cannot bee put directly or ſtraighely into the woman's privie parts. There bee ſom that have not the orifice of the conduit of the yard rightly in the end thereof, but a little higher, ſo that they cannot ejaculate or caſt out their ſeed into the womb.

The ſign of the palſie in the yard.

Alſo the particular palſie of the yard is numbred among the cauſſes of barrenneſs; and you may proov whether the palſie bee in the yard by dipping the genitals in cold water: for except they do draw themſelvs together or ſhrink up after it, it is a token of the palſie, for members that have the palſie, by the touching of cold water, do not ſhrink up, but remain in their accuſtomed laxitie and looſneſs: but in this caſe the genitals are endued with ſmall ſenſe, the ſeed commeth out without pleaſure or liſtfulneſs of the yard; the ſtones in touching are cold, and to conclude, thoſe that have their bodies daily waxing lean through a conſumption, or that are vexed with an evil habit or diſpoſition, or with the obſtruction of ſom of the entrails, are barren and unfertil, and likewiſe thoſe in whom ſom noble part neceſſarie to life and generation exceedeth the bounds of nature with ſom great diſtemperature, and laſtly thoſe who by anie means have their genital parts deformed.

Magick bands and enchanted knots.

Here I omit thoſe that are withholden from the act of generation by inchantment, magick, witching and inchanted knots, bands and ligatures, for thoſe matters belong not to Phyſick, neither may they be taken away by the remedies of our Art: The Doctors of the Canon laws have made mention of thoſe magick bands which may have power in them, in the particular title *De ſigniſicatione, maleficiatis, impotentibus & innuntatis*: alſo St. *Auguſt.* hath made mention of them, *Trath. 7 in Joan.*

CHAP. XXXVIII.

Of the barrenneſs or unfruitfulneſs of Women.

The cauſ why the neck of the womb is narrow.

A Woman may becom barren or unfruitful through the obſtruction of the paſſage of the ſeed, or through ſtraitneſs and narrowneſs of the neck of the womb comming either through the default of the formative facultie, or elſ afterwards by ſom miſchance, as by an abſceſs, *ſcirrhus*, warts, chaps, or by an ulcer, which being cicatrized, doth make the way more narrow, ſo that the yard cannot have free paſſage thereinto: Moreover, the membrane calle *Hymen*, when it groweth in the midſt or in the bottom of the neck of the womb, hinder's the receiving of the man's ſeed. Alſo if the womb bee over ſlipperie, or more doufy or overfluide, it maketh the woman to bee barren; ſo doth the ſuppreſſion of the menſtrual flood, or the too immoderate flowing of the courſes or whites; which commeth by the default of the womb, or ſom entrail, or of the whole bodie, which conſumeth the menſtrual matter, or corrupts the ſeed wherewith it.

The membrane called *Hymen*.

The cauſ of the flux of women.

The cold and moiſt diſtemperature of the womb, extinguiſh's and ſuffocate's the moſt ſeed, and maketh it that it will not ſtay or cleav unto the womb, and ſtiffe it to bee conſumed: but the more hot and drie doth corrupt for want of nouriſhment, for the ſeeds that are ſown either in a marſh or in the ground cannot proſper well: alſo a wen contained in the womb, the falling down of the womb, the leanneſs of the woman's bodie, all humors filled by eating crude and raw fruits, or great, or overmuch, whereof obſtructions and crudities follow which hinder her fruitfulneſs. Furthermore, by the palſie of ſtupefadding things, the ſeminal matter is congealed and reſtrained, and although it flow and lie cloſe, yet it is deprived

prived of the prolifick power, and of the lively heat and ſpirits, the orifices or cotylidones of the veins and arteries are ſtopped, and ſo the paſſage for the menſtrual matter into the womb, is ſtopped. When the Kall is ſo far that it girdeth in the womb narrowly, it hindereth the fruitfulneſs of the woman, becauſ it will not permit the mans ſeed to enter into the womb. Moreover the fat and fleſhie habit of the man or woman hinder generation. For it hindereth them that they cannot join their genital parts together: and by how much the more blood goeth into fat, by ſo much the leſs is remaining to bee turned into ſeed & menſtrual blood, which two are the originals and principals of generation. Thoſe women that are ſpeckled in the face, ſomwhat lean, and pale, becauſ they have their genitals moiſtned with a ſaltiſh, ſharp and tickling humor, are more given to venerie then thoſe that are red and fat. Finally, *Hippocrates* ſet's down four cauſes onely why women are barren and unfruitful. The firſt is, becauſ they cannot receiv the mans ſeed, by reaſon of the faulc of the neck of the womb; the ſecond, becauſ when it is received into the womb, they cannot conceiv it; the third is, becauſ they cannot nouriſh it; the fourth, becauſ they are not able to carrie or bear it untill the due and lawful time of birth. Theſe things are neceſſarie to generation, the object, will, facultie, concourſ of the ſeeds, and the remaining or abiding thereof in the womb, untill the due and appointed natural time.

Aph 36. ſect. 5. Gal. lib. 14. de uſu par cap. 9. Ariſt. in prob. ſect deſter. qua. 3. & 4.

CHAP. XXXIX.

The ſignes of a diſtempered womb.

THat woman is thought to have her womb too hot, whoſe courſes com forth ſparingly and with pain, and exulcerate by reaſon of their heat, the ſuperfluous matter of the blood being diſſolved or turned into winde by the power of the heat: whereupon that menſtrual blood that floweth forth is more groſs and black. For it is the propertie of heat, by digeſting the thinner ſubſtance, to thicken the reſt, and by aduſtion to make it more black. Furthermore, ſhee that hath her genitals itching with the deſire of copulation, will ſoon exclude the ſeed in copulation, and ſhee ſhall feel it more ſharp as it goeth through the paſſages. That woman hath too cold a womb whoſe flowers are either ſtopped, or flow ſparingly, and thoſe pale and not well colored. The ſignes of a hot womb. The ſignes of a cold womb.

Thoſe that have leſs deſire of copulation, have leſs delight therein, and their ſeed is more liquid and wateriſh, and not ſtaining a linnen cloth by ſticking thereunto, and it is ſparingly and ſlowly caſt forth. That womb is too moiſt that floweth continually with manie liquid excrements, which therefore will not hold the ſeed, but preſently after copulation ſuffereth it to fall out; which will eaſily cauſ abortion. The ſignes of too drie a womb appear in the little quantitie of the courſes, in the profuſion of a ſmall quantitie of ſeed, by the deſire of copulation, whereby it may bee made ſlipperie by the moiſture of the ſeed, by the fiſſures in the neck thereof, by the chaps and itching, for all things for want of moiſture will ſoon chap, even like unto the ground, which in the ſummer by reaſon of great drought or drineſs, will chap and chink this waie and that waie, and on the contrarie with moiſture it will cloſe and join together again as it were with glew. The ſignes of a moiſt womb. The ſignes of drie womb.

A woman is thought to have all opportunities unto conception when her courſes or flowers do ceaſ, for then the womb is void of excremental filth, and becauſ it is yet open, it will the more eaſily receiv the mans ſeed, and when it hath received it, it will better retain it in the wrinkles of the cotylidones yet gaping as it were in rough and unequal places. Yet a woman will eaſily conceav a little before the time that the flowers ought to flow: becauſ that the menſtrual matter falling at firſt like dew into the womb, is verie meet and fit to nourish the ſeed, and not to drive it out again, or to ſtuffocate it. A meet time for conception.

Thoſe which uſe copulation when their courſes fall down aboundantly, will verie hardly or ſeldom conceiv, and if they do conceiv, the childe vvill bee vveak and diſeaſed, and eſpecially if the vvomans blood that flovv's out bee unſound; but if the blood bee good and laudable, the childe vvill bee ſubject to all plethorick diſeaſes. There are ſom vvomen in vvhom preſently after the flux of the termes, the orifice of the vvomb vvill bee cloſed, ſo that they muſt of neceſſitie uſe copulation vvith a man vvhen their menſtrual flux flovveth, if at leaſt they vvould conceiv at all. A vvoman may bear children from the age of fourteen untill fortie or fiftie; vvhich time vvhoſoever doth exceed, vvill bear untill threeſcore yeers, becauſ the menſtrual fluxes are kept, the prolifical facultie is alſo preſerved: therefore manie vvomen have brought forth children at that age, but after that time no vvoman can bear, as *Ariſtotle* vvriteth. *Ariſt. l. 7. de hiſt. anim. c. 2. & c. 5*

Yet *Plinie* ſaith that *Cornelia* (who was of the houſ of the *Scipioes*) beeing in the fixtie ſecond yeer of her age, bear *Voluſius Saturnius*, who was Conſul; *Valeſius de Tarenta* alſo affirmeth, that hee ſaw a woman that bear a childe on the fixtie ſecond yeer of her age, having born before on the ſixtieth and fixtie firſt yeer. Therefore it is to bee ſuppoſed that by reaſon of the varietie of the air, region, diet and temperament, the menſtrual flux and procreative facultie ſeaſeth in ſom ſooner, in ſom later; which varietie taketh place alſo in men. *Lib. 7. ca. 14. Lib. 6. cap. 12.*

For

Lib. 7. de hist. anim. c. 1. & 5. 6. For in them although the seed be genitable for the most part in the second seventh yeer, yet truly it is unfruitful untill the third seventh yeer. And whereas most men beget children untill they bee threescore yeers old, which time if they pass, they beget till seventie: yet there are som known that have begot children untill the eightieth yeer. Moreover, *Plinie* writeth that *Masinissa* the King begot a son when hee was fourscore and six yeers of age, and *Lib. 7. cap. 14.* also *Cato* the Censor after that hee was fourscore.

CHAP. XL.

Of the falling down, or perversion, or turning of the womb.

What is the falling down of the womb.

The womb is said to fall down and bee perverted, when it is mooved out of its proper and natural place; as when the bands and ligatures thereof beeing loosed and relaxed, it falleth down unto one side or other, or into its own neck, or elss passeth further, so that it com's out at the neck, and a great portion thereof appear's without the privie parts. Therefore what things soever resolv, relax, or burst the ligaments or bands whereby the womb is tied, are supposed to bee the causses of this accident. It somtimes happen's by vehement labor or travail in childe-birth, when the womb with violence excluding the issue and the secundines, also follow's and fall's down, turning the inner side thereof outward. And somtimes the foolish rashness of the Midwise, when shee draweth away the womb with the infant, or with the secundine cleaving fast thereunto, and so drawing it down and turning the inner-side outward. Furthermore, a heavie bearing of the womb, the bearing or the carriage of a great burthen, holding or stretching of the hands or bodie upwards in the time of greatness with childe, a fall, contusion, shakeing, or jogging by rideing, either in a Waggon or Coach; or on horse-back, or leaping or dancing, the falling down of a more large and abundant humor, great gripeing, a strong and continual cough, a *Tenesmus*, or often desire to go to stool, yet not voiding anie thing, neesing, a manifold and great birth, difficult bearing of the womb, an asmatical and orthopnoical difficultie of breathing, whatsoever doth weightilie press down the *Diaphragma* or Midriff, or the muscles of the *Epigastrium*, the takeing of cold air in the time of travail with childe, or in the flowing of the menstrual flux, sitting on a cold marble-stone, or anie other such like cold thing, are thought often times to bee the occasion of these accidents, becaus they may bring the womb out of its place.

The causses.

Arist. lib. 7. de histor. anim. cap. 2. It fall's down in manie (saith *Aristotle*) by reason of the desire of copulation that they have, either by reason of the lustiness of their youth, or elss becaus they have abstained a long time from it.

The signes.

You may know that the womb is fallen down by the pain of those parts wherehence it is fallen, that is to say by the entrals, loines, *os sacrum*, and by a tractable tumor at the neck of the womb, and often with a visible hanging out, of a diverss greatness, according to the quantitie that is fallen down. It is seen somtimes like unto a piece of red flesh, hanging out at the neck of the womb, of the bigness and form of a Goos-egg; if the woman stand upright, shee feeleth the weight to lie on her privie parts, but if shee sit or lie, then shee perceiveth it on her back, or go to the stool, the straight gut called *intestinum rectum* will bee pressed or loaden as if it were with a burthen, if shee lie on her bellie, then her urine will bee stopped, so that shee shall fear to use copulation with a man.

The prognostications.

When the womb is newly relaxed in a young woman, it may bee soon cured, but if it hath been long down in an old woman, it is not to bee helped. If the palsie of the ligaments thereof have occasioned the falling, it scarce admit's of cure, but if it fall's down by means of putrefaction, it cannot possibly bee cured. If a great quantitie thereof hang out betvveen the thighes, it can hardly bee cured; but it is corrupted by takeing the air, and by the falling down of the urine and filth, and by the motions of the thighes in going it is ulcerated, and so putrefie's.

A historie.

I remember that once I cured a young vvoman vvho had her vvomb hanging out at her privie parts as big as an egg, and I did so vvell perform and perfect the cure thereof, that afterwards shee conceived, and bare children manie times, and her vvomb never fell dovvn.

CHAP. XLI.

The cure of the falling down of the womb.

Remedies for the assension of the womb.

By this vvord, falling dovvn of the vvomb, vvee understand everie motion of the vvomb out of its place or seat: therefore if the womb ascend upwards, vvee must use the same medicines as in strangulation of the womb. If it bee turned towards either side, it must bee restored and dravvn back to its right place, by applying and using cupping-glasses. But if it descend and fall down into its ovvn neck, but yet not in great quantitie, the vvoman must bee placed so that her buttocks may bee verie high, and her legs across; then cupping-glasses must bee applied to her navel and *Hipogastrium*, and vvhen the

the womb is ſo brought into its place, injections that binde and drie ſtrongly muſt bee injected into the neck of the womb, ſtinking fumigations muſt bee uſed unto the privie parts, and ſweet things uſed to the mouth and noſe. But if the womb hang down in great quantitie between the thighs, it muſt be cured by placing the woman after another ſort, and by uſing other kinde of medicines. Firſt of all ſhee muſt bee ſo laied on her back, her buttocks and thighs ſo lifted up, and her legs ſo drawn back as when the childe or ſecundine are to bee taken or drawn from her; then the neck of the womb, and whatſoever hangeth out thereat, muſt be anointed with oil of lillies, freſh butter, capons greaſe, and ſuch like, then it muſt be thruſt gently with the fingers up into its place, the ſick or pained woman in the mean time helping or furthering the endeavour by drawing in of her breath as if ſhe did ſup, drawing up as it were that which is fallen down. For the falling down of the womb, properly ſo called.

After that the womb is reſtored unto its place, whatſoever is filled with the ointment muſt bee wiped with a ſoft and clean cloth, leſt that by the ſlipperineſs thereof the womb ſhould fall down again; the genitals muſt bee fomented with an aſtringent decoction, made with pomegranate pils, cypreſs nuts, gals, roach allom, horſ-tail, ſumach, berberies, boiled in the water wherein Smiths quench their irons; of theſe materials make a powder, wherewith let thoſe places bee ſprinkled: let a peſſarie of a competent bigneſs bee put in at the neck of the womb, but let it bee eight or nine fingers in length, according to the proportion of the grieved patient's bodie. Let them bee made either with latin, or of cork covered with wax, of an oval form, haveing a thread at one end, whereby they may bee drawn back again as need require's.

The forms of oval peſſaries.

A. ſheweth the bodie of the Peſſarie.
B. ſheweth the thread wherewith it muſt be tied to the thigh.

When all this is don, let the ſick woman keep her ſelf quiet in her bed, with her buttocks lying verie high, and her legs acroſs, for the ſpace of eight or ten daies: in the mean while the application of cupping glaſſes will ſtaie the womb in the right place and ſeat after it is reſtored thereunto: but if ſhee hath taken any hurt by cold air, let the privie parts bee fomented with a diſcuſſing and heating fomentation, on this wiſe. ℞. *fol. alth. ſalv. lavend. roriſmar. artemiſ. flor. chamem. melilot. an.* m ß. *ſem. aniſ. fœnugr. an.* ℥ i. let them bee all well boiled in water and wine, and make thereof a decoction for your uſe. Give her alſo glyſters, that when the guts are emptied of the excrements, the womb may the better bee received into the void and emptie capacitie of the bellie: for this reaſon the bladder is alſo to bee emptied, for otherwiſe it were dangerous leſt that the womb lying between them both beeing ful, ſhould bee kept down and cannot bee put up into its own proper place by reaſon thereof. Alſo vomiting is ſuppoſed to bee a ſingular remedie to draw up the womb that is fallen down: furthermore alſo it purgeth out the phlegm which did moiſten and relax the ligaments of the womb; for as the womb in the time of copulation at the beginning of the conception is moved downwards to meet the ſeed, ſo the ſtomack, even of its own accord, is lifted upwards when it is provoked by the injurie of anie thing that is contrarie unto it, to caſt it out with greater violence, but when it is ſo raiſed up, it draw's up together therewith the *peritonæum*, the womb, and alſo the bodie or parts annexed unto it. If it cannot bee cured or reſtored unto its place by theſe preſcribed remedies, and that it bee putrified and ſo putrefied that it cannot be reſtored unto his place again, we are commanded by the precepts of art to cut it away, and then to cure the womb according to art, but firſt it ſhould be tied, and as much as is neceſſarie muſt bee cut off, and the reſt ſeared with a cauterie. There are ſom women that have had almoſt all their womb cut off, without anie danger of their life, as *Paulus* teſtifieth. A diſcuſſing and heating fomentation. How vomiting is profitable to the falling down of the womb. The cutting away of the womb when it is putrified. *Lib. 6.*

John Langius Phyſician to the Count *Palatine*, writeth that *Caryus* the Chirurgian took out *Epiſt. 39. lib. 2. Epiſt. med.*

the womb of a woman of *Bononia*, hee being present, and yet the woman lived and was verie well after it. *Antonius Benivenius* Physician of *Florence*, writeth that hee was called by *Vigolius* the Physician to the cure of a woman whose womb was corrupted and fell away from her by pieces, and yet shee lived ten years after it.

Trac. de mirand. morb. caus.

An Historie.

There was a certain woman, being sound of bodie, of good repute, and about the age of thirtie years, in whom, shortly after shee had been married the second time, which was in *Anno* 2571. haveing no childe by her first husband, the lawful signs of a right conception did appear: yet in processe of time there arose about the lower part of her privities the sent or feeling of a weight or heavinesse, being so troublesom unto her by reason that it was painful, and also for that it stopped her urine, that shee was constrained to disclose her mischance to *Christopher Mombey* a Surgeon her neighbor dwelling in the Suburbs of S. *Germans*; who haveing seen the tumor or swelling in her groin, asswaged the pain with mollifying, and anodyne fomentations and cataplasms; but presently after her had don this, hee found on the inner side of the lip of the orifice of the neck of the womb, an Impostume rotten and running, as if it had been out of an abscess newly broken, with sanious matter, somwhat red, yellow, and pale, running a long time. Yet for all this the feeling of the heavinesse or weight was nothing diminished, but did rather encreas daily, so that from the year of our Lord 1573. shee could not turn herself being in her bed on this or that side, unless shee laid her hand on her bellie to bear and eas herself of the weight, and also shee said when shee turned herself, shee seem to feel a thing like unto a bowle to rowle in her bodie unto the side whereunto shee turned her self, neither could shee go to stool, or avoid her excrements standing or sitting, unless shee lifted up that weight with her hands towards her stomach or midriff: when shee was about to go shee could scarce set forwards her feet, as if there had somthing hanged between her thighs, that did hinder her going. At certain seasons that rotten apostume would open or unclose of it self, and flow & run with it's wonted sanious matter, but then shee was grievously vexed with pain of the head, and all her members, swouning, loathing, vomiting, and almost choaking, so that by the perswasion of a fooliſh woman shee was induced and contented to take *Antimonium*; the working and strength thereof was so great and violent, that after manie vomits, with manie frettings of the guts and watrie dejections or stools, shee thought her fundament fell down: but beeing certified by a woman that was a familiar friend of hers, unto whom shee shewed her self, that there was nothing fallen down at or from her fundament, but it was from her womb, shee called, in the year of our Lord 1575. Surgeons, as my self, *James Guillemeau*, and *Antonie Vieux*, that wee might help her in this extremitie.

Antimonium taken in a potion doth caus the womb to fall down.

When wee had diligently and with good consideration weighed the whole estate of her disease, wee agree'd with one consent, that that which was fallen down should bee cut away, becaus that by the black color, stinking, and other such signs, it gave a testimonie of a putrefied and corrupted thing. Therefore for two daies wee drew out the bodie by little and little, and piece-meal, which seemed unto the Physicians that wee had called, as *Alexius*, *Gaudinus*, *Feureus*, and *Violaneus*, and also to our selvs, to bee the bodie of the womb, which thing wee prooved to bee so, becaus one of the testicles came out whole, and also a thick membrane or skin, beeing the relick of the *mola*, which beeing suppurated, and the abscess broken, came out by little and little in matter; after that all this bodie was so drawn away, the sick woman began to wax better and better, yet notwithstanding for the space of nine daies before it was taken away, shee voided nothing by siege, and her urine also was stopped for the space of four daies.

The signs of the substance of the womb drawn out.

After this all things became as they were before, and shee lived in good health three months after, and then died of a Pleurisie that came on her verie suddenly, and I haveing opened her bodie, observing and marking everie thing verie diligently, could not finde the womb at all, but in stead thereof there was a certain hard and callous bodie, which Nature, who is never idle, had framed in stead thereof, to supplie the want thereof, or to fill the hollownesse of the bellie.

CHAP. XLII.

Of the tunicle or membrane called Hymen.

Whether there bee a membrane called *Hymen*.

IN som virgins or maidens in the orifice of the neck of the womb there is found a certain tunicle or membrane called of antient writers *Hymen*, which prohibiteth the copulation of a man, and causeth a woman to be barren; this tunicle is supposed by manie, and they not of the common sort onely, but also learned Physicians, to bee, as it were, the enclosure of the virginitie or maiden-head. But I could never finde it in anie, seeking of all ages from three to twelv, of all that I had under my hands in the Hospital of *Paris*.

An Historie.

Yet once I saw it in a virgin of seventeen yeers, whom her mother had contracted to a man, and shee knew nevertheles there was somthing in her privie parts that hindered her from

from bearing of children, who desired mee to see her; and I found a verie thin nervous membrane a little beneath the *nymphæ*, neer unto the orifice of the neck of the womb; in the midst there was a verie little hole whereout the terms might flow: I seeing the thickness thereof, cut it in sunder with my sciffars, and told her mother what shee should do afterwards: and truly shee married shortly after and bore children. *Realdus Columbus* is of my opinion, and saith that this is seen verie seldom, for these are his words: under the *nymphæ* in manie, but not in all virgins, there is another membrane, which when it is present (which is but seldom) it stoppeth, so that the yard cannot bee put into the orifice of the vvomb; for it is verie thick aboov tovvards the bladder, it hath an hole by vvhich the courses flovv out. And hee also addeth, that hee observed it in tvvo young virgins, and in one elder maid. *Lib. 11. cap. 16.*

Avicen writeth, that in virgins in the neck of the womb there are tunicles composed of veins and ligaments verie little, riseing from each part of the neck whereof, which at the first time of copulation are wont to bee broken, and the bloud to run out. *Almansor* writeth, that in virgins, the passage of the neck of the womb is verie wrinkled, or narrow and straight, and those wrinkles to be woven or staied together with manie little veins and arteries, which are broken at the first time of copulation. *Lib. 3. sent. 21. tract. 1. cap. 1.*

The trifles of midwives about the membrane called *Hymen.*

These are the judgments of Physitians of this membrane: Midwives will certainly affirm that they know a virgin from one that is defloured, by the breach or soundness of that membrane. But by their report too credulous Judges are soon brought to commit an error. For that Midwives can speak nothing certainly of this membrane, may bee proved by this, becaus that one saith that the situation thereof is in the verie entrance of the privie parts, others saie it is in the midst of the neck of the womb, and others saie it is within at the inner orifice thereof, and som are of an opinion that they saie or suppose that it cannot be seen or perceived before the first birth. But truly of a thing so rare, and which is contrarie to nature, there cannot be anie thing spoken for certaintie. Therefore the blood that commeth out at the first time of copulation, come's not alwaies by the breaking of that membrane, but by the breaking and violating or renting of the little veins which are woven and bespread all over the superficial and inward parts of the womb and neck thereof, descending into the wrinkles, which in those that have not yet used the act of generation, are closed as if they were glewed together: although that those maids that are at their due time of marriage, feel no pain nor no flux of blood, especially if the man's yard be answerable to the neck of the womb; whereby it appear's evidently how greatly the inhabitants of *Fez*, the metropolitan citie of *Mauritania*, are deceived: for *Leo* the African writeth, that it is the custom among them, that so soon as the married man and his spouse are returned home to their house from the church where they have been married, they presently shut themselves into a chamber, and make fast the door, while the marriage dinner is preparing: in the mean while som old or grave matron standeth waiting before the chamber door, to receiv a bloodie linnen cloth the new married husband is to deliver her there, which when shee hath received, shee bring's it into the midst of all the companie of guests, as a fresh spoil and testimonie of the married wives virginitie, and then for joie thereof they all fall to banquetting solemnly. But if through evil fortune it happeneth that in this time of copulation the spous bleedeth not in the privie parts, shee is reftored again unto her parents, which is a verie great reproach unto them, and all the guests depart home sad, heavie, and without dinner.

What virgins at the first time of copulation do not bleed at their privie parts. *Lib. 3.*

Moreover, there are som, that having learned the most filthie and infamous arts of bawderie, prostitute common harlots to make gain thereof, making men that are naughtily given to believ that they are pure virgins, making them to think that the act of generation is verie painful and grievous unto them, as if they had never used it before, although they are verie expert therein indeed; for they do caus the neck of the womb to be so wrinkled and shrunk together, so that the sides thereof shall even almost close or meet together, then they put thereinto the bladders of fishes, or galls of beasts filled full of blood, and so deceiv the ignorant and young lecher, by the fraud and deceit of their evil arts, and in the time of copulation they mix sighs with groanes, and womanlike cryings, and the crocodiles tears, that they may seem to be virgins, and never to have dealt with man before.

The filthie deceit of bauds and harlots.

CHAP. XLIII.

A memorable historie of the membrane called Hymen.

Lib. de præst. damon. cap. 30.

Ioh. Wierus writeth that there was a maid at Camburge, who in the middest of the neck of the womb, had a thick and strong membrane growing overthwart, so that when the monethlie tearms should come out, it would not permit them, so that thereby the menstrual matter was stopped and flowed back again, which caused a great tumor and distension in the bellie, with great torment, as if shee had been in travell with childe: the midwives beeing called, and having seen and considered all that had been don, and did appear, did all with one voice affirm, that shee sustained the pains of childe-birth, although that the maid her self denied that shee ever dealt with man. Therefore then this foresaid Author was called,

who, when the midwives were void of help and counsel, might help this wretched maid haveing alreadie had here urine stopped now three whole weeks, and perplexed with great watchings, loss of appetite, and loathing: and when hee had seen the grieved place, and marked the orifice of the neck of the womb, hee saw it stopped with a thick membrane; hee knew also that that sudden breaking out of bloud into the womb and the vessels thereof, and the passage for those matters that was stopped, was the caus of her grievous and tormenting pain. And therefore hee called a Chyrurgian presently, and willed him to divide the membrane that was in the midst, that did stop the flux of bloud, which beeing don, there came forth as much black congealed and putrefied bloud as as waighed som eight pounds. In three daies after shee was well and void of all diseas and pain. I have thought it good to set down this example here, becaus it is worthie to bee noted, and profitable to bee imitated, as the like occasion shall happen.

CHAP. XLIIII.

Of the strangulation of the womb.

What is the strangulation of the womb.

THe strangulation of the womb, or that which commeth from the womb, is an interception or stopping of the libertie in breathing or takeing winde, becaus that the womb, swoln or puffed up by reason of the access of gross vapors and humors that are contained therein, and also snatched as it were by a convulsive motion, by reason that the vessels and ligaments distended with fulnes, are so carried upwards against the midriff and parts of the breast, that it maketh the breath to bee short, and often as if a thing lay upon the breast and pressed it.

Whythe womb swelleth.

Moreover, the womb swelleth, becaus there is contained or inclosed in it a certain substance, caussed by the destuxion either of the seed or flowers, or of the womb or whites, or of som other humor, tumor, abscess, rotten apostume, or som ill juice, putrefying, or getting, or ingendering an ill qualitie, and resolved into gross vapors. These, as they affect sundry or divers places, infer divers and sundrie accidents, as rumbling and noise in the bellie, if it bee in the guts, desire to vomit, after (with seldom vomiting) commeth wearines and loathing of meat, if it trouble the stomach. Choaking with strangulation, if it assail the breast and throat; swooning, if it vex the heart; madnes, or elss that which is contrarie thereto, sound sleep or drousines, if it griev the brain: all which oftentimes proov as malign as the biteing of a mad dog, or equal the stinging or biteings of venemous beasts.

The accidents that com of the strangling of the womb.

What the strangulation that commeth of the corruption of the seed is more dangerous then that that com's of the corruption of the bloud.

It hath been observed, that more grievous symptomes have proceeded from the corruption of the seed, then of the menstrual bloud. For by how much everie thing is more perfect and and noble, while it is contained within the bounds of the integritie of it's own nature, by so much it is the more grievous and perillous, when by corruption it hath once transgressed the laws thereof. But this kinde of accident doth verie seldom griev those women which have their menstrual flux well and orderly, and do use copulation familiarly; but verie often those women that have not their menstrual flux as they should, and do want, and are destitute of husbands, especially if they bee great eaters, and lead a solitarie life. When the vessels and ligaments of the womb are swollen and distended as we said before, so much as is added to their latitude or bredth, so much is wanting in their length; and therefore it happeth that the womb, beeing removed out of it's seat, doth one while fall to the right side towards the liver, somtimes to the left towards the milt, somtimes upwards unto the midriff and stomach, somtimes downwards, and so forwards unto the bladder, whereof commeth an Ischurie and strangurie; or backwards, whereof commeth oppression of the straight gut, and and suppression of the excrements, and the *Tenesmus*.

The cauſ of the divers turning of the womb into divers parts of the bodie.

But although wee acknowledg the womb to decline to those parts which wee named, yet it is not by accident onely, as when it is drawn by the proper and common ligaments and bands, when they are contracted or made shorter, beeing distended with fulnes, but also of it's self, as when it is forced or provoked through the grief of something contrarie to nature that is contained therein: it wandreth somtimes unto one side, and somtimes unto another part with a plain and evident natural motion, like unto the stomach which imbraceth anie thing that is gentle and milde, but avoideth anie thing that is offensive and hurtful; yet wee denie that so great accidents may bee stirred up by the falling of it alone unto this or that side, for then it might happen, that women that are great with childe, whose wombe are so distended by reason that the childe is great, that it doth press the midriff, might bee troubled with a strangulation like unto this; but much rather by a venemous humor breathing out a malign and gross vapor, not onely by the veins and arteries, but also by the pores that are invisible, which pollute's the faculties of the parts which it toucheth with it's venomous malignitie and infection, and intercept's the functions thereof. Neither doth the varietie of the parts receiving, onely, but also of the matter received, caus varietie of accidents.

The womb is not so greatly mooved by an accident, but by it self.

Whereof com such divers accidents of strangulation of the womb.

For som accidents com by suppression of the terms, others com by corruption of the

feed,

ſeed, but if the matter bee cold, it bringeth a drouſineſs, beeing lifted up unto the brain, whereby the woman ſinketh down as if ſhee were aſtoniſhed, and lieth without motion, and ſenſ or feeling, and the beating of the arteries, and the breathing are ſo ſmall, that ſomtimes it is thought they are not at all, but that the woman is altogether dead. If it be more groſs, it interreth a convulſion; if it participate of the nature of a groſs melancholick humor, it bringeth ſuch heavineſs, fear, and ſorrowfulneſs, that the party that is vexed therewith ſhall ſhall think that hee ſhall die preſently, and cannot bee brought out of his minde by anie means or reaſon: if of a cholerick humor, it cauſſeth the madneſs called *furor uterinus*, and ſuch a pratling, that they ſpeak all things that are to bee concealed; and a giddineſs of the head, by reaſon that the animal ſpirit is ſuddenly ſhaken by the admixtion of a putrefied vapour and hot ſpirit: but nothing is more admirable, then that this diſeaſ taketh the patient ſomtimes with laughing, and ſomtimes with weeping, for ſom at the firſt will weep and then laugh in the ſame diſeaſ and ſtate thereof.

The cauſ of ſleepineſs in the ſtrangulation of the womb.

The cauſ of a drouſie madneſs.

But it exceedeth all admiration which *Hollerius* writeth uſually happened to two of the daughters of the Provoſt of Roven. For they were held with long laughter for an hour or two before the fit, which neither for fear, admonition, nor for any other means they could hold; and their parents chid them, and asked them wherefore they did ſo, they anſwered, that they were not able to ſtay their laughter. The aſſcention of the womb is diligently to bee diſtinguiſhed from the ſtrangulation thereof; for the accidents of the aſſcention and of the ſtrangulation are not one, but the woman is onely oppreſſed with a certain pain of the heart, difficultie of breathing, or ſwouning, but yet without fear, without raveing or idle talking, or any other greater accident.

A hiſtorie.

The aſſcention of the womb is to bee diſtinguiſhed from the ſtrangulation.

Therefore oftentimes contrary cauſſes infer the aſſcention: that is, overmuch drineſs of the womb, laboring through the defect of moiſture, whereby it is forced after too violent and immoderate evacuations of the flowers, and in childe-bed, and ſuch like, and laborious and painful travel in childe-bed, through which occaſion it waxeth hot, contrary to nature, and withereth and turneth it ſelf with a certain violence unto the parts adjoining, that is to ſay, unto the liver, ſtomach and midriff: if haply it may draw ſom moiſture therehence unto it. I omit that the womb may be brought unto it's place upwards by often ſmelling to aromatick things, yet in the mean while it infer's not the ſtrangulation that wee deſcribed before.

CHAP. XLV.

The ſigns of imminent ſtrangulation of the womb.

BEfore that theſe fore-named accidents com, the woman think's that a certain painfull thing ariſeth from her womb unto the orifice of the ſtomach and heart, and ſhee thinketh her ſelf to bee oppreſſed and choaked, ſhee complaineth her ſelf to bee in great pain, and that a certain lump or heavie thing clime's up from the lower parts unto her throat, and ſtoppeth her winde, her heart burneth and panteth. And in manie the womb and veſſels of the womb ſo ſwell, that they cannot ſtand upright on their legs, but are conſtrained to lie down flat on their bellies, that they may bee the leſs grieved with the pain, and to preſs that down ſtrongly with their hands, that ſeemeth to ariſe upwards, although that not the womb it ſelf, but the vapor aſſcendeth from the womb, as wee ſaid before: but when the fitt is at hand, their faces are pale on a ſudden, their underſtanding is darkned, they becom ſlow and weak in the legs, with unableneſs to ſtand. Hereof commeth ſound ſleep, fooliſh talking, interception of the ſenſes, and breath as if they were dead, loſs of ſpeech, the contraction of their legs, and the like.

The womb it ſelf doth not ſo well make the aſſcention as the vapor that of.

CHAP. XLVI.

How to know whether the woman bee dead in the ſtrangulation of the womb, or not.

IHave thought it meet (becauſ manie women, not onely in ancient times, but in our own and our fathers memorie have been ſo taken with this kinde of ſymptome, that they have been ſuppoſed and laid out for dead, although truly they were alive:) to ſet down the ſigns in ſuch a caſe which do argue life and death. Therefore firſt of all it may be prooved, whether ſhee bee alive or dead, by laying or holding a clear and ſmooth looking-glaſs before her mouth and noſtrils. For, if ſhee breath, although it bee never ſo obſcurely, the thin vapor that commeth out will ſtain or make the glaſs duskie. Alſo a fine downiſh feather taken from under the wing of any bird, or elſ a fine flock beeing held before the mouth, will by the trembling or ſhakeing motion thereof, ſhew that there is ſom breath, and therefore life remaining in the bodie. But you may proov moſt certainly whether there bee anie ſpark of life remaining in the bodie, by blowing ſom ſneeſing powders of pellitorie of Spain, and elebore into the noſtrils. But though there no breath appear, yet

Women liveing taken for dead.

How women that have the ſuffocation of the womb, live onely by tranſpiration without breathing,

must you not judg the woman for dead, for the ſmall vital heat, by which, beeing drawn in to the heart, ſhee yet liveth, is contented with tranſpiration onely, and require's not much attraction, which is performed by the contraction and dilatation of the breaſt and lunga unto the preſervation of it's ſelf. For ſo flies, gnats, piſmires and ſuch like, becauſ they are of a cold temperament, live unmooveably incloſed in the caves of the earth, no token of breathing appearing in them, becauſ there is a little heat left in them, which may bee conſerved by the office of the acteries and heart, that is to ſay, by perſpiration, without the motion of the breaſt, becauſ the greateſt uſe of reſpiration is, that the inward heat may bee preſerved by refrigeration and ventilation. Thoſe that do not mark this, fall into that error which almoſt coſt the life of him who in our time firſt gave life to anotomical adminiſtration, that was almoſt decaied and neglected.

How flies, gnats and piſmires do live all the winter without breathing.

A hiſtorie.

For hee beeing called in Spain to open the bodie of a noble woman which was ſuppoſed dead through ſtrangulation of the womb, behold, at the ſecond impreſſion of the inciſion knife, ſhee began ſuddenly to com to her ſelf, and by the mooving of her members and bodie, which was ſuppoſed to bee altogether dead, and with crying, to ſhew manifeſt ſigns that there was ſom life remaining in her. Which thing ſtrook ſuch an admiration and horror into the hearts of all her friends that were preſent, that they accounted the Phyſician, beeing before of a good fame and report, as infamous, odious and deteſtable, ſo that it wanted but little but that they would have ſcratched out his eies preſently: wherefore hee thought there was no better waie for him, if hee would live ſafe, then to forſake the countrie. But neither could hee ſo alſo avoid the horrible prick and inward wound of his conſcience (from whoſe judgment no offender can bee abſolved) for his inconſiderate dealing, but within few daies after, beeing conſumed with ſorrow, hee died, to the great loſs of the Common-wealth, and the art of Phyſick.

CHAP. XLVII.

How to know whether the ſtrangulation of the womb com's of the ſuppreſſion of the flowers, or the corruption of the ſeed.

The ſigns of ſuffocation of the womb comming of corrupt ſeed.

THere are two chief cauſſes eſpecially, as moſt frequently happening of the ſtrangulation of the womb: but when it proceedeth from the corruption of the ſeed, all the accidents are more grievous and violent: difficultie of breathing goes before, and ſhortly after com's deprivation thereof; the whole habit of the bodie ſeemeth more cold then a ſtone: the woman is a widow; or elſ hath great ſtore or abundance of ſeed, and hath been uſed to the companie of a man, by the abſence whereof ſhee was before wont to be pained with heavineſs of the head, to loath her meat, and to bee troubled with ſadneſs and fear, but chiefly with melancholie. Moreover when ſhee hath ſatisfied, and everie waie fulfilled her luſt, and then preſently on a ſudden begin's to contain her ſelf. It is verie likely that ſhee is ſuffocated by the ſuppreſſion of the flowers, which formerly had them well and ſufficiently, which formerly had been fed with hot, moiſt and manie meats, and therefore engendring much bloud, which ſitteth much, which is grieved with ſom weight and ſwelling in the region of the bellie, with pain in the ſtomach, and a deſire to vomit, and with ſuch other accidents as com by the ſuppreſſion of the flowers. Thoſe who are free'd from the fit of the ſuffocation of the womb, either by nature or by art, in a ſhort time their color commeth into their faces by little and little, and the whole bodie beginneth to wax ſtrong, and the teeth, that were ſet and cloſed faſt together, begin (the jaws beeing looſed) to open and uncloſe again, and laſtly, ſom moiſture floweth from the ſecret parts with a certain tickling pleaſure; but in ſom women, as in thoſe eſpecially in whom the neck of the womb is tickled with the Midwives finger, inſtead of that moiſture com's thick and groſs ſeed, which moiſture or ſeed when it is fallen, the womb beeing before as it were rageing, is reſtored unto it's own proper nature and place, and by little and little all ſymptoms vaniſh away. Men by the ſuppreſſion of their ſeed have not the like ſymptomes as women have, becauſ mans ſeed is not ſo cold and moiſt, but far more perfect and better digeſted, and therefore more meet to reſiſt putrefaction, and whiles it is brought or drawn together by little and little, it is diſſipated by great and violent exerciſe.

The ſigns when it com's of the ſuppreſſion of the flowers.

The ſigns of one recovering of or from the ſuffocation of the womb.

Why the ſuppreſſion of the ſeed is not perilous or deadly to men.

CHAP. XLVIII.

Of the cure of the Strangulation of the womb.

The pulling of the hairs of the lower parts are profitable both for this maladie and for the cauſ of the ſame.

SEeing that the ſtrangulation of the womb is a ſudden and ſharp diſeaſ, it therefore requireth a preſent and ſpeedie remedie, for if it bee neglected it manie times cauſeth preſent death. Therefore, when this maladie commeth, the ſick woman muſt preſently bee placed on her back, having her breaſt and ſtomach looſ, and all her cloaths & garments ſlack & looſ about her, whereby ſhee may take breath the more eaſily and

ſhee

ſhee muſt be called on by her own name, with a loud voice in her eare, and pulled hard by the haire of the temples and neck, but yet eſpecially by the haire of the ſecret parts, that by prouoketing or cauſſing paín in the lower parts, the patient may not onely bee brought to her ſelf again, but alſo that the ſharp and malign vapor aſcending upwards, may bee drawn downwards: the legs and armes muſt bee bound and tied with painfol ligatures, all the bodie muſt bee rubbed ouer with rough linnen clothes beſprinkled with ſalt and vineger, until it bee verie ſore and red, and let this peſſarie following bee put into the womb. *℞. ſucci mercurial. artemiſ. an. ℥ ii. in quibus diſſolue pul. bened. ℥ iii. pul rodic. cumin comp. galang minor. an. ℥ i.* make thereof a peſſarie. Then let the ſoals of her feet bee annointed with oil of baies, or with ſom ſuch like oil, let a great cupping-glaſs with a great flame bee applied to the bellie below the navel, to the inner part of the thigh, and to the groin, whereby both the matter that climes upwards, and alſo the womb it ſelf running the ſame waie, may bee brought downwards or drawn back. There may bee made a fumigation of ſpices to bee received up into the womb, which, that it may bee the eaſier don, the womb may bee held open by putting in this inſtrument here deſcribed into the neck thereof. Let it bee made of gold, ſilver or latin into the form of a peſſarie: at the one end thereof, that is to ſay, that end which goeth up into the neck of the womb, let there bee made manie holes on each ſide, but at the lower end let it bee made with a ſpring, that it may open and ſhut as you will have it. Alſo it muſt have two laces or bands by which it muſt bee made faſt unto a ſwathe or girdle tied about the patient's bellie.

A Peſſarie.

The deſcription of a veſſel made with a funnil or pipe for to fumigate the womb.

The form of a Peſſarie to bee put in the neck of the womb to hold it open.

The matter of ſweet fumigatons.

The matter and ingredients of ſweet and aromatick fumigations, are cinnamom, callam. aromat. lig. aloes, ladanum, benzoin, thyme, pepper, cloves, lavander, calaminth, mugworth, penniroyal, *alepta moſchat.* nutmegs, muſk, amber, ſquinant, and ſuch like, which for their ſweet ſmell and ſympathie, allure or entice the womb downwards, by their heat conſume and digeſt the thick vapors, and putrefied ill juice. Contrariwiſe, let the noſtrils bee perfumed with fetid and rank ſmels, and let theſe bee made with *gum. galbanum, ſagapenum, ammoniacum, aſſa fœtida, bitumen,* oil of Jeat, ſnuff of a tallow-candle when it is blown out, with the fume of bird's fethers, eſpecially of Partridges and Woodcocks, of man's hair or goat's hair, of old lether, of horſ hoofs, and ſuch like things burned, whoſe noiſom or offenſive ſavor the womb avoiding, doth return unto its own place or ſeat again.

By what power ſweet fumigations do reſtore the womb unto its own nature and place.

Stinking ſmels to bee applied to the noſtrils.

Moreover it ſhall bee verie neceſſarie to procure vomit by thruſting a goſ fether down into the throat, or elſ the hairs of the patient's own head. Shortly after ſhee muſtuſe a potion of fifteen grains of black pepper bruiſed and diſſolved in *hydromel,* or water and honie mixed together, or in ſom ſtrong wine, which remedie *Avicen* holdeth for a ſecret.

Avicen's ſecret for ſuffocation of the womb.

Alſo in ſtead thereof three hours before meat ʒß. of Treacle diſſolved in ʒi. of the water of wormwood may bee given her: Alſo it is thought that one drop of the oil of Jeat dropped on the tongue, is a verie profitable remedie. There bee ſom that allow a potion of half a dram of *Caſtoreum* diſſolved in white wine, or in the broth of a Capon; alſo it is profitable not onely to give her Treacle to drink, but alſo to inject it into the womb, beeing firſt diſſolved in *aqua vitæ*, and in the mean time to drop two drops of oil of Sage, or ſom ſuch Chimical oil, into the ears. If ſhee bee drowſie or ſleepie, ſhee muſt bee awaked or kept wakeing with ſneeſing powders, of white hellebore and pellitorie.

Caſtoreum drunken.

Expreſſions into the womb.

The matter of peſſaries.

It is alſo requiſite to inject glyſters both into the fundameut and ſecret parts, which muſt bee made of the decoction of things that diſcuſs winde, as of calamint, mugwort, lavander, penniroyal, cammomil, melilot, and ſuch like; and let peſſaries or ſuppoſitories bee made of ladanum, ginger, *gallia moſchat.* treacle, mithridate, civet and muſk, of the oil of cloves, anniſeeds, ſage, roſemarie, and ſuch like, chymically drawn; this following is a convenient deſcription of a glyſter. Rx. *radic. enulæ, ɔamp. Ireos, ebuli, ariſtoloch. an.* ʒi. *fol. abſynth. artemeſiæ, matricar. puleg. origani, an.* m.i. *baccarum laurſ, juniperi & ſambuc. an* p.i. *ſem. amios, cymini, rutæ, an.* ʒii. *florum ſtœchados, roriſmarin. ſalviæ, centaur. minor. an.* p.ii. *fiat decoctio, cape colaturæ* ℔.i. *in quâ diſſolve mellis anthoſati, ſacc. rubr. & bened. an.* ʒ i.. *diachartb.* ʒii. *olei aneth. mard. an* ʒiſß. make thereof a glyſter, and and applie this plaiſter following to the bellie. Rx. *maſs. empl. oxycrocei, & melilot. an.* ʒiii. *olei nard.* as much as ſhall ſuffice to make it conveniently ſoft, make thereof a plaſter, and ſpread it on leather, and applie it to the region of the bellie when the fit is ended: if ſhee bee married, let her forthwith uſe copulation, and bee ſtrongly encountered by her husband, for there is no remedie more preſent then this.

A glyſter ſcattering groſs vapors.

A quick, certain and a pleaſant remedie for the ſuffocation of the womb.

Let the midwife annoint her fingers with *oleum nardinum* or *moſchet. linum,* or of cloves, or elſ of ſpike mixed with muſk, ambergreeſ, civet, and other ſweet powders, and with theſe let her rub or tickle the top of the neck of the womb which toucheth the inner orifice; but her ſecret parts muſt firſt bee warmed by the applying of warm linnen cloaths, for ſo at length the venomous matter contained in the womb, ſhall bee diſſolved and flow out, and the malign, ſharp and flatulent vapors, whereby the womb is driven as it were into a furie or rage, ſhall bee reſolved and diſſipated, and ſo when the conjunct matter of the diſeaſ is ſcattered and waſted, the womb, and alſo the woman ſhall bee reſtored unto themſelvs again. Som hold it for a ſecret to rub the navel with the juice of garlick boiled and mixed with aloës.

Tickling of the neck of the womb.

CHAP. XLIX.

Of women's monthly flux or courſes.

The reaſon of the names of the monthlie flux of women.

USually they call the flux of blond, that iſſueth from the ſecret parts of women, monthlie flowers or courſes, becauſ it happenth to them everie month ſo long as they are in health. There bee ſom which call them terms, becauſ they return at their uſual time. Manie of the French men call it ſeparains, becauſ in ſuch as fit much, and are given to plentifull feeding, it endureth almoſt for the ſpace of ſeven daies. Som call them purgations, becauſ that by this flux all a woman's bodie is purged of ſuperfluous humors. There bee ſom alſo that call thoſe fluxes the flowers, becauſ that as in plants the flower buddeth out before the fruits; ſo in women kinde this flux goeth before the iſſue, or the conception thereof.

What women do conceiv, this flux not appearing at all.

For the courſes flow not before a woman bee able to conceiv; for how ſhould the ſeed beeing caſt into the womb have his nouriſhment and increaſ, and how ſhould the childe have his nouriſhment when it is formed of the ſeed, if this neceſſarie humor were wanting in the womb? yet it may bee ſom women may conceiv without the flux of the courſes: but that is in ſuch as have ſo much of the humor gathered together, as is wont to remain in thoſe which are purged, although it bee not ſo great a quantitie that it may flow out, as it is recorded by

by *Ariſtotle*. But as it is in ſom verie great, and in ſom verie little, ſo it is in ſom ſeldom, and in ſom verie often.

There are ſom that are purged twice, and ſom thrice in a moneth, but it is altogether in thoſe who have a great liver, large veins, and are filled and fed with many and greatly nouriſhing meats, which ſit idlely at home all day, which haveing ſlept all night, do notwithſtanding lie in bed ſleeping a great part of the day alſo, which live in a hot, moiſt, rainie and ſoutherly air, which uſe warm baths of ſweet waters and gentle frictions, which uſe and are greatly delighted with carnal copulation: in theſe and ſuch like women the courſes flow more frequently and abundantly. What women have this menſtruall flux often, abundantly, and for a longer ſpace then others.

But contrariwiſe, in thoſe that have ſmall and obſcure veins, in thoſe that have their bodies more furniſhed and big either with fleſh or with fat, are more ſeldom purged, and alſo more ſparingly, becauſ that the ſuperfluous quantitie of blood uſeth to go into the habite of the bodie. Alſo tender, delicate and fair women are leſs purged then thoſe that are brown and endued with a more compact fleſh, becauſ that by the raricie of their bodies, they ſuffer a greater waſting or diſſipation of their ſubſtance by tranſpiration. Moreover, they are not ſo greatly purged with this kinde of purgation, which ſom other ſolemn or unuſuall evacuation in anie other place of their bodie, as by the noſe or hemorrhoids. What women have this flux more ſeldom, leſs, and a far more ſhort time then others.

And as concerning their age, old women are purged when the Moon is old, and young women when the Moon is new, as it is thought. I think the cauſ thereof is, for that the Moon ruleth moiſt bodies, for by the variable motion thereof the Sea flowteth and ebbeth, and bones, marrow and plants abound with their genital humor. Why young women are purged in the new of the Moon.

Therefore young people which have much blood, and more fluxible, and their bodies more fluxible, are ſoon moved unto a flux, although it be even in the firſt quarter of the Moon's riſing or increaſing: but the humors of old women, becauſ they are ſtiff and it mere with cold, and are not ſo abundant, and have more denſ bodies and ſtraighter veſſels, are not ſo apt to a flux, nor do they ſo eaſily flow, except it bee in the full of the Moon, or elſ in the decreaſ, that is to ſay, becauſ the blood that is gathered in the full of the Moon fall's from the body even of its own weight, for that by reaſon of the decreaſing or wane of the Moon this time of the moneth is more cold and moiſt. Why old women are purged in the wane of the Moon.

CHAP. L.

The cauſes of the monethly flux or courſes.

BEcauſ a woman is more cold, and therefore hath the digeſtive facultie more weak, it cometh to paſs, that ſhee requireth and deſireth more meat or food than ſhee can digeſt or concoct. And becauſ that ſuperfluous humor that remaineth is not digeſted by exerciſe, nor by the efficacie of ſtrong and lively heat, therefore by the providence or benefit of nature it floweth out by the veins of the womb, by the power of the expulſive faculty, at its own certain and prefixed ſeaſon or time. But then eſpecially it beginneth to flow, and a certain crude portion of blood to bee expelled, being huſtfull and malign otherwiſe in no qualitie, when nature hath laid her principal foundations of the increaſ of the bodie, ſo that in greatneſs of the bodie, ſhee hath com as it were in a manner to the higheſt top, that is to ſay, from the thirteenth to the fiftieth yeer of our age. The materiall cauſe of the monethlie flux. When the monethly flux begin's to flow.

Moreover, the childe cannot bee formed in the womb, nor have his nutriment or encreaſ without this flux: therefore this is another finall cauſ of the monethly flux. Manie are perſwaded that women do far more abound with blood than men, conſidering how great an abundance of blood they caſt forth of their ſecret parts everie moneth, from the thirteenth to the fiftieth yeer of their age: how much women great with childe, of whom alſo manie are menſtruall, yeeld unto the nutriment and encreaſ of the childe in their wombs, and how much Phyſicians take from women that are with childe by opening of a vein, which otherwiſe would bee delivered before their naturall and prefixed time; how great a quantitie thereof they avoid in the birth of their children, and for ten be turly dayes after, and how great a quantitie of milk they ſpend for the nouriſhment of the childe when they give ſuck, which milk is none other thing than blood made white by the power of the kernels that are in the duga, which doth ſuffice to nouriſh the childe, bee it bee great or little: yet notwithſtanding manie nurſes in the mean while are menſtruall: and as that may bee true, ſo certainly this is true, that one dram (that I may ſo ſpeak) of a mans blood, is of more efficacie to nouriſh and encreaſ, than two pounds of woman's blood, becauſ it is far more perfect, more concocted, wrought, and better replenished with abundance of ſpirits: whereby it commeth to paſs that a man endued with a more ſtrong heat, doth more eaſily convert what meat ſoever he eateth into the nouriſhment and ſubſtance of his bodie; and if that bee ſuperfluous remain's, he doth eaſily digeſt and ſcatter it by inſenſible tranſpiration. But is woman being more cold than a man, becauſ ſhee taketh more than ſhee can concoct, doth gather together more humors, which becauſ ſhee cannot diſperſ, by reaſon of the unperfect- The final cauſ. A woman ſeemeth a man in quantitie of blood. A man exceedeth a woman in goodneſs and qualitie of his blood. A man is more hot than a woman, and therefore not menſtrual.

unperfectneſs and weakneſs of her heat, it is neceſſarie that ſhee ſhould ſuffer, and have her monethly purgation, eſpecially when ſhee groweth unto ſom bigneſs; but there is no ſuch need in a man.

CHAP. LI.

The cauſſes of the ſuppreſſion of the courſes or menſtruall flux.

THe courſes are ſuppreſſed or ſtopped by manie cauſſes, as by ſharp, vehement, and long diſeaſes, by fear, ſorrow, hunger, immoderate labors, watchings, fluxes of the bellie, great bleeding, hæmorrhoïds, fluxes of blood at the mouth, and evacuations in anie other part of the bodie whatſoever, often opening of a vein, great ſweats, ulcers flowing much and long, ſcabbineſs of the whole skin, immoderate groſneſs and clammineſs of the blood, and by eating of raw fruits, and drinking of cold water, by ſluggiſhneſs and thickneſs of the veſſels, and alſo the obſtruction of them by the defaults and diſeaſes of the womb, by diſtemperature, an abſceſs, an ulcer, by the obſtruction of the inner orifice thereof, by the growing of a Callus, caruncle, cicatrize of a wound or ulcer, or membrane growing there, by injecting of aſtringent things into the neck of the womb, which place manie women endeavor fooliſhly to make narrow: I ſpeak nothing of age, greatneſs with childe, and nurſing of children, becauſ theſe cauſſes are not beſides nature, neither do they require the help of the Phyſitian.

The fooliſh endeavor of making the orifice of the womb narrow, is rewarded with the diſcommoditie of ſtopping of the flowers.

Manie women, when their flowers or tearms be ſtopped, degenerate after a manner into a certain manly nature, whence they are called *Viragines*, that is to ſay, ſtout, or manly women; therefore their voice is more loud and big, like unto a mans, and they become bearded.

What women are called *Viragines*.

In the citie *Abdera* (ſaith *Hippocrates*) *Phæthuſa* the wife of *Pythean* at the firſt did bear children and was fruitful, but when her husband was exiled, her flowers were ſtopped for a long time: but when theſe things happened, her bodie became manlike and rough, and had a beard, and her voice was great and ſhrill. The verie ſame thing happened to *Nannyſia* the wife of *Gorgippus* in *Thaſus*. Thoſe virgins that from the beginning have not their monethly flux, and yet nevertheleſs enjoy their perfect health, they muſt neceſſarily be hot and drie, or rather of a manly heat and drineſs, that they may ſo diſperſ and diſſipate by tranſpiration, as men do, the excrements that are gathered, but verily all ſuch are barren.

Lib. 6. epidem ſect. 7.

The women that are called *viragines* are barren.

CHAP. LII.

What accidents follow the ſuppreſſion or ſtopping of the monethly flux or flowers.

WHen the flowers or monethly flux are ſtopped, diſeaſes affect the womb, and from thence paſs into all the whole bodie. For thereof commeth ſuffocation of the womb, headach, ſwouning, beating of the heart, and ſwelling of the breaſts and ſecret parts, inflammation of the womb, an abſceſs, ulcer, cancer, a feaver, nauſeouſneſs, vomitings, difficult and ſlow concoction, the dropſie, ſtrangurie, the full womb preſſing upon the orifice of the bladder, black and bloodie urine, by reaſon that portion of the blood ſweateth out into the bladder. In manie women the ſtopped matter of the monethly flux is excluded by vomiting, urine, and the hæmorrhoïds, in ſom it groweth into *varices*. In my wife, when ſhee was a maid, the menſtrual matter was excluded and purged by the noſtrils. The wife of *Peter Feure* of *Caſteaudun*, was purged of her menſtrual matter by the dugs everie moneth, and in ſuch abundance, that ſcarce three or four cloaths were able to drie it and ſuck it up.

Why the ſtrangurie, or bloodineſs of the urine followeth the ſuppreſſion of the flowers.

Hiſtories of ſuch as were purged of their menſtrual flux by the noſe and dugs.

In thoſe that have not the flux monethly to evacuate this plenitude by ſom part or place of the bodie, there often follow's difficultie of breathing, melancholie, madneſs, the gout, an ill diſpoſition of the whole bodie, diſſolution of the ſtrength of the whole bodie, want of appetite, a conſumption, the falling ſickneſs, an apoplexie.

Thoſe whoſe blood is laudable, yet not ſo abundant, do receiv no other diſcommoditie by the ſuppreſſion of the flowers, unleſs it be that the womb burn's or itcheth with the deſire of copulation, by reaſon that the womb is diſtended with hot and itching blood, eſpecially if they lead a ſedentary life. Thoſe women that have been accuſtomed to bear children, are not ſo grieved and evil at eaſe when their flowers are ſtopped by anie chance contrarie to nature, as thoſe women which did never conceiv, becauſ they have been uſed to be filled, and the veſſels by reaſon of their cuſtomarie repletion and diſtention, are more large and capacious: when the courſes flow, the appetite is partly dejected, for that nature, beeing then wholly applied to expulſion, cannot throughly concoct or digeſt, the face waxeth pale, and without its lively color, becauſ that the heat with the ſpirits, go from without inwards, ſo to help and aid the expulſive facultie.

To what women the ſuppreſſion of the moneths is moſt grievous.

CHAP.

CHAP. LIII.

Of provoking the flowers or courſes.

THe ſuppreſſion of the flowers is a plethorick diſeaſe, and therefore muſt bee cured by evacuation, which muſt bee don by opening the vein called *Saphena*, which is at the ankle, but firſt let the baſilike vein of the arm bee opened, eſpecially if the bodie bee plethorick, leſt that there ſhould a greater attraction bee made into the womb, and by ſuch attraction or flowing in, there ſhould come a greater obſtruction. When the veins of the womb are diſtended with ſo great a ſwelling that they may bee ſeen, it will bee verie profitable to applie horſ-leaches to the neck thereof. peſſaries for women may bee uſed; but fumigations of aromatick things are more meet for maids, becauſe they are bashfull and shamefac'd. Unguents, liniments, emplaſters, cataplaſms, that ſerv for that matter, are to bee preſcribed and applied to the ſecret parts, ligatures and frictions of the thighs and legs are not to bee omitted, fomentations and feruentatories are to bee uſed, and cupping glaſſes are to bee applied to the groins, walking, dancing, riding, often and wanton copulation with her husband, and ſuch like exerciſes, provoke the flowers. Of plants, the flowers of St. John's-Wurt, the roots of fennel, and aſparagus, bruſcus or butcher's-broom, of parſlie, brook-lime, baſil, balm, beronie, garlick, onions, criſta marina, coſtmarie, the rinde or bark of caſſia fiſtula, calamint, origanum, pennyroyall, mugwort, thyme, hyſſop, ſage, marjoram, roſemarie, horehound, *rue*, ſavin, ſpurge, ſaffron, agarick, the flowers of elder, baie-berries, the berries of Ivie, ſcammonie, *Cantharides*, *pyrethrum* or pellitorie of Spain, *euphorbium*. The aromatick things are *amomum*, cinnamon, ſquinanth, nutmegs, *calamus aromaticus*, *cyperus*, ginger, cloves, galingal, pepper, cubibes, amber, muſk, ſpiknard, and ſuch like; of all which let fomentations, fumigations, baths, broaths, boles, potions, pils, ſyrups, apozemes, and opiates be made as the Phyſicians ſhall think good.

Why the vein called *baſilica* in the arm muſtbe opened before the vein *ſaphena* in the foot.

Horſ-leaches to be applied to the neck of the womb.

Plants that provoke the flowers.

Sweet things.

The apozeme that followeth is proved to be verie effectuall. ℞ *fol. & ſtor. diſtam. an.* p ii. *pimpinel.* m ß. *omnium capillar. an.* p i. *artemiſ. thymi, marjor. origan. an* m ß. *rad. rub. majo. petroſelin. fenicul. an* ʒ i ß. *rad. paon. biſtort. an.* ʒ ß. *cicerum rub. ſem. paon. fenicul. an.* ʒ ß. make there of a decoction in a ſufficient quantitie of water, adding thereto cinnamon ʒ iii. in one pint of the decoction diſſolve (after it is ſtrained) of the ſyrup of mugwort, and of hyſſop, *an.* ʒ ii. *diarrhod. abbat.* ʒ i. let it be ſtrained through a bag, with ʒ ii. of the kernels of Dates, and let her take ʒ iiii. in the morning.

An apozeme to provoke the flowers.

Let peſſaries bee made with *galbanum*, *ammoniacum*, and ſuch like mollifying things, beaten into a maſs in a mortar with a hot peſtel, and made into the form of a peſſarie, and then let them bee mixed with oil of Jaſmine, *euphorbium*, an ox-gall, the juice of mugwurt, and other ſuch like, wherein there is power to provoke the flowers, as with ſcammonie in powder: let them be as big as ones thumb, ſix fingers long, and rowled in lawn, or ſom ſuch like thin linnen cloth; of the ſame things nodula's may bee made. Alſo peſſaries may bee prepared with honie boiled, adding thereto convenient powders, as of ſcammonie, pellitorie, and ſuch like. Neither ought theſe to ſtaie long in the neck of the womb, leſt they ſhould exulcerate, and they muſt be pulled back by a thread that muſt bee put through them, and then the orifice of the womb muſt bee fomented with white wine of the decoction of pennyroyall or mother-wort.

But it is to be noted, that if the ſuppreſſion of the flowers happeneth through the default of the ſtopped orifice of the womb, or by inflammation, theſe maladies muſt firſt bee cured before we come unto thoſe things that of their proper ſtrength and virtue provoke the flowers: as for example, if ſuch things bee made and given when the womb is inflamed, the blood being drawn into the grieved place, and the humors ſharpned, and the bodie of the womb heated, the inflammation will bee increaſed. So if there bee anie ſuperfluous fleſh, if there bee anie Callus of a wound or ulcer, or if there bee anie membrane ſtanding the orifice of the womb, and ſo ſtopping the flux of the flowers, they muſt firſt bee conſumed and taken away, before anie of thoſe things bee adminiſtred. But the opportunitie of taking and applying of things, muſt bee taken from the time wherein the ſick woman was wont to bee purged before the ſtopping, or if ſhee never had the flowers, in the decreaſing of the Moon, for ſo wee ſhall have cuſtom, nature, and the external efficient cauſe to help us. When theſe medicines are uſed, the woman muſt not to be put into baths or hot houſes, as munte do, except the maladie proceed from the denſitie of the veſſels, and the groſſneſs and clammineſs of the blood. For ſweats hinder the menſtrual flux, by diverting and turning the matter another waie.

What cauſſes of the ſtopping of the flowers muſt be cured before the diſeaſe it ſelf.

The fittеſt time to provoke the flowers.

When hot houſes do hurt, thoſe in whom the flowers are to be provoked.

CHAP. LIIII.

The ſigns of the approaching of the menſtrual flux.

WHen the monthlie flux firſt approacheth, the dugs itch and become more ſwoln and hard then they were wont, the woman is more deſirous of copulation, by reaſon of the

What women do love and what women do loath the act of generation when the months are ſtopped.

the ebullition of the provoked blood, and the acrimonie of the blood that remaineth, her voice becommeth bigger, her ſecret parts itch, burn, ſwell, and wax red. If they ſtaie long, ſhee hath pain in her loins and head, nauſeouſneſs and vomiting troubleth the ſtomach: notwithſtanding, if thoſe matters which flow together in the womb, either of their own nature, or by corruption, bee cold, they loath the act of generation, by reaſon that the womb waxeth feeble through ſluggiſhneſs and waterie humors filling the ſame, and it floweth by the ſecret parts verie ſoftly.

With what accidents thoſe that are marriageable and are not married, are troubled.

Thoſe maids that are marriageable, although they have the menſtrual flux verie well, yet they are troubled with headach, nauſeouſneſs, and often vomiting, want of appetite, longing, an ill habite of bodie, difficultie of breathing, trembling of the heart, ſwouning, melancholie, fearfull dreams, watching, with ſadneſs and heavineſs, becauſ that the genital parts burning and itching, they imagine the act of generation, whereby it commeth to paſs that the ſeminal matter, either remaining in the teſticles in great abundance, or elſ powred into the hollowneſs of the womb, by the tickling of the genitals, is corrupted, and acquireth a venemous qualitie, and cauſſeth ſuch like accidents as happen's in the ſuffocation of the womb.

The cauſ of ſo manie accidents.

Maids that live in the countrie are not ſo troubled with thoſe diſeaſes, becauſ there is no ſuch lying in wait for their maiden-heads, and alſo they live ſparingly and hardly, and ſpend their time in continual labor. You may ſee manie maids ſo full of juice, that it runneth in great abundance, as if they were not menſtrual, into their dugs, and is there converted into milk, which they have in as great quantitie as nurſes, as we read it recorded by *Hippocrates*.

Aph. 36. ſect. 5.

If a woman which is neither great with childe, nor hath born children, hath milk, ſhee wants the menſtrual fluxes; whereby you may underſtand that that concluſion is not good which affirmeth that a woman which hath milk in her breaſts, either to be delivered of childe, or to be great with childe: for *Cardanus* writeth that hee knew one *Antonie Buzus* at *Genua*, who beeing thirtie years of age, had ſo much milk in his breaſts as was ſufficient to nurſ a childe; for the breeding and efficient cauſe of milk proceed's not onely from the engrafted facultie of the glandulous ſubſtance, but much rather from the action of the man's ſeed; for proof whereof you may ſee manie men that have verie much milk in their breaſts, and manie women that almoſt have no milk, unleſs they receiv man's ſeed. Alſo women that are ſtrong and luſtie like unto men, which the Latines call *Viragines*, that is to ſay, whoſe ſeed commeth unto a manly nature, when the flowers are ſtopped, concoct the blood, and therefore when it wanteth paſſage forth, by the likeneſs of the ſubſtance it is drawn into the dugs, and becommeth perfect milk: thoſe that have the flowers plentifully and continually for the ſpace of four or five daies, are better purged and with more happie ſucceſs then thoſe that have them for a longer time.

Lib. 2. de ſubt.

The efficient cauſ of the milk is to be noted.

CHAP. LV.

What accidents follow immoderate fluxes of the flowers or courſes.

IF the menſtrual flux floweth immoderately, there alſo follow's manie accidents; for the concoction is fruſtrated, the appetite overthrow'n, then follow's coldneſs throughout all the bodie, exolution of all the faculties, an ill habit of all the bodie, leanneſs, the dropſie, an hectick fever, convulſion, ſwouning, and often ſudden death: if anie have them too exceeding immoderatly, the blood is ſharp and burning, and alſo ſtinking, the ſick woman is alſo troubled with a continual fever, and her tongue will bee drie, ulcers ariſe in the gums and all the whole mouth. In women the flowers do flow by the veins and arteries which riſe out of the ſpermatick veſſels, and ended in the bottom and ſides of the womb, but in virgins and in women great with childe, whoſe children are ſound and healthful, by the branches of the hypogaſtrick vein and arterie, which are ſpred and diſperſed over the neck of the womb. The cauſ of this immoderate flux is in the quantitie or qualitie of the blood, in both the fault is unreaſonable copulation, eſpecially with a man that hath a yard of a monſtrous greatneſs, and the diſſolution of the receptive facultie of the veſſels: oftentimes alſo the flowers flow immoderately by reaſon of a painful and a difficult birth of the childe or the after-birth, beeing pulled by violence from the cotyledons of the womb, or by reaſon that the veins and arteries of the neck of the womb are torn by the comming forth of the infant with great travel, and manie times by the uſe of ſharp medicines, and exulcerating peſſaries. Oft-times alſo, nature avoids all the juice of the whole bodie critically by the womb after a great diſeaſ, which flux is not raſhly or ſuddenly to be ſtopped. That menſtrual blood that floweth from the womb is more groſs, black, and clottie, but that which commeth from the neck of the womb is more clear, liquid and red.

By what pores the flowers do flow in a woman and in a maid.

The cauſſes of an unreaſonable flux of blood.

The critical flux of the flowers.

The ſigns of blood flowing from the womb or neck of the womb.

CHAP. LVI.

Of ſtopping the immoderate flowing of the flowers or courſes.

YOu muſt make choice of ſuch meats and drinks as have power to incraſſate the blood; for as the flowers are provoked with meats that are hot, and of ſubtil parts, ſo they are ſtopped by ſuch meats as are cooling, thickning, aſtringent, and ſtipeick, as are barlie-waters, ſodden rice, the extreme parts of beaſts, as of oxen, calvs, ſheep, either fried or ſodden with ſorrel, purſlain, plantain, ſhepherp's-purſ, ſumach, the buds of brambles, berberries, and ſuch like. It is ſuppoſed that a Hart's-horn burned, waſhed, and taken in aſtringent water, will ſtop all immoderate fluxes; likewiſe *ſanguis draconis, terra ſigillata, bolus armena, lapis hæmatites*, coral beaten into moſt ſubtil powder, and drunk in ſteeled water; alſo pap made with milk, wherein ſteel hath oftentimes been quenched, and the flowr of wheat, barlie, beans, or rice, is verie effectual for the ſame. Quinces, cervices, medlars, cornelian-berries, or cherries may likewiſe bee eaten at the ſecond courſ, Julips are to bee uſed of ſteeled waters, with the ſyrup of drie roſes, pomegranats, ſorrel, myrtles, quinces, or old *conſervs* of red roſes, but wine is to bee avoided: but if the ſtrength bee ſo extenuated, that they require it, you muſt chuſe groſs and aſtringent wine tempered with ſteeled water; exerciſes are to bee ſhunned, eſpecially venereous exerciſes, anger is to bee avoided, a cold air is to bee choſen, which (if it bee not ſo naturally) muſt bee made ſo by ſprinkling cold things on the ground, eſpecially if the ſummer or heat bee then in his full ſtrength; ſound ſleeping ſtaie's all evacuations, except ſweating. The opening of a vein in the arm, cupping-glaſſes faſtened on the breaſts, bands, and painful frictions of the uppar parts are greatly commended in this maladie.

The inſtitution or order of life.

But if you perceiv that the cauſ of this accident lieth in a cholerick ill juice mixed with the blood, the bodie muſt bee purged with medicines that purge choler and water, as Rubarb, Myrobalanes, Tamarinds, Sebeſtens, and the purgeing ſyrup of Roſes.

Purgeing.

CHAP. LVII.

Of local medicines to bee uſed againſt the immoderate flowing of the Courſes.

ALſo unguents are made to ſtay the immoderate flux of the terms, and likewiſe injections and peſſaries. This or ſuch like may bee the form of an unguent. *Rx. ol. maſtich. & myrt. an. ℥ii. nucum cupreſſ. olibani, myrtil. an. ℥ii. ſucci roſar. rubr. ℥i. pulv. maſtichin. ℥ii. boli armen. terræ ſigillat. an. ℥ß. cetæ quantum ſufficit, fiat unguentum.* An injection may bee thus made. *Rx. aq. plantag. roſar. rubr. hurſæ paſtor. centinodii, an. lbß. corticis querni, nucum cupreſſi, gallar. non maturar. an. ℥ii. berberis, ſumach. balauſt. lumin. rach. an. ℥i.* make thereof a decoction, and inject it in a ſyringe blunt-pointed into the womb; leſt if it ſhould bee ſharp, it might hurt the ſides of the neck of the womb; alſo Snails beaten with their ſhells, and applied to the navel, are verie profitable. Quinces roſted under the coles, and incorporated with the powder of Myrtles, and *Bole-armenick*, and put into the neck of the womb, are marvellous effectual for this matter. The form of a peſſarie may bee thus. *Rx. gallar. immaturar. combuſt. & in aceto extinctar. ℥ii. ammo. ℥ß. ſang. draconis. pulv. rad. ſymphyt. ſumach maſtich. ſucci acaciæ, cornu cremſt. colophon, myrrhæ, ſcoriæ ferri, an. ℥i. caphur. ℈ii.* mix them, and incorporate them all together with the juice of knot-graſs, ſyngreen, night-ſhade, hen-bane, water-lillies, plantain, of each as much as is ſufficient, and make thereof a peſſarie.

An unguent.

An aſtringent injection.

Aſtringent peſſaries.

Cooling things, as Oxycrate, *unguentum roſatum*, and ſuch like, are with great profit uſed to the region of the loins, thighs, and genital parts: but if this immoderate flux do com by eroſion, ſo that the matter thereof continually exulcerateth the neck of the womb; let the place bee annointed with the milk of a ſhee-Aſs, with barlie-water, or bindeing and aſtringent mucelages, as of *Pſilium*, Quinces, Gum Tragacanth, Arabick, and ſuch like.

CHAP. LVIII.

Of Women's Fluxes, or the Whites.

BEſides the fore-named Flux, which by the law of nature happeneth to women monthly, there is alſo another called a *Woman's Flux*, becauſ it is onely proper and peculiar to them: this ſomtimes wearieth the woman with a long and continual diſtillation from the womb, or through the womb, comming from the whole bodie without pain, no otherwiſe then when the whole ſuperfluous filth of the bodie is purged by the reins or urine; ſomtimes it returneth at uncertain ſeaſons, and ſomtimes with pain and exulcerateing the places of the womb: it differeth from the menſtrual Flux, becauſ that this for the ſpace of a few daies, as it ſhall ſeem convenient to nature, caſteth forth laudable blood; but this *Woman's Flux* yeeldeth impure ill juice, ſomtimes

The reaſon of the name.

The differences.

What women are apt to this flux.

Women's flux commeth verie seldom of blood.

By what signs an ulcer in the womb may bee known from the white flowers.

somtimes sanious, somtimes serous and livid, otherwhiles white and thick, like unto barlie-cream, proceeding from flegmatick blood: this last kinde thereof is most frequent. Therefore wee see women that are flegmatick, and of a soft and loos habit of bodie, to bee often troubled with this diseas; and therefore they will say among themselvs that they have the whites. And as the matter is divers, so it will stain their smocks with a different color. Truely, if it bee perfectly red and sanguine, it is to bee thought it commeth by erosion, or the exsolution of the substance of the vessels of the womb, or of the neck thereof: therefore it commeth verie seldom of blood, and not at all except the woman bee either great with childe, or ceas to bee menstrual for som other cans; for then in stead of the monethly flux there floweth a certain whayish excrement, which staineth her cloaths with the color of water wherein flesh is washed.

Also it verie seldom proceed's of a melancholick humor, and then for the most part it causeth a cancer in the womb. But often-times the purulent and bloodie matter of an ulcer lying hidden in the womb, deceiveth the unskilful Chirurgian or Physician: but it is not so hard to know these diseases one from the other; for the matter that floweth from an ulcer, becaus (as it is said) it is purulent, it is also lesser, grosser, stinking, and more white. But those that have ulcers in those places, especially in the neck of the womb, cannot have copulation with a man without pain.

CHAP. LIX.

Of the causses of the Whites.

How a woman's flux is wholsom.

How it causeth diseases.

How it letteth the conception.

Why it is hard to bee cured.

An historie.

SOmtimes the cans of the Whites consisteth in the proper weakness of the womb, or elss in the uncleanness thereof; and somtimes by the default of the principal parts. For if the brain or the stomach bee cooled, or the liver stopped or schirrous, manie crudities are engendered, which if they run, or fall down into the womb that is weak by nature, they caus the Flux of the womb, or Whites: but if this Flux bee moderate, and not sharp, it keepeth the bodie from malign diseases; otherwise it useth to infer a consumption, leanness, paleness, and an oedematous swelling of the legs, the falling down of the womb, the dejection of the appetite and all the faculties, and continual sadness and sorrowfulness; from which it is verie hard to perswade the sick woman, because that her minde and heart will bee almost broken, by reason of the shame that shee taketh, becaus such filth floweth continually; it hindereth conception, becaus it either corrupteth, or driveth out the seed when it is conceived. Often-times, if it stoppeth for a few months, the matter that staieth there causeth an abscess about the womb in the bodie or neck thereof; and by the breaking of the abscess there followeth rotten and cancerous ulcers, somtimes in the womb, somtimes in the groin, and often in the hips.

This diseas is hard to bee cured, not onely by reason of it self, as becaus all the whole filth and superfluous excrements of a woman's bodie floweth down into the womb, as it were into a sink; becaus it is naturally weak, hath an inferior situation, manie vessels ending therein; and last of all, becaus the courses are wont to com through it; as also by reason of the sick woman, who often-times had rather die then to have that place seen, the diseas known, or permit local medicines to bee applied thereto: for so saith *Montanus*, that on a time hee was called to a noble woman of *Italie*, who was troubled with this diseas, unto whom hee gave counsel to have cleansing decoctions injected into her womb, which when shee heard, shee fell into a swound, and desired her husband never thereafter to use his counsel in anie thing.

CHAP. LX.

The cure of the Whites.

If the flux of a woman bee red, wherein it differeth from the menstrual flux.

A woman's flux is not suddenly to bee stopped.

What baths are profitable.

IF the matter that floweth out in this diseas bee of a red color, it differeth from the natural monthly flux in this onely, becaus it keep's no order or certain time in its returning. Therefore phlebotomie and other remedies which wee have spoken of, as requisite for the menstrual flux, when it floweth immoderately, is here necessarie to bee used. But if it bee white, or doth testifie or argue the ill juice of this or that humor by anie other color, a purgation must bee prescribed of such things as are proper to the humors that offend's: for it is not good to stop such a flux suddenly; for it is necessarie, that so the bodie should bee purged of such filth or abundance of humors: for they that do hasten to stop it, caus the dropsie, by reason that this sink of humors is turned back into the liver; or elss a cancer in the womb, becaus it is staied there; or a fever, or other diseases, according to the condition of the part that receiveth it. Therfore wee must not com to local deterfives, deficcatives, restrictives, unless wee have first used universal remedies according to art. Alum-baths, baths of brimstone, and of bitumen, or iron, are convenient

for

for the whites that com of a phlegmatick humor; instead whereof baths may bee made of the decoction of herbs that are hot, drie, and indued with an aromatick power, with alom, and pebbls, or flint-stones red hot thrown into the same. Let this bee the form of a cleansing decoction and injection. *℞. fol. absynth. agrimon. centinod. burs-past. aa.* m ß. boil them together, and make thereof a decoction, in which dissolv *mellis-rosar.* ℥ ii. *aloës, myrrhæ, salis nitri, an.* ℥i. make thereof an injection, the woman beeing so placed on a pillow under her buttocks that the neck of the womb beeing more high, may bee wide open: when the injection is received, let the woman set her legs across, and draw them up to her buttocks, and so shee may keep that which is injected. They that indeavor to drie and binde more strongly, add the juice of *acatia*, green galls, the rindes of pomegranates, roch-alome, romane vitriol, and they boil them in Smiths-water and red-wine; pessaries may bee made of the like faculti.

What baths are profitable.

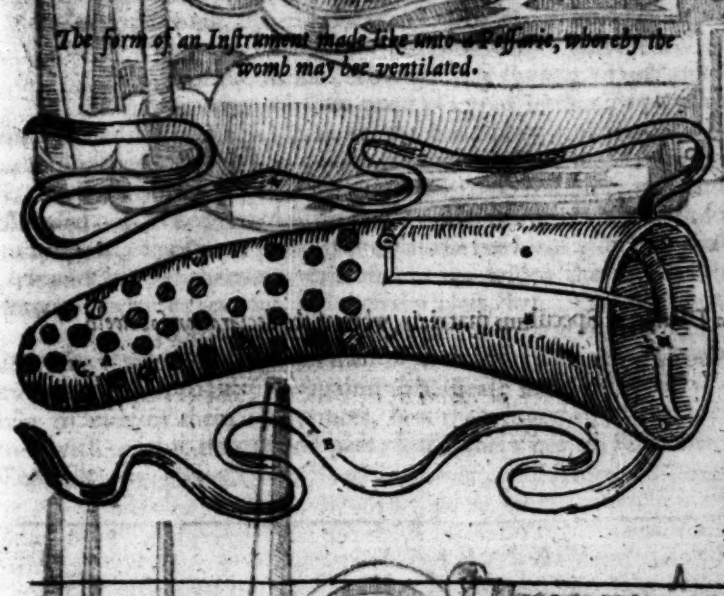
An astringent injection.

If the matter that commeth forth bee of an ill color or smell, it is like that there is a rotten ulcer; therefore wee ought to inject those things that have power to correct the putrefaction: among which *ægyptiacum*, dissolved in lie or red-wine, excelleth. There are women which when they are troubled with a virulent *Gonorrhæa*, or an involuntarie flux of the seed, cloaking the fault with an honest name, do untruly say that they have the whites, becaus that in both these diseases a great abundance of filth is avoided. But the Chyrurgian may easily perceiv that maladie by the rottennes of the matter that floweth out, and hee shall perswade himself that it will not bee cured without salivation or fluxing at the mouth, and sweats. In the mean while let him put in an instrument made like unto a pessarie, and caus the sick woman to hold it there: this instrument must have manie holes in the upper end, through which the purulent matter may pass, which by staying or stopping might get a sharpnes; as also that so the womb may breath the more freely, and may bee kept more temperate and cool by receiving the air, by the benefit of a spring whereby this instrument, beeing made like unto a pessarie, is opened and shut.

The signs of a putrefied ulcer in the womb.

The virulent *Gonorrhæa* is like unto the flux of women.

The form of an Instrument made like unto a Pessarie, whereby the womb may bee ventilated.



A. Sheweth the end of the Instrument, which must have manie holes therein.

B. Sheweth the bodie of the Instrument.

C. Sheweth the plate whereby the mouth of the Instrument is opened and shut, as wide and as close as you will, for to receiv the air more freely.

D. Sheweth the spring.

EE. Shew the laces and bands to tie about the patient's bodie, that so the Instrument may bee staied and kept fast in his place.

CHAP. LXI.

Of the Hemorrhoides and Warts of the neck of the womb.

Like as in the fundament, so in the neck of the womb, there are *Hæmorrhoides*, and as it were varicous veins, often-times flowing with much blood, or with a red and stinking whayish humor. Som of these, by reason of their redness and great roundnes as it were of knobs, are like unripe Mulberries, and are called vulgarly *venæ morales*, that is to say, the veins or *hæmorrhoides* like unto Mulberries: others are like unto Grapes, and therefore are named *uvales*; other som are like unto warts, and therefore are called *venæ verrucales*: som appear and shew themselvs with a great tumor, others are little, and in the bottom of the neck of the womb; others are in the side or edg thereof. *Acrochordon* is a kinde of wart with a callous bunch or knot, haveing a thin or slender root, and a greater head, like unto the knot of a rope, hanging by a small thred; it is called of the Arabians, *verruca botoralis*.

The differences of the *Hæmorrhoides* of the neck of the womb.

What an *Acrochordon* is.

There is also another kinde of wart, which becaus of his great roughnes and inequalitie, is called *thymus*, as resembling the flower of Thyme. All such diseases are exasperated and made more grievous by anie exercise, especially by venereous acts: manie times they

What a *Thymus* is.

have a certain malignitie, and an hidden virulencie joined with them, by occasion whereof they are aggravated even by touching onely; becauſe they have their matter of a rageing humor: therefore to theſe wee may not rightly uſe a true, but onely the palliative cure, as they term it: the Latines call them onely *ficus*, but the French men name them with an adjunct, Saint *Fiacrius* figs.

S. *Fiacrius* figs.

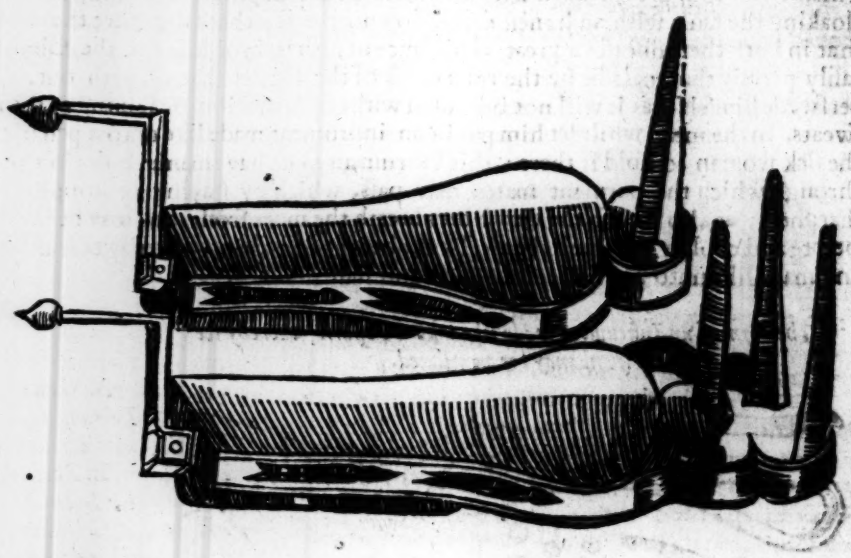
CHAP. LXII.

Of the cure of the Warts that are in the neck of the womb.

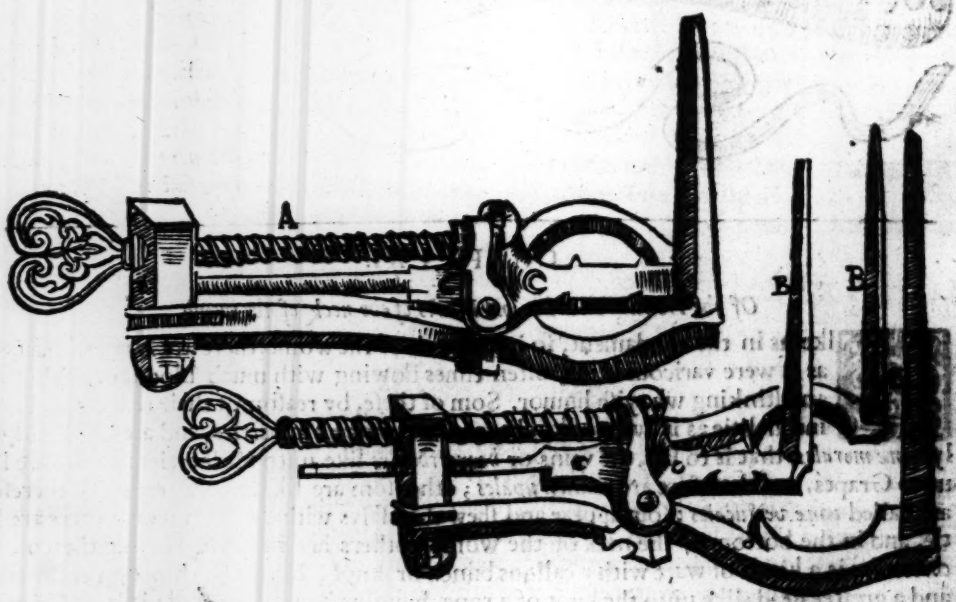
What warts of the womb muſt bee bound, and ſo cut off.

THe warts that grow in the neck of the womb, if they bee not malignant, are to bee tied with a thred, and ſo cut off Thoſe that lie hid more deep in the womb, may bee ſeen and cured by opening the *matrix* with a Dilater made for the purpoſe.

Divers Specula matricis, *or Dilaters for the inſpection of the* Matrix.



Another form of a Dilater, or Speculum matricis, *whereof the declaration followeth.*



A. *Sheweth the ſcrew, which ſhutteth and openeth the Dilater of the* Matrix.
BB. *Shew the arms or branches of the Inſtrument, which ought to bee eight or nine fingers long.*

But

But theſe Diſters of the matrix ought to bee of a bigneſs correſpondent to the patient's bodie; let them bee put into the matrix, when the woman is placed as we have ſaid, when the childe is to bee drawn out of her bodie. That inſtrument is moſt meet for the the warts, which wee have deſcribed in the relaxation of the palate or *Vvula*: let them bee tied harder and harder everie day until they fall away. Therefore for the cureing of warts there are three chief ſcopes, as bands, ſections, cauteries: and leſt they grow up again, let oil of vitriol bee dropped on the place, or *aqua fortis*, or ſom of the lee whereof potential cauteries are made. This water following is moſt effectual to conſume and waſte warts. R. *aq. plantag. ℥vi. viridi. vit. ℥ii. alum. rocha ℥ii. ſal com. ℥ß. vitriol. ℥ß.* beat them all together, and boil them; let one or two drops of this water bee dropped on the grieved place, not touching anie place elſe; but if there bee an vlcer, it muſt bee cured as I have ſhewed before. A certain man, ſtudious of phyſicke, of late affirmed to mee, that Ox-dung temperated with the leave or powder of Savine, would waſte the warts of the womb, if it were applied thereto warme: which, whether it bee true or not, let Experience, the miſtreſs of things, bee judge. Verily, *Cantharides* put into unguents will do it, and (as it is likely) more effectually; for they will conſume the callouſneſs which groweth between the toes or fingers. I have proved by experience, that the warts that grow on the hands, may bee cured by applying of Purſlain beaten or ſtamp't in his own juice. The leaves and flowers of Marigolds do certainly perform the ſame thing.

Three ſcopes of the cure of warts in the womb.

An effectual water to conſume warts.

Unguents to conſume warts.

CHAP. LXIII.

Of Chaps, and thoſe wrinkled and hard excreſcences, which the Greeks call Condylomata.

CHaps or Fiſſures, are cleft and vlcer long little Vlcers, with pain verie ſharp and burning, by reaſon of the biteing of an acrid, ſalt and drying humor, making ſecret a contraction, and ſometimes narrowneſs in the fundament and the neck of the womb; that ſcarcely the top of one's finger may bee put into the orifice thereof, like unto pieces of leather or parchment, which are wrinkled and parched by holding of them to the fire. They riſe ſometimes in the mouth, ſo that the patient can neither ſpeak, eat, nor open his mouth, ſo that the Surgeon is conſtrained to cut it. In the cure thereof, all ſharp things are to bee avoided, and thoſe which mollifie are to bee uſed; and the grieved place do purpoſ to bee moiſtened with fomentations, liniments, cataplaſms, emplaſters, and if the maladie bee in the womb, a dilater of the matrix or peſſarie muſt bee put therinto verie often, ſo to widen that which is over hard, and too much drawn together or narrow, and then the cleft little ulcers muſt bee cicatrized. *Condylomata* are certain wrinkled and hard bunches, and as it were excreſcences of the fleſh, riſeing eſpecially in the wrinkled edges of the fundament and neck of the womb. Cooling and relaxing medicines ought to bee uſed againſt this diſeaſe; ſuch as are oil of eggs, and oil of lin-ſeed, take of each of them two ounces, beat them together a long time in a leaden mortar, and therewith anoint the grieved part; but if there bee an inflammation, put thereto a little Camphir.

What Chaps are.

The cure.

What *Condylomata* are.

CHAP. LXIV.

Of the itching of the womb.

IN women, eſpecially ſuch as are old, there often-times commeth an itching in the neck of the womb, which doth ſo trouble them with pain, and deſire to ſcratch, that it taketh away their ſleep. Not long ſince is a woman priked my counſel, that was ſo troubled with this kinde of maladie, that ſhee was conſtrained to tear in pieces or ſlay the itching burning of her ſecret parts by ſprinkling cinders of fire, and rubbing them hard on the place. I counſelled her to take *aegypt.* diſſolved in ſea-water or lee, and inject it in her ſecret parts with a ſyringe, and to wet *ſtupes* of flax in the ſame medicine, and put them up into the womb, and ſo ſhee was cured. Manie times this itch commeth in the fundament or teſticles of aged men, by reaſon of the gathering together or conflux of ſalt flegm, which when it falleth into the eies, it cauſeth the patient to have much ado to refrain ſcratching: when this matter hath diſperſed into the whole habit of the bodie, it cauſeth a burning or itching ſcab, which muſt bee cured by cooling and mollifying, by other, ſoom and purgeing of the ſalt humor, by baths and hot ſweats, with fumigation and anointing of the whole bodie with the ointment following. *Take ſalt gotes, ſalt ſtrained, aſſes ſalt, ſalt of ſtarch, of each two ounces, beat them all together, and make ointment according to art.* This ointment is thought to have great force, not without cauſe, to allay the

the itch, and drie the ſcab. Som uſe this that followeth. *R. alum. ſpum. nitr. ſulph. viv. an. ʒvi. ſtaphiſ. ʒi.* let them all bee diſſolved in vinegar of Roſes, adding thereto *butyr. recent. q. ſ.* make thereof a liniment for the fore-named uſe.

CHAP. LXV.

Of the relaxation of the great Gut, or Inteſtine, which happeneth to women.

The cauſ. MAnie women that have had great travel and ſtrains in childe-birth, have the great Inteſtine (called of the Latines *craſſum inteſtinum*) or Gut, relaxed and ſlipped down; which kinde of affect happeneth much to children, by reaſon of a phlegmatick humor moiſtening the *ſphincter*-muſcle of the fundament, and the two others called *Levatores*. For the cure thereof, firſt of all the Gut called The cure. *rectum inteſtinum*, or the ſtraight Gut, is to bee fomented with a decoction of heating and reſolving herbs, as of Sage, Roſemarie, Lavander, Thyme, and ſuch like; and then of aſtringent things, as of Roſes, Myrtils, the rindes of Pomegranats, Cypreſs-nuts, Galls, with a little Alum, then it muſt bee ſprinkled with the powder of things that are aſtringent without biteing: and laſt of all, it is to bee reſtored, and gently put into its place. That is ſuppoſed to bee an effectual and ſingular remedie for this purpoſe, which is made of twelv red An effectual remedie. Snails put into a pot with ʒß. of Alum, and as much of Salt, and ſhaken up and down a long time, for ſo at length when they are dead there will remain an humor, which muſt bee put upon Cotton, and applied to the Gut that is faln down. By the ſame cauſ (that is to ſay, of painful childe-birth in ſom women) there ariſeth a great ſwelling in the navel; for when The differences and ſigns. the *peritonæum* is relaxed or broken, ſomtimes the Kall, and ſomtimes the Guts ſlip out: manie times flatulencies com thither: the cauſ, as I now ſhewed, is over great ſtraining or ſtretching of the bellie, by a great burthen carried in the womb, and great travel in childe-birth: if the faln-down Guts make that tumor, pain joined together with that tumor doth vex the patient; and if it bee preſſed, you may hear the noiſ of the Guts going back again: if it bee the Kall, then the tumor is ſoft, and almoſt without pain; neither can you hear anie noiſ by compreſſion: if it bee winde, the tumor is looſ and ſoft, yet it is ſuch as will yeeld to the preſſing of the finger with ſom ſound, and will ſoon return again: if the tumor bee great, it cannot bee cured, unleſs the *peritonæum* bee cut, as it is ſaid in the cure of An hiſtorie. of ruptures. In the Church-porches of *Paris*, I have ſeen Beggar-women, who by the falling down of the Guts, have had ſuch tumors as big as a bowl, who notwithſtanding could go, and do all other things as if they had been ſound, and in perfect health: I think it was, becauſ the *fæces* or excrements, by reaſon of the greatneſs of the tumor, and the bigneſs or wideneſs of the Inteſtines, had a free paſſage in and out.

CHAP. LXVI.

Of the relaxation of the navel in children.

OFten-times in children newly born, the navel ſwelleth as big as an egg, becauſ it hath not been well cut or bound, or becauſ the whayiſh humors are flowed thither, or becauſ that part hath extended it ſelf too much by crying, by reaſon of the pains of the fretting of the childe's guts, manie times the childe bringeth that tumor joined with an abſceſs with him from his mother's womb: but let not the Chirurgi- An abſceſs not to bee opened. an aſſay to open that abſceſs, for if it bee opened, the guts com out through the inciſion, as I have ſeen in manie, and eſpecially in a childe of my Lord *Martigues*; for when *Peter* of the Rock, the Chirurgian, opened an abſceſs that was in it, the bowels ran out at the inciſion, and the infant died; and it wanted but little that the Gentlemen of my Lord's retinue that were there, had ſtrangled the Chirurgian. Therefore when *John Gromontius* the Carver de- An hiſtorie. fired mee, and requeſted mee of late that I would do the like in his ſon, I refuſed to do it, becauſ it was in danger of its life by it alreadie, and in three daies after the abſceſs broke, and the bowels guſhed out, and the childe died.

CHAP. LX.

Of the pain that children have in breeding of teeth.

The time of breeding of the teeth. CHildren are greatly vexed with their teeth, which cauſ great pain when they begin to break, as it were, out of their ſhell or ſheath, and begin to com forth, the gums beeing broken, which for the moſt part happeneth about the ſeventh month of the childe's age. This pain commeth with itching and ſcratching of the gums, an inflammation, flux of the bellie, whereof manie times commeth a fever, falling of the hair, a convulſion, at length death. The cauſ of the pain

pain in the ſolution of the continuitie of the gums by the comming forth of the teeth. The cauſe of the pain in breeding teeth.
The ſignes of that pain is an unaccuſtomed burning, or heat of the childe's mouth, which may bee perceived by the nurſe that giveth it ſuck, a ſwelling of the gums and cheeks, and the childe's beeing more way-ward and crying then it was wont, and it will put its fingers to its mouth, and it will rub them on its gums as though it were about to ſcratch, and it ſlavereth much. The ſignes.
That the Phyſician may remedie this, hee muſt cure the nurſe as if ſhee had the fever, and ſhee muſt not ſuffer the childe to ſuck ſo often, but make him cool and moiſt when hee thirſteth by giving him at certain times *ſyrupus alexandrinus*, *ſyrup. de limonibus*, or the ſyrup of pomegranats with boiled water; yet the childe muſt not hold thoſe things that are actually cold long in his mouth, for ſuch by binding the gums, do in ſom ſort ſtay the teeth that are newly comming forth; but things that leniſie and mollifie are rather to bee uſed, that is to ſay, ſuch things as do by little and little relax the looſe fleſh of the gums, and alſo aſſwage the pain. The cure.
Therefore the Nurſe ſhall often times rub the childe's gums with her fingers, annointed or beſmeared with oil of ſweet almonds, freſh-butter, honie, ſugar, mucilage of the ſeeds of *pſilium*, or of the ſeeds of marſh-mallows extracted in the water of pelletorie of the wall. Som think that the brain of a hare, or of a ſucking pig roſted or ſodden, through aſtrinct propertie, are effectual for the ſame: and on the outſide ſhall bee applied a cataplaſm of barlie-meal, milk, oil of roſes, and the yelks of egs. Alſo a ſtick of liquorice ſhaven and bruiſed and annointed with honie, or anie of the forenamed ſyrups, and often rubbed in the mouth or on the gums, is likewiſe profitable: ſo is alſo anie toie for the childe to plaie withall, wherein a wolve's tooth is ſet, for this by ſcratching doth aſſwage the painfull itching, and rarifie the gums, and in ſom weareth them that the teeth appear the ſooner. What power ſcratching of the gums hath to aſſwage the pain of them.
But manie times it happeneth that all theſe and ſuch like medicines profit nothing at all, by reaſon of the contumacie of the gums, by hardneſs or the weakneſs of the childe's nature: therefore in ſuch a caſe, before the fore-named mortal accidents com, I would perſuade the Chirurgian to open the gums in ſuch places as the teeth bunch out with a little ſwelling, with a knife or lancet, ſo breaking and opening a waie for them, notwithſtanding that a little flux of blood will follow by the tenſion of the gums: of which kinde of remedie I have with proſperous and happie ſucceſs made trial in ſom of mine own children, in the preſence of *Feurus*, *Altinus*, and *Cartinus*, Doctors of Phyſick, and *Guillemeau* the King's Chirurgian, which is much better and more ſafe then to do as ſom nurſes do, who taught onely by the inſtinct of nature, with their nails and ſcratching, break and tear, or rent the children's gums. An hiſtorie.
The Duke of *Nevers* had a ſon of eight months old, which died of late, and when wee, with the Phyſicians that were preſent, diligently ſought for the cauſe of his death, wee could impute it unto nothing elſe, then to the contumacious hardneſs of the gums, which was greater then was convenient for a childe of that age; for therefore the teeth could not break forth, nor make a paſſage for themſelves to com forth: of which our judgment this was the trial, that when wee cut his gums with a knife, wee found all his teeth appearing as it were in an arraie, readie to com forth, which if it had been don when he lived, doubtleſs hee might have been preſerved.

The end of the twentie fourth Book.

About

Of *Monsters* and *Prodigies*.

The twentie fifth Book.

THE PREFACE.

What a Monster is.

What a Prodigie is.

WEe call Monsters, what things soever are brought forth contrarie to the common ordeir of nature. So wee term that infant monstrous, which is born with one arm, or with two heads. But wee define Prodigies, those things which happen contrarie to the whole course of nature, that is, altogether differing and dissenting from nature, as if a woman should be delivered of a Snake, or a Dog. Of the first sort are thought all those, in which anie of those things, which ought, and are accustomed to bee, according to nature, is wanting, or doth abound, or changed, more, covered or defended, hurt, or not put in his right place: for sometimes som are born with three fingers, when they should, other som but with one finger: som with those parts divided which should bee joined, others with those parts joined which should bee divided: som are born with the privities of both sexes, male and female.

Lib. 4. gen. anim. cap. 4.

And Aristotle saw a Goat with a horn upon her knee. No liveing creature was ever born which wanted the Heart, but som have been seen wanting the Spleen, others with two Spleens, and som wanting one of the Reins. And none have bin known to have wanted the whole Liver, although som have been found that had it not perfect and whole: and there have been those which wanted the Gall, which by nature they should have had: and besides it hath been seen that the Liver, contrarie to his naturall site, hath lien on the left side, and the Spleen on the right. Som women also have had their privities closed and not perforated, the membranous obstacle, which they call the Hymen, hindering. And men are sometimes born with their fundaments, eares, noses, and the rest of the passages shut, and are accounted monstrous, manie erring from its extended scope. But to conclude, those Monsters are thought to portend som ill, which are much differing from their nature.

CHAP. I.

Of the caus of Monsters; and first of those Monsters which appear for the glorie of God, and the punishment of mens wickednes.

THere are reckoned up manie causes of Monsters, the first wherof is the glorie of God, that his immens power may bee manifested to those which are ignorant of it, by the sending of those things which happen contrarie to nature, for thus our *Savior Christ* answered the *Disciples* (asking whether he or his parents had offended, who being borne *blinde*, received his sight from him) that neither *hee* nor his *parents* had committed anie faulc so great, but this to happened onely that the *glorie* and majestie of God should bee divulged by that miracle, and such great works.

Another caus is, that God may either punish men's wickednes, or shew signs of punishment at hand, becaus parents somtimes lie and join themselvs together without law and measure, or luxuriously and beastly, or at such times as they ought to forbear by the command of God and the Church, such monstrous, horrid and unnatural births do happen.

The figure of a Colt with a man's face.

At *Verona Anno Dom.* 1254. a mare foaled a colt with the perfect face of a man, but all the rest of the bodie like an horse: a little after that, the war between the *Florentines* and *Pisans* began, by which all *Italie* was in a combustion.

About

The figure of a winged Monster.

About the time that Pope *Julius* the second raised up all *Italie*, and the greatest part of Christendom, against *Lewis* the twelfth the King of *France*, in the year of of our Lord 1512. (in which year, upon Easter daie, near *Ravenna* was fought that mortal battel, in which the Pope's forces were overthrown) a monster was born in *Ravenna*, haveing a horn upon the crown of his head, and besides, two wings, and one foot alone, most like to the foot of birds of prey, and in the knee thereof an eie, the privities of male and female, the rest of the bodie like a man, as you may see by this figure.

The third caus is, an abundance of seed and overflowing matter. The fourth, the same in too little quantitie, and deficient. The fift, the force and efficacie of imagination. The sixt, the straightnes of the womb. The seventh, the disorderly site of the partie with childe, and the position of the parts of the bodie. The eight, [illegible] stroak, especially upon the bellie of a woman with childe. The ninth, hereditarie diseases, or affects by anie other accident. The tenth, the confusion and mingling together of seed. The eleventh, the craft and wickednes of the divel. There are some others which are accounted for monsters, becaus their original or essence full of admiration, or else [illegible] contain prodigious form by the craft of som begging companions; therefore wee will speak briefly of them in their place in this our treatise of monsters.

CHAP. II.

Of Monsters caused by too great abundance of seed.

SEeing wee have already handled the two former and truly final causes of monsters, wee must now com to those which are material, corporeal and efficient causes, takeing our beginning from that wee call the too great abundance of the matter of seed. It is the opinion of those Philosophers which have written of monsters, that if at anie time a creature bearing one at once, as man, shall cast forth more seed in copulation then is necessarie to the generation of one bodie, it cannot bee that onely one should bee begot of all that; therefore from thence either two or more must arise: whereby it commeth to pas, that these are rather judged wonders, becaus they happen seldom, and contrarie to common custom. Superfluous parts happen by the same caus, that twins and manie at one birth, contrarie to nature's cours, do chance, that is, by a larger effusion of seed then is required for the frameing of that part, that so it exceed's either in number or elf in greatnes. So *Austin* tell's that in his time in the East an infant was born, haveing all the parts from the bellie upwards double, but from thence downwards single and simple: for it had two heads, four eies, two breasts, four hands, in all the rest like to a nother childe, and it lived a little while. *Celius Rhodiginus* saith hee saw two monsters in *Italie*, the one male, the other female, handsomly and neatly made through all their bodies, except their heads, which were double; the male died within a few daies after it was born; but the female (whose shape is here delineated) lived twenty-five years, which is contrarie to the common custom of monsters; for they for the most part are verie short-liv'd, becaus they both live and are born, as it were, against nature's consent; to which may bee added, they do not love themselvs, by reason they are made a scorn to others, and by that means lead a hated life.

Monsters are seldom long-lived.

But

But it is most remarkable which *Lycosthenes* telleth of a * Woman-monster, for, excepting her two heads, shee was framed in the rest of her bodie to an exact perfection: her two heads had the like desire to eat and drink, to sleep, to speak, and to do everie thing; shee begged from door to door, everie one giveing to her freely. Yet at length shee was banish't *Bavaria*, lest that by the frequent looking upon her, the imagination of women with childe, strongly mooved, should make the like impression in the infants they bare in their wombs.

*The effigies of a * Maid with two heads.*

*The effigies of two * Girls whose backs grew together.*

In the year of our Lord 1475, at *Verona* in *Italie*, two * Girls were born with their backs sticking together from the lower part of the shoulders unto the verie buttocks. The novelde and strangeness of the thing mooved their parents, beeing but poor, to carrie them through all the chief towns in *Italie* to get monie of all such as came to see them.

The figure of a man with another growing out of him.

In the year 1530. there was a man to bee seen at *Paris*, out of whose bellie another, perfect in all his members except head, hanged forth as if hee had been grafted there. The man was fortie years old, and hee carried the other implanted or growing out of him, in his arms, with such admiration to the beholders, that manie ran verie carefully to see him.

The

The effigies of a horned or hooded monster.

At *Quiers*, a small village some ten miles from *Turine* in *Savoy*, in the year 1578. upon the seventeenth daie of January, about eight a clock at night, an honest matron brought forth a childe haveing five horns, lik to Ram's horns, set opposite to one another upon his head: hee had also a long peece of flesh, like in form [illegible] to a French-hood which women used to wear, hanging down from his forehead by the nape of his neck almost the length of his back: two other peeces of flesh, like the collar of a shirt, were wrapped about his neck: the finger's ends of both his hands somwhat resembled a Hawk's talons, and his knees seemed to bee in his hams: the right leg and the right foot were of a verie red color; the rest of the bodie was of a tawnie color: it is said hee gave so terrible a scritch when hee was brought forth, that the Midwives, and the rest of the women that were at her labor, were so frighted that they presently left the house and ran away. When the Duke of *Savoy* heard of this monster, hee commanded it should bee brought to him, which performed, one would hardly think what various censures the Courtiers gave of it.

The monster you see here delineated, was found in the middle and innermost part of an * Egg, with the face of a man, but hairs yeelding a horrid representation of Snakes; the chin had three other snakes stretched forth like a beard. It was first seen at *Amas*, at the hous of one *Bancheron* a Lawyer, a maid breaking manie egs to butter: the white of this egg giving a Cat, presently killed her. Lastly this monster comming to the hands of the Baron *Senecy*, was brought to King *Charls* the ninth beeing then at *Metz*.

*The shape of a monster found in an * Egg.*

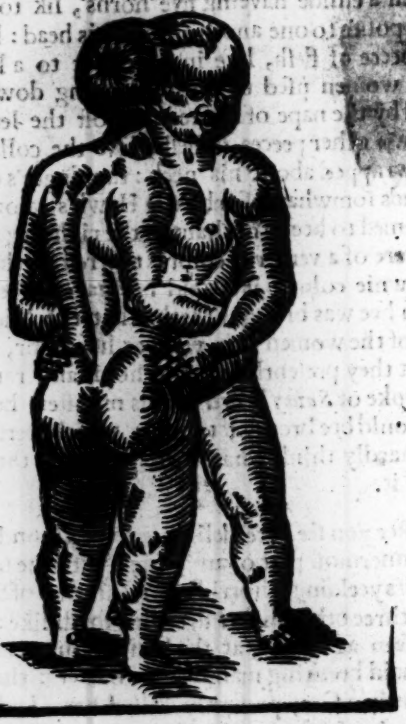
The effigies of a monstrous b Childe, haveing two heads, two arms and four legs.

In the year 1543. a woman at *Paris* in her first month of her account, brought forth a b Childe having two heads, two arms and four legs: I, dissecting the bodie of it, found but one heart, by which one may know it was but one infant. For you may know this from *Aristotle*, whether the monstrous birth bee one or more joined together, by the principal part: for if the bodie have but one heart, it is but one; if two, it is double by the joining together in the conception.

In

In the year 1569. a certain woman of *Towers* was delivered of * Twins joined together with one head, and mutually embraceing each other. *Renatus Ciretus* the famous Chirurgian of those parts, sent mee their *Sceleton*.

*The portraiture of * Twins joined together with one head.*



*The effigies of two * Girls beeing twins, joined together by their fore-heads.*

Munster write's that in the village *Briſtant*, not far from *Worms*, in the year 1495. hee ſaw two * Girls perfect and entire in everie part of their bodies, but they had their foreheads ſo joined together that they could not bee parted or ſevered by anie art: they lived together ten years; then the one dying, it was needful to ſeparate the liveing from the dead: but ſhee did not long out-live her ſiſter, by reaſon of the malignitie of the wound made in parting them aſunder.

In the year of our Lord 1570: the twentieth of Julie, at *Paris*, in the ſtreet *Gravilliers*, at the ſign of the Bell, theſe two infants were born, differing in ſex, with that ſhape of bodie that you ſee here expreſſed in the figure. They were baptized in the Church of S. *Nicolas* of the fields, and named *Ludovicus* and *Ludovica*: their father was a Maſon, his name was *Peter Germane*, his ſurname *Petit Dieu* (*i.*) little-God, his mother's name was *Mathea Percuilla*.

The ſhape of the infants lately born at Paris.

In

In the year 1572 in *Pont de See*, near *Angers* a little town, were born upon the tenth daie of Julie, two girls, perfect in their limbs, but that they had but four fingers apiece on their left hands: they clave together in their fore parts, from their chin to their navel, which was but one, as their heart also but one; their liver was divided into four lobes: they lived half an hour, and were baptized.

The figure of two girls joined together in their breasts and bellie.

The figure of a childe with two heads, and the bodie as big as one of four monthes old.

Var. hist. lib. 24 cap. 8.

Celius Rhodiginus tell's, that in a town of his countrie called *Sarzano*, *Italie* beeing troubled with civil Wars, there was born a monster of unusual bigness; for hee had two heads, having all his limbs answerable in greatness and tallness to a childe of four months old: between his two heads, which were both alike, at the setting on of the shoulder, it had a third hand put forth, which did not exceed the ears in length, for it was not all seen: it was born the 5. of the Ides of *March*, 1514.

The figure of one with four legs and as manie arms.

The figure of a man out of whose bellie another head shewed it self.

Jovianus Pontanus tell's in the year 1529. the ninth daie of Januarie, there was a man childe born in Germanie, haveing four arms, and as many legs.

In the year that *Francis* the first King of *France* entered into league with the *Swiſſes*, there was born a monster in *Germanie*, out the midst of whose bellie there stood a great head; it came to man's age, and his lower, and as it were inferted head, was nourished as much as the true and upper head.

The ſhape of two monſtrous Twins, beeing but of one onely Sex.

In the year 1572. the laſt daie of *Februarie*, in the pariſh of *Vinhan*, in the waie as you go from *Carinate* to *Paris*, in a ſmall village called *Bordes* one called *Cypriana Girauda*, the wife of *James Merchant* a husbandman, brought forth this monſter whoſe ſhape you ſee here delineated, which lived until the Sundaie following, beeing but of one onely ſex, which was the female.

The ſhape of a monſtrus Pig.

In the year 1572. on Eaſter Mundaie at *Metz* in *Lorain*, in the Inn whoſe ſign is the Holie Ghoſt, a Sow pigged a pig, wch had eight legs, four ears, and the head of a dog; the hinder part from the bellie downward was parted in two as in twins, but the fore-parts grew into one; it had two tongues in the mouth, with four teeth in the upper jaw, and as manie in the lower. The ſex was not to bee diſtinguiſhed, whether it were a Bore or Sow pig, for there was one ſlit under the tail, and the hinder parts were all rent and open. The ſhape of this monſter, as it is here ſet down, was ſent mee by *Borgeſius* the famous Phyſician of *Metz*.

CHAP. III.

Of women bringing manie Children at one birth.

WOman is a creature bringing uſually but one at a birth; but there have been ſom who who have brought forth two, ſom three, ſom four, ſom five, ſix, or more at one birth. *Empedocles* thought that the abundance of ſeed was the cauſ of ſuch numerous births: the *Stoïks* affirm the diverſ cells or partitions of the womb to bee the cauſ; for the ſeed beeing variouſly parted into theſe partitions, and the conception divided, there are more children brought forth; no otherwiſe then in rivers, the water beating againſt the rocks, is turned into divers circles or rounds. But *Ariſtotle* ſaith there is no reaſon to think ſo, for in women that parting of the wombe into cells, as in dogs and ſows, taketh no place; for women's wombs have but one cavitie, parted into two receſſes, the right and left, nothing comming between, except by chance diſtinguiſhed by a certaine line; for often twins lie in the ſame ſide of the womb. *Ariſtotle*'s opinion is, that a woman cannot bring forth more then five children at one birth. The maid of *Auguſtus Ceſar* brought forth five at a birth, and, a ſhort while after, ſhe and her children died. In the year 1554. at *Bearn* in *Switzerland*, the wife of Dr. *John Gelenger* brought forth five children at one birth, three boies and two girls. *Albucraſis*, affirm's a woman to have been the mother of ſeven children at one birth; and another, who by ſom external injurie did abort, brought forth fifteen perfectly ſhaped in all their parts. *Plinie* report's that it was extant in the writeings of Phyſicians, that twelv children were born at one birth; and that there was another in *Peloponneſus* which four ſeveral times was delivered of five children at one birth; and that the greater part of thoſe children lived. It is reported by *Dalechampius* that *Buonaventura* the ſlave of one *Sanſi*, a gentleman of *Sena*, at one time brought forth ſeven children, of which four were baptized. In our time, between *Sarte* and *Main*, in the pariſh of *Seaux*, not far from *Chambellay*, there is a familie and noble houſ called *Maldemeure*; the wife of the Lord of *Maldemeure*, the firſt year ſhee was married brought forth twins, the ſecond year ſhee had three children, the third year four, the fourth year five, the fifth year ſix, and of that birth ſhee died: of thoſe ſix one is yet alive, and is Lord of *Maldemeure*. In the valley of *Beaufort*, in the countie of *Anjou*, a young woman the daughter of *Mace Channiere*, when at one perfect birth ſhee had brought forth one childe, the tenth daie following ſhee fell in labor of another, but could not bee delivered untill it was pulled from her by force, and was the death of the monſter.

4. *De gen. anim. cap.* 4.

Lib. 7. *cap.* 11. *Cap.* 3.

The picture of Dorothie, *great with childe with manie children.*

Martin Cromerus the autor of the Polish historie, writeth that one *Margaret*, a woman sprung from a noble and ancient familie neer *Cracovia*, and wife to Count *Virboslaw*, brought forth at one birth thirtie five live children, upon the twentieth daie of *Jan.* in the year 1296. *Franciscus Picus Mirandula* writeth that one *Dorothie* an Italian had twentie children at two births; at the first nine, and at the second eleven, and that shee was so big, that shee was forced to bear up her bellie, which laie upon her knees, with a broad and large scarf tied about her neck, as you may see by this figure.

The ninth Book of the Polish Historie.

And they are to bee reprehended here again, who affirm the cauſ of numerous births to consist in the varietie of the cels of the womb, for they feign a woman's womb to have seven cels or partitions; three on the right side for males, three on the left side for females, and one in the mid'st for Hermophrodites or Scrats: and this untruth hath gon so far, that there have been som that affirmed everie of these seven cels to have been divided into ten partitions, into which the seed dispersed doth bring forth a divers and numerous encreas, according to the varietie of cels furnished with the matter of seed; which, though it may seem to have been the opinion of *Hippocrates*, in his Book *De natura Pueri*, notwithstanding it is repugnant to reason, and to those things which are manifestly apparent to the eies and senses.

The opinion of *Aristotle* is more probable, who saith twins and more at one birth, are begot and brought forth by the same cauſ that the sixth finger groweth on the hand, that is, by the abundant plentie of the seed, which is greater and more copious then can bee all taken up in the natural framing of one bodie; for if it all bee forced into one, it maketh one with the parts encreased more then is fit, either in greatness or number; but if it bee, as it were, cloven into divers parts, it causeth more then one at one birth.

Lib. 4. de gen. anim. cap. 4.

CHAP. IV.

Of Hermophrodites, or Scrats.

AND here also wee must speak of Hermophrodites, becauſ they draw the cauſ of their generation and conformation from the abundance of seed, and are called so, becauſ they are of both sexes, the woman yeelding as much seed as the man. For hereupon it commeth to pass that the forming faculti (which alwaies endeavor's to produce something like it self) doth labor both the matters almost with equal force, and is the cauſ that one bodie is of both sexes.

Yet som make four differences of Hermophrodites; the first of which is the male Hermophrodite, who is a perfect and absolute male, and hath onely a slit in the *Perinæum* not perforated, and from which neither urine nor seed doth flow. The second is the female, which besides her natural privitie, hath a fleshie and skinnie similitude of a man's yard, but unapt for erection and ejaculation of seed, and wanteth the cod and stones; the third difference is of those, which albeit they bear the expres figures of members belonging to both sexes, commonly set the one against the other, yet are found unapt for generation, the one of them onely serving for making of water: the fourth difference is of those who are

able in both ſexes, and throughly perform the part of both man and woman, becauſ they have the genitals of both ſexes complete and perfect, and alſo the right breſt like a man, and the left like a woman: the laws command thoſe to chuſe the ſex which they will uſe, and in which they will remain and live, judging them to death if they bee found to have departed from the ſex they made choice of, for ſom are thought to have abuſed both, and promiſcuouſly to have had their pleaſure with men and women. There are ſigns by which the Phyſicians may diſcern whether the Hermophrodites are able in the male or female ſex, or whether they are impotent in both: theſe ſigns are moſt apparent in the privities and face; for if the matrix bee exact in all it's demenſions, and ſo perforated that it may admit a man's yard, if the courſes flow that waie, if the hair of the head bee long, ſlender and ſoft, and to conclude, if to this tender habite of the bodie a timid and weak condition of the minde bee added, the female ſex is predominant, and they are plainly to bee judged women. But if they have the *Perinæum* and fundament full of hairs, (the which in women are commonly without anie) if they have a yard of a convenient largeneſs, if it ſtand well and readily, and yeeld ſeed, the male ſex hath the preheminence, and they are to bee judged men. But if the conformation of both the genitals bee alike in figure, quantitie, and efficacie, it is thought to bee equally able in both ſexes: although by the opinion of *Ariſtotle*, thoſe who have double genitals, the one of the male, the other of the female, the one of them is alwaies perfect, the other imperfect.

Lib. 4 de gener. anim. cap. 5.

The figure of Hermophrodite twins cleaving together with their backs.

Anno Dom. 1486. In the *Palatinate*, at the village *Robach*, neer *Heidelberg*, there were twins, both Hermophrodites, born with their backs ſticking together.

The effigies of an Hermophrodite haveing four hands and feet.

The ſame day the *Venetians* and *Genoëſes* entred into leagne, there was a monſter born in *Italie* haveing four arms and feet, and but one head; it lived a little after it was baptized. *James Ruef* a *Helvetian* Chirurgian ſaith hee ſaw the like, but which beſides had the privities of both ſexes, whoſe figure I have therefore ſet forth, *Pag.* 653.

CHAP. V.

Of the changeing of Sex.

Amatus Luſitanus report's that in the village *Eſquina*, there was a maid named *Maria Pateca*, who at the appointed age for her courſes to flow, had in ſtead of them a man's yard, laying before that time hid and covered, ſo that of a woman ſhee became a man, and therefore laying aſide her woman's habite, was cloathed in man's, and changeing her name, was called *Emanuël*; who, when hee had got much wealth by manie and great negotiations and commerce in *India*, returned into his countrie, and married a wife: but *Luſitanus* ſaith hee did not certainly know whether hee had anie children, but that hee was certain he remained alwaies beardleſs.

Anthonie Loquenex, the King's keeper or receiver of his rents of St. *Quintain* at *Vermandois*, lately affirmed to mee that hee ſaw a man at *Reimes*, at the Inn haveing the ſign of the Swan,

in

Anno 1560. who was taken for a woman until the fourteenth year of his age; for then [illegible] he played somewhile wantonly with a maid which lais in the same bed with him, [illegible] to lying [illegible] started forth and unfolded themselvs: which when his parents knew (by help of the Bodelitick power) they changed his name from *Joan* to *John*, and put him in man's apparel.

Som years agoe, living in the raign of King *Charls* the Nineth, in the French Glass-hous, I was shewed a man called *Germane Garnierus*, but by som *Germane Maria* (becaus in former times when hee was a woman hee was called *Marie*) hee was of an indifferent stature, and well set bodie, with a thick [illegible] beard; hee was taken for a girl until the fifteenth year of his age, becaus there was [illegible] of being a man [illegible] in his bodie, and for that amongst women, hee in like attire [illegible] those things which [illegible] to repeate: in the fifteenth year of his age, whilest hee [illegible] [illegible] who running into the [illegible] and [illegible] whereby it came to pass that the [illegible] and folding [illegible] without pain; going [illegible] with which his mo[illegible] turned into a man; [illegible] of *Leamcure*, an assemblie [illegible] of

Plinie reports that the [illegible] of a girl became a man, living with his parents; but by the command of the So[illegible] was carried into a [illegible] Isle, becaus they thought such monsters did alwaies [illegible] som monstrous [illegible]. Certainly women have so manie and like parts [illegible] womb, as men have hanging forth; onely a strong and livelie heat seem's to bee [illegible] which may drive forth that which lie's hid within; therefore in proces of time, [illegible] heat being increased and nourished, and the humiditie (which is predominant [illegible] [illegible] it is not impossible that the virile members, which hitherto sluggish by defect of heat lay hid, may bee put forth; especially if to that strength of the growing heat som vehement concussion or jactation of the bodie bee joined. Therefore I think it manifest by these experiments and reasons, that it is not fabulous that som women have been changed into men; but you shall finde, in no historie note, that have degenerated into women (for nature alwaies intend's and goe's from the imperfect to the more perfect, but not safely from the more perfect to the imperfect.

CHAP. VI.

Of Monsters caused by the defect of [illegible]

IF, [illegible], the seed bee anie thing deficient in quantitie, for the conformation of the [illegible]nt or infants, som one or more members will bee wanting, or more [illegible] [illegible]. Hereupon it happen[illegible] nature bringing twins, a childe is born with two heads, and but [illegible], or altogether lame in the rest [illegible] Plinie.

The effigies of a monstrous childe, by reason of the defect of the matter of seed.

Anno Dom. 1573. I saw in Saint *Andrew's* Church in [illegible] a boy nine years old, born in the village *Perpavilla*, six miles from *Guise*; his father's name was *Jean Renard*, and his mother, *Marie* [illegible] had but seven fingers on his right hand, his [illegible] well proportioned, from the top of his shoulder [illegible] to his wrist, but from thence to his two finger's ends it was verie deformed, having [illegible] thighs and thighs, although from the right [illegible] a certain imperfect figure [illegible] to put it self forth; from the midst of the left buttock two toes [illegible] [illegible] [illegible]

In the year 1562 in the Calends of November, at *Villa franca* in *Gascoine*, this monstrous headless woman, whose figure thou here seest, was born, which figure Dr. *John* [illegible] Physician gave to mee, when I went about this book of Monsters, having received it from *Fontanus* the Physician of *Angolestre*, who seriously affirmed her [illegible]

The figure of a monstrous woman without a head, before and behinde.

The effigies of a man without arms, doing all that is usually don with hands.

The figure of a monstrous man [illegible]

A few years agon there was a man of fortie years old to bee seen at *Paris*, who although hee wanted his arms, notwithstanding did indifferently perform all those things which are usually don with the hands; for with the top of his shoulder, head and neck, hee would strike an Axe or Hatchet with as sure and strong a blow [illegible] could do with his hand: and hee would lash a Coach-man's whip, that hee would make it give a great crack, by the strong refraction of the air; but hee ate, drank, plaid at cards, and

The force of imagination upon the body and humors.

Of Monsters which take their cause and shape by imagination.

The Antients diligently fought into all the secrets of nature, have marked and observed the wonderfull effects of the generation of Monsters; for understanding the force of imagination to bee so powerful in us, as for the most part, it may alter the bodie [illegible] imagine, they soon perswade themselves that the facultie which formeth the [illegible] bee led and governed by the [illegible] long cogitation of the Parents begetting [illegible] (concluded by nocturnal and [illegible] apparitions) or by the mother conceiving; and so that which is strongly [illegible] the minde, imprint's the [illegible] infant conceived in the womb: [illegible] think to bee confirmed [illegible] *Jacob* encreased [illegible] scattered the part of the sheep granted to [illegible] by putting rods, having [illegible] bark in part pulled off, finely [illegible] upon white and green, in the places [illegible] to drink, especially at the time they [illegible] that the representation [illegible] tion, should bee presently [illegible] the young; for the force of imagination hath so much power over the [illegible] that it acts upon it the notes or characters of the thing conceived. *Gen. chap. 30.*

Wee have read in *Historie*, that *Persina* Queen of *Æthiopia*, by her husband *Hidustes*, beeing also an Ethiope, [illegible] daughter of a white complexion, because in the embraces of her husband, by which shee proved with childe, shee earnestly [illegible] and minde upon the picture of the fair *Andromeda* standing opposite to her. *Damascene* report's, that bee saw a maid halfe like a [illegible], which had that deformitie by no other chance or occasion then that her mother earnestly [illegible] in the verie instant of receiving and conceiving the seed, the image of S. *John* covered with a Camel's skin, hanging upon the pole of the bed.

They say, *Hippocrates* by this explication of the causes, free'd a certain noble woman from suspition of adulterie, who being white her self, and her husband also white, brought forth a childe as black as an Ethiope, because in copulation shee strongly and continually had in her minde the picture of the Ethiope.

The effigies of a maid all native, and an infant that was black by the imagination of their Parents.

There

There are som who think the infant once formed in the womb, which is ordinarily almost within two and fortie daies after the conception, is in no danger of the mother's imagination, neither of the seed of the father which is cast into the womb; for when once it hath got a perfect figure, it cannot bee altered with anie external form or thing, which whether it bee true, or no, is not here to bee inquired of: truly I think it best to keep the woman, all the time shee goeth with childe, from the sight of such shapes and figures.

In *Stecquer* a village of *Saxonie*, they say, a monster was born, with four feet, eies, mouth, and nose like a calf, with a round and red excrescence of flesh on the forehead, and also a piece of flesh like a hood hung from his neck upon his back, and it was deformed with its thighs torn and cut.

The effigies of a horrid Monster, bearing feet hands and other parts like a Calf.

The effigies of an infant with a face like a Frog.

Anno Dom. 1517. in the parish Kingf-wood, in the forrest *Bieta*, in the waie to *Fontain-Bleau*, there was a monster born, with the face of a Frog, beeing seen by *John Bellanger*, Chirurgian to the King's Engineers, before the Justices of the town of *Harmoy*, principally *John Bribon* the King's procurator in that place. The father's name was *Amadeus* the *Little*, his mother's *Magdalene Sarbucata*, who troubled with a fever, by a woman's perswasion, held a quick frog in her hand until it died, shee came thus to bed with her husband and conceived; *Bellanger*, a man of an acute wit, thought this was the cauf of the monstrous deformitie of the childe.

CHA VIII.

Of Monsters caused by the straitnes of the womb.

That the straitness or littleness of the womb may bee the occasion of monsters

WE E are constrained to confess by the event of things, that monsters are bred and caused by the straitness of the womb; for so apples growing upon the trees, if before they com to just ripeness, they bee put into anie vessels, their growth is hindred. So som whelps which women take delight to, are hindred from anie further growth by the littleness of the place in which they are kept. We know's not that the plants growing in the earth, are hindred from a longer progress and propagation of their roots, by the opposition of a flint, or anie other solid bodie, and therefore in such places are crooked, slender and weak, but on the other part, where they have free nourishment, to bee strait and strong? for seeing that by the opinion of Naturalists, the place is the form of the thing placed; it is necessarie that those things that are shut up in [illegible] prohibited of free motion, should be lessened, depraved, and lamed.

Empedocles and *Diphilus* acknowledged three causes of monstrous births: The too great or small matter of the seed; the corruption of the seed; and depravation of growth by the straitness or figure of the womb: which they thought the chiefest of all; because they thought

thought the case was such in natural births, as in forming of metals and fusible things, of which statues beeing made, do less express the things they bee made for, if the molds or forms into which the matter is poured, bee rough, scabrous, too strait, or otherwise faultie.

CHAP. IX.

Of monsters caussed by the ill placeing of the mother, in sitting, lying down, or anie other site of the bodie in the time of her beeing with childe.

WEE often too negligently and carelessly corrupt the benefits and corporal endowments of nature in the comlines and dignitie of conformation: it is a thing to bee lamented and pitied in all, but especially in women, with childe, becaus that fault doth not only hurt the mother, but deform's and pervert's the infant which is contained in her womb: for wee mooving anie manner of waie, must necessarilly moov whatsoever is within us. Therefore they which sit idlely at home all the time of their beeing with childe, or cross-legged, those which holding their heads down, do sow or work with the needle, or do any other labor, which press the bellie too hard with cloaths, breeches or swathes, do produce children wrie-necked, stooping, crooked, and disfigured in their feet, hands, and the rest of their joints, as you may see in the following figure.

The effigies of a childe, who from the first conception, by the site of the mother, had his hands and feet standing crooked.

CHAP. X.

Of monsters caussed by a stroke, fall, or the like occasion.

THere is no doubt but if anie injurie happen to a woman with childe, by reason of a stroke, fall from on high, or the like occasion, the hurt also may extend to the childe. Therefore by these occasions the tender bones may bee broken, wrested, strained, or depraved after som other monstrous manner; and more, by the like violence of such things, a vein is often opened or broken, or a flux of bloud, or great vomiting is caussed by the vehement concussion of the whole bodie, by which means the childe want's nourishment, and therefore will bee small and little, and altogether monstrous.

CHAP.

CHAP. XI.

Of Monsters which have their original by reason of hereditarie diseases.

BY the injurie of hereditarie diseases, infants grow monstrous, that is, monstrously deformed: for crook't-back't produce crook-back't, and often-times so crooked, that between the bunch behinde and before, the head lie's hid, as a Tortoise in her shell: so lame produce lame, flat-nos'd their like, dwarfs bring forth dwarfs, lean bring forth lean, and fat produce fat.

CHAP. XII.

Of Monsters by the confusion of seed of divers kindes.

THat which followeth is a horrid thing to bee spoken; but the chaste minde of the Reader will give mee pardon, and conceive that, which not onely the Stoicks, but all Philosophers, who are busied about the search of the causes of things, must hold, That there is nothing obscene or filthie to bee spoken. Those things that are accounted obscene may bee spoken without blame, but they cannot bee acted or perpetrated without great wickedness, furie and madness; therefore that ill which in obscuritie consist's not in word, but wholly in the act. Therefore in times past there have been som, who nothing fearing the Deitie, neither the Law, nor themselvs, that is, their soul, have so abjected and prostrated themselvs, that they have thought themselvs nothing different from beasts: wherefore Atheists, Sodomites, Out-laws, forgetful of their own excellencie and divinitie, and transformed by filthie lust, have not doubted to have filthie and abominable copulation with beasts. This so great, so horrid a crime, for whose expiation all the fires in the world are not sufficient, though they too maliciously craftie, have concealed, and the conscious beasts could not utter, yet the generated mis-shapen issue hath abundantly spoken and declared, by the unspeakable power of God, the revenger and punisher of such impious and horrible actions. For of this various and promiscuous confusion of seeds of a different kinde, Monsters have been generated and born, who have been partly men and, partly beasts.

The like deformitie of issue is produced, if beasts of a different species do copulate together, nature alwaies affecting to generate somthing which may bee like it self: for wheat grow's not but by sowing of wheat, nor an apricock but by the setting or grafting of an apricock; for nature is a most diligent preserver of the species of things.

The effigies of a Monster half man and half dog.

Anno Dom. 1493. there was generated of a woman and a dog, an issue, which from the navel upwards perfectly resembled the shape of the mother, but therehence downwards the fire, that is, the dog. This monster was sent to the Pope that then reigned, as *Volaterane* writeth: also *Cardane* mention's it; wherefore I have given you the figure thereof.

Cardan. lib. 14. de var. rerum cap. 94.

Celius

The figure of a Monster in face resembling a man, but a Goat in his other members.

Celius Rhodoginus write's that at *Silvaris*, a beardſ-man called *Chrabis* fell in love with a Goat, and accompanied with her, and of this deteſtable and brutiſh copulation an infant was born, which in legs reſembled the dam, but the face was like the father's.

The figure of a pig, with the head, face, hands, and feet of a man.

Anno Dom. 1110. In a certain town of *Liege* (as ſaith *Lycoſthenes*) a Sow farrowed a pig with the head, face, hands, and feet of a man, but in the reſt of the bodie reſembling a ſwine.

Anno Dom. 1564. at *Bruxels*, at the houſ of one *Joeſt Dilzeperi*, in the ſtreet *Warmesbroeck*, a Sow farrowed ſix pigs, the firſt whereof was a monſter repreſenting a man in the head, face, fore-feet and ſhoulders, but in the reſt of the bodie another pig, for it had the genitals of a ſow-pig, and it ſucked like other pigs. But the ſecond dale after it was farrowed, it was killed of the people together with the ſow, by reaſon of the monſtrouſneſs of the thing. Here followeth the figure thereof.

The effigies of a Monſter half man and half ſwine.

Anno Dom. 1571. at *Antwerp*, the wife of one *Michaël* a Printer dwelling with one *John Molline* a Graver or Carver, at the ſign of the Golden Foot, in the *Camiſtrate*, on St. *Thomas* his daie, at ten of the clock in the morning, brought forth a monſter wholly like a dog, but that it had a ſhorter neck, and the head of a bird, but without anie fethers on it. This monſter was not alive, for that the mother was delivered before her time; but ſhee giveing a great ſcritch in the inſtant of her deliverance, the chimnie of the houſ fell down, yet hurt no bodie, no not ſo much as anie one of four little children that ſate by the fire-ſide.

The figure of a monſter like a dog, but with a head like a bird.

Lewis Gellius writeth that hee hath read in an approved autor, that an Ew once brought forth a Lion, a beaſt of an unlike and adverſ nature to her.

Anno Dom. 1577. in the town *Blandie*, three miles from *Melon*, there was lambed a Lamb, haveing three heads, the middlemoſt of which was bigger then the reſt, when one bleated they all bleated. *John Bellanger* the Chirurgian of *Melon* affirmed that hee ſaw this monſter, and hee got it drawn, and ſent the figure thereof to mee with that humane monſter that had the head of a Frog, which wee have formerly deſcribed.

The figure of a three-headed Lamb.

There are ſom monſters in whoſe generation by this there may ſeem to bee ſom divine cauſ, for that their beginnings cannot bee derived or drawn from the general cauſ of monſters, that is, nature, or the errors thereof, by reaſon of ſom of the fore-mentioned particular cauſſes: ſuch are theſe monſters that are wholly again all nature, like that which wee formerly mentioned, of a Lion yeaned by an Ew.

Yet Aſtrologers (leſt there ſhould ſeem to bee anie thing which they are ignorant of) refer the cauſſes of theſe to certain conſtellations and aſpects of the Planets and Stars, according to *Ariſtotle's* ſaying in his Problems; in confirmation whereof they tell us this tale. It happened in the time of *Albertus Magnus*, that in a certain village, a Cow brought forth a Calf, which was half a man: the townſ-men apprehended the heardſ-man, and condemned him as guiltie of ſuch a crime, to bee preſently burnt together with the Cow; but by good luck *Albertus* was there, to whom they gave credit by reaſon of his much and certain experience in Aſtrologie, that it was no occaſioned by anie humane wickedneſs, but by the efficacie of a certain poſition of the ſtars, that this monſter was born.

CHAP.

CHAP. XIII.

Of monsters occasioned by the craft and subtiltie of the Devil.

IN treating of such monsters as are occasioned by the craft of the Devil, wee crave pardon of the courteous Reader, if peradventure going further from our purpose, wee may seem to speak more freely and largely of the existence, nature, & kindes of Devils. Therefore first it is manifest that there are Conjurers, Charmers, and Witches, which whatsoever they do, perform it by an agreement and compact with the Devil, to whom they have addicted themselvs: for none can bee admitted into that societie of Witches, who hath not forsaken God the Creator, and his Saviour, and hath not transferred the worship due to him above, upon the Devil, to whom hee hath obliged himself. And assuredly, whosoever addict's himself to these Magical vanities and witch-crafts, doth it, either becaus hee doubt's of God's power, promises, studie and great good will towards us: or elf for that hee is madded with an earnest desire of knowing things to com; or elf becaus disdaining povertie, hee affect's and desire's from a poor estate to becom rich on the sudden. It is the constant opinion of all, both antient and modern, as well Philosophers as Divines, that there are som such men; which when they have once addicted themselvs to impious and diveliſh Arts, can by the wondrous craft of the Divel, do manie strange things, and change and corrupt bodies, and the health and life of them, and the condition of all mundane things. Also experience forceth us to confess the same, for punishments are ordained by the laws against the professors and practisers of such Arts; but there are no laws again those things which neither ever have been, nor never came into the knowledg of men: for such things are rightly judged and accounted for impossibilities, which have never been seen nor heard of.

There are forcerers, and how they com so to bee.

What induceth them thereto.

Before the birth of Christ there have been manie such people, for you may finde in *Exodus* and *Leviticus* laws made against such persons by *Moses*, by whom God gave the Law to his people. The Lord gave the sentence of death to *Ochawas* by his Prophet, for that hee turned into these kinde of people. Wee are taught by the Scriptures that there are good and evil spirits, and that the former are termed Angels, but the later Devils; for the law is also said to bee given by the ministrie of Angels: and it is said that our bodies shall rise again at the sound of a trumpet, and the voice of an Arch-angel. Christ said that God would send his Angels to receiv the Elect into the heavens.

Exod. cap. 22. *Levit. cap. 19.* *Hebr. 1. 14.* *Gal. 5. 19.* *1 Thes. 4. 16.*

The historie of *Job* testifieth that the Devil sent fire from heaven, and killed his sheep and cattel, and raised windes that shook the four corners of the hous, and overwhelmed his children in the ruines thereof. The historie of *Achab* mentioneth a certain lying spirit in the mouth of the false Prophets. Sathan entring into *Judas*, moved him to betraie Christ. Devils, who in a great number possessed the bodie of a man, were called and obtained of Christ that they might enter into Swine, whom they carried headlong into the Sea.

Job. 13. *Mat. 26. 34.*

In the beginning God created a great number of Angels, that those divine and incorporeal spirits might inhabit heaven, and as messengers, signifie God's pleasure to men, and as ministers or servants, perform his commands, who might bee as over-seers & protectors of humane affairs. Yet of this great number there were som who were blinded by pride, and thereby also cast down from the presence, and heavenlie habitation of God the Creator. These harmful and craftie spirits delude men's mindes by divers jugling tricks, and are alwaies contriving somthing to our harm, and would in a short space destroie mankinde, but that God restrain's their furie; for they can onely do so much as is permitted them: Expelled heaven, som of them inhabit the air; others, the bowels of the earth; there to remain until God shall com to judg the world: and as you see the clouds in the air somwhiles to resemble centaures, otherwhiles serpents, rocks, towers, men, birds, fishes, and other shapes: so these spirits turn themselvs into all the shapes and wondrous forms of things; as oft-times into wilde-beasts, into serpents, toads, owls, lapwings, crows or ravens, goats, asses, dogs, cats, wolvs, bulls, and the like. Moreover, they oft-times assume and enter humane bodies, as well dead as alive, whom they torment and punish, yea also they transform themselvs into angels of light.

The power of evil spirits over mankinde.

The differences of devils.

They feign themselvs to bee shut up and forced by Magical rings, but that is onely their deceit and craft, they wish, fear, love, hate, and oft-times as by the appointment and decree of God they punish malefactors: for wee read that God sent evil angels into Egypt, there to destroie. They houl on the night, they murmure and rattle, as if they were bound in chains, they move benches, tables, counters, props, cupboards, children in the cradles, plaie at tables and chess, turn over books, tell monie, walk up and down rooms and are heard to laugh, to open windows and doores, cast sounding vessels, as brass and the like, upon the ground, break stone-pots & glasses, & make other the like noises. Yet none of all these things appear to us when as we arise in the morning, neither find we anie thing out of its place or broken.

The delusions of devils.

Their titles and names. They are called by divers names, as Devils, evil Spirits, *Incubi*, *Succubi*, Hobgoblins, Fairies, Robin-good-fellows, evil-Angels, Sathan, Lucifer, the father of lies, Prince of darkneſs and of the world, Legion, and other names agreeable to their offices and natures.

CHAP. XIV.

Of the ſubterrene Devils, and ſuch as haunt Mines.

What the Devils in Mines do. LEwis *Lavater* write's, that by the certain report of ſuch as work in Mines, that in ſom Mines there are ſeen ſpirits, who in the ſhape and habit of men, work there, and running up and down ſeem to do much work, when as notwithſtanding they do nothing indeed. But in the mean time they hurt none of the by-ſtanders, unleſs they bee provoked thereto by words, or laughter. For then they will throw ſom heavie or hard thing upon him that hurt them, or injure them ſom other waie.

The ſame autor affirm's that there is a ſilver Mine in *Rhetia*, out of which *Peter Briot*, the Governor of the place, did in his time get much ſilver. In this Mine there was a Devil, who chiefly on Fridaie, when as the Miners put the Mineral they had digged into tubs, kept a great quarter, and made himſelf exceeding buſie, and poured the Mineral as hee liſted, out of one tub into another. It happened one daie that hee was more buſie then it uſed to bee, ſo that one of the Miners reviled him, and bad him bee gone on a vengeance to the puniſhment appointed for him. The Devil offended with his imprecation and ſcoff, ſo wreſted the Miner, takeing him by the head, twineing his neck about, hee ſet his face behinde him, yet was not the workman killed therewith, but lived, and was known by divers for manie years after.

CHAP. XV.

By what means the Devils may deceiv us.

Devils are ſpirits, and from eternitie. OUr mindes involved in the earthie habitation of our bodies, may bee deluded by the Devils divers waies; for they excel in puritie and ſubtiltie of eſſence, and in the much uſe of things: beſides, they challenge a great preheminence, as the Princes of this world, over all ſublunarie bodies. Wherefore is is no marvel if they, the taachers and parents of lies, ſhould caſt clouds and miſts before our eies from the beginning, and turn themſelvs into a thouſand ſhapes of things and bodies, that by theſe juglings and tricks they may ſhadow and darken men's mindes.

CHAP. XVI.

Of Sucubi *and* Incubi.

The reaſon of the name. *Lib.* 15. *de civit. Dei, cap.* 22. & 23. POwerful by theſe fore-mentioned arts and deceits, they have ſundrie times accompanied with men in copulation, whereupon ſuch as have had to do with men were called *Sucubi*, thoſe which made uſe of women, *Incubi*. Verily St. *Auguſtine* ſeemeth not to bee altogether againſt it, but that they, takeing upon them the ſhape of man, may fill the genitals, as by the help of nature, to the end that by this means they may draw aſide the unwarie, by the flames of luſt, from virtue and chaſtitie.

An hiſtorie. *John Ruef* in his book of the conception and generation of man, write's that in his time, a certain woman of monſtrous luſt, and wondrous impudencie, had to do by night with a Divel, that turned himſelf into a man, and that her bellie ſwelled up preſently after the act; and when as ſhee thought ſhee was with childe, ſhee fell into ſo grievous a diſeaſ, that ſhee voided all her entrails by ſtool, medicines nothing at all prevailing.

Another. The like hiſtorie is told of the ſervant of a certain Butcher, who thinking too attentively on venereous matters, a Devil appeared to him in the ſhape of a woman, with whom (ſuppoſing it to bee a woman) when as hee had to do, his genitals ſo burned after the act, that becomming enflamed hee died with a great deal of torment.

An opinion confuted. Neither doth *Peter Paludanus*, and *Martin Arelatenſis* think it abſurd to affirm that Devils may beget children, if they ſhall ejaculate into the woman's womb ſeed taken from ſom man either dead or alive. Yet this opinion is moſt abſurd and full of falſitie, man's ſeed conſiſting of a ſeminal or ſanguineous matter, and much ſpirit: if it run otherwaies then into the womb from the teſticles, and ſtaie never ſo little a while, it loſeth it ſtrength and efficacie, the heat and ſpirits vaniſhing away; for even the too great length of a man's yard, is reckoned amongſt the cauſſes of barrenneſs, by reaſon that the ſeed is cooled by the length of the waie. If anie in copulation, after the ejaculation of the ſeed, preſently draw themſelvs from the woman's embraces, they are thought not to generate, by reaſon of the air entring

into

into the yet open womb, which is thought to corrupt the seed. By which it appear's how falſe that hiſtorie in *Averrois* is, of a certain woman that ſaid ſhee conceived with childe by a man's ſeed ſhed in a bath, and ſo drawn into her womb, ſhee entring the bath preſently after his departure forth. It is much leſs credible that Divels can copulate with women, for they are of an abſolute ſpirituous nature, but bloud and fleſh are neceſſarie for the generation of man. What natural reaſon can allow that the incorporeal Devils can love corporeal women? And how can wee think that they can generate, who want the inſtruments of generation? How can they who neither eat nor drink bee ſaid to ſwel with ſeed? Now where the propagation of the ſpecies is not neceſſarie to bee ſupplied by the ſucceſſion of individuals, Nature hath given no deſire of veneric, neither hath it imparted the uſe of generation; but the devils once created were made immortal by God's appointment: If the facultie of generation ſhould bee granted to devils, long ſince all places had been full of them. Wherefore if at anie time women with childe by the familiaritie of the devil, ſeem to travel, we muſt think it happen's by thoſe arts wee mentioned in the former chapter, to wit, they uſe to ſtuff up the bodies of living women with old clouts, bones, pieces of iron, thorns, twiſted hairs, pieces of wood, ſerpents, and a world of ſuch trumperie, wholly diſſenting from a womans nature: who afterwards, the time, as it were, of their deliverie drawing nigh, through the womb of her that was falſly judged with childe, before the blinded, and, as it were, bound up eies of the by-ſtanding women, they give vent to their impoſtures. The following hiſtorie, recorded in the writings of manie moſt credible authors, may give credit hereto.

Averrois his hiſtorie convict of falſhood.

The illuſions of the devil,

There was at *Conſtance* a fair damoſel called *Margaret*, who ſerved a wealthie Citizen: ſhee gave it out everie where that ſhee was with childe by lying with the devil on a certain night. Wherefore the Magiſtrates thought it fit ſhee ſhould bee kept in priſon, that it might bee apparent both to them and others, what the end of this exploit would bee. The time of deliverance approching, ſhee felt pains like thoſe which women endure in travel; at length, after manie throws, by the midwive's help, in ſtead of a childe, ſhee brought forth iron nails, pieces of wood, of glaſs, bones, ſtones, hairs, tow, and the like things, as much different from each other, as from the nature of her that brought them forth, and which were formerly thruſt in by the devil to delude the too credulous minds of men.

A hiſtorie.

The Church acknowledgeth that devils, by the permiſſion and appointment of God puniſhing our wickedneſs, may abuſe a certain ſhape, ſo to uſe copulation with mankinde. But that an humane birth may thence ariſe, it not onely affirm's to bee falſe, but deteſt's as impious, as which believ's that there was never anie man begot without the ſeed of man, our Saviour Chriſt excepted. Now what confuſion and perturbation of creatures ſhould poſſeſs this world (as *Caſsianus* ſaith) if devils could conceiv by copulation with men? or if women ſhould proov with childe by accompanying them, how manie monſters would the devils have brought forth from the beginning of the world? how manie prodigies by caſting their ſeed into the wombs of wilde and bruit beaſts? for by the opinion of Philoſophers, as often ab facultie and will concur, the effect muſt neceſſarily follow: now the devils never have wanted will to diſturb mankinde, and the order of this world: for the devil, as they ſay, is our enemie from the beginning; and as God is the autor of order, and beautie, ſo the devil, by pride, contrarie to God, is the cauſſer of confuſion and wickedneſs.

Our ſins are the cauſ that the devils abuſe us.

Wherefore if power ſhould accrew equall to his evil minde and nature, and his infinite deſire of miſchief and envie, who can doubt but a great confuſion of all things and ſpecies, and alſo great deformitie would invade the decent and comlie order of this univerſ, monſters ariſeing on everie ſide: But ſeeing that devils are incorporeal, what reaſon can induce us to believ that they can bee delighted with venereous actions; and what will can there bee where as there is no delight, nor anie decaie of the ſpecies to bee feared? ſeeing that by God's appointment they are immortal, ſo to remain for ever in puniſhment: ſo what need they ſucceſſion of individuals by generation? wherefore if they neither will nor can, it is a madneſs to think that they do commix with man.

CHAP. XVII.

Of Magick and ſupernatural diſeaſes and remedies.

THat I may refreſh the minde of the Reader, invited to theſe hiſtories of monſters raiſed up by the art of the devil, witches, and conjurers, his ſervants, I have thought good to add the following hiſtorie of certain diſeaſes, and remedies ſupernatural, and wholly magical out of *Fernelius*. There are diſeaſes, which as they are ſent amongſt men by God beeing offended, ſo they cannot expect cure otherwiſe then from God, from whence they are thought ſupernaturally to have their eſſence and cure. Thus the air oft-times, yet chiefly in the time of King *David*, being defiled with the peſtilence, killed ſixtie odd thouſand perſons.

Lib. 2. de abdit. cauſ. cap. 16.

Thus *Ezechias* was ſtruck with a grievous diſeaſe: *Job* was defiled with filthie ulcers by Sathan at God's command. And as the Devil, the cruel enemie of mankinde, commonly

Witches hurt by the devil's aſſiſtance.

uſeth by God's permiſſion to afflict thoſe, ſo wicked perſons by the wondrous ſubtiltie of the devil, offer violence and do harm to manie. Som invoke I know not what ſpirits, and adjure them with herbs, exorciſms, imprecations, incantations, charms: others hang about their necks, or otherwiſe carrie certain writings, characters, rings, images, and other ſuch impious ſtuff. Som uſe ſongs, ſounds or numbers: ſomtimes potions, perfumes, and ſmels; ſomtimes geſtures and jugling. There bee ſom that make the portraiture of the abſent partieln wax, and boaſt that they can cauſ or bring a diſeaſ into what ſoever part thereof they prick, by the force of their words and ſtare, into the like part of the partie abſent; and they have no few other tricks to bring diſeaſes.

We know for certain that magicians, witches, and conjurers, have by charms ſo bound ſom, that they could not have to do with their wives; and have made others ſo impotent, as if they had been gelt or made eunuchs. Neither do wicked men onely ſend diſeaſes into man's bodie, but alſo devils themſelvs. Theſe truely are ſoon diſtracted with a certain furie, but in this one thing they differ from ſimple madneſs, for that they ſpeak things of great difficultie, tell things paſt and hid, diſcloſe the ſecrets of ſuch as are preſent, and revile them manie waies, and are terrified, tremble and grow angrie by the power of divine words.

A hiſtorie.

One not very long agon, beeing by reaſon of heat exceeding drie in the night time, riſeing out of his ſleep, and not findeing drink, took an apple that hee found by chance, and eating it, hee thought his jaws were ſhut and held faſt as by ones hands, and that hee was almoſt ſtrangled: and alſo, now poſſeſſed of a devil entring into him, hee ſeemed in the dark to bee devoured of a huge exceeding black dog, which hee, afterwards reſtored to his former health, orderly related to mee. There were divers, who by his pulſ, heat and the roughneſs of his tongue, thought him to bee in a fever, and by his watching, and the perturbation of his minde, thought him onely to rave.

A hiſtorie.

Another young Noble man, ſom few years ſince, was troubled at ſet times with a ſhaking of the bodie, and as it were, a convulſion, wherewith one while hee would moov onely his leſt arm, another while the right arm, and alſo ſom times but one finger onely, ſomwhiles but one leg, ſomtimes the other, and at other times the whole trunk of his bodie, with ſuch force and agilitie, that lying in his bed, hee could ſcarce bee held by four men; his head laie without anie ſhakeing, his tongue and ſpeech was free, his underſtanding ſound, and all his ſenſes perfect even in the height of his fit. Hee was taken at the leaſt ten times a daie, well in the ſpaces between, but wearied with labor: it might have been judged a true Epilepſie, if the underſtanding and ſenſes had failed.

The moſt judicious Phyſitians who were called to him, judged it a convulſion, coſen-germane to the falling ſickneſs, proceeding from a malign and venemous vapor impact in the ſpine of the back, whence a vapor diſſperſed it ſelf over all the nerva, which paſs from the ſpine every waie into the limbs, but not into the brain. To remoov this, which they judged the cauſ, frequent glyſters are ordained, and ſtrong purges of all ſorts, cupping-glaſſes are applied to the beginnings of the nerva, fomentations, unctions, emplaſters, firſt to diſcuſs, then to ſtrengthen and wear away the malign qualitie: Theſe things doing little good, hee was ſweated with bathes, ſtoves, and a decoction of *Guacum*, which did no more good then the former, for that wee were all far from the knowledg of the true cauſe of his diſeaſ: for in the third month, a certain devil was found to bee the autor of all this ill, bewraying himſelf by voice, and unaccuſtomed words and ſentences, as well Latin as Greek (though the patient were ignorant of the Greek tongue): hee laied open manie ſecrets of the by-ſtanders, and chiefly of the Phyſicians, derideing them for that hee had abuſed them to the patients great harm, becauſ they had brought his bodie ſo low by needleſs purgations.

The devil ſhew's himſelf by ſpeaking of greek.

When his father came to viſit him, hee would crie out long before hee came at him, or ſaw him, drive away this viſitant, and keep him from coming in here, or elſ pluck his chain from about his neck: for on this (as it is the cuſtom of the French order of Knights) there hangs the image of St. *Michael*. If holie and divine things were read before him, hee ſhook and trembled more violently. When his fit was over, hee remembred all that was don, and affirmed that hee did it againſt his will, and that hee was forrie for it. The devil, forced by ceremonies and exorciſms, denied that hee was damned for anie crime, and ſaid that hee was a ſpirit: beeing asked who hee was, and by what means and power hee did theſe things, hee ſaid that hee had manie habitations into which hee could betake himſelf, and in the time of his reſt, hee could torment others: that hee was caſt into this bodie by a certain perſon whom hee would not name, and that hee entred by his feet up to his neck, and that hee would go forth again the ſame waie, when as his appointed time was com. Hee ſpoke of ſundrie other things, as others which are poſſeſſed uſe to do.

Devils wax angrie, and are terrified by divine things.

Now I ſpeak not theſe things as new or ſtrange, but that it may appear that devils ſomtimes entring into the bodie, do ſomwhiles torment it by diverſ and uncouth waies; other whiles they do not enter in, but either agitate the good humors of the bodie, or draw the ill into the principal parts, or with them obſtruct the veins or other paſſages, or chang the ſtructure of the inſtruments, from which cauſes innumerable diſeaſes proceed: of theſe, devils

vils are the actors, and wretched and forlorn persons the ministers: and the reason of these things is beyond the search of nature.

Plinie tels that the Emperor *Nero* in his time, found magical arts most vain and false: but what need we alledg profane writers, when as those things that are recorded in Scripture of the pithonisse, of the woman speaking in her bellie, of King *Nebuchodonosor*, of the Magitians of *Pharaoh*, and other such things not a few, proov that there both is, and hath been Magick? *Plinie* tels of *Demarchus*, that hee tasteing of the entrails of a sacrificed childe, turned himself into a Wolf. Wee reade in *Homer* that *Circes*, in the long wandring of *Ulysses*, changed his companions into beasts, with an inchanted cup or potion: and in *Virgil*, that the growing corn may bee spoiled or carried away by inchantments: which things, unless they were approoved and witnessed by manie men's credits, the wisdom of Magistrates and Lawgers, would not have made so manie Laws against Magicians, neither would there have been a mulct imposed upon their heads by the law of the twelv tables, who had inchanted other men's corn. But as in magical arts the devil doth not exhibit things themselvs, as those which hee cannot make, but onely certain shews or appearances of things: so in these which are anie waies accomodated to the use of Physick, the cure is neither certain, nor safe, but deceitful, captious, and dangerous.

I have seen the Jaundis, over the whole bodie, cured in one night, by a written scroul hanged about the neck: also I have seen Agues chased away by words and such ceremonies, but in a short while after they returned again and became much worse. Now there are som vain things, and verily the fancies of old women, which becaus they have long possessed the mindes of men, weakned with too much superstition, we term them superstitious. These are such as wee cannot truly say of them, wherefore and whence they have the faculties ascribed to them: for they neither arise from the temperament, neither from the other manifest qualities, neither from the whole substance, neither from a divine or magical power, from which two last mentioned, all medicines beyond nature, and which are consequently to bee used to diseases, whose essence are supernatural, must proceed. Such like old wive's medicines & superstitions remedies are written figures and characters, rings, where neither the assistance of God or Spirits is implored. Let me ask you, is it not a superstitious medicine to heal the falling sickness, to carrie in writing the names of the three Kings, *Gaspar*, *Melchior*, and *Balthasar*, who came to worship Christ? To help the tooth ache, if one whil'st Mass is in saying, touch his teeth, saying these words, *Os non comminuetis ex eo*? To stale vomiting with certain ceremonies and words, which they absent pronounce, thinking it sufficient if that they but onely know the patient's name.

It is but a deceitful cure that is performed by the devil.

Old wive's superstitious medicines against divers diseases

I saw a certain fellow that with murmuring a few words, and touching the part, would stanch bloud out of what part soever it flowed: there bee som who to that purpose sale this, *De latere ejus exivit Sanguis & Aqua*. How manie praiers or charms are carried about to cure agues? som taking hold of the patient's hand, sale, *Æquè facilis tibi Febris hæc sit, atque Mariæ virgini Christi parium*. Another washeth his hands with the patient before the fit, saying to himself that solemn Psalm, *Exaltabo te Deus meus Rex*, &c. If one tell an Ass in his ear that hee is stung by a Scorpion, they sale that the danger is immediately over.

An hilarious or a counterfeit sum.

As there are manie superstitious words, so there are many superstitious writings also. To help sore eies, a paper wherein the two greek letters, Ω and Α, are written must bee tied in a thread, and hanged about the neck. And for the tooth ache this ridiculous saying, *Stringles, falcóque dentate, dentium dolorem persanate*. Also oft times there is no small superstition in things that are outwardly applied. Such is that of *Apollonius* in *Plinie*, to scarifie the gums in the tooth-ach, with the tooth of one that died a violent death: to make pils of the skul of one hanged, against the bitings of a mad dog: to cure the falling sickness by eating the flesh of a wilde beast, killed with the same iron wherewith a man was killed: that hee shall bee free'd from a quartain ague who shall drink the wine wherein to the sword that hath cut off a man's head, shall bee put; and hee, the parings of whose nails shall bee tied in a linnen cloth to the neck of a quick Eel, and the Eel let go into the water again. The pain of the Milt to bee assuaged, if a beast's Milt bee laid upon it, and the Physician saie that hee cures or make's a medicine for the Milt. Anie one to bee free'd from the cough, who shall spit in the mouth of a Toad, letting her go away alive. The halter wherein one hath been hanged put about the temples, to help the head-ach. This word *Abracadabra*, written on a paper after the manner described by *Serenus*, and hanged about the neck, to help agues or fevers especially semitertians. What truth can bee in that which Sandrie affirm, that a leaf of *Labyrinthus*, which is a kinde of Spunge, if it bee plucked upwards, will cause vomiting, but if pulled downwards, will move to stool? You may also finde manie other superstitious fictions concerning herbs, such as *Galen* report's that *Andreas* and *Pamphilus* write of transformations, and herbs dedicated to conjurers and devils.

Another of a ridiculous kind.

lib. 6. de simp.

I had thought never in this place to have mentioned these and the like, but that there may bee every where found such wicked persons, who leaving the arts and means, which are appointed by God to preserv the health of man's bodie, flie to the superstitious and ridiculous remedies of sorcerers, or rather of devils, which notwithstanding the devil sometimes

make's to perform their wish't for effects, that so hee may still keep them ensnared and addicted to his service. Neither is it to bee approoved which manie say, that it is good to bee healed by anie art or means, for that healing is a good work. This saying is unworthy of a Christian, and savor's rather of him that trust's more to the devil then in God. Those Empericks are not of the societie of Sorcerers and Magitians, who heal simple wounds with drie lint, or lint dip't in water: this cure is neither magical nor miraculous, as many suppose, but wholly natural, proceeding from the healing fountains of nature, wounds and fractures, which the Surgeon may heal by onely takeing away the impediments, that is pain, defluxion, inflammation, an abscess and gangrene, which retard and hinder the cure of such diseases. The following examples will sufficiently make evident the devil's maliciousness, alwaies wickedly and craftily plotting against our safetie and life.

Lib. epist. 38. ep. A certain woman of *Florence* (as *Langius* write's) haveing a malign ulcer, and beeing troubled with intolerable pain at the stomach, so that the Physitians could give her no eas: behold on a sudden shee vomited up long and crooked nails, and brass needles, wrapped up with wax and hairs, and at length a great gobbet of flesh, so big that a Giants jaws could scarce swallow it.

But that which happened in the year of our redemption 1539. in a certain town called *Fugenstal*, in the Bishoprick of *Eistet*, exceed's all credit, unless there were eie-witnesses of approoved integritie yet living. In this town, one *Ulrich Neusesser* an husbandman, was tormented with grievous pain in the one side of his bellie, hee suddenly got hold of an iron key with his hand under the skin, which was not hurt, the which the Barbar-Surgeon of the place cut out with a razor; yet for all this the pain ceased not, but hee grew every daie worse then other: wherefore expecting no other remedie but death, hee got a knife and cut his throat. His dead bodie was opened, and in his stomach were found a round and loggish piece of wood, four steel knives, part sharp, and part toothed like a saw, and two sharp pieces of iron, each whereof exceeded the length of a span, there was also as it were a ball of hair. All these things were put in by the craft and deceit of of the devil. Thus far *Langius*.

CHAP. XVIII.

Of the Cozenages and crafty Tricks of Beggars.

Haveing treated of Monsters, it follow's that wee speak of those things which either of themselvs, by reason of their nature full of admiration, have som kind of monstrousnes in them; or elss from som other waies, as by the craft and cozenage of men. And becaus to the last mentioned crafts of the Devil, the subtle devices of begging companions are somwhat alike, therefore I will handle them in the next place, that the Surgeon beeing admonished of them, may bee more cautious and cunning in discerning them when hee meet's with them.

An historie of a counterfeit arm.

Anno Dom. 1525. when I was at *Anjou*, there stood a craftie beggar begging at the Church door, who tying and hideing his own arm behinde his back, shewed in steed thereof, one cut from the bodie of one that was hanged, and this hee proped up and bound to his brest, and so laid it open to view, as if it had been all enflamed, so to moov such as passed by unto greater commiseration of him. The cozenage lay hid, every one giving him monie, until at length his counterfeit arm not beeing surely fastened, fell upon the ground, many seeing and observing it: hee beeing apprehended and laid in prison, by the appointment of the Magistrate, was whipped through the town, with his falss arm hanging before him, and so banished.

Another of a cancrous breast

I had a brother called *John Parey*, a Surgeon, who dwelt in *Vitre* in *Britanie*; hee once observed a young woman begging, who shewed her breast, as if it had a cancrous ulcer thereon, looking fearfully by reason of much sordid filth, wherewith it seemed to defile the cloth that lay under it. But when as hee had more diligently beheld the woman's face, and the fresh color thereof, as also of the places about the ulcer, and the good habite of the whole bodie agreeable to that color (for shee was somwhat fat, and of a very good habit of bodie) hee was easily hereby induced to suspect som roguery and deceit. Hee acquainted the Magistrate with this his suspicion, and got leav that hee might carrie her home to his bous, so to search her more narrowly. Where opening her breast, hee found under her arm-pit, a spong moistned with a commixture of beast's bloud and milk, and carried through an elder-pipe to the hidden holes of her counterfeit cancer. Therefore hee foment's her breast with warm water, and with the moisture thereof looseth the skins of black, green, and yellow frogs, laid upon it, and stuck together with glew, made of bole armenick, the white of an egg, and flower; and these beeing thus fetched off, hee found her breast perfectly sound.

The beggar beeing cast for this into prison, confessed that shee was taught this trick by a beggar that lay with her, who himself also, by putting about his leg an Oxes Milt, and perforating it in sundry places, that so the forementioned liquor might drop out, counterfeited an ulcer of a monstrous bignes and malignitie, covering the edges of the Milt on every side

side with a filthie cloth. This beggar was diligently enquired after, but could not bee found; and so shee was whipped and banished.

Within lesse then a year after, there came into the same citie another notable craftie companion, who presently takeing up the Church doors, laid open his wares; to wit, a Kercher with som small pieces of monie lying thereon, a wooden Barrel, and * Cliquets, wherewith hee would ever now and then make a great noise: his face was spread over with great thick pustles, beeing of a blackish red color, and made with glue like those that have the Leprosie: this his ghastly look made him to bee pitied by all men, which was the cause that everie one gave him monie. Then my brother came somwhat nearer him, and asked him how long hee had been troubled with this so cruell disease; hee answered with an obscure and hoarse voice, that hee was born a Leper from from his mother's wvmb, and that his parents both died of this wicked disease, so that their members fell away piece-meal. Now hee had a woollen swathe about his chaps, wherewith (haveing his left hand under his cloak) hee so straitned his chaps, that much black bloud rose into his face, and made him so hoarse that hee could scarce speak; yet hee could not contain himself, but that in speaking hee ever now and then slackned the swathe with his hand, the freelier to draw his breath: which when my brother had observed, suspecting som cozenage, hee obtained leav of the Magistrate to search and examine the man whether hee were truly leprous, or no. First therefore hee took away his swathe or rowler that was about his neck, then washed his face with warm water, so that the counterfeit glued pustles were dissolved, and his face (free from all tainture) shewed it self of a good and natural color and shape. Then hee laid bare his whole body, and diligently viewed each part, and found no sign of a Leprosie, one or other. Which when the Magistrate once heard, hee made him to bee put in prison, and to bee thrice whipped through the streets of the citie, with his barrel hanging before him, and his cliquets behinde him, adding thereto the punishment of perpetual banishment. It happened that as hee was whipped the third market-day, the people cried out to the hang-man in jest, that hee should not fear to lash him soundly, for beeing leprous hee could not feel it: the executioner incited by this crie of the people, did so belabor him, that the wretch died of his whipping within a short while after, haveing a just reward for his wickedness. For these impostors, besides that they live like drones, feigning this or that disease, and so beeing idle, enjoy the fruits of others labors; they also divers times conspireing together, take away the lives and goods of honest and substantial citizens, and other people: for there are som of them, that in an evening, as men that have no habitation, desire lodging for a night, and it beeing granted them, they, when as the master of the house and his familie are asleep, open the doors to their comrades, men as wicked as themselvs, and kill and carrie away all they can.

Of one feigning himself leprous.

* Cliquets are things made somwhat resembling a small woolcard, but have two or three little pieces of boards so fastned together with leather, that they will make a great noise with them and these are used by the French beggars.

Certainly wee may justly affirm, that this craftie begging is the mother and school of all dishonestie: for how manie acts of bawdrie and poisoning everie where corrupt the wells and publick fountains? How manie places have been burnt under the shew of begging? Where can you get more fit spies? Where more fit undertakers and workers of all manner of villanie, then out of the crew of these beggers?

A multitude of beggars hurtful to the citie.

Som of them there are, who besmear their faces with soot laid in water, so to seem to have the Jaundis. But you may at the first sight finde out the deceit, by the native whitenes of the utter coat of the eie, called *Adnata*, which in such as truly have the Jaundis, useth to bee died and overcast with a yellowish color; also you may bee more certain thereof, if you wet a cloth in water or spittle, and so rub the face, for the adventitious yellowness will quickly vanish, and the true native color shew it self.

How to discover such a counterfeit the Jaundis.

Som there bee, who not content to have mangled, and filthily exulcerated their limbs with caustick herbs, and other cauteries; or to have made their bodies more swoln, or all lean, with medicated drinks; or to have deformed themselvs som other wale, but from good and honest Citizens, who have charitably relieved them, they have stoln children, have broken or dislocated their arms and legs, have cut out their tongues, have depressed the chest, or whole breast; that with these, as their own children, begging up and down the countrie, they may get the more relief, pitifully complaining that they came by this mischance by thunder, or lightning, or som other strange accident.

Lastly, they part the Kingdom amongst themselvs as into Provinces, and communicate by letters one to another, what news or new quaint devises there are to conceal or advance their roguerie: to which purpose they have invented a new language onely known to themselvs, so to discourse together and not to bee understood by others. [Wee here vulgarly term it *Canting.*]

Dr. *Fiecelle*, a Physician of *Paris*, entreated mee to bear him companie to his countrie house at *Champigny*, four miles from *Paris*. Where assoon as wee arrived, and were walking in the Court, there came presently to us a good lustie well fleshed manlie woman, begging alms for St. *Fiacre* sake, and takeing up her coat and her smock, shee shewed a great gut hanging down som half a foot, which seemed as if it had hanged out of her fundament, whereout there dropped filth like unto *pus*, which had all stained her legs and smock, most beastly and filthie to look upon. *Fiecelle* asked her how long shee had been troubled with this disease:

Of one counterfeiting the falling of the fundament.

shee

ſhee anſwered that it was four years ſince ſhee firſt had it. Hence hee eaſily gathered that ſhee plaied the counterfeit: for it was not likelie that ſuch abundance of purulent matter came forth of the bodie of ſo well fleſh't and colored a woman; for ſhee would rather have been verie lean and in a conſumption. Wherefore provoked with juſt anger, by reaſon of the wickedneſs of the deceit, hee run upon her and threw her down upon the ground, and trod her under his feet, and hit her divers blows upon the bellie, ſo that hee made the gut, which hung at her, to com away, and by threatning her with more grievous puniſhment, made her confeſs the cozenage, and that it was not her gut, but of an ox, which being filled with bloud and milk, and tied at both ends, ſhee put the one of them into her fundament, and let the filth flow forth at verie little holes.

Of one feigning the falling down of the womb.

Not verie long ago, a woman equally as ſhameleſs, offered her ſelf to the overſeers of the poor of *Paris*, entreating that ſhee might bee entred for one of their Penſioners, for that her womb was fallen down by a dangerous and difficult birth, wherefore ſhee was unable to work for her living. Then they commanded that ſhee ſhould bee tried and examined, according to the cuſtom, by the Surgeons which are therefore appointed. Who ſeeing how the whole buſineſs was carried, made report ſhee was a counterfeit; for ſhee had thruſt an ox's bladder, half blown and beſmeared with beaſtlie bloud by the neck, whereto ſhee had faſtned a little ſponge, into the neck of her womb, for the ſponge beeing filled and ſwollen up by the accuſtomed moiſture of the womb, ſo held up the ox's bladder that hanged thereat, that ſhee might ſafely go vvithout anie fear of the falling of it out, neither could it bee pulled forth but vvith good force. For this her device ſhee vvas put into priſon, and beeing firſt vvhipped, vvas after baniſhed. Their cozenage is not much unlike this, vvho by fitly applying a ſheep's paunch to their groin, counterfeit themſelvs to bee burſten.

Of a begger that feigned her ſelf to have a ſnake in her bellie.

Anno Dom. 1561. there came to *Paris* a luſtie, ſtout, and verie fat Norman vvoman, beeing about ſom thirtie years old, who begging from door to door, did caſt to meet with rich women, and verie familiarly and pittifully would relate unto them her misfortune; ſaying, ſhee had a ſnake in her bellie, which crep't in at her mouth as ſhee ſlep't in an hemp-land: ſhee would let one feel her ſtir, by putting their hand unto her bellie, adding alſo that ſhee was troubled daie and night with it's unceſſant gnawing of her guts. The noveltie of this ſad chance, mooved all to pitie and admiration, wherefore as much as they could, they aſſiſted her with means and counſel. Amongſt the reſt, there was a woman of great devotion and charitie, who ſending for Dr. *Hollerius*, *Chevall*, and mee, asked us if this ſnake could by anie means be gotten forth. *Hollerius* gave her a ſtrong purgation, hoping that by ſtirring up the expulſive facultie, the ſerpent might bee caſt forth, together with the noxious humors. But this hope had no ſuch ſucceſs. Wherefore when as wee met again, wee thought it fit to put a *Speculum matricis* into the neck of her womb, ſo to ſee if wee could diſcern either her head or tail: but I makeing large dilatation of her womb, could ſee no ſuch thing, onely wee obſerved a certain voluntarie motion, whereof ſhee her ſelf was the author, by contracting and dilateing the muſcles of the lower bellie. Which when as wee had obſerved, perceiving the deceit and impoſture, wee thought good ſo to terrifie and her, and make her confeſs the deceit, to tell her that ſhee muſt take another, but that a more ſtrong purgation; that what wee could not do by the former, as more gentle, wee might attain to by the later, as far ſtronger. Shee diſſembling all fear, and conſcious of her craft and diſſimulation, after wee were gon in the evening, packing up her ſtuff, and a great deal more then her own, ſhee ſecretly ſtole away, not bidding her hoſteſs farewel: and thus at length the fraud was apparent, to the loſs of the honeſt gentlewoman. I ſaw this baggage, ſix daies after, ſitting luſtily upon a Pack-horſ, at the gate *Mont-martre*, and laughing heartily with ſuch as brought Sea-fiſh to town; and ſhee was returning (as it was moſt likely) into her countrie, ſeeing her cozenage was diſcovered here.

The craft of ſuch as feign themſelvs to have the falling ſickneſs. Of ſuch as feign themſelvs leprous.

Such as feign themſelvs dumb, draw back and double their tongues in their mouths. Such as falling down counterfeit the falling ſickneſs, binde ſtraitly both their wreſts with plates of iron, tumble and rowl themſelvs in the mire, ſprinkle and defile their heads and faces with beaſts bloud, and ſhake their limbs and whole bodie. Laſtly, by putting ſope into their mouths, they foam at the mouth like thoſe that have the falling ſickneſs. Otherſom with flour make a kinde of glue, wherewith they beſmear their whole bodies, as if they had that Leproſie or Scab, that is vulgarly termed, *Malum ſancti manis*. Neither muſt wee think this art of counterfeiting and cheating begging to bee new, and of late invention, for long ago it flouriſhed in *Aſia*, even in the time of *Hippocrates*, as may appear by his book *De Aere, Locis, & Aquis*. But by how much this diſeaſ hath taken more deep root, and grown more inveterate by proceſs of time, by ſo much it muſt more diligently and carefully bee looked to and prevented, by cruelly puniſhing ſuch counterfeits; for thereby this feigned begging, as the nouriſher of ſloth, and ſhop of all diſhoneſtie, that which is taken from the good is beſtowed upon the ill, and one wicked and counterfeit begger hurt's all other wretched people.

CHAP.

CHAP. XIX.

Of strange or monstrous accidents in diseases.

WHat monstrousnes soever was in the last mentioned parties, it was made up by the craft of beggars for filthie gain. But if there bee anie monstrousnes in the following narrations, it is of nature, but working, as it were, miraculously, by som secret and occult means; for thus there are oft times monsters in diseases. Before the town of St. *John de Angeley*, a souldier called *Francis*, of the companie of Captain *Muret*, was wounded with a Harquebux-shot on the bellie, between his navel and sides; the bullet was not taken out, becaus the Surgeons, who searched him diligently, could not finde it: wherefore hee was troubled with grievous and tormenting pains, until the ninth daie after hee received the wound, the bullet came forth at his fundament: wherefore within three weeks after hee was perfectly whole. Hee was healed by *Simon Crinay*, the Surgeon of the French companies.

Monsters happen also in diseases.

A bullet shot into the bellie came forth at the fundament.

James Pope, Lord of St. *Albans* in *Dauphine*, was wounded at the skirmish at *Chasenay*, having three harquebux bullets entring into his bodie, one whereof pierced under his throat, where it buncheth out as with a knot, neer to the pipe of his longs, even to the beginning of the *vertebræ* of the neck, in which place the leaden bullet stuck, and as yet doth remain. Hereupon hee was afflicted with manie and fearful symptoms, as a fever, and a great swelling of his whole neck, so that for ten whole daies hee could swallow nothing but broaths and liquid things. Yet hee recovered, and remaineth well at this present, by the cure of *James Dalam* the Surgeon.

A bullet sticking in the throat and patient recovering.

Alexander Benedictus make's mention of a certain countrie-man, who, shot into the back with a dart, drawing out the shaft, the head was left behinde, beeing in length about the bredth of two fingers, but hooked and sharp on the sides. When as the Surgeon had carefully and diligently sought for it, and could by no means finde it, hee healed up the wound, but two months after this crooked head came forth at his fundament.

Lib. 3. anatom. cap. 9.

A crooked iron shot into the back came forth at the fundament.

The same author telleth that at *Venice* a virgin swallowed a needle, which som two years after shee voided by urine, covered over with a stonie matter, gathered about viscous humors.

A swallowed needle voided by urine.

Catherine Perlan, the wife of *William Guerrier*, a Draper of *Paris*, dwelling in the Jewrie, as shee rode on horse-back into the countrie, a needle out of her pin-cushion, was got under her by accident, ran so deep into her right buttock, that it could not by anie art or force bee plucked forth. Four months after shee sent for mee to com to her, and shee told mee that as often as shee had to do with her husband, shee suffered extreme pricking pain in her right groin; putting my hand thereto, as I felt it, my fingers met with somthing sharp and hard: wherefore I used the matter so, that I drew forth the needle all rustie: this may bee accounted a miracle, that steel, naturally heavie, should rise upwards, from the buttock to the groin, and pierce the muscles of the thigh, without causing an abscess.

A needle running in at the buttock came forth at the groin.

Anno Dom. 1566. the two sons of *Laurence Colo* (men excellent in cutting for the stone) took forth a stone of the bignes of a wall-nut, in the mid'st whereof was a needle, just like those that shoo-makers use: the patient's name was *Peter Cocquin*, dwelling in the street *Goland* at the place called *Maubert*, at *Paris*, and I think hee is yet living. This stone was shewed to King *Charls* the ninth, for the monstrousnes of the thing, I beeing then present, which beeing given me by the Surgeon, I preserv amongst my other rarities.

A needle in the mid'st of a stone taken forth of the bladder.

The figure of a stone taken forth of the bladder of a Confectioner.

Anno Dom. 1570. the Dutchess of *Ferrara* at *Paris*, sent for *John Colo*, to take a stone out of a Confectioner. This stone, though it weighed nine ounces, & was as thick as one's fist, yet was it happily taken out, the patient recovering, *Francis Rousset*, and *Joseph Favelle*, the Dutchess Physicians, beeing present. Yet not long after this Confectioner died by the stoppage of his water, by reason of two other little stones, which about to descend from the kidnies to the bladder, staied in the mid-way of the Ureters. The figure of the extracted stone was this.

Anno

Anno Dom. 1569. *Laurence Collo* the younger, took three ſtones out of the bladder of one dwelling at *Marly*, called commonly *Tire-vit*: becauſ being troubled with the ſtone from the tenth year of his age, hee continually ſcratched his yard, each of the ſtones were as big as an hen's egg; of color white, they all together weighed twelv ounces. When they were preſented to King *Charls*, then lying at Saint *Maure des Fauſſez*, hee made one of them to bee broken with a hammer, and in the middeſt thereof there was found another, of a cheſnut color, but otherwiſe much like a Peach ſtone. Theſe three ſtones, beſtowed on mee by the brethren, I have here repreſented to the life.

The effigies of the three forementioned ſtones, whereof one is broken.

I have in the diſſecting of dead bodies, obſerved divers ſtones, of various forms and figures, as of pigs, whelps, and the like. *Dalechampius* telleth that hee ſaw a man, which by an abſceſs of his loins, which turned to a Fiſtula, voided manie ſtones out of his kidnies, and yet notwithſtanding could endure to ride on horſ-back, or in a coach. *John Magnus*, the King's moſt learned and skilful Phyſician, haveing in cure a woman, troubled with cruel torment and pains of the bellie and fundament, ſent for mee, that by putting a *Speculum* into the fundament, hee might ſee if hee could perceiv anie diſcernable cauſ of ſo great and pertinacious pain: and when as hee could ſee nothing which might further him in the findeing out of the cauſ of her pain (following reaſon as a guid) by giveing her often glyſters and purgations, hee brought it ſo to paſs, that ſhee at length voided a ſtone at her fundament of the bigneſs of a Tennis-ball: which once avoided, all her pains ceaſed.

A ſtone by the force of purging medicines voided by the fundament. 5. *Epid.*

Hippocrates tell's that the ſervant of *Dyſeris* in *Lariſſa*, when ſhee was young, in uſeing venerie was much pained, and yet ſomtimes without pain, yet ſhee never conceived. But when as ſhee was ſixtie years old, ſhee was pained in the after-noon as if ſhee had been in labor. When as ſhee one daie before noon had eaten manie leeks, afterward ſhee was taken with a moſt violent paiu, far exceeding all her former, and ſhee felt a certain rough thing riſeing up in the orifice of her womb. But ſhee falling into a ſwoun, another woman putting in her hand, got out a ſharp ſtone of the bigneſs of a whirl, and then ſhee forthwith became well, and remained ſo.

A ſtone comming out of the neck of the womb.

Lib. 1. cap. de palp. cond.

In a certain woman, who, as *Hollerius* tell's, for the ſpace of four months was troubled with an incredible pain in makeing water, two ſtones were found in her heart, with manie abſceſſes, her kidnies and bladder beeing whole.

Anno Dom. 1558. I opened in *John Bourlier* a Tailor, dwelling in the ſtreet of St. *Honoré*, a watrie abſceſs in his knee, wherein I found a ſtone, white, hard, and ſmooth, of the thickneſs of an Almond; which beeing taken out, hee recovered. Certainly there is no part of the bodie wherein ſtones may not breed and grow.

No part of the bodie wherein ſtones may not bee found.

Anthonie Benevenius a Florentine Phyſician write's, that a certain woman ſwallowed a braſs needle without anie pain, and continued a year after without feeling or complaining of it: but at the end thereof ſhee was moleſted with great pains in her bellie; for helping of which ſhee asked the adviſe of all the Phyſicians ſhee could, makeing, in the interim, no mention of the ſwallowed needle. Wherefore ſhee had no benefit by all the medicines ſhee took; and ſhee continued in pain for the ſpace of two years, until at length the needle came forth at a little hole by her navel, and ſhee recovered her health.

A needle ſwallowed, came forth at the navel ſom two years after.

A Scholar

A Scholar named *Chambelant*, a native of *Bourges*, a student in *Paris*, in the Colledg of *Presse*, swallowed a stalk of grass, which came afterwards whole out between two of his ribs, with the great danger of the scholar's life. For it could com there nnles by passing or breaking through the lungs, the encompassing membrane, and the intercostal muscles, yet hee recovered, *Fernelius* and *Haguet* having him in cure.

A sprig of gras swallowed came forth whole again between the ribs.

Cabrolle Chirurgian to *Mounsieur* the Marshal of *Anville*, told mee that *Francis Guillenet* the Chirurgian of *Sommiers*, a small village som eight miles from *Mompelier*, had in cure, and healed a certain Shepherd, who was forced by theeves to swallow a knife of the length of half a foot, with a horn handle of the thickness of ones thumb: hee kept it the space of half a yeer, yet with great pain, and hee fell much away, but yet was not in a consumption, until at length an abscess tissing in his groin, with great store of verie stinking quitture, the knife was there taken forth in the presence of the Justices, and left with *Joubert* the Physician of *Mompelier*.

A knife swallowed, came forth at an abscess in the groin.

Mounsieur the Duke of *Roban* had a Fool called *Guido*, who swallowed the point of a sword of the length of three fingers, and hee voided it at his fundament on the twelfth daie following, yet with much adoo: there are yet living manie Gentlemen of *Britanie*, who were eie-witnesses thereof.

The point of a sword swallowed came forth at the fundament.

There have been sundrie women with childe, who have so cast forth piece-meal children that have died in their wombs, as that the bones have broke themselvs a passage forth at the navel, but the flesh, dissolved as it were into quitture, flowed out by the neck of the womb and the fundament, the mothers remaining alive, as *Dalechampius* observ's out of *Albucrasis*.

Wonderful excretions of infants out of the womb.

Is it not verie strange that there have bin women, who troubled with a fit of the Mother, have lien three whole daies without motion, without breathing, or pulse that were anie wale apparent, and so have been carried out for dead?

Women troubled with the Mother laid out for dead.

A certain young man, as *Fernelius* tell's, by somwhat too vehement exercise, was taken with such a cough, that it left him not for a moment of time, until hee therewith had cast forth a whole impostume of the bigness of a pigeon's egg, wherein, beeing opened, there was found quitture exquisitely white and equal. Hee spit blood two daies after, had a great fever, and was much distempered, yet notwithstanding hee recovered his health.

An impostume spit out, of the bigness of a Pigeon's egg.

Anno Dom. 1578. *Stephana Chartier*, dwelling at St. *Maure des Faussez*, a widow of fortie yeers old, beeing sick of a tertian Fever, in the beginning of her fit vomited up a great quantitie of choler, and together therewith three hairie worms, in figure, color, and magnitude like the worms called Bear-worms, yet somwhat blacker; they lived eight whole daies after without anie food: the Chirurgian of this town brought them to Dr. *Milot*, who shewed them to *Feure*, *Le Gros*, *Marescot* and *Courtin* Physicians, and to mee also.

Worms cast up in the fit of an Ague.

This following historie, taken out of the Chronicles of *Monstrele*, exceed's all admiration. A certain Franck-Archer of *Meudon*, four miles from *Paris*, was for robberie condemned to bee hanged: in the mean time it was told the King by the Physicians, that manie in *Paris* at that time were troubled with the stone, and amongst the rest the Lord of *Bostage*, and that it would bee for the good of manie, if they might view and discern with their eies the parts themselvs wherein so cruel a disease did breed, and that it might bee don much better in a living then in a dead bodie, and that they might make trial upon the bodie of the Franck-Archer, who had formerly been troubled with these pains. The King granted their request; wherefore opening his bodie they viewed the breathing parts, and satisfied themselvs as much as they desired, and having diligently and exactly restored each part to its proper place, the bodie, by the King's command, was sewed up again, and dressed and cured with great care. It came so to pass, that this Franck-Archer recoverd in a few daies, and getting his pardon, got good store of monie besides.

This narration exceed's not onely all admiration, but also belief.

Alexander Benedictus tell's that hee saw a woman called *Victoria*, who having lost all her teeth, and beeing bald, yet had others came up in their places, when as shee was fourscore yeers old.

Stephen Tessiter a Chirurgian of *Orleance*, told mee that not long ago hee cured one *Charls Verignel*, a Serjeant of *Orleance*, of a wound received in his ham, whereby the two tendons bending the ham, were quite cut in sunder. Hee took this order in the cure; hee caused the patient to bend his leg, then hee sewed together the ends of the cut-tendons, then placed the member in that fite, and handled with that art, that at length hee healed the wound, the patient not halting at all. Truly this is a memorable thing, and carefully and heedfully to bee imitated by the young Chirurgian. *Pract. lib. 64. cap. 1.*

How manie have I seen, who wounded and thrust through the bodie with swords, arrows, pikes, bullets, have had portion of the brain cut off by a wound of the head, an arm or leg taken away by a cannon-bullet, yet have recovered? and how manie on the contrarie, have died of light and small wounds, not worth the speaking of.

A certain man was shot in near to his groin with an arrow, whom wee have seen, saith *Hippocrates*, and hee recovered beyond all men's expectation; The arrow's-head was not taken forth, for it was verie deep in, neither did the wound bleed verie much, neither did hee halt: but wee found the head, and took it forth six yeers after hee was hurt. *5. Epidem.*

Now

Now *Hippocrates* give's no reaſon of it's ſo long ſtaie, but that hee ſaith it might bee ſuſpected it laie hid between the nervs, and that no vein nor arterie was cut thereby.

CHAP. XX.

Of the wonderful original, or breeding of ſom creatures.

Boiſt. in hiſtor. prdig.

WEE have read in *Boiſtey*, that a certain work-man of *Avignion*, when as hee lived in that cittie, opened a leaden coffin, wherein a dead bodie laie, that was ſo cloſely ſaudered, that the air could not get in; and as hee opened it, hee was bitten by a ſerpent that laie therein, with ſo venomous and deadlie a bite, that it had neer to have coſt him his life. Yet the original of this creature is not ſo prodigious as hee ſuppoſeth, for it is an uſual thing for a Serpent to breed of anie putrefied carcaſs, but chiefly of man's.

It is a common thing for a ſerpent to breed of the dead corp's of a man.

Baptiſta Leo write's, that in the time of Pope *Martin* the fifth, there was a live-Serpent found encloſed in a vaſte, but ſolid Marble, no chink appearing in ſuch denſ ſoliditie, whereby this living creature might breathe.

A live ſerpent in a ſolid Marble.

Whileſt in my vine-yard, that is at *Meudon*, I cauſſed certain huge ſtones to bee broken to pieces, a Toad was found in the mid'ſt of one of them. When as I much admired thereat, becauſ there was no ſpace wherein this creature could bee generated, increaſ, or live; the Stone-cutter wiſhed mee not to marvel thereat, for it was a common thing, and that hee ſaw it almoſt everie daie. Certainly it may com to paſs, that from the more moiſt portion of ſtones, contained in places moiſt and under ground, and the celeſtial heat mixing and diffuſeing it ſelf over the whole maſs of the world, the matter may bee animated for the generation of theſe creatures.

The cauſ of ſuch wonderful generations.

CHAP. XXI.

Of the wondrous nature of ſom marine things, and other living creatures.

THE laſt mentioned creatures were wonderful in their original, or rather in their growth: but theſe which follow, though they bee not wonderful of themſelvs, as thoſe that conſiſt of their own proper nature, and that working well and after an ordinarie manner; yet they are wondrous to us, or rather monſtrous, for that they are not verie familiar to us. For the raritie and vaſtneſs of bodies, is in ſom ſort monſtrous. Of this ſort there are manie, eſpecially in the Sea, whoſe ſecret corners and receptacles are not pervious to men: as Tritons, which from the middle upwards are reported to have the ſhape of men. And the *Strenes*, *Nereïdes* or Meremaids, who (according to *Plinie*) have the faces of women, and ſcalie bodies; yea, where as they have the ſhape of man: neither yet can the forementioned confuſion and conjunction of ſeeds take anie place here, for as wee lately ſaid, they conſiſt of their own proper nature.

Lib. 9. cap.

When *Mena* was Preſident of *Egypt*, and walked on the banks of *Nilus*, hee ſaw a Sea-monſter in the ſhape of a man, comming forth of the waters: his ſhape was juſt like to a man even to the middle, with his countenance compoſed to gravitie, his hair yellow, yet intermixed with ſom graie, his ſtomach bonie, his arms orderly made and jointed, his other parts ended in a fiſh. Three daies after in the morning, there was ſeen another Sea-monſter, but with ſhape or countenance of a woman, as appeared by her face, her long hair, and ſwoln breaſts: both theſe monſters continued ſo long above water, that anie one might view them verie well

The effigies of the Triton *and* Siren *of* Nilus.

In

In our times, (saith Rondeletius) in Norway was a monster taken in a tempestuous sea, the which as manifest sayings especially conteined a Monk, by reason of the shape which you may see here set forth.

The figure of a fish in the habit or shape of a Bishop.

The figure of a fish resembling a Monk.

Anno Dom. 1531. there was seen a sea-monster in the habit of a Bishop, covered over with scails: *Rondeletius* and *Gesner* have described it.

Gesner professeth that he received from *Jerom Cardane* this monster, having the head of a Bear, the feet and hands of an Ape.

The effigies of a Sea-monster headed like a Bear.

The effigies of a Lion-like scalie Sea-monster.

Not long before the death of Pope *Paul* the third, in the midst of the Tyrrhene sea, a monster was taken, & presented to the successor of of this *Paul*. It was in shape & bigness like to a Lion, but all scalie; and the voice was like a man's voice. It was brought to *Rome* to the great admiration of all men, but it lived not long there, beeing destitute of its own natural place and nourishment, as it is reported by *Philip Forrest*.

Anno Dom. 1523. the third daie of *November*, there was seen at *Rome* this sea-monster, of the bigness of a childe of five years old, like to a man even to the navel, except the ears; in the other parts it resembled a fish.

The effigies of a Sea-monster with a man's face.

Gesner make's mention of this Sea-Monster, and saith that hee had the figure thereof from a Painter, who took it from the verie fish, which hee saw at *Anwerp*. The head look's verie ghastly, having two horns, prick-ears, and arms not much unlike a man, but in the other parts it was like a fish. It was taken in the Illyrian Sea, as it came a shore out of the water to catch a little childe: for being hurt by stones cast by fisher-men that saw it, it returned a while after to the shore from whence it fled, and there died.

The effigies of a Sea-Devil.

Gesner tel's that a Sea-monster with the head, mane, and breast of a horse, and the rest of his bodie like a fish, was seen and taken in the ocean-Sea, brought to *Rome*, and presented to the Pope.

Olaus Magnus tel's that a Sea-monster taken at *Bergen*, with the head and shape of a Calf, was given him by a certain English Gentleman. The like of which was presented lately to King *Charls* the ninth, and was long kept living in the waters at *Fountain-Bleau*, and it went oft-times a shore. This is much different from the common Sea-calf or Seal.

*The effigies of a monstrous * Sea-calf,*

* This here figured is the sea-Morse, taken commonly by our men in their greenland voiages: and I judg the sea-Bore and Elephant to bee the same, but that the Painter hath shewed his skil too much in the one: and the other is an old Morse, as this here figured is a young one.

This

This great monſter was ſeen in the Ocean-ſea, with the head of a Bore, but longer tuſks, ſharp and cutting, with ſcails ſet in a wonderful order, as you may ſee by this figure.

The effigies of a Sea-bore.

Olaus Magnus writes that this monſter was taken at *Thyle* an Iſland of the North, *Anno Dom.* 1538. it was of a bigneſs almoſt incredible, as that which was ſeventie two foot long, and fourteen high, and ſeven foot between the eies: now the liver was ſo large that there with they filled five hogſheads, the head reſembled a ſwine, having as it were a half-Moon on the back, and three eies in the mid'ſt of his ſides, his whole bodie was ſcalie.

The effigies of a monſtrous Sea-Swine.

The Sea-Elephant, as *Hector Boëtius* write's in his deſcription of *Scotland*; it is a creature that live's both in the water and aſhore, having two teeth like to Elephants, with which as oft as hee deſire's to ſleep, hee hang's himſelf upon a rock, and then hee ſleep's ſo ſoundly, that Mariners ſeeing him at ſea, have time to com aſhore and to binde him, by caſting ſtrong ropes about him. But when as hee is not awaken'd by this meanes, they throw ſtones at him, and makes a great noiſe; with which awakned, hee endevour's to leap back into the ſea with his accuſtomed violence, but findeing himſelf faſt, hee grow's ſo gentle, that they may deal with him as they pleaſe. Wherefore they then kill him, take out his fat, and divide or cut his skin into thongs, which becauſe they are ſtrong and do not rot, are much eſteemed of.

The effigies of a Sea-Elephant.

The Arabians of Mount *Mazuan*, which run's along'ſt the Red Sea, chiefly feed on a fiſh called *Oualone*, which is verie terrible, and much feared by other fiſh, beeing nine or ten foot long, and of the breadth agreeable thereto, and it is covered with ſcales like a Crocodile

A Crocodile is a vaſt creature, comming ſometimes to bee fifteen cubites long, and ſeeing it is a creature that doth not bring forth young, but eggs, it uſeth at the moſt to laie ſom ſixtie eggs, no bigger then Gooſe eggs, riſeng to ſuch bigneſs from ſo ſmall beginnings (for the hatched young one is proportionable to the egg) ſhee is verie long-lived.

It hath ſo ſmall and uſeleſs a tongue, that it may ſeem to have none at all. Wherefore ſeeing it live's both on land and water; as it live's on land it is to bee taken for a tongue, but as it live's part of the life in the water it hath no uſe of a tongue, and therefore is not to bee reputed one. For fiſhes either wholly want tongues, or elſ have them ſo impedite and bound, that they ſerv for little uſe. The Crocodile onely of all other things moov's the upper jaw, the lower remaining unmovable: for her feet, they are neither good to take nor hold anie thing; ſhee hath eies not unlike thoſe of ſwine, long teeth ſtanding forth of the mouth, moſt ſharp claws, a ſcailie skin, ſo hard that no weapon can pierce it. Of the land-Crocodile (reſembling this both land and water one) is made the medicine *Crocodilea*, moſt ſingular for ſore eies, beeing annointed with the juice of leeks, it is good againſt ſuffuſions or dimneſs of the ſight; it take's away freckles, puſtles, and ſpots; the Gall annointed on the eies help's Cataracts, but the bloud clear's the ſight.

The Crocodile onely moov's the upper jaw.

Expende diligenter Plinii locum lib. 28. c. 8

Thevet ſaith they live in the fountains of the river *Nilus*, or rather in a lake flowing from the ſame fountains, and that hee ſaw ſom that were ſix paces long, and a yard croſs the back, ſo that their verie looks were formidable. They catch them thus; when as the water of *Nilus* fal's, the Egyptians let down a line, haveing thereto faſtened an iron hook of ſom three pound waight, made verie large and ſtrong, upon this hook they put a piece of fleſh of a Camel or ſom other beaſt; which when as hee ſee's, hee preſently fal's upon it, and devour's it hook and all, wherewith when hee finde's himſelf to bee cruelly pulled and pinched, it would delight you to ſee how hee fret's and leap's aloft; then they draw him thus hooked, by little and little to the ſhore, and faſten the rope ſurely to the next tree, leſt hee ſhould fall upon them that are about him; then with prongs, and ſuch things they ſo belabor his bellie, whereas his skin is ſoft and thin, that at length they kill him, and uncaſeing him, they make readie his fleſh, and eat it for delicious food. *John Lereus*, in his hiſtorie of *Braſil*, write's, that the Salvages of that countrie willingly feed upon Crocodiles, and that hee ſaw ſom who brought into their houſes young ones, wherewith their children gathering about it, would plaie without receiving anie harm thereby.

Coſmograph tom. 1. l. 2. c. 8.

How they take Crocodiles.

Cap. 10.

Lib. 9. cap. 2.

True (ſaith *Plinie*) is that common opinion, Whatſoever is brought forth in anie part of Nature, that alſo is in the ſea, and manie other things over and above, that are in no other place. You may perceiv that there are not onely the reſemblances of liveing creatures, but alſo of other things; if you look upon the ſword, ſaw, cucumber, like in ſmel and color to that of the earth, that you may leſs wonder at the Sea-feather and grape, whoſe figures I have here given you out of *Rondeletius*.

The ſea-feather is like thoſe feathers of birds, which are worn in hats for ornament, after they are trimmed and dreſt for that purpoſe. The fiſhermen call them ſea-pricks, for that one end of them reſembleth the end of a man's yard, when the prepuce is drawn off it. As long as it is alive it ſwel's, and becom's ſomtimes bigger and ſomtimes leſſer; but dead, it becom's verie flaccid and lank: it ſhine's bright on the night like a ſtar.

You may by this gather, that this which wee here expreſs is the Grape whereof *Plinie* mak's mention, becauſ in the ſurface and upper part the reof it much reſemble's a fair bunch of Grapes; it is ſomwhat longiſh, like a mis-ſhapen club, and hang's upon a long ſtalk. the inner parts are nothing but confuſion, ſomtimes diſtinguiſhed with little glandules, like that wee have here figured alone by it ſelf.

The figures of the Sea-Feather and Grape.

In the Sea near the Iſland *Hiſpaniola* in the Weſt Indies, there may bee ſeen manie monſtrous fiſhes, amongſt which *Thevet* in his Coſmographie thought this moſt rare and obſervable, which in the vulgar language of the natives is termed *Aloes*. For it is juſt like a gioſ, with a long and ſtraight neck, with the head ending ſharp, or in a Cone, not much unlike a ſugar-

ſugar-pear, it is no bigger than a gooſ, it wanteth ſcails, it hath foure fins under the bellie for ſwimming, when it is above water you would ſaie that it were a gooſ.

The Sarmatian, or Eaſtern Germane Ocean contain's fiſhes unknown to hot countries, and verie monſtrous. Such is that which reſembling a ſnail, equal's a barrell in magnitude of bodie, and a ſtag in the largeneſs and branches of her horns: the ends of her horns are rounded as it were into little balls, ſhineing like unto pearls, the neck is thick, the eies ſhineing like unto little candles, with a roundiſh noſe ſet with hairs like to a cat's, the mouth wide, whereunder hang's a piece of fleſh verie uglie to behold. It goe's on foure legs, with ſo manie broad and crooked feet, the which with a long tail, and variegated like a Tiger, ſerv's her for fins to ſwim withal. This creature is ſo timerous, that though it be an *Amphibium*, that is, which live's both in the water and aſhore, yet uſually it keep's it ſelf in the ſea, neither doth it com aſhore to feed, unleſs in a verie clear ſeaſon. The fleſh thereof is verie good and grateful meat, and the bloud medicinable for ſuch as have their livers ill affected, or their lungs ulcerated, as the bloud of great Tortoiſes is good for the Leproſie. *Thevet* in his Coſmographie affirmeth that hee ſaw this in *Denmark*.

The bloud of great Tortoiſes good for the leproſie. *Tom. 2. lib. 20.*

In a deep lake of freſh water, upon which ſtand's the great cittie or town of *Themiſtitan*, in the Kingdom of *Mexico*, which is built upon piles, like as *Venice* is, there is found a fiſh of the bigneſs of a calf, called by the Southern Salvages, *Andura*, but by thoſe of the place, and the Spaniards the conquerers of that place, *Hoga*. It is headed and eared almoſt like a ſwine; from the chaps hang five long bearded *appendices*, or the length of ſom half a foot, like the beard of a Barbel. It hath fleſh verie grateful and good to eat. It bringeth forth live young like as the Whale. As it ſwim's in waters, it ſeem's green, yellow, red, and of manie colors, like a Chameleon: it is moſt frequently converſant about the ſhore-ſides of the lake, and there it feed's upon the leavs of the tree called *Hoga*, whence alſo the fiſh hath its name. It is fearfully toothed and fierce fiſh, killing and devouring ſuch as it meeteth withal, though they bee bigger then her ſelf: which is the reaſon why the Fiſhermen chiefly deſire to kill her, as *Thevet* affirmeth in his Coſmographie.

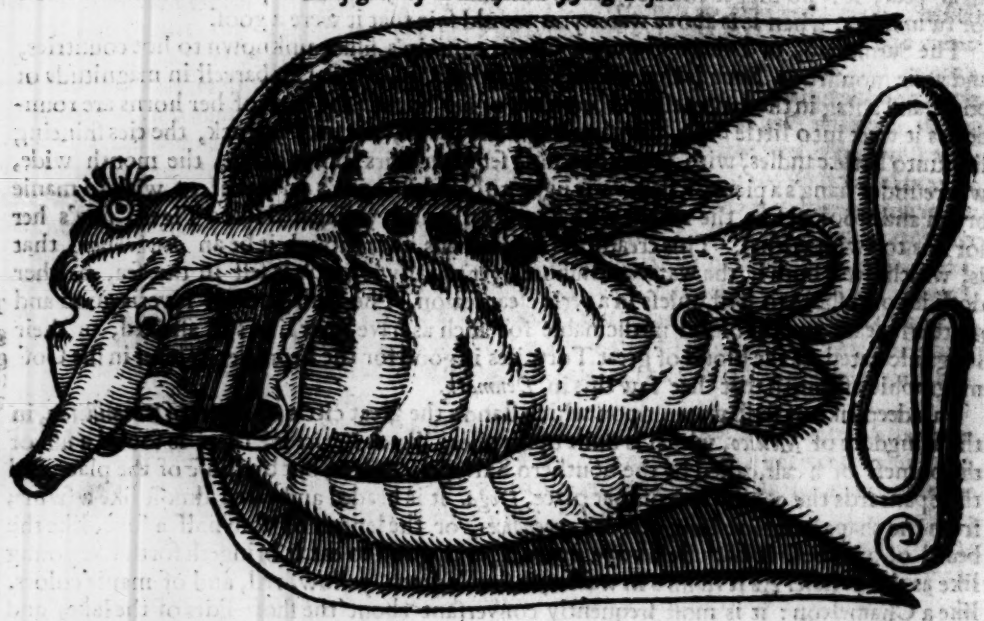
The monſtrous fiſh Hoga.

Andrew Thevet in his Coſmographie write's that as hee ſailed to *America*, hee ſaw infinite ſtore of flying fiſhes, called by the ſalvages *Bulampech*, who riſing out of the water, flie ſom fiftie paces, eſcaping by that means from other greater fiſh that think to devour them.

This kinde of flying fiſh exceed's not the bigneſs of a *Mackrel*, is round headed, with a blewiſh back, two wings which equal the length of almoſt all their bodies. They oft-times flie in ſuch a multitude, that they fall foul upon the ſails of ſhips, whileſt they hinder one another's flight, and by this means they fall upon the decks, and becom a preie to the ſailers: which ſame thing wee have read confirmed by *John Lereus* in his hiſtorie of *Breſil*.

In the Venetian gulf, between *Venice* and *Ravenna*, two miles above *Quiova*, *Anno Dom.* 1550. there was taken a flying fiſh, verie horrible and monſtrous, being four foot long, it had a verie great head, with two eies ſtanding in a line, and not one againſt another, with two ears, and a double mouth, a ſnout verie fleſhie and green, two wings, five holes in her throat, like thoſe of a Lampreie, a tail an ell long, at the ſetting on whereof there were two little wings. This monſter was brought alive to *Quiova*, and preſented to the chief of the cittie, as a thing whereof the like had not been formerly ſeen.

The figure of a monstrous flying Fish.



There are ſo manie and different ſorts of ſhels to bee found in the Sea, that it may bee truely ſaid, that Nature, the hand-maid of the Almightie, diſport's it ſelf in the framing of them. In ſo great diverſitie I have chiefly made choice of three to treat of here, as thoſe that are worthie of the greateſt admiration. In theſe lie hid certain little fiſhes, as ſnails in their ſhels, which *Ariſtotle* cal's *Cancelli*, and hee affirmeth them to bee the common companions of the * cruſted and ſhell fiſhes, as thoſe which in their *ſpecies* or kinde are like to Lobſters, and uſe to bee bred without ſhels; but as they creep into ſhels, and there inhabit, they are like to ſhell fiſhes. It is one of theſe that is termed the Hermite. Hee hath two ſomwhat long and ſlender horns, under which are his eies, alwaies ſtanding out of his head, as thoſe which hee cannot pluck and draw in, as Crabs can. His fore-feet have claws upon them, wherewith hee defend's himſelf, and carrie's meat to his mouth, haveing two other on each ſide, and a third beeing leſſer, the which hee uſeth in going. The female laie's eggs, which hang forth at her back part as if they were put upon a thread, beeing joined together by certain little membranes. Laſtly, in the opinion of *Ælian*, the *Cancellus* or ſmall Craie-fiſh is born naked and without a ſhell, but within a while after, ſhee of manie which ſhee finde's emptie, make's choice of a fit one, and when as grown bigger, ſhee cannot bee contained or dwell anie longer therein, or elſ beeing ſtimulated with a natural deſire of copulation, ſhee remoov's into a more capacious and convenient one. Theſe little Craie-fiſhes oft-times fight together for their habitation, and the ſtronger carrie's away the emptie ſhell, or elſ make's the weaker to quit poſſeſſion. Now the ſhell is either of a *Nerita*, or *Turbo*, and oft-times of a ſmall Purple; and entring into poſſeſsion, ſhee carrie's it about, there feed's and grow's, and then ſeek's a more capacious one, as *Ariſtotle* ſaith in the formerly-cited place.

4. de hiſt. anim. cap. 4.

* By cruſted is meant Crabs, Lobſters, Shrimps, and ſuch like.

The deſcription of the Hermite cray-fiſh.

Lib. 7. cap. 31.

They change their habitation for two cauſſes.

The effigies of the emptie ſhel's whereinto the Cancelli *uſe to creep to dwell.*

What the *Pinnoter*, or dwarf-crab is.

Som think that this Bernard the Hermit is that kinde of *Cancellus* which is by *Plinie* termed *Pinnoter*; but in truth the *Pinnoter* is not a kinde of *Cancellus*, or Cray-fiſh, but of a little Crab. Now in *Ariſtotle* there is much difference between *Cancellus* and *Cancer parvus*, though *Plinie* may ſeem to confound them; for hee is bred naked, haveing his cruſt onely, but without a ſhell: wherefore ſeeing that by nature hee want's it, hee diligently ſearche's for it, and dwell's in it, when as hee hath found it: But the *Pinnoter* is not bred by it ſelf alone, but in *Pinnæ* and ſom others, and hee changeth not his habitation, becauſ (as *Ariſtotle* think's

think's) being of the kinde of dwarf-Crabs, it never grow's big, neither dwell's it in emptie shells. Now the *Pinna*, or Pin is a kinde of shell-fish, it breed's in muddie places, and is alwaies open, neither is it at anie time without a companion, which they therefore call the *Pinnoter*, or *Pinnophylax*, (*i.e.*) the Pin-keeper, as *Plinie* saith. Verily that these things are thus, you may plainly perceiv by these words of *Athenæus*. *Chrysippus Solensis* saith the *Pinna* and *Pinnoter* assist and further each other, neither can they live asunder. The *Pinna* may bee referred to the kindes of oisters, but the *Pinnoter* is a dwarf-crab: the *Pinna* open's her shell for the little fishes to enter therein; the *Pinnoter* stand's by, observing if anie com in, which if they do, hee give's the Pin notice thereof by biting, who presently thereupon shut's her shell, and so they feed together upon that they catch by this means. Thus *Athenæus*. Shee is also for this her craft mentioned by *Plutarch* in his writings. The *Pinnoter* is sometimes called by *Plinie*, *Canser dapis assitator*.

What the *Pinna* is.

Lib. 9. cap. 42. *Lib. 3. Deipno.*

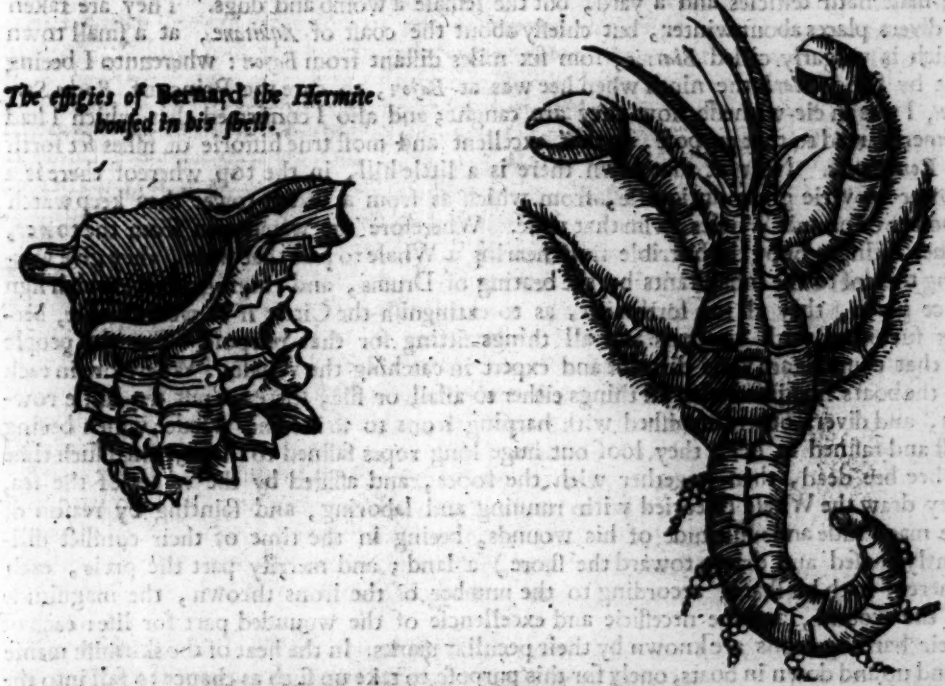
The familiaritie and craft of the *Pinna* and *Pinnoter*.

But that which by these authors is attributed to the dwarf-Crab, the same by *Cicero* is ascribed to the little shrimp: Now the *Pinna* (saith hee) opening her two large shells, enter's into confederacie with the little shrimp for getting of food, wherefore when little fishes swim into her gaping shell, then the *Pinna*, admonished by the shrimp's biteing her, shut's her shell; thus two unlike creatures get their livings together. But *Plutarch* seem's to make the *Pinna* to bee the Pearl-oister, in that work of his, wherein hee inquireth whether the craft of Water or Land-beasts bee the greater.

Lib. 2. de nat. deorum.

The figure of him out of his Cell.

The effigies of Bernard *the Hermite housed in his shell.*



But amongst the most miraculous fishes may fitly bee placed the *Nautilos*, or Sailer, of som called *Pompylos* (it is thought to bee a kinde of *Polypus*) it com's with the face upwards to the top of the Sea, raising it self by little and little, that casting forth all the water by a pipe, as if it had a Pump, it easily float's: then putting back the two first tendrils or arms, it extend's between them a membrane of wondrous fineneſs or thinneſs, which gathering air like as a sail, and shee rowing with the rest of her arms, shee guide's her self with her tail in the mid'st, as a Rudder. Thus shee sail's along in imitation of Pinnaces, and if anie thing affright her, shee presently take's in water, and sink's her self.

Plin. lib. 9. cap. 29.

The shape of Nautilos, *or Sailer-fish.*

The

How the Whale may be reckoned amongſt monſters.

The better to ſtore this Treatiſe of Monſters, abuſing the name with the Poëts, wee will reckon up the whale amongſt the Sea-monſters, by reaſon of his monſtrous and wondrous magnitude. Now the Whale is the greateſt by much of all the fiſhes of the Sea, for moſt commonly this beaſt is thirtie ſix cubits long, eight high, the ſlit of his mouth is eighteen foot long, teeth they have none, but in ſtead thereof in each Jaw hornie black excreſcences or fins [which wee vulgarly term Whale-bones] which by little and little end in ſmall hairs like to a ſwine's briſtles, which comming and ſtanding out of his mouth, are in ſtead of Guides, leſt whileſt hee ſwim's with a blinde and rapid violence, hee might run againſt a rock. His eies are diſtant one from the other the ſpace of four ells, which outwardly appear ſmall, but inwardly they are bigger then a man's head; wherefore they are deceived that ſaie that they are no bigger then an Ox's eies: his noſe is ſhort, but in the middle of his fore-head hee hath a pipe whereat hee draw's in the air, and caſt's forth a whole ſhower or river of water, that therewith hee will even ſink the veſſels or boats of Mariners; when hee hath filled himſelf beyond meaſure, hee crie's out or roar's with ſo great or ſtrong a voice, that hee may bee heard two miles off. Hee hath two verie large fins upon his ſides wherewith hee ſwim's, and under which in the time of danger hee hide's his young; hee hath none upon his back. His tail in ſite is like to the tails of Dolphins, neither is it much unlike in ſhape, which when hee moov's, hee ſo toſſeth the Sea, that hee drown's and overturn's the boats that hee toucheth. You may by diſſecting them finde that a Whale bring's forth live-young, and give's them ſuck; for the male hath teſticles and a yard, but the female a womb and dugs. They are taken in divers places about winter, but chiefly about the coaſt of *Aquitane*, at a ſmall town which is vulgarly called *Biarris*, ſom ſix miles diſtant from *Bayon*: whereunto I beeing ſent by King *Charls* the ninth when hee was at *Bayon*, to cure the Prince of *Roche Sur-Yon*, I was an eie-witneſſe how they are caught; and alſo I confirmed that which I had formerly read to that purpoſe, in that excellent and moſt true hiſtorie of fiſhes ſet forth by *Rondeletius*. Now at that town there is a little hill, in the top whereof there is a Tower of verie great antiquitie, from which as from a watch-tower they keep watch whether or no anie Whales ſwim that waie. Wherefore the watch-men from the tower, either ſeeing, or by the horrible noiſ hearing a Whale to paſs that waie, they give warning thereof to the inhabitants by the beating of Drums, and ringing a Bell: which ſign once given, they all run forthwith, as to extinguiſh the Cittie if it were on fire, beeing furniſhed with weapons and all things fitting for that purpoſe. For the people of that countrie are verie diligent and expert in catching the Whale. Wherefore in each of the boats furniſhed with all things either to aſſail or flie, there are put ten luſtie rowers, and divers others furniſhed with harping irons to ſtrike the Whale; which beeing caſt and faſtned in her, they looſ out huge long ropes faſtned to them, until ſuch time as hee bee dead, then together with the ropes, and aſſiſted by the waves of the ſea, they draw the Whale (wearied with running and laboring, and fainting by reaſon of the magnitude and multitude of his wounds, beeing in the time of their conflict diligently chaſed and driven toward the ſhore) a land; and merrily part the preie, each whereof hath his ſhare, according to the number of the irons thrown, the magnitude of the wound, and the neceſſitie and excellencie of the wounded part for life: each of their harping-irons are known by their peculiar marks. In the heat of the skirmiſh manie ſtand up and down in boats, onely for this purpoſe, to take up ſuch as chance to fall into the Sea, leſt they ſhould bee drowned. The males are caught with more difficultie, the females more eaſily, eſpecially if their young ones bee with them; for whil'ſt they linger to help and ſuccour them, they loſe the occaſion of eſcaping. The fleſh is of no eſteem, the tongue onely is commendable; for beeing verie large, and of a verie lax ſubſtance, it is poudered, and by moſt Gentlemen accounted for a daintie. The lard is diſperſed over manie countries, to bee boiled and eaten with fiſh in the time of Lent, that Gourmandizers may have ſomthing to ſerv them in ſtead of fleſh which is then forbidden. There is great ſtore of fat in them in the parts under the skin and bellie, which melted, concreet's not again, by reaſon of the ſubtiltie of the parts, they keep it to burn in lamps, and to uſe about their ſhips. The houſes of the fiſh-eaters are builded with their bones; alſo orchards in the coaſt of *Aquitane* are fenced with theſe bones. The fins that ſtand forth of their mouths, which are commonly called Whale-bones, beeing dried and poliſhed, ſerve to make buſks for women, whip-ſtaves, and little ſtaves, as alſo to ſtiffen garments. Manie make ſeats or ſtools of the *vertebræ*, or ſpondils of the back-bone.

A Whale bring's forth young, and ſuckle's them.

How they are caught.

Why the females are more eaſily caught then the males.

Whale-bone.

The

The manner of cutting up the Whale.

In the river *Scalde*, ten miles from *Antwerp*, *Anno Dom.* 1477. the ſecond daie of *Julie*, there was a Whale taken, of a blackiſh blue color, ſhee had a ſpout hole in the top of her head, out of which ſhee caſt great ſtore of water: ſhee was fiftie eight foot long, and ſixteen foot high: her tail was fourteen foot broad; from the eie to the end of her noſe was ſom ſixteen foot. Her lower jaw was ſix foot on each ſide, ſhee had twentie five teeth, which ſhee could hide in her upper jaw, there beeing holes for them, it beeing whollie toothleſs; for which one thing this Whale may bee judged monſtrous, for that nature hath denied them teeth, and and for that in creatures that are not horned, it is ſo ordained by nature, that when they have teeth in their lower jaw, they ſhould have others alſo in the upper to anſwer to them, ſo to chaw their meat. The longeſt of theſe teeth exceed not ſix inches.

There is (as *Plinie* report's) a verie ſmall fiſh accuſtomed to live about rocks, it is called *Echeneis*, never excceeding the length of a foot; it is thought that ſhips go more ſlowly if this ſtick to them: wherefore the Latins have alſo given it a name of *Remora*, for that a ſhip beeing under ſail with a good winde, may by the *Echeneis* ſeazing on her as if ſhee would devour her, bee ſtaied againſt the Sailer's wills, and ſtand ſtill as if ſhee were in a ſafe harbor. Wherefore ſhee is ſaid in the Actian fight to have ſtaied the ſhip of *Marcus Antonius*, haſtening to go about and encourage his ſouldiers, ſo that hee was forced to enter into another ſhip, and thereupon *Ceſar's* navie came upon them too haſtily, and before they were provided. *Lib.9.cap.25. & lib.32.cap.1* The wondrous power of the *Remora*.

Shee alſo ſtai'd the ſhip of the Emperor *Caius*, comming from *Aſtura* to *Antes*, his ſhip of all the navie makeing no waie; neither did they long wonder at this ſtaie, the cauſ beeing preſently known; ſom forthwith leaping into the Sea to finde the cauſ thereof, there found her about the ſhip, even ſticking to the Rudder, and they ſhewed her to *Caius*, beeing wroth that this ſo ſmall a thing ſhould ſtop him, and countermand the endevour of fortie Rowers.

Therefore this little fiſh came's and infringe's the violence and madneſs of the world, and that with no labor, not without holding or anie other waie, but onely by ſticking thereto. Cetainly how ever it com's to paſs, who from this example of holding of ſhips, can doubt of anie power or effect of nature, in medicines which grow naturally? Yea, and without this example, the *Torpedo* out of the ſea alſo may bee ſufficient, who a far off, and at diſtance, if it bee touched with a ſpear or rod, will benumb even the ſtrongeſt arms, and retard the feet, how ever nimble to run away. The wondrous force of the *Torpedo*.

CHAP. XXII.

Of the admirable nature of Birds, and of ſom Beaſts.

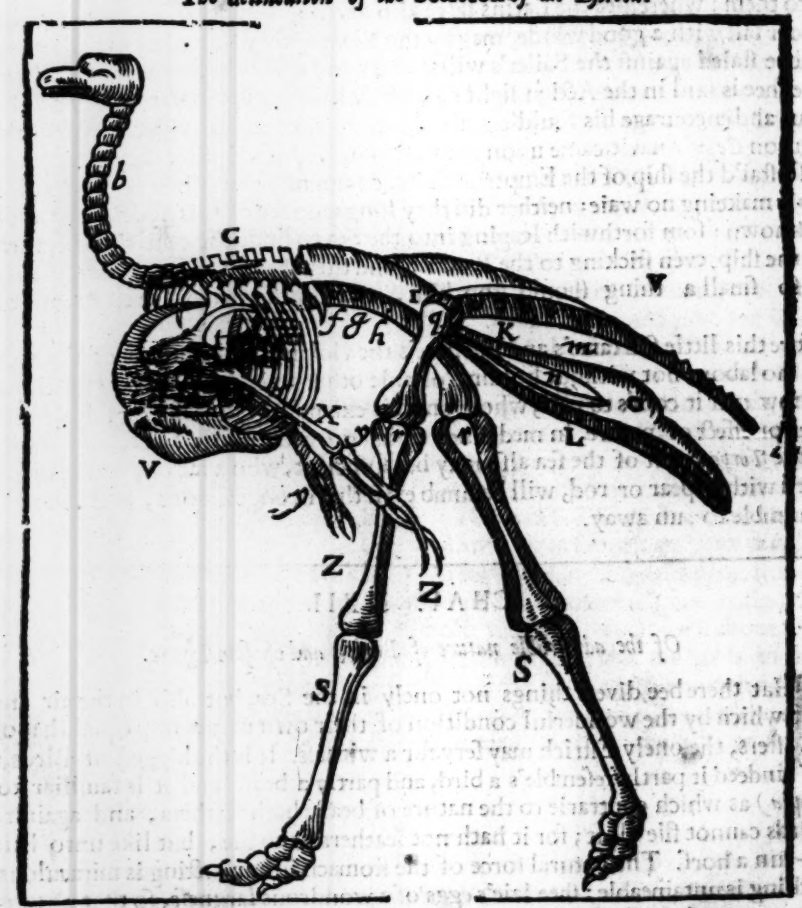
That there bee divers things not onely in the Sea, but alſo in the air and earth, which by the wonderful condition of their own nature may equal that of Monſters, the onely Eſtrich may ſerv for a witneſs. It is the biggeſt of Birds, though indeed it partly reſemble's a bird, and partly a beaſt (and it is familiar to *Africa* and *Æthiopia*) as which contrarie to the nature of beaſts hath feathers, and againſt the cuſtom of birds cannot flie aloft; for it hath not feathers fit to flie, but like unto hairs, yet will it out-run a horſ. The natural force of the ſtomach in concocting is miraculous, as to which nothing is untameable: ſhee lai'e's eggs of a wondrous largneſs, ſo that they may bee framed into cups: their feathers are moſt beautiful, as you may perceiv by this following figure. The Eſtrich is between a bird and a beaſt. The wondrous force of her ſtomach.

The

The figure of an Eſtrich.

Anie one may eaſily gather of what a prodigious magnitude an Eſtrich is, by the greatneſs of his bones. three of theſe birds were kept at the King's charge, by the *Mareſchal de Rets:* one whereof dying, it was beſtowed upon mee, whereof I have with great diligence made a *Sceleton.*

The delineation of the Sceleton *of an Eſtrich.*



A. Shew's the head, which was ſomwhat thicker then the head of a Crane, of the length of one's hand, plain from the crown even to the beak; the beak being divided to the middle region of the eie, beeing roundiſh at the end thereof.

B. The

B. The neck, a yard long, consisting of seventeen *vertebræ*'s, each whereof on each side is furnished with a transverse process looking downwards, of som fingers length, excepting the two which are next the head, as which want these, and are joined together by *Ginglymds*.

C. The back is of a foot's length, consisting of seven *Vertebræ*.

D. The holie-bone of two foot long, in whose top there is a transverse process, under which there lie's a great hole.

E. Three more, but less.

F. G. H. After which there follow's the cavitie or socket, whereinto the head of the thigh-bone is received and hid. This externally and on the side produceth a perforated bone, noted with the letter *I.* perforated I sale at the beginning, for it is presently united at the letter, *K.* then is it forked and divided into two other bones, whereof one is bigger then the other. The less is noted with the letter, *L.* then are they both united at the letter *M.* each of them is half a foot and four inches long. But from that part whereas they first began to bee divided, to that whereas they are united, there is a hole som four fingers broad, but the length of one's hand, or more, and it is noted with the letter *N.* The residue of the bone is like to a pruning knife three inches broad, but six in length: at the end whereunder is the letter, *O.* it is joined by coalition.

P. The rump consisting of nine *vertebræ*'s, like to a man's. The thigh-bones are two, whereof that which is noted with the letter *Q* is of the length of a foot, and of thickness equal to a horse's thigh. The other next under (which peradventure you may call the leg-bone) noted with *R.* is a foot and half long: it hath joined thereto the *Fibula*, or lesser focil of the length, but which grow's smaller as it com's lower.

S. Is the leg, to which the foot adhere's, being one foot and a half long, divided at the end into two claws, the one bigger, the other less, whereof each consist's of three bones.

T. Eight ribs, which are inserted into the *Sternon*, the three middlemost of these have a bonie production like to a hook.

V. Is the *Sternon*, consisting of one bone of som foot's length, representing a buckler, to this there is joined another bone, which stretched over the three first ribs, is in stead of clavicles or collar-bones.

X. The first bone of the wing, which is one foot and half long.

Y. Two bones under this, equivalent to the ell and wand, under which there are six other bones composing the point of the wing, noted with *Z.*

This whole *Skeleton* is seven foot long, and so manie foot or more high from the feet to the beak: there are manie other observable things in his composure, but I have thought fit to omitt them for brevitie's sake.

Jerom Cardane in his books *De subtilitate*, write's, that in the Ilands of the *Molucca*'s you may somtimes finde lying upon the ground, or take up in the waters, a dead bird called a *Manucodiata*, that is in Hebrew, the bird of God, it is never seen alive. It live's aloft in the air, it is like a Swallow in bodie and beak, yet distinguished with divers colored feathers: for those on the top of the head are of a golden color, those of the neck like to a Mallard, but the tail and wings like Peacocks; * it want's feet: Wherefore if it becom wearie with flying, or desire sleep, it hang's up the bodie by twineing the feathers about som bough of a tree. It passeth through the air, wherein it must remain as long as it live's, with great celeritie, and live's by the air and dew onely. The cock hath a cavitie depress in the back, wherein the hen laie's and sit's upon her eggs. I saw one at *Paris* which was presented to King *Charls* the ninth.

The description of the bird of Paradise.

The effigies of a Manucodiata, *or bird of Paradise.*

* Whosoever desire's to know more of the truth of this bird, let him read *Clusius* in the *Auctarium ad lib. 4 cap. 1. exoticorum.*

Wee have read in *Thevet's* Cosmographie, that hee saw a bird in *America*, which in that countrie speech is called *Touca*, in this verie monstrous and deformed, for that the beak in length and thickness, exceed's the bigness of the rest of the bodie; it feed's on pepper, as the black-birds and felfares with us do upon Ivie-berries, which are not less hot then pepper. *Tom. 2. l. 21. cap. 12.*

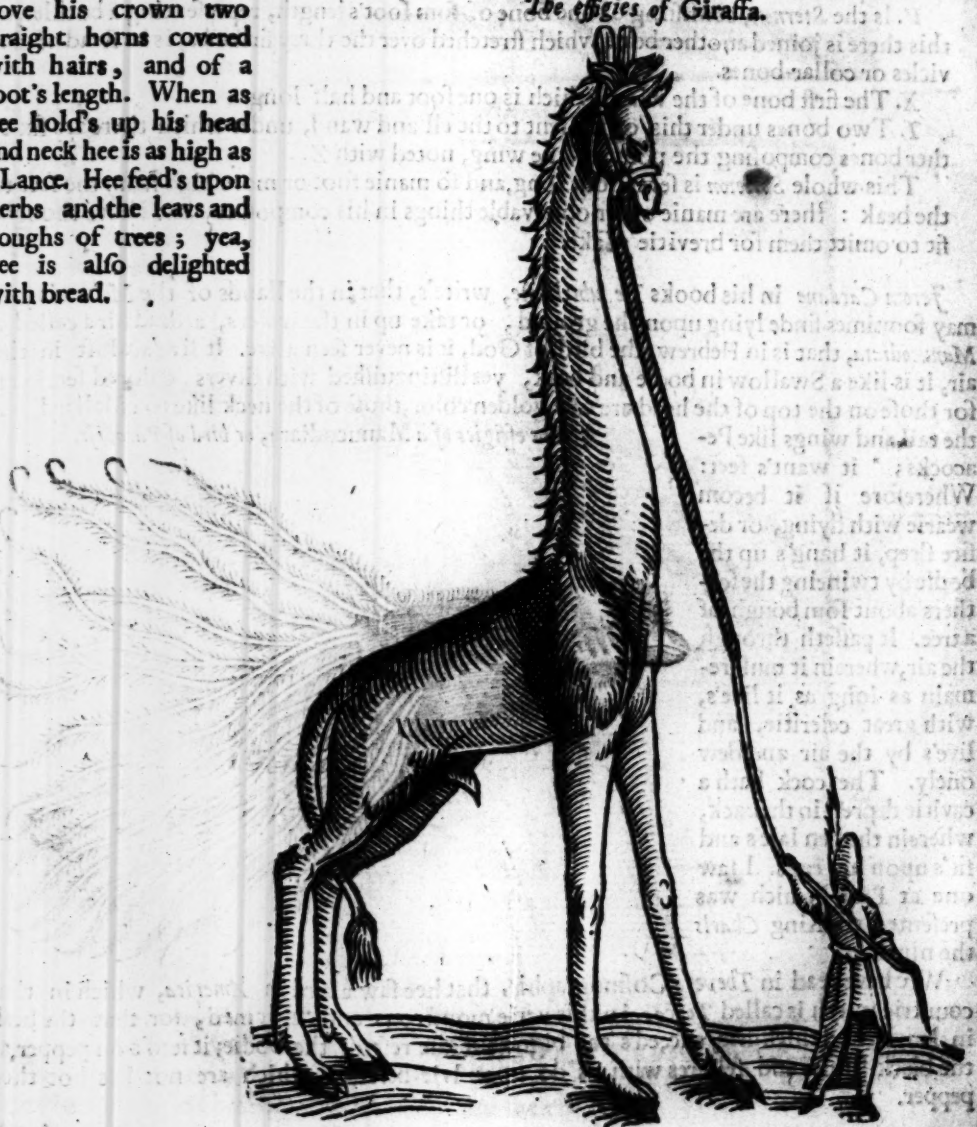
A cur-

A certain Gentleman of *Provence* brought a bird of this kinde from that countrie, to present it to King *Charls* the ninth, but dying in the waie hee could not present it alive. Wherefore the King wished the *Mareschal de Rets* to give her to me, that I might take forth her bowels and embalm her, that shee might bee kept amongst the King's rarities. I did what I could, yet not long after shee rotted: shee resembled a crow in bodie and feathers, but had a yellowish beak, clear, smooth, and toothed like a saw, and of such length and thickness as wee formerly mentioned. I keep it yet as a certain monstrous thing.

Tom. 1. cap. 11. lib. 4. *Thevet* write's, that in the Island *Zocotera* there is frequently found a certain wilde beast called *Hulpalis*, of the the bignes of an Ethiopian Monkie. It is a verie monstrous creature, but in nothing more, then that it is thought to live upon the air only; the skin as if it were died in grain, is of a scarlet color, yet it is in som places spotted and variegated: it hath a round head like to a boul, with feet round, broad, and wanting hurtful nails. The Moors kill it and use to eat the flesh of it, being first bruised, that so it may bee the more tender.

Thevet tom 1. lib. 11. cap. 13. In the Realm of *Camota*, of *Abob*, of *Benga*, and other mountains of *Cangila*, *Plinatig* and *Catagan*, which are in the inner *India*, beyond the river of *Ganges*, som five degrees beyond the Tropick of *Cancer*, is found a beast, which the Western Germans call Giraff. This beast in head, ears, and cloven feet, is not much unlike our Do; it hath a verie slender neck, but it is som six foot long, and there are few beasts that exceed him in the length of their legs: his tail is round, but reacheth no further then his hams; his skin is exceeding beautiful, yet somwhat rough, having hair thereon somwhat longer then a Cow, it is spotted and variegated in som places with spots of a middle color, between white and chesnut, so as Leopards are; for which caus by som Greek Historians it is called a *Cameleopardalis*: it is so wilde before it bee taken, that with the good-will it will not so much as bee seen. Therefore it inhabite's and live's onely in desert and secret places, unknown to the rest of the beasts of that region. Hee presently flie's away at the sight of a man, yet is hee taken at length, for that hee is not verie speedie in running away; once taken, hee is as easily and speedily tamed as anie wilde beast whatsoever. Hee hath above his crown two straight horns covered with hairs, and of a foot's length. When as hee hold's up his head and neck hee is as high as a Lance. Hee feed's upon herbs and the leavs and boughs of trees; yea, hee is also delighted with bread.

The effigies of Giraffa.



Such

Such as sail in the red sea along the coast of *Arabia*, meet with an Iland called by the *Arabians Cademota*; in that part thereof where the river *Plata* run's, is found a wilde beast, called by the barbarous inhabitants *Paraſſoupi*, beeing of the bigneſs of a Mule, headed not unlike one, yet rough and haired like to a Bear, but not of so dark a color, but inclineing to yellow, with cloven feet like a Hart: shee hath two long horns on her head, but not branched, somwhat resembling those so much magnified horns of Unicorns. For the native's of the place, bitten by the venemous tooth of either beast or fish, are presently helped and recover by drinking the water wherein such horns have been infused for six or seven daies space, as *Thevet* in his Cosmographie report's.

In one of the Islands of the Moluccas there is found a beast living both on land and water like as a Crocodile; it is called *Cangurou*, it is of the bigneſs of an Hart, it hath one horn in the fore-head, moovable after the fashion of the nose of a Turkie-cock: it is som three foot and an half long, and never thicker then a man's arm; his neck is covered over with an ash color, hee hath two feet like to a goos's feet, wherewith hee swim's both in fresh and salt waters. His fore-feet are like to a stag's, hee live's upon fish. Manie have perswaded themselvs that this beast is a kinde of Unicorn, and that therefore his horn should bee good against poisons. The King of the Island love's to bee called by the name of this beast; and so also other Kings take to themselvs the names of the wilde beasts, fishes, or fruits, that are most precious and observable in their dominions, as *Thevet* report's.

Mauritania and *Æthiopia*, and that part of *Africk* that is beyond the deserts and tyrret, bring forth Elephants; but those of *India* are far larger. Now although in the largeneſs of their bodie they exceed all four-footed beasts, yet may they bee more speedily and easily tamed then other beasts. For they may bee taught to do manie things above the common nature of beasts. Their skin is somwhat like to a Buffles, with little hair upon it, but that which is, is ash colored, his head large, his neck short, his ears two handfuls broad, his nose or trunk verie long, and hanging down almost to the ground, hollow like as a trumpet, the which hee useth in stead of an hand, his mouth is not far from his breast, not much unlike a swine's, from the upper part whereof two large teeth thrust forth themselvs, his legs are thick and strong, not consisting of one bone as manie formerly have falsly believed (for they kneel to admit their Rider, or to bee laden, and then rise up again of themselvs) his feet are round like a quoit som two or three hand's bredth, and divided into five cleſts. Hee hath a tail like a Buffle, but not verie rough, som three hand's bredth long, wherefore they would bee much troubled with flies and waſps, but that nature hath recompenced the shortneſs of their talls by another waie; for when they finde themselvs molested, they contract their skin so strongly, that they suffocate and kill these little creatures taken in the wrinkles thereof; they over-take a man running by going only, for his legs are proportionable to the rest of his bodie.

The Indian Elephants are bigger then the African.

How they keep flies from them.

They feed upon the leavs and fruits of trees, neither is anie tree so strong or well rooted, which they cannot throw down and break. They grow to bee sixteen handfuls high, wherefore such as ride upon an Elephant are much troubled as if they went to sea. They are of so unbridled a nature, that they cannot endure anie head-stall or reins, therefore you must suffer them to take the court and waie they pleas. Yet do they obey their countrie-men without anie great trouble; for they seem after som sort to understand their speech, wherefore they are easily governed by their known voices and words. They throw down a man that anger's them, first taking him up with their trunk and lifting him aloft, and then letting him fall, they thread him under foot, and leav him not before hee bee dead. *Aristotle* write's that Elephants generate not before they bee twentie years old: they know not adulterie, neither touch they anie female but one, from which they also diligently abstain when they know shee hath once conceived. It cannot bee known how long they go with young, the reason is for that their copulation is not seen, for they never do it but in secret. The females bring forth resting upon their hinde legs, and with pain like women, they lick their young, and these presently see and go, and suck with their mouths, and not with their trunks. You may see Elephant's teeth of a monstrous and stupendious bigneſs, at *Venice*, *Rome*, *Naples*, and *Paris*; they term it Ivorie, and it is usefl for Cabinets, Harps, Combs, and other such like uses.

Lib. 9. de hiſt. anim. cap. 28.

It is not known how long an Elephant go's with young.

The figure of an Elephant.

Wee have read in *Thevet*, that in *Florida* there are great Bulls, called in that countrie tongue *Beautrol*, they have horns of a foot long, a bunch on their back like a Camel, their hair long and yellow, the tail of a Lion; there is scarce anie creature more fierce or wilde, for it can never bee tamed, unless it bee taken from the dam. The Salvages use their hides against the cold, and their horns as an Antidote against poison. *Tom. 2. lib. 23. cap. 2.*

Their horns good against poison.

The same author affirm's that whileſt hee sailed in the red sea, hee saw a monster in the hands of certain Indian merchants, which in the bigness and shape of his limbs was not unlike a Tiger, yet had the face of a man, but a verie flat nose: besides, his fore feet were like a man's hands, but the hinde like the feet of a Tigre, hee had no tail, hee was of a dun color: to conclude, in head, ears, neck, and face it resembled a man, but in the blackish and curled hair, a Moor: for the other parts they were like a Tigre; they called it *Thanaſih*. *Tom. 1. lib. 2. cap. 10.*

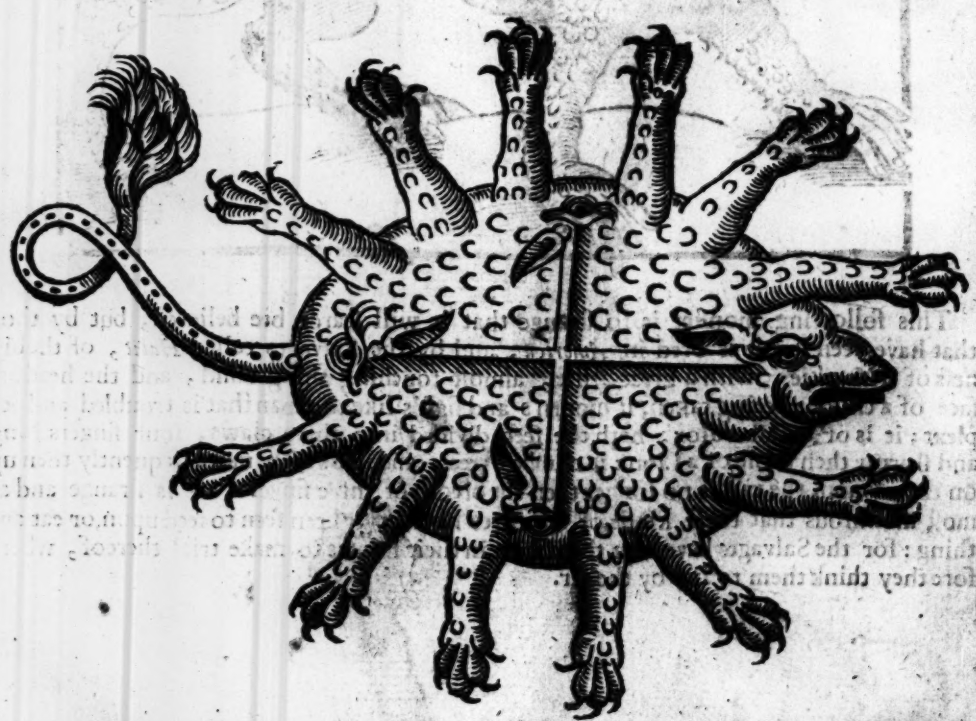
The figure of a beast called Thanaſih.

This following monster is so strange that it will scarce bee believed, but by those that have seen it: it is bred in *America*, and by the Salvages called *Hait*, of the bigness of a Monkie, with a great belly, almost touching the ground, and the head and face of a childe: being taken, it mourn's and sigh's like to a man that is troubled and perplext; it is of an ash-color, hath the feet divided into three claws, four fingers long, and sharper then those of a Lion: it climbe's trees, and live's there more frequently then upon the ground, the tail is no longer then the breadth of three fingers. It is strange and almost monstrous that these kinde of creatures have never been seen to feed upon, or eat anie thing: for the Salvages have kept them long in their houses to make trial thereof, wherefore they think them to live by the air.

The figure of the beast called Haiie.

I have taken this following monster out of *Leo*'s African historie; it is verie deformed, being round after the manner of a Tortois, two yellow lines crossing each other at right angles, divide his back; at everie end of which hee hath one eie, and also one ear, so that such a creature may see on everie side with his four eies, as also hear by his so manie ears: yet hath hee but one mouth, and one bellie to contain his meat, but his round bodie is encompassed with manie feet, by whose help hee can go anie waie hee pleas without turning of his bodie, his tail is somthing long and verie hairie at the end The inhabitants affirm, that his blood is more effectuall in healing of wounds then anie balsom.

Blood as good as balsom.



It is strange that the *Rhinoceros* should bee a born enemie to the Elephant; wherefore hee whet's his horn, which grow's upon his nose, upon the rocks, and so prepare's himself for fight, wherein hee chiefly assails the bellie, as that which hee know's to bee the softest: hee is as long as an Elephant, but his legs are much shorter, hee is of the color of box, yet somwhat spotted. *Pompie* was the first, that shewed one at *Rome*.

Plin. l. 8. c. 29.

The figure of the Chameleon.

Plin lib. 8. c. 33. *Africa* produceth the *Chameleon*, yet is it more frequent in *India*: hee is in shape and greatnes like a Lizard, but that his legs are straight and higher, his sides are joined to the bellie as in fish, and his back *Arist. lib. 2. hist. anim. cap. 12.* stand's up after the same manner, his nose stand's out not much unlike a swine's, his tail is long, and endeth sharp, and hee fould's it up in a round, like a serpent, his nails are crooked, his pace slow like as the Tortois, his bodie rough, hee never shut's his eies, neither doth hee look about by the mooving of the apple, but by the turning of the whole eie. The nature of his color is verie wonderful, for hee changeth it now and then in his eies and tail, and whole bodie beside; and hee alwaies assimilate's that which hee is next to, unless it bee red or white. His skin is verie thin, and his bodie clear; therefore the one of these two, either the color of the neighbouring things in so great subtiltie of his clear skin, easily shine's as in a glass; or elss various humors diversly stirred up in him, according to the varietie of his affections, represent divers colors in his skin, as a Turkie-cock doth in those fleshie excrescences under his throat, and upon his head: hee is pale when hee is dead. *Mathiolus* write's that the right eie taken from a living *Chameleon* take's away the white spots which are about the thornie coat of the eie; his bodie being beaten, and mixed with Goat's milk, and rubbed upon anie part, fetcheth off hairs; his gall discusseth the Cataracts of the eie.

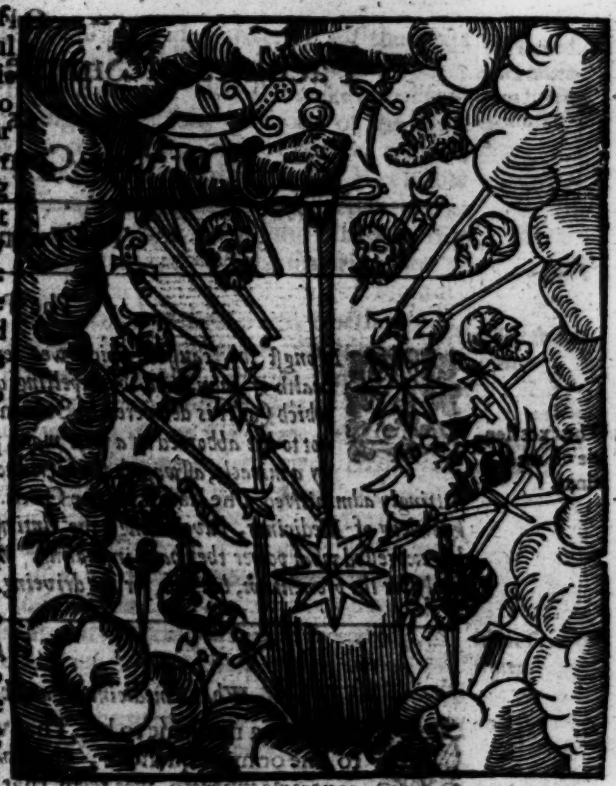
The strange nature of the color of the Chameleon.

CHAP. XXIII.

Of Celestial Monsters.

PEradventure it hath not been strange that monsters have been generated upon the earth and in the Sea: but for monsters to appear in heaven, and in the upper region of the air, exceed's all admiration. Yet have wee often read it written by the antients, that the face of heaven hath been deformed, by bearded, tailed, and haired Comets; by meteors representing burning torches, and lamps, pillars, darts, shields, troops of clouds, hostilely assailing each other; Dragons, two Moons, Suns, and the like monsters and prodigies. An-

Antiquitie hath not seen nor daily sees any prodigious then that Comet which appeared with bloodie hair in *Uverstine*, upon the ninth daie of *October*, 1528. for it was so horrible and fearful a spectacle, that divers died with feare, and manie fell into grievous diseases; going from the East to the South, it endured no longer then one hour and a quarter: in the top whereof was seen a long bending arm holding a great sword in a threatning hand; at the end thereof appeared three starrs, but that over which the point of the sword directly hanged was more bright and clear then the rest: on each side of this Comet were seen manie spears, swords, and other kindes of weapons died with blood, which were intermixed with men's heads, having long and terrible hair and beards, as you may see in this figure.



The figure of a fearful Comet.

Also there have been seen great and thick barrs of iron to have faln from heaven, which have presently been turned into swords and rapiers. At *Sugella* in the borders of *Hungaria*, a stone fell from heaven with a great noise, the seventh daie of *September*, *Anno Dom.* 1514. it weighed two hundred and fiftie pound: the Citizens hanged it up with a great iron-chain put through it, in the midst of the Church of their Cittie, and used to shew it, as a miracle, to travellers of better note that passed that waie. *Plinie* reports that clashing of armours, and the sound of a trumpet were heard from heaven often, before and after the Cimbrian war. The same author writes that in the third Consulship of *Marius*, the *Antes* and *Tulingines* saw the heavenlie armies comming from East and West; and so joining, those being vanquished which came from the East. Which same thing was seen in *Lusatia*, at a town called *Juba*, two hours after mid-night, *A. Dom.* 1535. But in *A. Dom.* 1550. upon the 19. daie of *July*, in *Suevia*, not far from *Wittenberg*, there appeared in the air a great Stag, incompassed with two armed hosts, making a great noise in their conflict, and at the same instant it rained blood in great abundance, the sun seemed to bee cloven in two pieces, and the one of them to fall upon the earth. A little before the taking of *Constantinople* from the Christians, there appeared a great armie in the air appointed to fight, attended on with a great companie of dogs and other wild beasts. *Julius Obsequens* reports that in *A. Dom.* 486. it rained flesh in *Italie*, in greater and lesser pieces, part of which were devoured by the birds before they fell upon the earth: that which fell upon the earth kept long unputrified, and unchanged in color and smel. *A. Dom.* 989. *Otho* the third being Emperor, it rained corn in *Italie*. *A. Dom.* 180. it rained milk and oil in great abundance, and fruit-bearing trees brought forth corn. *Lycosthenes* tel's that in the time of *Charls* the fifth, while *Magdenburg* was besieged, three suns first appeared about 7. a clock in the morning, and then were seen for a whole daie whereof the middlemost was the brightest, the two others were reddish, and of a bloodie color; but in the night time there appeared three Moons. The same appeared in *Saturnia*, *An. Dom.* 1554.

L. 2. c. 57.

Presages of the taking of *Constantinople.*

Monstrous rains.

But if so prodigious and strange things happen in the heavens besides the common order of nature, shall we think it incredible that the like may happen in the earth? *An. Dom.* 542. the whole earth quaked, mount *Ætna* cast forth flames and sparks of fire, with which manie houses of the neighbouring villages were burn'd. *An. Dom.* 1531. in *Portugal* there was an earthquake for eight daies, and it quaked seven or eight times each daie; so that in *Lisbone* alone it cast down a thousand and fiftie houses, and more then six hundred were spoiled. *Ferrara* lately was almost wholly demolish'd by a fearful earthquake. Above all which ever have been heard is that prodigie which happened in the time of *Plinie*, at the death of *Nero* the Emperor, in the *Marsian* field, the whole Olive-field of *Vettius Novellus* a Roman Knight going over the high banks, and the fields which were against it comming into the place thereof. Why should I speak of the miracles of waters, from whose depth and flotants, fires and great flames have oft broke forth? They tell out of *St. Augustine*, that the fire of the sacrifice, which for those seventie years of the Babylonian captivitie endured under the waters, was extinguished, *Nehemias* selling the priests blood for it. What miracle is this, that the fire should live in the water, above its force and natural efficacie, and that the water should forget the extinguishing faculties? Verily Philosophers truely affirm that the elements, which are understood to be contrarie, and so fight in variable manner among themselves, are mutually joyned and tied together by most seldom observed

Earth quakes.

OF THE

Faculties of Simple MEDICINES,

AS ALSO

Of their Compoſition and Uſe.

The Twentie ſixth Book.

The PREFACE.

The excellencie of medicines.

AMongſt the cauſſes which wee term healthful, and other remedies which pertain to the health of man, and the expelling of Diſeaſes, Medicines eaſily challenge the prime place; which (as it is delivered by Solomon) *God hath produced out of the earth, and they are not to bee abhorred by a wiſe man; for there is nothing in the world, which ſooner, and as by a miracle, aſſwageth the horrid torments of diſeaſes. Therefore* Herophilus *called them fittingly adminiſtred,* The hands of the Gods. *And hence it was that ſuch Phyſicians as excelled in the knowledg of Medicines, have amongſt the Antients acquired an opinion of Divinitie. It cannot by words bee expreſſed what power they have in healing. Wherefore the knowledg of them is verie neceſſarie not onely for the prevention, but alſo for the driveing away of Diſeaſes.*

CHAP. I.

What a medicine is, and how it differeth from nouriſhment

WEE define a medicine to bee, That which hath power to change the bodie according to one or more qualities; and that ſuch as cannot bee changed into our nature: contrarie whereto wee term that nouriſhment which may bee converted into the ſubſtance of our bodies. But wee define them by the word *power*, becauſ they have not an abſolute nature, but as by relation and depending upon the condition of the bodies by whom they are taken. For that which is medicine to one, is meat to another, and that which is meat to this, is medicine to that. Thus for example, Hellebore is nouriſhment to the Quail, but a medicine to man: Hemlock is nouriſhment to a Sterling, but poiſon to a Gooſ; the *Ferula* is food to an Aſs, but poiſon to other cattel. Now this diverſitie is to bee attributed to the different natures of creatures.

It is recorded in hiſtorie, that the ſame by long uſe may happen in men. They report that a maid was preſented to *Alexander* the Great, who nouriſhed with *Napellus*, and other poiſons, had by long uſe made them familiar to her, ſo that the verie breath ſhee breathed was deadlie to the by-ſtanders. Therefore it ought to ſeem no marvail, if at anie time it happen, that medicines turn into the nature and nouriſhment of our bodies: for wee commonly may ſee birds and ſwine feed upon ſerpents and toads without anie harm: and laſtly,

———Serpenti Ciconia pullos
Nutrit, & per devia rura lacerta:
Illi eadem ſumptis quærunt animalia pennis,

The Stork with Serpents and with Lizards caught,
In waieleſs places nouriſheth her brood:
And they the ſame purſue, when as they 're taught
To uſe their wing, to get their wiſh'd-for food.

CHAP. II.

The differences of Medicines in their matter and ſubſtance.

The earth the mother of riches and medicines

EVen as the concealed glorie of worldlie riches lieth hid in the bowels of the earth, and depths of the ſea and waters, as gold, ſilver and all ſorts of metals, gemms and pretious ſtones, furniſh'd with admirable virtues; ſo wee may behold the ſuperficies of this earth clothed with almoſt an infinite varietie of trees, ſhrubs, and herbs: where wee may contemplate and wonder at the innumerable diverſities of roots, leavs, flowers, fruits, gums, their ſmels, pleaſant taſts and colors, but much more at their virtues. This ſame mother-earth, as with her breaſts, nouriſheth marvellous diſtinct kindes of liveing creatures, various in their ſpringing, encreaſ and ſtrength. Wherein the immenſ goodneſs of God, the great Architect and framer of all things, doth moſt clearly appear towards man, as who hath ſubjected to our government, as a patrimonie, ſo ample and plentiful proviſion of nature for our delight in nouriſhment and neceſſitie of healing. Therefore the antient Phyſicians have

right-

rightly delivered, that all ſorts of medicines may bee abundantly had from liveing creatures, plants, the earth, water and air.

Medicines are taken from liveing creatures either whole and entire, or elſ the parts and excrements of them. Wee oftimes uſe in Phyſick whole creatures, as foxes, whelps, hedg-hogs, frogs, ſnails, worms, crabs, and other living creatures. Wee alſo make uſe of ſom parts of them, as the liver of a Wolf or Goat, the lungs of the fox, the bone of the ſtags heart, *Cranium humanum*, fat, blood, fleſh, marrow, the cods of the *Caſtor* or Beaver, which, is therefore termed *Caſtoreum*, and ſuch other particles that are uſeful in Phyſick. Wee know alſo that there are ſom medicines taken from excrements, as horns, nails, hairs, feathers, skin; as alſo from urine, dung, ſpittle, honie, eggs, wax, milk, wool, ſweat, and others of this kinde, under which wee may comprehend muſk, civet, pearl, *æſipus*, and ſundrie others of this nature. What medicines taken from liveing creatures.

Wee take medicines from plants, both whole, and alſo from their parts, whether trees, ſhrubs, or herbs. For we oft-times uſe ſuccorie, marſh-mallows, mallows, plantain, and the like, whole: but otherwhiles onely the roots of plants, their pith, wood, bark, ſhoots, ſtalks, leavs, flowers, ſeeds, fruits, juices, gums, roſines, moſſes, and the like. What from plants.

Things taken from the earth for the uſe and matter of medicine, are either earths, ſtones, or Minerals. The ſorts of earth are Bole-Armenick, *Terra ſigillata*, fuller's-earth, chalk, potters claie, and ſuch like. Stones, are the pumice, Marchiſite of gold, ſilver, braſs, marble, the load-ſtone, plaiſter, chalk, *ſulphur vivum*, *lapis ſpecularis*, and others. Metals and Minerals are gold, ſilver, tin, lead, braſs, iron, ſteel, antimonie, ceruſe, brimſtone, Cinnaber, litharge of gold and ſilver, tuttie, true *Pompholix*, verdigreece, alum, romane vitriol, copras white and green, ſalts of ſundrie kinds, both of Arſenicks, and ſuch like. What from the earth.

The following medicines are from freſh water, rain-water, ſpring-water, river-water, and all things thence ariſeing, as water-lentile, common flags, water-lilies, water-mints, and all the creatures that live therein. From the ſalt-water are taken ſalt, *Alcyonium*, all ſorts of coral, ſhels of fiſh, as alſo cuttle-bones, ſponges, and all creatures of the ſea. From waters mixt of ſalt and freſh, the herb *Androſace* (which grow's in plentie in the marſhes at *Fontignan* and *Cape de Sete*) *Aſphaltum*, which is found in the dead ſea. What from the water.

From the air proceed's *Manna*, therefore called *mel-æriſon* (*i.e.*) honie of the air, and alſo all other kindes of dew that are uſeful in Phyſick, by reaſon of the virtues they receiv from the ſun which raiſeth them up; from the air, whereas they make ſom ſtaie; as alſo from the plants, whereupon they fall and reſide. What from the air.

CHAP. III.

The differences of ſimples in their qualities and effects.

ALL the mentioned ſorts of ſimples are indued with one or more of the four faculties, whereof I now purpoſe to treat.

The firſt faculty common to all the reſt, and as it were their foundation, flow's from the four firſt qualities of the prime bodies or elements, that is heat, coldneſs, drineſs, and moiſture, and this either ſimple or compound, as one or two of theſe prime qualities exceed in the temper of the medicine, as may appear by this following.

The *ſimple* qualitie is either to Heat, Cool, Humect, Drie.

The *compound*, ariſeing from two joined qualities, either Heat's and drie's, Heat's and moiſten's, Cool's and drie's, Cool's and moiſten's.

Heat moderate, Heat's, Attenuate's, Rarifie's, Open's the paſſages, Digeſt's, Suppurate's. Immoderate, Inflame's and burn's, Bite's, whence follow's Violent attraction, Rubrification, Conſumption, Colliquation, An eſchar, Mortification.

Cold moderate, Cooleth, Condenſeth, Obſtructeth. Immoderate, Congeal's, Stupifie's, Mortifie's.

Moiſture moderate. Humect's, Lubricate's, Levigate's and mitigate's, Glue's. Immoderate, Obſtruct's, liſt's up into a flatulent tumor, eſpecially if it bee a vaporous humiditie.

Drineſs moderate, Drie's, Rarifie's, Attenuate's. Immoderate, Binde's, Contract's or ſhrink's, Cauſſeth chops and ſcails.

The effect of theſe qualities is diſtinguiſhed, and as *Galen* obſerv's digeſted into theſe orders, which wee term Degrees, ſo that by a certain proportion and meaſure, they may ſerv to oppugn diſeaſes, as the ſame *Galen* affirm's. For to a diſeaſ (for example) hot in the ſecond degree, no other medicine muſt bee uſed then that which is cold in the like degree: Wherefore all ſimple medicines are Hot, Cold, Moiſt, or Drie; in the beginning, middle, or extreme, of the firſt, ſecond, third, or fourth degree. *1. ſimp. & 1. de aliment.*

The Heat, Coldneſs, Moiſture, Drineſs, of the firſt, ſecond, third, fourth degree; is either Obſcure, Manifeſt, Vehement or Exceſſive.

Examples of the degrees of heat.

An example of heat diſtinguiſhed thus by degrees, may bee thus; Warm water is temperate; that which is a little hotter, is in the firſt degree of heat; if manifeſtly hot, it is in the ſecond degree; but if it heat more vehemently, it may bee thought to com to the third; but if it ſcald, then wee know that it hath arrived to the fourth degree of heat. Such alſo is the diſtinction of coldneſs, moiſture, and drineſs by degrees. Wherefore it will bee worth our labor, to give you examples of certain medicines, diſtinguiſhed in their order and degree, by which you may the more eaſily give conjecture of the reſt.

Simple Medicines hot in the

Firſt degree. *Abſinthium. Althæa. Amygdala dulcia. Beta. Braſſica. Chamæmelum. Ladanum. Semen Lini. Saccarum. Ervum, ſive Orobus. Vinum novum:* Forold is judged hot in the ſecond or third degree, as it is more or leſs years old.

Second degree. *Ammoniacum. Arthemiſia. Anethum. Fœnugræcum. Maſtiche. Salvia. Marrubium. Meliſſa. Apium. Chamæpytis. Crocus. Ficus. Thus. Myrrha. Mel. Nux moſchata. Pix utraque tum arida corporibus particuliſque ſolidioribus aptior, tum liquida delicatioribus. Scilla. Sarcocolla. Bryonia. Sal. Opopanax. Ammi.*

Third degree. *Abrotanum. Agnus caſtus. Aniſum. Aſarum. Ariſtolochia. Chamædrys. Sabina. Calamintha. Cinnamomum. Iris. Juniperus. Hyſſopus. Origanum. Sagapenum. Chelidonium majus. Ruta ſaliva.*

Fourth degree. *Allium. Cæpa. Euphorbium. Naſturtium. Pyrethrum. Sinapi Tithymalli. Anacardi. Chelidonium minus, Galeno.* Yet ours, by reaſon of the gentleneſs of the air, and moiſture of our ſoil, is not ſo acrid. *Ruta ſylveſtris.* This, as all wilde and not cultivated things, becom's more ſtrong and acrid then the Garden-Rue.

Simples cold in the

Firſt degree. *Atriplex. Hordeum. Cydonia mala. Malva. Pyra. Pruna. Roſa. Viola.*

Second degree. *Acacia. Cucurbita. Cucumis. Mala granata acida, dulcia enim temperata ſunt potiùs. Plantago. Polyganum. Solanum hortenſe; nam id quod ſomniferum dicitur, vi refrigerandi ad papaver accedit.*

Third degree. *Hyoſcyamus. Solanum ſomniferum. Portulaca. Sempervivum. Mandragora.*

Fourth degree. *Cicuta. Papaveris genera omnia, excepto Corniculato; huic enim incidendi & abſtergendi vim attribuit Gal. Certè nitroſum & ſalſum guſtu percipitur, quò fit ut calidæ & ſiccæ ſit naturæ. Opium.*

Simples moiſt in the

Firſt degree. *Bugloſſum. Viola. Malva. Rapum. Spinacia.*

Second degree. *Ammoniacum. Lactuca. Cucurbita. Cucumis. Melones. Portulaca.*

Simples drie in the

Firſt degree. *Thus. Chamæmelum. Braſſica. Sarcocolla. Crocus. Faba. Fœnugræcum. Hordeum integrum.*

Second degree. *Artemiſia. Pix arida. Orobus. Plantago. Balauſtia. Nux moſchata. Lens Maſtiche. Mel. Sal. Anethum. Myrrha.*

Third degree. *Abrotonum uſtum. Abſinthium. Myrtus. Acetum. Aloe. Milium. Cuminum. Sanguis draconis. Galla. Sabina.*

Fourth degree. *Piper. Allium. Naſturtium. Sinapi. Euphorbium.*

The effects of the firſt qualities by accident.

Thoſe wee have mentioned have of themſelvs and their own nature all ſuch qualities; yet do they produce far other effects by accident, and beſides their own nature in our bodies, by reaſon of which they are termed accidental cauſſes. This ſhall bee made manifeſt by the following examples.

External heat by accident refrigerate's the bodie within, becauſ it open's the paſſages and pores, and call's for the internal heat, together with the ſpirits and humors by ſweats: whence it follow's, that the digeſtion is worſ, and the appetite is diminiſhed. The ſame encompaſſing heat alſo humect's by accident, whileſt it diffuſe's the humors concrete with cold: for thus Venerie is thought to humect.

The like may bee ſaid of Cold, for that it heat's, not by it's proper and native, but by an adventitious force: whereof you may make trial in Winter, when as the ambient cold, by ſhutting the pores of the bodie, hinder's the breathing forth aud diſſipation of the native heat. Whence it is inwardly doubled, and the concoction better performed, and the appetite ſtrengthned. This ſame Cold alſo drie's by accident, when as it by accident repercuſſe's the humor that was readie to flow down into anie part, and whil'ſt it concrete's that which is gathered in the part: for thus, by the immoderate uſe of repercuſſers, an œdematous tumor proceeding from groſs and viſcid phlegm, degenerate's into a *ſcirrhus.*

Drineſs and Moiſture, becauſ they are more paſſive qualities, ſhew their effects by not ſo manifeſt operations, as heat and cold do; but in compariſon of them they are rather to bee judged as matter, or a ſubject.

CHAP. IV.

Of the ſecond faculties of Medicines.

WEE term thoſe the ſecond faculties of Medicines, which have dependance upon the firſt, which are formerly mentioned, as it is the part of Heat to Reſolve, Attract, Open, Attenuate,

Attenuate, Levigate, Cleanſ. Of *Cold*, to Condenſ, Repercuſs, Shut up, Incraſſate, Exaſperate, Conſtipate. Of *Moiſture*, to Soften, Relax. Of *Drineſs*, to Harden. Stiffen.

Hence wee term that an attractive medicine, which hath an attractive facultie, as on the contrarie, that a repercuſſive, that repel's; a detergent, that which cleanſes viſcous matter. Wee call that an Emplaſtick medicine, which not onely ſhut's up the pores of the bodie, but reduce's the liquid bodies therein contained to a certain equalitie and ſubſtance. Thus alſo emollients, relaxers, and the reſt, have their denominations from their effects, as wee ſhall declare hereafter.

CHAP. V.

Of the third faculties of Medicines.

THe third facultie of medicines depend's for the moſt part upon the firſt and ſecond faculties, ſomtimes conjoined, otherwhiles ſeparate. Alſo ſomtimes it follow's neither of theſe faculties, but a certain propertie and inexplicable qualitie, which is onely known by experience. Now the operations of this third facultie are to agglutinate, to fill with fleſh, to cicatrize, to aſſwage pain, to moov or ſtaie the urine, milk, ſeed, the courſes, ſweats, vomits, and perform ſuch like operations in, or about the bodie.

Thus the generation of fleſh is produced by the concourſ of two faculties, that is, of drying and cleanſing. But drineſs and aſtriction produce a glutinating and cicatrizing faculties A hot and attenuating facultie cauſſeth ſweats, moov's urine, the courſes, and the like in the bodie; but contrarie faculties retard and ſtop the ſame.

To mitigate pain, proceeds' onely from the firſt facultie, to wit, from heat, or a moderately heating facultie; to procure reſt, from cold onely, or coldneſs ioined with ſom moiſture. But to procure vomit, proceed's neither from the firſt nor ſecond facultie, but from a certain occult and eſſential propertie, which is naturally implanted in Agarick, and other nauſeous and vomitorie medicines.

CHAP. VI.

Of the fourth facultie of Medicines.

THe fourth facultie of medicines is not of the ſame condition with thoſe that are formerly mentioned; for it depend's not upon them, or anie other manifeſt or elementarie qualitie, but on an occult propertie of the whole ſubſtance; by means whereof, it work's rather upon this then that part, upon this rather then that humor. Wherefore Phyſicians cannot by anie reaſon finde out this facultie, but onely by experience, as wee have ſaid a little before of medicines procuring vomit. Hence it is, that names are given to thoſe medicines from thoſe parts that they chiefly reſpect: For they are termed Cephalicks, which reſpect the head; as, Betonie, Marjarom, Sage, Roſemarie, *Stechas*. Pneumonicks, which reſpect the Lungs: as, Liquorice, ſweet Almonds, Orris, Elecampane. Cordials, that ſtrengthen the heart: as, as Saffron, Cinnamom, Citrons; but chiefly their rindes, Bugloſs, Coral, Ivorie. Stomatical, which reſpect the ſtomach, and the orifice thereof: as, Nutmegs, Mint, Aniſ, Maſtick, Pepper, Ginger. Hepaticks, which reſpect the Liver: as, Wormwood, Agrimonie, Spiknard, Succorie, Sanders. Spleneticks, which have relation to the ſpleen: as, as Time, *Epithymum*, Broom flowers. Cetrach, Capers, the bark of their roots, the bark of Tamariſk. Diureticks, ſuch as reſpect the kidnies and urinarie paſſages: as, the roots of Smallage, Aſperagus, Fennel, Butcher's broom, the four greater cold ſeeds, Turpentine, Plantain, Saxifrage. Arthniticks, or ſuch as ſtrengthen the joints: as Cowſlips, *Chamæpytis*, Elecampane, Calamint, Hermodactils, and the like.

The fourth facultie of medicines depend's onely upon an occult propertie.

To this rank may bee referred purging medicines, which, furniſhed with a ſpecifick propertie, ſhew their efficacie on one humor more then another humor, and that impaſt more in one part then in another. For thus Agrick chiefly draw's phlegm from the head and joints, Rubarb draw's choller chiefly from the Liver, and hurt's the kidnies. But let us here forbear the conſideration of ſuch things, as not appertaining to Surgerie. But ſom medicines of this kinde are furniſhed with one ſimple facultie, otherſom with more, and thoſe contrarie, whereof you taſte may give you ſufficient notice: for Rubard at the firſt touch of the tongue is found acrid and hot; but when you com to chaw and throughly to taſte it, you ſhall finde it to partake of an earthlie aſtriction. Therefore becauſ taſtes give notice of the faculties of medicines, therefore I have thought good to treat of them briefly.

CHAP.

CHAP. VII.

Of Tastes.

Lib. 1. simpl.

Differences of tastes.

TAste, as *Galen* deliver's according to *Aristotle* and *Theophrastus*, is a certain concoction of moisture in drineſs, causſed by means of heat, which wee know or discern by the tongue well tempered, and fittingly furnished with spittle and his nervs. There are nine differences of tastes; for there are three judged hot, to wit, the acrid, bitter, and salt: three cold; the acid, austere, and acerb: three temperate; the sweet, the oilie or fat, and the insipide. Now they are thought so manie, according to the different degrees of concoction; for it appear's greater in hot tastes, and as it were a certain assation, but less in cold, but indifferent, and as it were an elixation in things temperate: therefore Nature observ's this order in the concoction of sapid bodies, that at the first the acerb taste should take place, then the austere, and lastly, the acid: from these (as it were) rudiments of concoction, arise's an insipid, then an oilie, then a sweet perfectly concocted and temperate. This concoction exceeding the bounds of mediocritie, there arise's a salt taste, then a bitter, and then an acrid with the highest excels of almost a fierie heat. Yet I would bee thus understood, that all things that are by nature sapid, do not alwaies ascend to the height of sweetneſs by the degrees of acerbitie, austeritie, and aciditie, as though it were of absolute necessitie, that all things that are sweet, they should bee acerb, austere, and acid. For there are manie things found, especially in plants and their fruits, which when they shall arrive to their perfection and maturitie, are acid, bitter, or salt, but beeing yet unripe, and not com to full perfection, they have a certain sweetneſs, which afterwards, by a further digestion, or perfection and concoction, acquire a bitter, austere, or acid taste. For thus bitterneſs in Wormwood and Aloës, acrimonie in Pepper or Pellitorie, is a perfection of nature, a full ripeneſs and perfect concoction, and not an excels of heat in that *species*. Also acerbitie and austeritie is a perfection of nature, and not a rudiment in Services and Cornelians; aciditie or tartneſs is also in verjuice. But in verie manie things it so fall's out, that the sweet or fattie tastes becom so, and acquire their perfection by concoction, as in Grapes, Figs, Pears, Apples, and almost all other such fruits, as wee usually feed upon. Therefore I will now treat of each of them in order, first beginning with cold tastes.

The acerb taste.

The acerb taste is cold and terrestrial, and of a substance absolutely gross, beeing less humid then the austere, but much less then the acid. It notablie cool's and drie's, it condensat's, binde's, repel's, especially from the superficies, and it also exasperate's; this taste reside's, and may bee found in Pomegranat pills, Galls, *Sumach*, and Cypress nuts.

The austere.

The austere is nigheſt in temper and effects to the acerb, but somwhat moister; for the acerb absolutely consist's in a terrestrial and cold substance. Wherefore this, increased by a degree of concoction, acquire's more store either of heat alone, or elſ of moisture alone, or elſ of both together: moisture, I say, and that is either aërie, or elſ watrie. Therefore if these fruits, which before their maturitie are acerb, have an accession of heat, then do they becom sweet, as you perceiv by Chesnuts; but if there bee an accession of moisture onely, and that more gross, of acerb they becom austere: for both the tastes are in the like degree of cold, but the austere is the moisture. But if to the same frigiditie remaining in fruits, a certain subtle humiditie accrew, then is there causſed an acid taste. But if they have an accession of a watrish moisture and heat, they will acquire a sweet taste, or elſ oilie, if the humiditie accrewing with the heat bee aërie.

I have judged it requisite to admonish you hereof, that you might know by what means sapid bodies mitigated becom sweet of acerb, as it were by these interposed degrees of austeritie, aciditie, and oilineſs, as they acquire a various accession of heat and moisture separately, or conjunctly.

Now by all that wee have delivered, you may gather, that all acerb and austere things are cold and drie; and as they are cold, they repel and hinder defluxions: as they are drie and terrestrial, they condensate, incrassate, constipate, and straiten the passages; yea, and they also cicatrize: but acerb things perform this far more powerfully, as those which are absolutely terrene, cold, and drie, not partaking of moisture, or water. Now austere things consist (as it were) in a middle matter, that is, in a more dilute terrene bodie, as it is apparent in Services, unripe Grapes, Cornelians, Medlars, Crabs, wilde Pears, and all sort of unripe fruits, whence it is termed a crude taste.

The acid taste.

The acid taste is of a cold and watrish nature, but most subtle, by benefit whereof it penetrate's, and divide's almost as powerfully as the acrid. It incide's or divide's, attenuate's, bite's, cleanse's, open's obstructions, repel's and drie's. For by the means of the deep piercing cold, it repel's all defluctions; and by the drying facultie, which is strong even in it's watrie consistence, it staie's and stops all bleedings, the hæmorrhoides and dysenteries. The force thereof is chiefly manifest in Vineger, as also in the juice of Citrons, Sorrel, Cherries, Berberies, and the like. And this is the nature of cold tastes, now it is time wee speak of such as are temperate.

The

The inſipid is unproperly termed a taſte, as that which is rather a privation of taſtes, it is in ſom ſort cold, and of a verie watriſh and groſs nature, it inſpiſſate's, conſtipate's, and ſtupifie's. This kinde of taſte is chiefly manifeſt in Water, and next in Gourds, Citruls, and manie ſuch like things. The inſipid.

The oilie taſte is hot, humid, and aiërie; therefore it humect's, relaxate's, mollifie's, lubricate's. Of this kinde are oil, butter, fat which is not rauced by age, nor acrid by nature, as that of Lions and Foxes. The oilie.

The ſweet taſte is made by a moderate and well concocting heat, conſiſting in a matter more tenuious and hot then the inſipid, but in ſomwhat more groſs then the oilie, from which in the firſt qualities it doth not differ; therefore it is of a hot, aiërie, and temperate nature. Therefore everie ſweet thing detergeth, levigate's, concoct's, ripen's, relaxe's, and aſſwageth pain. Examples of this taſte may bee had in Sugar, Honie, Manna, ſweet Almonds, Milk, and other like. Now let us com to hot taſtes. The ſweet.

The ſalt taſte is hot and aſtringent, leſs earthie then the bitter, as that which reſide's as it were in a middle matter. For it proceed's from an earthie drineſs, which is formerly torrified and attenuated by the force of heat in a watrie humiditie. Wherefore that which is ſalt contract's the pores, cut's, cleanſe's, digeſt's, or rather drie's up the humors by the drineſs thereof, without anie manifeſt ſenſ of heat, whence it is, that it vindicate's from putrefaction. Under this kinde are conteined all ſorts of ſalt; as ſalt-peter, *niter*, *ſal Ammoniacum*, *ſal gemmæ*, common-ſalt, ſea-water, and ſuch other like. The ſalt.

The bitter taſte is hot, earthie, and drying; for the matter thereof is groſs and earthie, which the abounding heat hath torrified and dried up. Wherefore bitter things taken inwardly, purge and carrie away ſuperfluous humors: and outwardly applied, they mundifie and deterge ulcers, they open the mouths and paſſages of the veins oft-times by their abſtergent facultie; whence it is that they moov the courſes and hæmorrhoïdes. The principal things indued with this taſte are Aloës, Gall, Wormwood, Gentian, the leſſer Centaurie, Coloquintida, Fumitorie, Soot, and ſuch like. The bitter.

The acrid taſte is hot, of a ſubtil and fiërie nature; for it is kindled of a hot, ſubtle, and drie matter, neither can it conſiſt in anie other. Therefore that which is acrid, heat's, prick's or bite's the mouth by the acrimonie, it heat's, and oft-times burn's, it penearate's, open's the paſſages, attenuate's, attract's and draw's forth groſs humors, evacuate's and ſend's forth urine, the courſes, and ſweat: beſides it oft-times is ſeptick, bliſtering, and eſcharotick; and laſtly, burning, and cauſtick. The ſeptick and putrefactive things are ſublimate, *Chamælen*, the juice of *Thapſia*. The veſicatories are Dittander, Cantharides, Crow-foot, Muſtard, Pellitorie of Spain, *Euphorbium*. But the cauſtick and eſcharotick are Lime, Oke-aſhes, and the like. The acrid.

But wee know medicines not onely by the taſte, but alſo by our other ſenſes, as touch, ſight, hearing, ſmell. And as by the taſte, ſo alſo by theſe wee judg of and trie the goodneſs of medicines, and diſtinguiſh the true legitimate from the adulterate. The touch judge's what are hot and cold, moiſt and drie, rough and gentle, or ſmooth, hard and ſoft, brittle or friable, glutinous and viſcid, drie or ſlipperie. Wee approov of the goodneſs of medicines by their color, brightneſs, or duskineſs, whereof the eie is judg; for wee commend that Senna which is ſomwhat greeniſh, but diſlike the whitiſh: as alſo wee like well of ſuch Caſſia as is black both within and without, ſhining and full, and not drie and ſhrunk up. Yet the judgment of the firſt qualities, by the color is deceitful, or none at all; for ſuch things as are white, or the color of Snow, are not therefore cold: for ſundrie of them are hot, as Lime. Neither are red things to bee therefore judged hot; for Roſes cool. Alſo medicines are choſen by the ſmell; for ſuch as have a good, freſh, and natural ſmell, are commonly hot, and in their perfect vigor. On the contrarie, things that want ſmell are for the moſt part cold and evanid. By hearing wee diſtinguiſh things full from ſuch as are emptie: thus wee chuſe Caſſia, which ſhaken, make's no noiſ with the grains or ſeeds rattling in it. Hitherto wee have explained the firſt, ſecond, third, and fourth faculties of medicines in general, and have ſhewed how they may bee found out: now muſt wee more particularly treat of their ſecond and third faculties, becauſ by reaſon of theſe they chiefly com into uſe in Surgerie: Yet let mee firſt briefly ſhew by what means and arts they may bee prepared.

CHAP. VIII.

Of the preparation of Medicines.

TO prepare medicines, is nothing elſ, then by Art to make them more commodious for uſe and compoſition, whereby they are either made

More gentle. By *bruiſing*; as when medicines are broken by ſtriking and rubbing or grinding in a mortar, and that either of Braſs, Iron, Lead, Glaſs, Wood, Marble, and other like. Conſidering the thing which is to bee beaten. The ſtrength or force wherewith it muſt bee performed. The time or ſpace. The ſituation. The things to bee added. The conſiſtence which the thing beaten muſt bee of.

More ſtrong

By *ſearſing*; whereby wee ſeparate the pure and finer from the more impure and groſs, which is don by ſivs and ſearſes, made of Wood, Parchment, Horſ-hair, Silk, Lawn. Wherein is to bee noted, that the ſame conſideration is to bee had in ſearſing, asin beating; therefore ſuch things as are to bee finely powdered, muſt bee ſearſed in a finer ſearſ: ſuch as are more groſs, in a courſer.

More pleaſant

By *diſſolving* or *mollifying*; Which is nothing elſ but a diſſolving of a ſimpleor a compound medicine, of a thick or hard conſiſtence, either into a mean conſiſtence, or a little more liquid or ſoft, which is performed either by heat onely for by heat gums and horns are mollified: or by liquor, as by vineger, water, wine, juice of Limmons, &c.

More wholeſom

By *deſiccation* or *hardening*; which is nothing elſ, but the conſuming of the ſuperfluous and hurtful moiſture; and this is performed, either by the Sun, or by Fire. By *infuſion*; which is nothing elſ but the tempering or macerating of a medicinea little beaten or cut, in ſom liquor appropriate and fit for our purpoſe; as in Milk, Vineger, Water, oil, and the like, ſo long as the nature of the medicine require's. To Infuſion, Nutrition may bee reduced, which is nothing elſ, but as it were a certain accretion of the medicine, by beeing moiſtened, macerated, rubbed, or groun'd with ſom moiſture, eſpecially with heat. By *burning*; that is, by conſuming the humiditie which is in them. And that, eisher that they may bee the better powdered, beeing otherwiſe too glutinous, or that they may laie aſide their groſs eſſence, and becom of a ſubtiler temper; or that they may put off, or partly loſe ſom fiërie qualitie, as acrimonie, *Gal. lib. 4. cap. 9. ſimplicium.* Or that they may acquire a new color. Now all things are burnt, either alone; as, ſuch things as have a fattie moiſture, as hairs, ſweatie wool, horns: Or elſ with ſom combuſtible matter; as ſulphur, alum, ſalt, barlie, &c.

More fit for mixture

By *boiling* or *elixation*; which is performed by a humid heat; as burning is by a drie, and that either that wee may increaſ the weak faculties of ſuch medicines as are boiled, by boiling them with ſuch as are ſtronger; or elſ to weaken ſuch as are too ſtrong, or elſ wholly to diſſipate ſuch as are contrarie: Or that one facultie may ariſe of ſundrie things of different faculties beeing boiled together, or for the longer keeping them, or bringing them to a certain form or conſiſtence: All which are don, by the Fire, or Sun. By *waſhing* or *cleanſing*; whereby the impuritie of the medicine is waſted away or cleanſed, and ſuch things are either hard: as metals, ſtones, parts of living creatures, condenſed juices, and otherlike: Or ſoft; as Roſins, Gums, Fats, Oils. And theſe ought firſt to bee finely beaten, that the water may penetrate in all their ſubſtance. Or to bee diſſolved, and caſt into a veſſel filled with water, and ſo ſtirred, and then ſuffered to ſubſide, ſo that the fat mayſwim aloft: And this muſt bee don ſo long that the water retain nothing thereof in color, ſmell, or taſte.

CHAP. IX.

Of repelling, or repercuſſive Medicines.

Aſtringents are underſtood by the name of repellers.

REpelling or repercuſſive medicines are cold, and of groſs and earthie parts; by which name alſo aſtringent medicines are underſtood, becauſ they hinder the falling down of the humors upon the part. Repercuſſives are ſuch, either of their nature, and of themſelvs, or elſ by accident, beeing not ſuch of their own nature. Theſe which of themſelvs are ſuch, are of two kindes; for ſom are watriſh and moiſt, without anie aſtrictive facultie, which almoſt wholly proceed's from an earthie eſſence; wherefore that facultie of repelling which they poſſeſs, they have it wholly from coldneſs. Of this kinde are lettuce, purſlain, ſow-thiſtle, duck's-meat, kidnie-wurt, cucumbers, melons, gourds, houſ-leek, mandrag-apples, night-ſhade, henbane, and the like, which cool powerfully, and unleſs they bee taken away before the part wax blackiſh, they extinguiſh the natural heat. Other ſom are of an earthie eſſence, and therefore aſtrictive; but yet ſom of theſe are hot, other ſom cold. Such things as are cold of temper, and of an earthie conſiſtence, are properly and truly termed repellers. Of theſe, ſom are ſimple, other ſom compound: the ſimples are plaintain, vine-leavs, leavs of roſes, okes, brambles, cypreſs, berberies, *ſumach*, all unripe fruits, verjuice, vineger, red wine, the juice of ſower pomegranats, *acacia*, the juice of barberries, and quinces, *hypociſtis*, pomegranate-pills, oke-bark, the flowers of wilde pomegranats, the meal of barlie, beans, panick, oats, millet, *orobus* mixed with juices in form of a pultis, bole-armenick, *ſanguis draconis*, ceruſs, litharge, *terra ſigillata*, fuller's-earth, chalk, marl, the load-ſtone, lead, corals, all marchiſites, antimonie, *ſpodium*, true *pomphylix*, all ſorts of earth, and other things of the like nature.

The differences of repercuſſives.

Now compound things are *Oleum roſaceum*, *omphacinum*, *mirtillorum*, *papaveris*, *cidoniorum*, *nenupharis*, *unguentum roſatum*, *album rhaſis*, *camphoratum*, *emplaſtrum diacalcitheos*, diſſolved in vineger and oil of roſes, *deſiccativum rubrum*, *populeon*, *emplaſtrum nigrum ſeu tetrapharmacum* of *Galen's* deſciption, *empl. contra ruptur.*, *de ceruſſa*, *pro matrice*. All ſuch cold repercuſſives

repercuſſives are more effectual if they bee aſſociated with tenuitie of ſubſtance, either of themſelvs, or by mixture with ſom other things: for to this purpoſe wee often mix vinegar, camphire, and the like things of ſubtil parts, with repercuſſives of groſs parts, that they may ſerv as *vehicles* to carrie in the repercuſſive's faculties. Why things of ſubtil parts are oft-times mixed with repercuſſives. Repercuſſives of groſs parts and hot, are wormwood, centorie, gentian, agrimonie, ſavin, coriander, mint, baie-leavs, cardamomes, *calamus, aromaticus*, aloës, ſpiknard, ſaffron, nutmeg, cinnamom, amber, ſalt, alum, cõporas, *ſulphur, oleum abſinthinum, maſtichinum, nardinum, coſtinum, ceratum, Gal. ſtomachicum, ſantalinum, emplaſtrum diacalcitheos.* But ſuch things as repel by accident, are bandages, compreſſes, linnen-cloths, and rowlers of all ſorts, caſes, cauteries, blood-letting, cupping, painful frictions in the oppoſite parts, and other ſuch like things as are properly ſaid to make revulſion. Repellers by accident. The uſe of repercuſſives is to force back the humor which flow's from anie other place into the part, and thus they mitigate the heat of ſuch inflammation as that defluxion of humors hath cauſed, yea, oft-times to aſſwage and help pain, the fever, abſceſs, malign ulcers, and mortification. Such repercuſſives muſt alwaies bee ſo oppoſed to the diſeaſ, that reſpect may bee had to the temper, complexion, and particular nature of the part whereto they are applied; for all parts cannot equally bear the like force of repercuſſives, as nervous and other ſpermatick and cold parts. Furthermore, there are ſom parts whereto wee may by no means applie repercuſſives; as the groins, arm-pits, and thoſe glandules or kernels which are behinde the ears and brain, leſt the humor ſhould retire back into ſom of the principal parts: the like reaſon is alſo of bodies; for the bodies of women, children, eunuchs, cannot endure ſo ſtrong repercuſſives and the like exceſs of cold as the manlie and vigorous bodies may. When, and to what parts repercuſſives muſt bee applied. Beſides, everie diſeaſ require's not repercuſſives, for if the bodie bee repleat with ill humors; if it bee plethorick; the uſe of repercuſſives, unleſs after general purgation, cannot bee ſafe; as neither if the humor, which is in motion, ſhall bee venenate, groſs, acrid, critical, or ſhall cauſ great pain in the part, for then on the contrarie wee muſt rather make uſe of attractives. But now if the diſeaſ bee great, weak repercuſſives will avail nothing againſt it, as lettuce againſt a great inflammation; and thou ſhalt do ill if thou ſet upon a ſmall defluxion with powerful repellers; for by that means the skin is ſtraitned, and the paſſages thereof ſtop't, whereby the inflammation is increaſed, or elſ brought to a *ſcirrus*. Wherefore let the Surgeon have a care that hee temper the force of his Repercuſſives according to the magnitude of the diſeaſ.

CHAP. X.

Of attractive medicines.

AN attractive medicine is contrarie to the repeller; the Greeks call it *Helcitícum*, it is of a hot and thin ſubſtance, whereby it draweth forth into the ſuperficies of the bodie that which lieth hid in the center, although ſomtimes it doth it by an occult qualitie; other-whiles alſo by accident, as by the acrimonie. What an attractive medicine is. Thoſe things which by a manifeſt qualitie do attract, are either ſimple or compound.

The ſimple are *Bryonia, allium, cæpa, porrum, araſtolochia, hermodactyli, ciclamen, lilium, ſigillum beatæ Mariæ, arum, aſarum, aſphodelus, gentiana, pyrethrum, ruta, ſabina, calamentum, omnes tithymalorum ſpecies, viſcum, abrotanum, anagallis, urtica, ranunculus, ſtrutbium*, and ſuch like: *Ammoniacum, bdelium, gabbanum, ſagapenum, euphorbium, aſphaltum, cinis è fæce vini vel aceti, calx viva, ſulphur, ſal ammoniacus, omnis ſalis ſpecies, auripigmentum, oleum vetus, adeps leonis, urſi, canis, anſeris, viperæ, ranarum, axungia porci vetuſtate acris, aut attritu rotarum. Compoſita verò, ut oleum de ſpica, philoſophorum, de terebinthina, de croco, de ſcorpionibus, rutaceum, vulpinum, laurinum, anethinum, de vitriolo, unguentum Agrippæ, aragon, ſeu auxiliare, martiatum, emulatum, theriaca, mithridatium, empl. de meliloto, diachylon magnum & parvum, oxycroceum, divinum.* Attractives by a manifeſt qualitie.

Thoſe things which draw by a ſecret propertie in nature, as are the load-ſtone, quick-ſilver, pyonie, amber, all antidotes and triacles that are remedies againſt the biteings of venemous beaſts, and all purging medicines. By an occult.

Theſe which draw by accident, perform it otherwiſe then of their own nature, they have that qualitie out of putrefaction and corruption, as dove's dung, goat's dung, cow-dung, man's dung, and all kinde of dungs: alſo leven, old cheeſ, and ſuch like. By accident.

Cupping glaſſes, leeches, ſyringes, rougher and harder frictions, ſucking, pain, ſtraight ligations, cauteries do alſo draw, but after a different manner from them ſpoken of before.

Attractive medicaments muſt neither burn nor diſcuſs, and beeing verie ſtrong and ſharp, they ſhould bee tempered and mixed with oil of roſes, and other lenitives: but to weak ones ſhould bee added oil of baies, *calx viva*, and ſuch like to ſtrengthen them. The uſe of attractives is to draw poiſon toward the skin, and to haſten forward critical abſceſſes; Their uſe.

and they make thoſe parts which are benummed and conſumed, to have life, they reſtore the refrigerated parts by drawing thither the ſpirits; they draw forth the viſcous filth of malign ulcers that lie's hid in the nervs, and hollow paſſages of them; they alſo draw out ſcales of bones, ſplinters of wood, nails, thorns, arrows, and that matter which is impact in hardned inflammations.

CHAP. XI.

Of reſolving Medicines.

What a reſolving medicine is. The differences thereof.

WHat is called a reſolving medicine, which by heat, and the tenuitie of his ſubſtance openeth the pores, attenuate's the humors, diſſipate's and diſcuſſeth by evaporating the unprofitable matter. There are two ſorts of theſe kinden of medicines; the one is called *Araeoticum* or rarifying; the other is termed *Diaphoreticum*, or digeſting.

The *Araeoticum* by a mean heat, and not drie, and indued with a tenuitie of ſubſtance, openeth and relaxeth the skin, and draweth forth the matter ſhut up under it, whereby it may eaſ pain, like as Anodynes, becauſ it doth not much depart from a temperate heat.

But the *Diaphoreticum* beeing much hotter, whatſoever ſticketh in the part beeing there impact, it doth by thin vapor inſenſibly diſſipate: therefore the acrid and hot things are in this caſe to bee made uſe of rather then then attractives, becauſ that cold and groſsneſs is more difficulty to bee digeſted, and the length and involution of the vaies beeing to bee conſidered. The Araeotick, which wee may call weak reſolvers, are either ſimple or compound.

The ſimples are theſe, *Biſmalva tota, parietaria, adianthum, mercurialis, ebulus, valeriana, roſmarinus, ſalvia, thymus. chamaemelum, melilotum, anethum, farina hordei, tritici, ſeminis lini, fœnugraeci, nigella, furfur, adeps gallinae, anſeris, anatis, cuniculi, vituli*; almoſt all metals unleſs ſuch as are acrid. The compounds are *Oleum chamaemelinum, anethinum, liliaceum, catellorum, lumbricorum, Keirinum, de vitellis ovorum, de tritico, amygdalarum dulcium, Unguentum de althaea, empl. diachylum, ireatum.* Diaphoreticks or digeſtives, are alſo both ſimple and compound: The ſimple are *Ariſtolochia, enula campana, iris, caſia, ſcylla, ſigillum Salomonis, ſigillum beatae Mariae, bryonia, panis porcinus, dracunculus, aſphodelus, origanum, mentha, pulegium, ſabina, ſerpillum, calamentha, byſſopus, urtica, artbemiſia, lavendula, chamepytis, aniſum, fœniculum, cuminum, piper, nux moſchata, coriandrum, baccae lauri & juniperi, farina, fabarum, lupinorum, orobi, milii, frumenti, furfur, mica panis, acetum tepidum, oxycratum, vinum vetus aut aromaticum, mel, aqua vitae, muria, adeps tauri, equi, leonis, canis, birci, medulla cervi, cruris bovis & arietis, ammoniacum, galbanum, opopanax, ſagapenum, myrrha, bdelium, thus, terebinthina, pix nigra, ladanum, ſtirax, calamita, benioinum, ſtercus caprinum, columbinum, caninum, lubulum, & aliae ſtercorum ſpecies.*

Compound diaphoreticks are *Oleum amygdalarum amararum, Juniperinum, laurinum, de ſcorpionibus, irinum, coſtinum, nardinum, de terebinthina, de croco, canabinum, raphaninum, e cucumere agreſti, vulpinum, rutaceum, philoſophorum de lateribus, de euphorbio, de tartaro, de petroleo, de herva, ſive ricininum, unguent. Agrippae, aragon, martiatum, emulatum, empl. de Vigo,* without addition, and with addition, *oxycroceum, diacalcitheos,* diſſolved in a digeſting oil to the form of a cerat.

Araeoticks are profitably uſed in the increaſ and ſtate of ſuperficial tumors.

The uſe of diaphoreticks.

But Diaphoreticks are not to bee uſed in the increaſ of tumors, unleſs ſom aſtringent bee added, leſt by their more ſtrong digeſtion, they ſhould draw and increaſ the defluxion: but when the tumors decline, they are then onely to bee uſed in the parts chiefly where the skin is denſ and hard, and when the humor is cold and groſs, and lying hid deep in the bodie, ſo that the virtue of medicaments can hardly com thereto: but conſideration is to bee had of the parts to which reſolutives are to bee applied; for you may not applie relaxers or diaphoreticks to the liver, ſpleen, ſtomach, or bowels, unleſs you add ſom aſtringents, of which a great part muſt bee aromaticks.

To the parts, where ſenſ is more dull, may bee applied the ſtronger diaphoreticks, but thoſe parts which are indued with a more exquiſite ſenſ, as the eie and the nerve, to them wee muſt applie weaker. When the matter is groſs and cold, things cutting and attenuating, and then emollient are to bee uſed, and ſo by degrees com to diaphoreticks; otherwiſe that onely is reſolved which is the moſt ſubtil of unprofitable matter, the groſſer becomming concrete and hardned. But if the part bee afflicted with a continual defluxion, ſo that there may bee danger of a gangrene or ſphacel, it is not lawful then to make uſe of reſolvers, but you muſt in the place where the humor flow's, divide the skin by ſcarification, as it is moſt learnedly noted by *Hollerius* in that profitable book of his left to poſteritie, whoſe title is, *De materia Chirurgica.*

CHAP.

CHAP. XII.

Of Suppuratives.

A Suppurative medicine is said to bee that, which shutting the pores, and preventing transpiration by his emplastick consistence, increaseth the matter of native heat, and therefore turneth the matter cast out of the vessels into *pus* and *sanies*. It is of nature hot and moist, and proportionable to the native heat of the part to which it is applied, and of an emplastick consistence, that so it may hinder the native heat from beeing exhaled; in which respect it differeth from emollients and malacticks, of which wee shall speak hereafter. There bee two kindes of suppuratives, for som do it of themselvs, and by their proper qualitie; others by accident. Those things which by their own strength do bring to suppuration, are either simples or compounds.

What a suppurative medicine is.

Differences of suppuratives.

Simples are *radix liliorum, cæpa, allium, malvarum omnium folia & semina, bugloſſum, acanthus, ſenecio, violæ, parietaria, crocus, caules, ficus, paſſulæ mundatæ*, with a decoction of these things, *farina tritici, farina volatilis, farina hordei excortitati, lolii, ſeminis lini & fœnugræci, galbanum, ammoniacum, ſtyrax pinguis, ladanum, viſcum aucupatorum, thus, pix, cera, reſina, colla, adeps, ſuillus, vitulinus, vaccinus, caprinus, butyrum, vitellus ovi, eſipus humida, ſtercus ſuillum, columbinum, caprinum, pueri.*

Compounds are *oleum liliorum, lumbricorum, de croco, unguent. baſilicum, emplaſt. diachylon commune, magnum, de mucilaginibus.*

Those things do suppurate by accident which work it onely by the means of an emplastick consistence: for so often-times astringents, becaus they are of earthie and thick parts, are found to suppurate; such are *unguentum de bolo nutritum*, and such like. Such also are those which by their coldnes keep the heat in, and shut the pores. Hence it is that the qualities of sorrel are commended to generate *pus*: for whil'st it keepeth the heat within, it increaseth his effects, to the thickning of the suppurable matter, and the overcomming other rebellious qualities. Wee use things ripening in great inflammations, whose growth wee cannot hinder with repellers, or increas with resolvers or discussers.

Suppuratives by accident.

CHAP. XIII.

Of Mollifying things.

That is defined to bee a mollifying medicine, which by a stronger heat then that which is proper to suppuratives, without anie manifest qualitie of drying or moistning, again malaxeth or softeneth hardned bodies: wherefore this differ's from that which suppurate's, becaus that they bee hot in the first or second degree, according to the several temper of the bodie, or part to which it is applied, working rather by the quantitie of heat, then the qualitie: contrariwise, that which mollifieth beeing indued with a greater heat, rather worketh by the qualitie of the heat, beeing otherwise in drines and moisture temperate.

Gal. cap. 7. lib. 9. simp.

How suppuratives & emollients differ.

Although as manie things agree together in som respects, though of a divers nature; so manie emollients are such as are hot in the first degree, and drie in the second and third, that so they may the better dispers and diffuse that which is congealed, by taking away a little of the humiditie, which is contained within the part affected: but not by exhausting it wholly by the violence of heat or drines: for hereon would follow a greater hardnes.

Things mollifying, are either simple or compound; and these again strong or weak. The weak are, *Radix liliorum alborum, cucumeris agreſtis, althææ, folia malvæ, biſmalvæ, liliorum, anethi, ſummitates, viola, branca urſina, ſemen malvæ, biſmalvæ, lini, fœnugræci, carici pinguis, paſſulæ mundatæ, pedum, capitum, inteſtinorum vervecinorum decoctum, adeps ex junioribus & caſtratis, domeſticis, ſeminis animalibus, adeps ſuillus, vitulinus, hædinus, caprinus, bubulus, vulpinus, gallinaceus, anſerinus, anatinus, olorinus, efficaces.* The weaker are things more gentle; as, *Butyrum, lana ſuccida, cera pinguis, vitellus ovi, medulla ex oſſibus, cervina, avilla, caprina.* The compound are oil, wherein are boiled mollifying herbs; as, *Oleum liliorum, chamæmelinum, amygdalarum dulcium.* Stronger emollients are, *Axungia, adeps taurinus, urſinus, cervinus, leoninus, pardalinus, apri, equi ſuillus, pinea, picea, abietina, terebenthina, ammoniacum, bdelium, ſtyrax, galbanum, ladanum, propolis, opopanax, ung. de althæa, emp. diachylon commune & magnum, de mucilaginibus, cerotum, oxycroceum, humis de vigo.*

The differences of emollients.

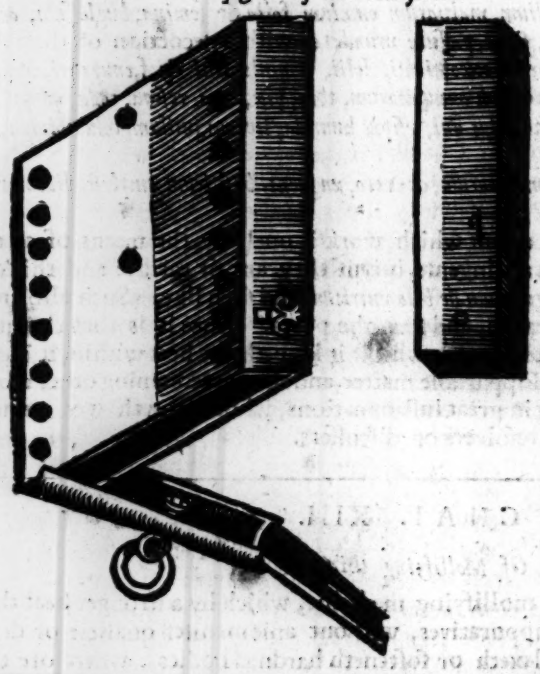
Wee use emollients in scirrous tumors of the muscles, or in the lips of ulcers; in anie of the limbs, bellie, glandules, bowels, by reason of a gross, cold, and viscous matter, either phlegmatick, or melancholick. Yet those tumors which com of melancholie, commonly turn to cancers, which are exasperated by mollifying things. On the contrarie, such as proceed from a phlegmatick matter, are brought to an equalitie of consistence, by the use of emollients. Furthermore, there are three things observable in the use of emollients: the first is,

Their use.

Things obſervable in the uſe of emollients.

duly to conſider how much the affected parts differ's from his proper and naturall temper and proportion, that ſo wee may applie an equivalent remedie. The ſecond is, that wee diſtinguiſh the natures of the parts. The third is, that wee artificially gather after what manner this mollifying muſt bee performed; that is, whether wee ſhould mingle with the emollients, deterſive or diſcuſſing medicines. For there are manie deſperate ſcirrous tumors, that is, ſuch as cannot bee overcom by anie emollient medicine, as thoſe which are grown ſo hard, that they have loſt their ſenſ; and thereupon are becom ſmooth and without hairs. Here you muſt obſerv, that the part ſomtimes becom's cold in ſo great an exceſs, that the native heat plainly appear's to languiſh, ſo that it cannot actuate anie medicine. That this languiſhing heat may bee reſuſcitated, an iron-ſtove ſhall bee ſet neer to the part, wherein a good thick piece of iron heated red hot ſhall bee encloſed, for ſo the ſtove will keep hot a long time.

The figure of an iron ſtove.



A. *The caſe of the ſtove.*
B. *The iron-Bat to bee heated.*
C. *The lid to ſhut the ſtove.*

CHAP. XIV.

Of Deterſives, or Mundificatives.

A Deterſive is defined to be that which doth deterge or cleanſ an ulcer, and purge forth a double kinde of excrements; of the which one is thicker, which is commonly called *ſordes*, which is drawn forth from the bottom of the ulcer, by the edificatious qualitie of the medicine, the other is more thin and wateric, which the Greeks call *Ichor*, the Latins *Sanies*, which is taken away by the drineſs of the medicine; and therefore *Hippocrates* hath well adviſed, that everie ulcer muſt bee cleanſed and dried.

Deterſives.

Of Deterſives, ſom are ſimple, ſom compound, ſom ſtronger, ſom weaker. The ſimple are either bitter, ſweet, or ſowr: the bitter are *Gentiana, Ariſtolochia, iris, enula, ſcilla, ſerpentaria, centaurinum minus, abſinthium, marrubium, perforata, abrotonon, epimn, cheliodonium, ruta, byſſopus, ſcabioſa, artbemiſia, eupatorium, aloë, fumus terræ, hædera terreſtris*, a *lixivium* made with the aſhes of theſe things, *lupini, orobus, amygdala amara, faba, terebinthina, myrrha, maſtiche, ſagapenum, galbanum, ammoniacum*, the gals of beaſts, *ſtercus caprinum, urina bene cotta, ſquammæ æris, æs uſtum, æruga, ſcoria æris, antimonium, calx, chalcitis, miſy, ſory, alumen*. The ſweet are *Viola, roſa, melilotum, ficus pingues, dactyli, uvæ paſſæ, glycyrrhiza, aqua hordei, aqua mulſa, vinum dulce, mel, ſaccharum, ſerum, lactis, manna, thus*. The ſharp are all kinde of ſowr things, *Caprioli vinum, acetum*, and other acid things. The compound are *Syrupus de abſinthio, de ſumaria, de marrubio, de eupatorio, de artbemiſia, acetoſus, lixivium, oleum de vitellis ovorum, de terebinthina, de ſiccura, unguentum mundificativum de apio, apoſtolorum, pulvis mercurialis*. Wee uſe ſuch things as deterge, that the ſuperfluous matter being taken away, nature may the more conveniently regenerate fleſh to fill up the cavitie: But in the uſe of them, conſideration is firſt to bee had of the whole bodie, whether it bee healthie, plethorick, or ill diſpoſed, then conſideration is to bee had of the part, which is moiſter and drier, indued with a more exquiſite or duller ſenſ. But oftentimes accidents befal ulcers beſides nature, as a reflux, a defluxion of a hot or otherwiſe malign humor, and the like ſymptoms. Laſtly, conſideration is to bee had, whether it bee a

Their uſe.

new

new or inveterate ulcer; for from hence, according to the indication, remedies are appointed different in quantitie and qualitie: so that oftentimes wee are constrained to appoint the bitter remedie in stead of the sweet. Neither truly with a painful and drie ulcer doth anie other then a liquid detersive agree: neither to the moist anie other then that of a drie consistence, as Powders.

CHAP. XV.

Of Sarcoticks.

THat medicine is said to bee sarcotick, which by its drinesse help's nature to regenerate flesh in an ulcer hollow, and diligently cleansed from all excrements. But this is properly don by blood indifferent in qualitie and quantitie. Wherefore, if wee must speak according to the truth of the thing, there is no medicine which can properly and truly be called sarcotick: For those which vulgarly go under that name, are onely accidentally such; as those which without biting and erosion do drie up and deterge the excrements of an ulcer, which hinder the endevour of nature in generating of flesh. For as by the law of nature, from that nourishment which flow's to the nourishing of the part, there is a remain, or a certain thin excrement, flowing from som other place, called by the Greeks *Ichor*, and by the Latines *Sanies*: Thus by the corruption of the part there concreet's another grosser excrement, termed *Rypos* by the Greeks, and *Sordes* by the Latines. That make's the ulcer more moist, this more filthie. Hence it is, that everie wound which require's restitution of the lost substance, must bee cured with two sorts of medicines, the one to drie up and waste the superfluous humiditie thereof, the other to fetch off the filth: and by how much the wound is the deeper, by so much it require's more liquid medicines, that so they may the more easily enter into everie part thereof. No medicine truly sarcotick

But diversitie of things shall bee appointed according to the various temper of the part. For if the affected part shall bee moist by nature, such things shall bee chosen as shall bee less drie: if on the contrarie the part bee drie, then such things shall bee used as bee more drie; but manie sorts of medicines shall bee associated with the sarcoticks, according to the manifold complication of the effects possessing the ulcer. Therefore nature onely is to bee accounted the workmaster, and the efficient cause in the regenerating of flesh, and laudable blood the material cause, and the medicine the helping or assisting cause, or rather the cause without which it cannot bee: as, that by cleansing and moderately drying without anie vehement heat, tak'es away all hinderances of incarnation and orders, and fit's the blood to receiv' the form of flesh. This kinde of medicine according to *Galen*, ought to be drie onely in the first degree, least, by too much drienesse, it might drink up the blood and matter of the future flesh, which notwithstanding is to bee understood of sarcoticks, which are to bee applied to a delicate and temperate bodie. For if the ulcer bee more moist, or the bodie more hard then is fit, wee may ascend to such things as are drie, even in the third degree. And hence it is that such drie medicines may first bee called detersives, and then presently sarcoticks. A sarcotick medicine is either simple or compound, stronger or weaker. Simple sarcotick medicines are, *Aristolochia utraque, iris, acorus, dracunculus, asarum, symphyti omnia genera, betonica, sanicula, millefolium, lingua canis, verbena, scabiosa, pimpinella, hypericon, scordium, plantago, rubia major et minor earumque succi. Terebinthina lota & non lota, resina pini, gummi arabicum, sarcocolla, mastiche, colophonia, mannæ thuris, cortex ejusdem, aloë, olibanum, myrrha, mel, vinum, fuligo draconis, lythargyros auri, spodium, pompholix, tutia, plumbum ustum lavatum, scoria ferri.* The compound sarcoticks are, *Oleum hyperici-nij, ol. averum, mastichinum, & cætera olea, quæ balsami nomine appellantur, unguentum aureum, unguentum de betonica, vigonis, de jovis, Emp. gratia Dei, Emp. nigrum.* Wee use not sarcoticks before that the ulcer bee cleansed and free'd from pain, defluction, inflammation, hardnes, and distemper. In using these things wee consider the temper of the bodie, and the affected part: For oft-times a part otherwise less drie by nature, require's a more powerful drying medicine, and stronger sarcotick, then another part which is more drie, and this for som other reason, which ought to com into our consideration: For example, the *glans* would bee more dried then the prodoce, although it bee of a temper less drie, becaus it is a passage of the urine. Wherefore wee must diligently observe the condition of the affected parts, and thence taking indication, make choice of more strong sarcoticks. For both that which is too little, and that which is too much sarcotick, make's a feeble ulcer: the first, becaus it drie's not sufficiently; the latter, for that by its continuitie it causeth defluxion. Therefore diligent care must bee used in the examination hereof. Simple sarcoticks. Compound Sarcoticks.

CHAP. XVI.

Of Epulotick, or skinning medicines.

AN Epulotick medicine is that which covereth the part with skin: it is said to bee such as by drienes and astriction without biting defense's, binde's and condense's the matter into a certain callous substance, like to the skin, which wee commonly call a cicatrice or scar:

ſcar: yet this, as the generating of fleſh, is the work of nature. A medicine therefore is ſaid to bee Epulotick, for that it aſſiſt's nature in ſubſtituting and generating a ſcar, in ſtead of the true skin, whileſt it conſume's the ſuperfluous humidities, condenſate's, incraſſate's, and binde's the next adjacent fleſh; therefore it ought to drie more powerfully then a ſarcotick. Epulotick medicines are of three kinds: the firſt is the true epulotick: which onely drie's and bind's. The ſecond is an acrid and biting epulotick, which, for that it waſte's the proud fleſh, is called ſo; and this muſt bee ſparingly uſed, and that onely to hard and ruſtick bodies. The third is that which onely drie's without aſtriction. The things whereof they conſiſt are theſe: *Ariſtolochia utraque, gentiana, iris, centaurium majus, pentaphyllon, ſymphytum majus, chamædrys, betonica, cauda equina, eupatorium, verbenaca, plantaginis & ſymphiti folia, gallæ, baccæ myrti, glandes & earum calices, balauſtia, cupreſſi nuces, malicorium, cortex quercûs, cortex tamaricis, cortex ligni aloës, acacia, colophonia, ſarcocolla, ſanguis draconis, ladanum, lithargyros, auri, argenti, ceruſa, plumbum uſtum, alumen uſtum, ruthia, ſquamma æris & ferri, & eorum ſcoria, æruginis, flos æris, æs uſtum et lotum, ſulphur vivum, chryſocolla, corali, bolus armenus, terra ſigillata, cineres buccenarum, oſtreorum, ſilicis, oſſa uſta et ſiccata, caries lignorum, ung. diapompholygos, ung. alb. rhaſis, de ſiccativum rubrum, emp. de ceruſa, de betonica, diacalcitheos, emp. nigrum.*

Three ſorts of Epuloticks.

Their uſe.

Wee uſe Epuloticks when as the ulcer is almoſt filled up, and equal to the adjacent skin. In the uſe of theſe wee muſt alwaies have reſpect to the tenderneſs and hardneſs of the bodie; for ſuch things as are corroſives to tender and delicate bodies, are epulotick to hard and ruſtick bodies. Alſo wee have much regard, whether the bodie bee plethorick or replete with ill humors, for ſuch do not eaſily admit cicatrization. Alſo it is moſt worthie of your obſervation, to mark whether the ulcer that is to bee cicatrized, bee fed or nouriſhed by the preſent defect of anie part, as the liver, ſpleen, lungs, or a *varix* lying about it. For it cannot bee cicatrized before theſe impediments (if anie ſuch bee) bee taken away. Laſtly, the callous lips of an ulcer, unleſs they bee ſcarified or ſoftened, hinder cicatrization. Therefore all ſuch defaults muſt bee taken away, and then ſuch an Epulotick applied, as may not by the too much drieneſs leav the ſcar too hollow, or the too little, leav it too high.

CHAP. XVII.

Of Agglutinatives.

AGlutinating, or agglutinative medicine is of a middle nature, between the Sarcotick and Epulotick, more ſtrong then the former, and weaker then the later, for it is drie to the ſecond degree. It by the drying and aſtrictive facultie, void of all deterſion, conjoin's parts that are diſtant, or rather lend's helping hands to nature the principal agent in this work. Glutinatives, whether they bee ſtrongly or weakly ſuch, do agglutinate either by their proper or accidental nature: Of this ſort are *Plantaginis omnes ſpecies, conſolida utraque, bugloſſa, millefolium, verbena, pimpinella, piloſella, cauda equina, ſempervivum, telephium, ſanicula, atractilis, folia quercûs et dracunculi, ſalix, ebulus, ſambucus, pentaphyllon, veronica, cortex pini, ulmi, palmæ quercûs, Aqua vitis, aq. è folliculis ulmi, ſuccus calaminthæ, vinum auſterum, terebinthina, myrrha, ſanguis draconis, bolus armenus, terra ſigillata, omnia denique acerba.*

Agglutinative medicines.

Glutinatives by accident.

Glutinatives by accident are thoſe that hinder deſluction, and binde the part, as Sutures, Bandages, Reſt, rowlers, and the like. Wee uſe glutinatives in green, and as yet bloodie wounds, whence the Greeks call a glutinative medicine *Enema*, although ſomtimes they are uſed to inveterate, malign, fiſtulous and ſinuous ulcers; for they hinder the deſluction from comming to the lips of ulcers. You muſt conſider, when as you intend to applie them, whether the skin bee whole or no: For ulcers knit together, or heal more difficultly, if the skin bee rubbed off, or cut, or otherwiſe loſt. Neither ought you to bee unmindful of the forementioned cautions and indications drawn from the ſex, the tenderneſs or hardneſs of the affected bodie, the continuance and magnitude of the ulcer: for hence indication muſt bee taken, what the quantitie and qualitie of the medicine ought to bee.

CHAP. XVIII.

Of Pyroticks, or cauſtick Medicines.

THat medicine is ſaid to bee Pyrotick or Cauſtick, which by its acrimonie and biting, commonly conſiſting in an earthie conſiſtence, either ſuperficially corrode's, or more deeply eat's and putrifie's, or laſtly, burn's and conſume's the skin and fleſh, ſo that it even pierce's into callous and hard bodies. Therefore there are three degrees of Pyroticks; for ſom are termed cathæretick or corroding, for that they waſte the proud fleſh of an ulcerated or anie other part, and theſe are judged the weaker ſort of Pyroticks. Otherſom are termed Septick or putrefying, as thoſe which deſtroie and diſſolv the tender and new-ſprung-up fleſh, and raiſ bliſters in the skin, and theſe are more powerful then the chathæreticks. Laſtly, there are otherſom termed moſt powerful Eſcharoticks, which by their fierie and terreſtrial

Three degrees of Cauſticks.

reſtrial qualitie cauſ eſchars or cruſts; whereupon they are alſo termed *Ruptoria*, and potential Cauteries: Now all theſe differences are taken from that they are more or leſs powerful. For it oft-times happen's, that according to the different temper and conſiſtence of the parts, according to the longer or ſhorter ſtaie, a Catharetick may penetrate as far as a Septick, and on the contrarie, an Eſcharotick may enter no farther then a Septick.

Cathaericks. Theſe are judged Catharetick, *Spongia uſta, alumen uſtum & non uſtum, vitriolum uſtum, calx mediocriter lota, æruga, chalchanthum, ſquamma æris, oleum de vitriolo, trochiſci andronis, phaſionis, aſphodelorum, ung. Ægipticum, apoſtolorum, pulvis mercurii, arſenicum ſublimatum.*

Septicks and Veſicatories. Septicks and Veſicatories are, *Radix ſcillæ, bryoniæ, ſigill. beatæ Mariæ, bugloſſa, radix ranunculi, panis porcini, apium, riſus, lac tithymallorum, lac fici, euphorbium, anacardus, ſinapi, cantharides, arſenicum ſublimatum*: For all theſe weaken the native temper and conſiſtence of the part, and draw thereunto humors plainly contrarie to nature.

Eſcharoticks. Eſcharoticks or Cauſticks are *Calx viva, ſæx uini cremata, & præcipuè aceti, ignis*, whereto are referred all Cauteries, as well actual as potential, whereof wee ſhall treat hereafter.

Their uſe. Wee uſe Catharetick in tender bodies and diſeaſes not verie contumacious; therefore by how much they are leſs acrid and painful, by ſo much oft-times they penetrate the deeper, for that they are leſs troubleſom by delaie; but wee uſe Septicks, and ſomtimes Eſcharoticks in ulcers that are callous, putrid, and of unexhauſted humiditie, but principally in cancers, carbuncles, and exceſſive hæmorrhagies. When as wee make uſe of theſe, the patient muſt have a convenient diet appointed, muſt abſtain from wine: laſtly, they muſt not bee uſed but with great diſcretion; for otherwiſe they may cauſ fevers, great inflammations, intolerable pains, ſwounings, gangreens, and ſphacels. Cauteries heedfully uſed, ſtrengthen and drie the part, amend an untameable diſtemper, dull the force of poiſon, bridle putrefaction and mortification, and bring ſundrie other benefits.

CHAP. XIX.

Of Anodynes, or ſuch as mittigate or aſſwage pain.

What pain is. BEfore wee treat of Anodyne medicines, wee think it fit to ſpeak of the nature of pain. Now pain is a ſorrowful and troubleſom ſenſ, cauſſed by ſom ſudden diſtemper, or ſolution of continuitie. There are three things neceſſarie to cauſ pain; The efficient cauſ, that is, a ſodain departure from a natural temper or union: the ſenſibleneſs of the bodie receiving the dolorifick cauſ: laſtly, the apprehenſion of this induced change, cauſſed either by diſtemper or union; for otherwiſe with how exquiſite ſoever ſenſ the bodie receiving the cauſ is indued with, unleſs it apprehend and mark it, there is no pain preſent. Hence is that Aphoriſm of *Hyppocrates*, *Quicunq; parte aliquâ corporis dolentes dolorem omninò non ſentiunt, his mens ægrotat*, that is, Whoſoever pained in anie part of their bodies do wholly feel no pain, their underſtanding is ill affected and depraved. Heat, cold, moiſture and drineſs, induce a ſodain change of temper; and heat and cold cauſ ſharp pain, drineſs moderate, but moiſture ſcarce anie at all: for moiſture cauſſeth not pain ſo much by its qualitie, as it doth by the quantitie. Both the fore-mentioned qualities, eſpecially aſſociated with matter, as alſo certain external cauſſes too violently aſſailing ſuch as theſe that may cauſ contuſion, cut, prick, or too much extend. Wherefore pain is a ſymptom of the touch, accompanying almoſt all diſeaſes; therefore oft-times leaving theſe, they turn the counſel of the Phyſician to mitigate them, which is performed either by mitigating the efficient cauſſes of pain, or dulling the ſenſ of the part. Hereupon they make three differences of Anodynes: For ſom ſerv to cure the diſeaſ, otherſom to mittigate it, otherſom ſtupifie, and are narcotick. We term ſuch curative of the diſeaſes, which reſiſt, and are contrarie to the cauſſes of diſeaſes. Thus pain, cauſſed by a hot diſtemper, is taken away by oil of Roſes, Oxycrate, and other ſuch like things, which amend and take away the cauſ of pain, to wit the exceſs of heat. Pain cauſſed by a cold diſtemper, is amended by *Oleum Laurinum, Nardinum, de Caſtoreo*. Pain occaſioned by too much drineſs, is helped by *Hydrælium*, a bath of freſh and warm water. Laſtly, by this word Anodyne, taken in the largeſt ſenſ, we underſtand all purging medicines, Phlebotomie, Scarification, Cauteries, Cuppings, Glyſters, and other ſuch like things as evacuate anie ſtore of the dolorifick matter. But ſuch as are properly termed Anodynes, are of two ſorts: for ſom are temperate, others hot and moiſt in the firſt degree, and conſequently, near to thoſe that are temperate: theſe preſerv the native heat in the proper integritie, thus they amend all diſtemperatures; of this kinde are accounted Sallad oil, oil of ſweet Almonds, the yolks of eggs, and a few other ſuch like things, theſe ſtrengthen the native heat, that thus increaſed in ſubſtance, it may with the more facilitie or'ecom the cauſ of pain: beſides alſo, they rariſie, attenuate, digeſt, and conſequently evacuate both groſs and viſcid humors, as alſo cloudie flatulencies hindred from paſſing forth: ſuch are *flores chamæmeli, meliloti, crocus, oleum chamæmelinum, anethinum, oleum lini, oleum ex ſemine althææ, lumbricorum, ovorum, ex tritico, butyrum, lana ſuccida, ſuillus adeps, vitulinus, gallinaceus, anſerinus, humanus, ex anguilla, cuniculo, & aliis. Lac muliebre, & vaccinum, mucago ſeminis lini, fænugræci, althææ, malvæ, vel ejuſmodi ſeminum decoctum*: as alſo *Decoctum liliorum, violariæ, capitis, pedum, & inteſtinorum arietis et hœdi.*

What properly termed Anodynes are.

Nar-

Narcoticks improperly termed anodynes.

Narcoticks, or ſtupefying medicines, improperly termed Anodynes, are cold in the fourth degree, therefore by their exceſs of cold, they intercept or hinder the paſſage of the animal ſpirit to the part, whence it is that they take away ſenſ: of this ſort are *hyoſcyamus, cicuta, ſolanum manicum, mandragora, papaver, opium, arctiſſima vincula.*

The uſe of them.

You may make uſe of the firſt ſort of Anodynes in all diſeaſes, which are cured by the oppoſition of their contraries: but of the ſecond, to expugn pains that are not verie contumacious, that by their application wee may reſiſt defluxion, inflammation, the fever, and other ſymptoms. But whereas the bitterneſs of pain is ſo exceſſive-great that it will not ſtoop to other medicines, then at the length muſt wee com to the third ſort of anodynes. Yet oft-times the bitterneſs of pain is ſo great that verie narcoticks muſt bee applied in the firſt place, if wee would have the part and the whole man to bee in ſafetie. Yet the two frequent uſe of them, eſpecially alone without the addition of ſaffron, myrrh, *caſtoreum*, or ſom ſuch like thing, uſeth to bee verie dangerous: for they extinguiſh the native heat, and cauſ mortification, manifeſted by the blackneſs of the part. But intolerable pains, to wit, ſuch as are occaſioned by the exceſs of inflammation and gangrenes, may bee ſooner mitigated by opening a vein, purging and ſcarifying the part affected, then either by properly-termed anodynes or narcoticks, to wit, that pain may bee the remedie of pain. By purgers wee here underſtand not onely ſuch, as taken by the mouth, produce that effect; but alſo ſuch as outwardly applied perform the ſame, as thoſe whereof *Aetius* make's mention, As,

Tetrab. 1. ſen. 3. cap. 35.

Purgatives to bee externally applied.

℞. *pulpæ ſeu medul. colocynth. ſemin. eruc. rut. ſylveſt. elaterii, gr. cindii, lathyrid. expurgatar. galban. nitri, ceræ, ſingulorum,* ℥ iiii. *opopan.* ʒ ii. *terebinth.* ʒ vi. *terenda terito, et taurino felle paullatim irrigato, donec aptè imbibantur.* Then applie it about the navel even to the ſhare, for thus it will purge by ſtool; if on the contrarie you applie it to the bottom of the ſtomach, it will cauſ vomit. Another; ℞. *elaterii,* ʒiii. *colocynth. ſcammon. ſquammæ æris, radic. cucumer. agreſt. lathyrid. an.* ʒ i. *aut pro lathyrid. tithymal. ſuccum terito et cribrato, at cum oleo plurimum ſalis habente ſubigito; magnam indè pilam è lana confertam hoc medicamento illitam, umbilico aut lumbis applicato.* Or, ℞. *fellis taurin.* ʒ. i. *gr. cindii virid.* ℥ iv. *ſucci lupinor. virid.* ℥ ii. *euphorb.* ℥ i. *pulp. colocynth. tantundem ædip. vulpin. recent.* ℥ vi. *adip. viper.* ℥ ii ß. *ſtercor. muris,* ℥ iv. *ſucci pæon. caſtor. ſingulor.* ʒ iv. *ol. liguſtrin.* ℥. vi. *ol. antiq.* ℥ i *fiat unguentum vel oleum.* It purgeth without trouble, and beſides the other commodities it alſo is good againſt diſtraction or madneſs. Two ſpoonfuls is the greateſt quantitie to bee uſed at one time, for in ſom, one is ſufficient: annoint therewith the navel and thereabouts, and a juſt purgation will enſue thereupon, which if it ſhall flie out beyond your exſpectation, you may foment the bellie with a ſponge moiſtened in warm wine and preſſed forth again, it will bee preſently ſtaied. Moreover *Fernelius lib. 7. methodi*, make's mention of a laxative ointment.

The compoſition of a purging oil and ointment.

CHAP. XX.

Of the compoſition and uſe of Medicines.

HItherto wee have ſpoken of the faculties of ſimple medicines, now wee think good to ſaie ſomthing of the compounding of them: for ſo by the Architect are had and known everie thing apart, and then hee ſettle's the workmen to the building, the conceived form of which hath been in his minde ever ſince hee did enterpriſe it. Therefore the compoſition of divers medicaments with their qualities and effects, is a mingling appointed by the art of the Phyſician. Hence therefore *rheum, aloë, roſa, abſynthium*, although they have divers ſubſtances and faculties, yet are notwithſtanding called ſimple medicines, becauſ they have that varietie from Nature, not from Art. But wee manie times call ſimple ſuch things as are compounded by art, as *oxym. ſimpl. oxyſaccb. ſimplex*, as compared to greater compoſitions. And therefore oftentimes wee uſe compound medicines, becauſ alwaies the ſimple medicine alone, hath not ſtrength enough to oppugn the diſeaſ. For manie times the ſick labor with manifold, and not ſimple effects, from which there beeing taken a various indication, wee gather contrarie ſimple medicines, to applie to everie affect, in one compoſition. But oftentimes the nature of the part of the patient, or of the bodie affected, requireth another kinde of medicament which may bee proper for the remooving that diſeaſ; wherefore it is ſo made to oppugn the diſeaſ and not offend the bodie: and wee mingle manie other together, whoſe effects may temper one another. Moreover, the compoſition of medicines was neceſſarie, that becauſ thoſe things which have not a good taſte, color, or ſmell, by art or compoſition, might bee made more grateful. Compound medicines of which we intend to ſpeak, are Glyſters, Suppoſitories, *Noduli*, Peſſaries, Oils, Liniments, Ointments, Emplaſters, Cerats, Pultiſſes, Cataplaſms, Fomentations, Embrocations, Epithemates, Veſicatories, Cauteries, *Collyria, Errhina*, Sneeſing-powders, Maſticatories, Gargariſms, Dentifrices, Bags, Fumigations, Semicupiums, Baths. But firſt it is expedient that I ſaie ſomthing of weights and meaſures, with their notes, by which medicines commonly are meaſured and noted by Phyſicians.

Gal. 2. ſimp. 4. de ſanit. tuend.

The neceſſitie of compound medicines.

CHAP.

CHAP. XXI.

Of weights and meaſures, and the notes of both of them.

EVerie weight ariſeth from a beginning and foundation, as it were; for as our bodies do ariſe of the four firſt ſimple bodies or elements, into which they are often reſolved: ſo all weights do ariſe from the grain, which is as it were the beginning and end of the reſt. Now hereby is underſtood a barlie-corn or grain, and that ſuch as is neither too drie, or overgrown with mouldineſs, or rancid, but well conditioned, and of an indifferent bigneſs. A grain the beginning of all weight. What is meant by a grain.

Ten grains of theſe make an *Obolus*; two Oboli, or twentie grains make a ſcruple, three ſcruples, or ſixtie grains make a dram, eight drams make one ounce, twelv ounces make one pound medicinal, which is for the moſt part the greateſt weight uſed by Phyſicians, and which they ſeldom exceed; and it is reſolved into ounces, drams, ſcruples, *oboli* and grains, which is the leaſt weight. To expreſs theſe weights we uſe certain notes, the pound is expreſſed by this note, ℔. the ounce by this ℥, the dram thus ʒ, the ſcruple thus ℈, the *obolus* with the beginning letter thus *obol.* the grain with his beginning letter thus, g. But ſomtimes wee meaſure the quantitie of medicines by meaſures and not alwaies by weights; and therefore wee expreſs a han dful by this note, m. a pugil thus, p. number thus, n. and the half part of everie weight and meaſure is expreſſed by this note, ß. put after everie note of the aforeſaid weights and meaſures of the ſame ſort, as the half pound, ℔ ß. the half ounce, ℥ß. and ſo of the reſt. Moreover, in deſcribing the ſame medicament we uſe the notes ſomtimes of weights, ſomtimes of meaſures; and therefore it is to bee noted that herbs, green or drie, are ſigned with theſe notes, m. p. but thoſe which are drie and bee brought to powder, with theſe notes, ℥. ℥. p. Roots, by theſe notes, ℥. ℥. p. m. Barks, by theſe notes, ℥. ℥. Seeds, by theſe notes, ℥. ℥. Fruits, by theſe notes, an. p. ℥. ℥. ℈. Flowers, by theſe notes, p. m. ℥. ℥. Pulſes, by theſe notes, p. ℥. ℥. *Obolus.* A ſcruple. A dram. An ounce. A pound.

All other medicaments either drie or liquid, are deſcribed with theſe notes, ℔. ℥. ℥. ℈ obol. g.

Having expounded theſe things, let us come to the deſcription of compound medicines, beginning with glyſters firſt, as the remedie which is moſt common and familiar, and almoſt chiefly neceſſarie of all others.

CHAP. XXII.

Of Glyſters.

A Glyſter is an injection prepared firſt and properly for the groſs inteſtines and fundament; for ſomtimes glyſters are uſed and made for the ſtomach, ſpleen, reins, bladder, womb, meſenterie, and alſo for the head, from whence oftentimes by ſharp glyſters, the hurtfull matter is brought downwards, as wee ſee in Apoplexies. Therefore there is no part of the bodie which receiv's not ſom benefit by glyſters, but more or leſs according to the vicinitie they have with the bellie, and the ſtrength of the glyſter: for there are divers ſorts of glyſters, ſom emollients, other evacuating, ſom anodynes, ſom aſtringents, ſom cleanſing, ſom ſarcotick, and epulotick, and ſom may bee ſaid to nouriſh. They may bee all made of the parts of plants or beaſts, with compound medicines either ſolutive, or altering, and others according to the adviſe of the Phyſician. The parts of plants which are uſed to this purpoſe, are roots, ſeeds, leavs, flowers, fruits, ſhouts, juices, mucilages. Parts of beaſts are yolks of eggs and whites, honie, chickens, capons, old cocks well beaten, heads and feet of ſheep, the inteſtines, whey, milk, ſewet, axungia, and ſuch like in decoctions, wherein wee mingle and diſſolv ſimple and compound medicines. Wee ſomtimes uſe without anie other medicament, to make a glyſter with oil alone, as oil of nuts for the Colick, of whey alone, the decoction of the head and feet of the ſheep alone, and of the decoction of Cicers and barlie do wee prepare glyſters. What a glyſter is. Differences of glyſters. The materials of glyſters.

The quantitie of a glyſter is ſomtimes leſs according to the divers diſpoſition of men and their diſeaſes: for weak children the quantitie is leſs: for women with child, and in the colick, dyſenterie, lyenterie, or when much hardened excrement, is within. But when we would abundantly moov the excrement, and there is nothing that may hinder, the doſe of a glyſter for the moſt part is half a pound, one pound, or three quarters of a pound. The glyſter muſt bee injected warm or hot, more or leſs, according to the nature or condition of the ſick: for beeing cold it offend's the inteſtines, and the neighboring nervous parts, which are cold of themſelvs. It muſt bee given by degrees, for beeing injected ſuddenly, the winde which is uſually in the guts will beat it back again, whence com's intolerable pain. But this will bee more clear by that wee ſhall teach concerning the differences of glyſters, whereof there ſhall bee ſufficient examples. Their quantitie

℞. *malv. violar. biſmalv. acanth. an.* m i. *radic. alth. lilior. an.* ℥ i. *paſſul. ficuum ping.* ℥ ß. *fiat decoctio ap* ℔ i. *in qua diſſolve caſſ. butyr. recent. an.* ℥ i. *ol. viol.* ℥ iii. *fiat Clyſter.* An emollient glyſter.

Glyſters, that do evacuate, are prepared by the counſel of the Phyſician, and of divers Simples, being boiled for ſeveral purpoſes. Therefore if the humors bee cold which are to

bee

A Glyſter to evacuate a cold phlegmatick humor.

bee evacuated, the Glyſter ſhall bee after this manner. ℞. *Salviæ, origani, abrotoni, chamæm. melilot. an.* m. ß. *ſeminum aniſi, fœnic. cumini, an.* ʒ iii. *ſemin. cartbar.* ʒii. Make a decoction of them, wherein diſſolv *Diaphon. Hier. Simpl. an* ʒß. *ol. anetb. chamæm. an.* ʒi. ß. *Mellis Anthe. ſacc. rub. an.* ʒ i. *fiat Clyſter.*

To evacuate Cholerick matter, prepare a Glyſter after this manner. ℞. *quat. remollient. paret. Cichor. endi. an.* m. ß. *Semen. quat. frigid. Major. an.* ʒiii. *bordei integri.* p. i. Make a decoction of them, and diſſolv in it *Caſſ.* ʒ. i. *Ol. viol. mellis viol. an.* ʒ ii. *fiat Clyſter.*

To evacuate melancholie, this Glyſter following will bee uſeful. ℞. *Fumiter. Centaur. minoris, Mercurialis, an.* m. i. *Polyp. Qu. folicul. ſennæ, an.* ʒ iii. *ſeminis agni caſti, Thymi, an.* ʒ ii. Make a decoction and diſſolv therein, *Confect. Hamech.* ʒ ß. *Caſſ. recens extract.* ʒ iii. *olei violati, lilior, an.* ʒß. *Sacc. rub. mellis viol. an.* ʒiß. *ſalis,* ʒi. And thoſe Glyſters do not onely evacuate the humors that offend, but alſo correct the diſtemper of the bowels and inward parts. For the Glyſters deſcribed againſt pituitous and melancholick matter, help the cold diſtemper; but that which is for choler, the hot diſtemper. Purging medicines, which are diſſolved in the decoction of Glyſters, are verie ſtrong, as, *Confect. Hamech. Benedicta, Diaprun. Solutivum, Diaphœnicon,* beeing uſed from ʒ.vi. to ʒi. at moſt: but the weaker and more gentle are *Catholicon. Caſſia, Hiera ſimplex,* from ʒvi. to ʒii. at moſt..

An Anodyne Glyſter.

An Anodyne Glyſter is uſually made without ſuch things as purge or evacuate: as, ℞. *Flor. Chamæm. melil. Anetb. an.* p. i. *rad. Biſmal.* ʒi. boil them in Milk, and to the decoction add *Mucaginis ſeminis lini fœnugræci extractæ in aqua Malvæ* ʒii. *ſaccari albi, olei anethi, chamæmeli, an.* ʒi. *vitellos ovorum duos, fiat Clyſter.* Theſe Glyſters ſhould bee kept longer in the bodie, that ſo they may more eaſily mitigate pain. *The example of an aſtringent Glyſter.*

An Aſtringent Glyſter.

℞. *Equi ſeti plantag. poligami. an.* m. i. boil them *in lacte uſtulato,* to ʒxii. to the decoction ſtrained add *Bole armeni, ſanguinis draconis, an.* ʒii, *olei roſati,* ʒii. *album. ovorum duorum, fiat Clyſter.* Wee uſe theſe kinde of Glyſters in Dyſenteries, and in the immoderate flux of the Hæmorhoid veines, having firſt evacuated the uſual excrements. Glyſters, which be ſarcotick, epulotick, and cleanſers of the greater guts, and fit for the curing of ulcers, are to bee prepared of ſuch medicines as are deſcribed before in their proper Chapters.

Nouriſhing Glyſters.

Alimentarie Glyſters are made of the decoction of Chickens, Capons, Cocks, beeing boiled to a gellie, and ſtrongly preſt forth. They are alſo prepared of Marrow, gellie, which are not altogether ſo ſtrong as thoſe which are commonly taken by the mouth, becauſe the facultie of concoction in the guts, is much weaker then that of the ſtomach. Oftentimes alſo the matter of theſe kinde of Glyſters are prepared in wine, where there is no pain of the head or fever, but more frequently in the decoction of Barlie, and in Milk, adding the yolks of Eggs, and ſom ſmall quantitie of white ſugar, leſt by the cleanſing facultie it move the guts to excretion. And therefore Sugar of Roſes is thought better, which is conceived to ſomwhat binding. Here you may have example of ſuch Glyſters. ℞. *Decoctionis Capi perfectè cocti* ℔. i. ß. *ſaccari albi,* ʒß. *miſce, fiat Clyſter.* ℞. *Decocti Pulli & Galatinæ, an.* ℔. ß. *vini opt.* ʒiv. *fiat Clyſter.* ℞. *Decocti bordei mundati, & in cremorem redacti* ℔. ß. *lactis boni* ℔. i. *Vitellos ovorum duos, fiat Clyſter.*

Their uſe.

We uſe theſe kinde of Glyſters to ſtrengthen children, old and weak men, and bodies which are in a Conſumption. But in the uſe of theſe there are three things to bee obſerved: Firſt, that the fæculent excrements may bee taken away, either by ſtrength of nature, or by art, as by a ſuppoſitorie, or an emollient Glyſter, leſt the alimentarie matter beeing mingled with them, ſhould ſo bee infected and corrupted. The other is, that there bee great quantitie given, that ſo ſom may aſſcend to the upper guts. The third is, that the ſick ſleep after the taking of it; for ſo it is more eaſily converted into nouriſhment, and the elementarie matter is better kept: for ſleep hindereth evacuations. In Glyſters of this kinde wee muſt beware of Salt, Honie, and oil; for the two firſt provoke excretion by their acrimonie, and the laſt by his humiditie doth relaxate and lubricate. They, who think no kinde of Glyſter can nouriſh or ſuſtein the bodie, relie upon this reaſon: That it is neceſſarie whatſoever nouriſheth, ſhould have a triple commutation or concoction in the bodie: firſt, in the ſtomach; ſecond in the liver: thirdly, in all the members. But this opinion is repugnant to reaſon and experience: to reaſon, for that a certain ſenſ of ſuch things as are defective, is implanted in all and everie of the natural parts of our bodie. Therefore ſeeing nutrition is a repletion of that which is emptie, without doubt the emptie and hungrie parts will draw from anie place that nouriſhment that is fit and convenient for them, and in defect thereof, whatſoever they meet with, which by anie familiaritie may aſſwage and ſatisfie their deſire. But the alimentarie Glyſters, by us deſcribed, conſiſt of things which agree verie well with the nature of our bodies, and ſuch as are boiled and ordered with much art, ſo to applie the chylification to bee performed in the ſtomach. Therefore they may bee drawn in by the meſeraick veins of the guts; which according to *Galen,* have a certain attractive facultie. And thence they may bee eaſily carried through the gate-vein, liver, and ſo over the whole bodie. And experience teacheth, that manie ſick people, when they could take nothing by the mouth, have been ſuſteined manie daies by the help of theſe kinde of Glyſters. What is more to bee ſaid? Wee have ſeen thoſe who have taken a Suppoſitorie by the fundament, and vomited it at the mouth; by which it alſo appeareth, that

Their Argument that denie Glyſters to nouriſh.

Confuted firſt by reaſon.

Secondly, by experience.

ſom-

ſomthing may flow without danger of the ſick from the guts into the ſtomach.

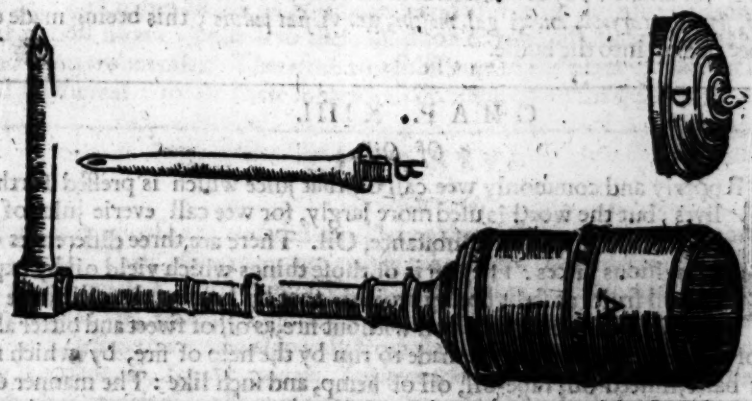
Commonly they give Glyſters anie hour of the daie, without anie reſpect of time, but it ſhould not bee don unleſs a great while after meals, otherwiſe the meat, being hindered from digeſtion, will bee drawn out of the ſtomach by the Glyſter.

Glyſters are uſed to help the weaker expulſive faculties of the guts, and by conſequence alſo of the other parts, both that ſuch as through want of age, and old people, and ſuch as by reaſon of great imbecilitie by ſickneſs cannot admit of a purging medicine, may by this means at leaſt eaſ themſelvs of the trouble and burden of hurtful humors. *Galen* hath attributed to Storks the invention of Glyſters, which with their bils, having drunk Sea-water, which from ſaltneſs hath a purging qualitie, waſh themſelvs by that part, whereby they uſe to bring away the excrements of their meats, and of the bodie. But a Glyſter is fitly taken after this manner: whileſt the Syringe is expreſſed, let the patient hold open his mouth; for by this means all the muſcles of the *Abdomen*, which help by compreſſion the excretion of the guts, are relaxed. Let him wear nothing that may gird in his bellie, let him lie upon his right ſide, bending in a ſemicircular figure; and ſo the Glyſter will the more eaſily paſs to the upper guts, and (as it were) by an overflowing, wet and waſh all the guts and excrements. It hap'neth otherwiſe to thoſe who lie upon their left ſide; for the Glyſter beeing ſo injected, is conceived to abide, and (as it were) to ſtop in the *Inteſtinum rectum*, or *Colon*, becauſ in this fite theſe two inteſtines are oppreſſed, and as it were ſhut up with the weight of the upper guts. A little while hee may lie upon his back after hee hath received the Glyſter, and preſently after hee may turn himſelf on either ſide. And if there bee pain in anie part, ſo long as hee is able hee may incline to that ſide. Moreover, becauſ there are manie who cannot by anie reaſon bee perſwaded to ſhew their buttocks to him that ſhould adminiſter the Glyſter, a fooliſh ſhamefaſtneſs hindering them: therefore I thought good in this place to give the figure of an Inſtrument, with which one may give a Glyſter to himſelf, by putting up the pipe into the fundament, lifting the buttocks a little up. The pipe is marked with this letter *A*. The bodie of the Syringe, whereinto the Glyſter muſt bee put, with this Letter *B*.

The common uſe of glyſters.

The ſick having received the glyſter, muſt turn to their ſide grieved.

The figure of a Glyſter pipe and Syringe, by benefit whereof a man may give himſelf a Glyſter.



CHAP. XXIII.

Of Suppoſitories, Nodules, and Peſſaries.

A Suppoſitorie is a certain medicament, formed like unto a tent, or gobbet of paſte, ſuch as is commonly uſed to fat Fowl. It is put into the fundament, that it might excite the ſphincter-muſcle to ſend forth thoſe excrements which are knit in the guts. Anciently it had the form of an Acorn, whence it is called to this daie *Glans*. The Suppoſitories, wee now uſually make, have the form of a Peſſarie, that is round and longiſh, in the form of a wax-Candle. They are either weak, ſtronger, or ſharp; the weak are made of the ſtalks or the roots of Beets, of Lard boiled Honie with Salt, or of Caſtle-ſope. The ſtronger of purging powders, as, *Hiera* with Salt and Honie. The ſharp with Scamonie, *Euphorbium*, *Coloquintida*, and like things powdred, and with Honie, or the juices of ſharp herbs, or mingled with the gals of beaſts. It is commonly made thus: as, R. *Mellis* ℥i. *Salis aut pulveris alterius irritantis* ℥i. The differences.

R. *Mellis cotti* ℥i. *pul. Colocynthidos* ℈ ß, *Salis gemmæ*. ℈i. *fiat Suppoſitorium*. Wee uſe Suppoſitories, when the ſick by his infirmitie is unwilling, or not able to bear or away with a Glyſter; as in burning Fevers: or, when as one being injected, is ſlow, and reſteth in the guts. And wee uſe the ſharper Suppoſitories in ſopotiferous affects of the head, that they might provoke the dull faculties of the guts to expulſion. As alſo, when the condition of the diſ- The form. The uſe.

eaſ is ſuch, that by the uſe of Glyſters there is manifeſt hurt; as, in an *Enterocele*, where the gut ſo ſwel's, that over and above it bee filled by the glyſter infuſed, it would the more preſs the *Peritonæum*, ſo that ſtraight-waies by the relaxed or broken part it might eaſily bee devolved into the Cod.

Nodules have the ſame uſe with Suppoſitories, and are oftentimes ſubſtituted in ſtead of Glyſters. They are made of gentle medicines, as the yelks of Eggs with a little Salt and Butter, or of Gall and Honie tied up in a cloth in the form of a Filbert, the ſtring of it may hang forth, whereby the Nodule in the fundament may bee drawn forth. This deſcription may bee an example of Nodules: ℞. *Vitellum unius ovi, cui adde ſalis modicum, fellis vervecis, mellis an.* ʒß. *butyri* ʒiii. *miſce, fiant Noduli filo appenſi.*

The form of a Nodule.

Peſſaries.

A Peſſarie is groſſer than a Suppoſitorie, and is appointed for the womb, beeing made with Cotton-wool or Silk ſteeped in ſom medicament, and then put into the neck of the womb.

Their uſe.

A peſſarie is uſed either to ulcers of the neck of the womb, or for the procuring or ſtoping of the *Menſtrua*, or againſt ſordid and hurtful humors of the womb cauſing hyſterical paſſions, and therefore to bee waſted away and evacuated. Therefore in the compoſition of peſſaries are uſed gums, juices, ſeeds of herbs, roots, and manie other things, according to the adviſe of the Phyſician; they are alſo made of a ſolid conſiſtence, the bigneſs of a finger, that they may enter into the neck of the womb; theſe beeing tied with a ſtring, which muſt hang forth to pluck it out withal when evaſion ſerv's. This following may bee an example of their deſcription. ℞. *myrrh. aloes, an* ʒ i. *ſabin. ſemin. nigel. arthemiſ. an.* ʒii. *radic. ellebor. nig.* ʒi. *croci,* ℈ i. *cum ſucco mercurial. & melle fiat peſſus*; let it bee tied to the thigh with a thred. Or thus, ℞. *maſtich. thurii, an.* ʒ iii. *alum, roſ. rub. nuc. cupreſ. an.* ʒii, *ladan. bypoci. ſumach, myrtil. an.* ʒ iii. *fiant peſſi cum ſucco arnogloſ. & cotoniorum.* According to this example others may bee made for to mollifie, to binde, to cleanſ, to incarnate, to cicatrize and cover the ulcers of the womb: they are to bee put up when the patient lieth in bed, and to bee kept all night.

Peſſaries are alſo made of medicinable powders, not onely mixed with ſom juice, but alſo with thoſe powders alone beeing put into a little bag of ſom thin matter, beeing ſtuffed with a little cotton that it might bee of a convenient ſtifneſs, and this kind of peſſaries may bee uſed profitably in the falling of the mother.

An example of one mentioned by Rondeletius *in his book of inward Medicines, is as followeth.*

Againſt the ſuffocation of the Mother.

℞. *Benioini, ſtyracis, caryoph. an.* ʒi. *gal. moſchi,* gr. vi. *fiat pulvis*; this beeing made up with cotton may bee put up into the bodie.

CHAP. XIIII.

Of Oils.

PRoperly and commonly wee call oil that juice which is preſſed forth of Olives; but the word is uſed more largly, for wee call everie juice of a fluxible, unctuous, and airie ſubſtance, Oil. There are three differences of theſe oleaginous juices: The firſt is of thoſe things which yield oil by expreſſion, as well fruits as ſeeds beeing bruiſed, that by beating the oilie juice may bee preſſed forth; ſom are drawn without fire, as oil of ſweet and bitter almonds, oil of nuts, of *palma Chriſti*. Others are made to run by the help of fire, by which means is gotten oil of baies, linſeed-oil, rape-oil, oil of hemp, and ſuch like: The manner of drawing oil from ſeeds is ſet down by *Meſue* in his third book.

The making oils by infuſion

The ſecond ſort of thoſe oils which are made by the infuſion of ſimple medicines in oil, wherein they leav their qualities: and this is don three ſeveral waies, the firſt is by boiling of roots, leavs, tops of flowers, fruits, ſeeds, gums, whole beaſts, with wine, water, or ſom other juice, with common or anie other oil, until the wine, water, juice bee conſumed, which you may perceiv to bee perfectly don, if you caſt a drop of the oil into the fire, and it maketh no noiſ but burneth. It is to bee remembred that ſomtimes the ſeeds or fruits are for a certain time to bee macerated before they are ſet to the fire; but it muſt bee boiled in a double veſſel, leſt the oil partake of the fire.

After this manner is made *oleum coſtinum, rutaceum, de croco, cydoniorum, myrtillorum, maſtichinum, de euphorbio, vulpinum, de ſcorpionibus*, and manie others. The ſecond is by a certain time of maceration, ſom upon hot aſhes, others in horſ-dung, that by that moderate heat the oil might draw forth the effects of the infuſed medicines into it ſelf. The third is by inſolation that is, when theſe or theſe flowers, beeing infuſed in oil, are expoſed to the ſun, that by the heat thereof the oil may change, and draw into him ſelf the faculcie of the flowers which are infuſed: of this kinde are oil of roſes, camomil, dill, lilies, of water-lilies, violets, and others, as you may ſee in *Meſue*.

The manner of oils by reſolution.

The third kinde is properly that of the Chimiſts, and is don by reſolution made after divers manners, and of this ſort there are divers admirable qualities of divers oleaginous juices, whether they bee made by the ſun or fire, or putrefaction, as wee ſhall ſpeak in his place hereafter.

Wee

Wee uſe oils when wee would have the virtue of the medicament to pierce deep, or the ſubſtance of the medicines mingled with the oil to bee ſoft and gentle. Moreover, when wee prepare oils that ſhould bee of a cooling qualitie, the common oil of the unripe Olive is to bee uſed: of that ſhould the oil of roſes bee made.

Again, when wee would prepare oils of heating qualities, ſuch as are *Oleum philoſophorum*, or of Tiles, ſweet and ripe oil is to bee choſen.

CHAP. XXV.

Of Liniments.

A Liniment is an external medicine of a mean conſiſtence, between an oil and an ointment, for it is thicker then an oil; for beſides oil it is compounded with butter, axungia and ſuch like, which is the reaſon why a liniment is more efficacious in ripening and mitigating pain, then ſimple oil. The varieties of liniments are drawn from their effects, ſom cool, others heat, ſom humect, ſom ripen, others by compoſition are made for divers uſes. The matter whereof they are uſually made, is oil, axungia, ſuet, butter, all thoſe things which have an oilie ſubſtance or conſiſtence, as *ſtyrax liquida*, turpentine, the mucilages of fenugreek, marſh-mallows, marrow, and other like. To theſe are ſomtimes added powders of roots, ſeeds, flowers, rindes, metals, but ſparingly, that the liniment may bee of a liquid conſiſtence. What a liniment is.

An example of a liniment that is good to attenuate, heat, and digeſt, is this that followeth.

℞. *ol. amygd. amar. lilior. an.* ℥i. *axung. anat. gallin. an.* ℥ß. *butyr. ſal expert.* ℥i. *muc. ag. ſem. alth. fœnugr. extract. in aq. hyſſop. an.* ℥ ß. *pulver. croci, ireos, an.* ℈i. *fiat linimentum.*

This may bee an example of a liniment to humect and mollifie.

℞. *ol. amygd. dulc.* ℥ii, *axung. human.* ℥ ß. *muc. ag. ſemin. malv. extract. in aq. parietar.* ℥ ß. *fiat linimentum:* you may add a little ſaffron. There bee manie others like theſe which may bee made for divers affects. They are eaſily applied to everie part of the bodie, becauſ they are not ſo liquid as oils: the reaſon is, they are more agreeable to anie of the parts. If they bee to enter into anie crooked narrow paſſage, ſuch as the ear, they muſt bee more liquid, and have more oil: if they bee to ſtick on the part, they will admit of more axungia and ſuet.

They are deceived who think that the difference between liniments and ointments is, that there is no wax in liniments as there is in unguents; for there bee ſom unguents which admit not anie wax to bee added, as *ægyptiacum*, and all ſuch as are uſed in gangreens, and all ſorts of putrid ulcers; becauſ to theſe kinds of diſeaſes all fattie things, as oils, fats, roſins, and wax, are enemies. Therefore wee ſubſtitute in the place of them in *ægyptiacum*, honie and verdigreaſ; for of theſe it hath his conſiſtence, and his qualitie of cleanſing.

CHAP. XXVI.

Of Ointments.

Ointments are of a more ſolid conſiſtence then Liniments, and are therefore of more force. Their differences are partly taken from their effects; for ſom heat, others cool, ſom drie, and ſom humect, ſom cleanſ, ſom corroborate, ſom waſte dead fleſh, and others cicatrize, partly from the varietie of colors, partly from the firſt invertors, as *Album rhaſis*, *Deſiccativum rubrum*: partly from the number of the ſimple medicaments whereof they bee made, as, *Tetrapharmacum*, *Tripharmacum*, or *Nutritum*: partly from that medicament which is principal in the compoſition, hence are they called, *Unguentum de Lytharg yro*, *de Minio*, *Diapompholigos*, and ſuch like. They are compounded of herbs, roots, ſeeds, fruits, metals, and part of Beaſts; the juices and other liquid things beeing conſumed away by boiling, as wee have ſaid in the Chapter of compound Oils. Herbs, and the parts of them, if they bee drie, muſt bee powd'red, and alſo metals; but beeing green, they are boiled and ſtrained forth, and the juice ſo preſſed is waſted by boiling. Gums and Roſins ſom are powdred, others beeing put to ſom convenient liquor are diſſolved by fire: So wax is diſſolved in the Oil. In the compoſition of unguents this proportion is uſually obſerved, that for one ounce of powder, two ounces of Wax, and eight of oil is added: notwithſtanding for that Wax ſerveth onely to the conſiſtence of the ointment, it is better to leav the quantitie to to the will of the Apothecarie; but hee may bee more ſparing in adding Wax to the ointments in Summer then in winter, for the heat of Summer, drying them, addeth to the conſiſtence; by examples propounded, theſe common precepts will more plainly appear. Ointments and their differences.

℞. *Olei roſ.* iv. *pil. lepor. bol. armen. terræ ſigil. an.* ℥i. *bal. Gallar. an.* ℥ß. *tritis terendis, & ſimul mixtis, addiâ cerâ quod ſufficit, fiat unguentum.* Here wee muſt obſerv, that there bee three waies of making ointments: The firſt is of thoſe which are made onely by ſtirring or grindeing in the Mortar without anie fire, and ſo is made *Unguentum nutritum*. The ſecond is, when wee diſſolv Wax in Oil, Fat, or ſom ſuch ſubſtance with fire; and beeing all diſſolved, wee mingle the powders according to the proportion wee noted before. After which manner are made *Unguentum Aureum*, *Baſilicon*, *Diapompholigos*, *Deſiccativum rubrum*, *Unguentum adſtringens.*

Enulatum. The third ſort is, when wee bruiſe herbs with a Peſtell, and mingle them with Axungie, boiling them together, and then ſtraining them, and the ointment is that which is ſtrained. Therefore let us proceed to explain this by examples.

unguentum nutritum. ℞. *Lythar. auri triti & loti* ℔ß. *olei roſ.* ℔i. *aceti roſ.* ℥iv. *fiat Unguentum.* Firſt, wee put the Lytharge into the Mortar, powring in a little Oil, and working it with a Peſtil, that it may grow thick, then with the Oil wee put a little Vineger, continually working, until they mingle into one bodie, now and then between whiles adding ſomtimes a little Oil, ſomtimes a little Vineger, until the whole bee brought to the conſiſtence of an ointment. If of an ointment of this kinde thou wouldeſt make a black plaſter, by degrees conſume all the Vineger, ſo ſhall the plaſter ſhine and grow black.

unguentum aureum. ℞. *Ceræ citr.* ℥vi. *olei boni* ℔ii. *tereb.* ℥ii. *reſin. & coloph. an.* ℥iß. *olib. maſtich. an.* ℥i. *croci* ℈i. *fiat Unguentum.* Firſt, diſſolv the Wax with a good part of Oil, then add the Roſin and Colophonie broken ſmall. Theſe beeing diſſolved, take the compoſition from the fire, and then add the Turpentine; when the whole is ſomwhat cooled, add the *Olibanum* and Maſtick beeing finely powdred, then the Saffron, which ſhall bee macerated in the reſt of the Oil.

ung. Tetrapharmacum, ſeu Baſilicum. Tetrapharmacon is ſo called, becauſ it is made of four ſimple medicines, Wax, Roſin, Pitch, Tallow, of each a like qnantitie, and ſo equally mixed.

℞ *Reſin. picis nigr. adip. vituli. & ceræ an* ℥ii. ß. *Olei veteris olivarum maturarum,* ℔i. ß. or if you would have it harder, ℔ i. that ointment is alſo called *Baſilicon*, the Wax beeing cut ſmall and diſſolved in Oil, then add the reſt of the things, which beeing diſſolved, thou ſhalt have the deſired ointment.

ung. Diapemphol ygos. ℞. *Olei roſ.* ℥ix. *cer. alb.* ℥iii. *ſucci ſolani hortenſis*, ℥iv. *Ceruſ. lot.* ℥i. *Pomphol ygos, plumbi uſti & loti, olib. puri, an.* ℥ß. *fiat unguentum.* Diſſolv the Wax in the Oil with a gentle fire, then you ſhall take it from the fire, and add to the reſt of the ingredients, working them together in a ſtone-Mortar, powring on the juice by degrees, at leaſt ſo much of it as will incorporate.

ung. deſiccativum rubrum. ℞. *Lap. calam. ter. ſig. an.* ℥ii. *Litharg. auri, ceruſ. an.* ℥iß. *Campbor.* ℥ß. *ceræ*, ℥iiß. *Olei roſat. viol. an.* ℥iii. *fiat Unguentum.* Diſſolv the Wax in the Oyl, then ſet it to cool, and work in the powders with a ſpatter, and at laſt add the Camphir diſſolved in a little Oil of Roſes, or Roſewater.

ung. Enulatum. ℞. *Rad. enul. campan. coct. cum aceto & contuſ. ut decet* ℔ß. *Axung. porci, olei commu. an.* ℥iß. *argen. vivi exſtincti, et tereb. lot. an.* ℥i. *ſal. commu. pulverati*, ℥ii. incorporate them according to art. The boiled roots muſt bee drawn through a Sieve, which beeing boiled by a gentle fire with the *Axungia*, muſt bee continually ſtirred, then put to the Salt with Oil and Wax: when you ſet it from the fire to cool, then add the Quickſilver, beeing killed with a little *Axungia* and Turpentine.

ung. Album Rhaſis. ℞. *Olei roſat.* ℥ix. *ceruſ. alb.* ℥iii. *cer. alb.* ℥ii. make it thus: Let the Ceruſs bee finely powdred, and put into the Oil and Wax whil'it it is hot, and ſo work the whole together, until they ſhall bee brought into a bodie.

De Althea. ℞. *Rad, Alth.* ℔i. *ſemi. lini, fœnugr. an.* ℔ß. *Scillæ* ℥iii. *Olei com.* ℔ ii. *cer.* ℔ ß. *terebinth. gum. heder. galb. an.* ℥i. *coloph et reſin.* ℥iii. The roots and ſeeds beeing bruiſed, are infuſed for three daies in five pints of water; boil them until three ounces bee conſumed, and then draw forth the Mucilage, and boil it with the Oil, then add Wax cut ſmall: theſe beeing taken from the fire, the *Galbanum* beeing diſſolved with Vineger, and mingled with the Turpentine, muſt bee added together with the Gum *Hederæ*, Colophonie, and Roſin.

ung. Populeum. ℞. *Ocul. populi arb.* ℔i. ß. *fol. papaveris nigr. Mandrag. byoſcami, lactucæ, ſempervivi parvi et magni, violæ nigræ, ſolani, umbilici veneris, ſeu cymbalar. bardanæ, an.* ℥ ß. (*Cordus*, *Fernelius*, *et Nicolaus ſingulorum* ℥iii. *præſcribunt*) *Adipis ſuilli recentis ſalis expertis*, ℔ ii. *vini boni*, ℔i. *fiat Unguentum.* The Poplar buds and Violet leavs muſt bee bruiſed and macerated in the *Axungia* for the ſpace of two moneths, that is until the reſt of the herbs bee readie; for they cannot bee gathered before the Summer time, but the Poplar buds and Violets may bee had in March. They muſt bee bruiſed and mingled verie well, and ſet in a warm place for eight daies; then add one pint of ſtrong Vinegar, and boil them till it bee conſumed, which may bee perceived by caſting a little of it into the fire, then ſtrain it forth, & put up the Ointment.

ung. Apoſtolorum. ℞. *Tereb. cer. alb. reſ. an.* ℥xiv. *Opopanacis, floris, ſeu viridis æris (nam hic flos æris non propriè accipitur pro granulis, quæ ſcintillarum inſtar ab ære exiliunt dum à fabris ferrariis aqua tingitur: ſed pro viridi æris uſurpatur, cujus contra maligna ulcera notæ ſunt vires, contra quæ omnino id Unguentum eſt comparatum) an.* ℥ii. *ammon.* ℥xiv. *ariſtol. lon. thuris maſculi an.* ℥vi. *myrrhæ et galbani an.* ℥iii. *bdelli*, ℥vi. *Lytharg.* ℥ix. *olei* ℔ ii. *fiat Unguentum.* The Litharge is to bee mingled with two ounces of Oil for the ſpace of five hours, and with a gentle fire to bee boiled until it com to the conſiſtence of honie, and bee alwaies ſtirring, leſt it burn: beeing taken from the fire and warm, the Wax and the Roſin, beeing diſſolved, with the reſt of the oil, muſt bee added. Then put to it, when it is cooling, the Gums diſſolved in Vineger, boiled and incorporated with the Turpentine. Then the *Ariſtolochia*, Myrrh, and Frankincenſ are to bee mingled, and laſt of all the Verdigreaſ, beeing in fine powder, and ſprinckled in: and ſo the unguent is made

Comitiſſa. ℞. *Cortic. median. caſtan. cortic. median. querc. cortic. median. gland. mirtil. æquiſ. cortic. fabar.*

acinor.

acinor. aceti. farbor. ficor. hordei. mel fallor. tunicator. rad. cheridon. folior. prunor. bdellij. ana. ℥ iß. vel quod plus ruffi, ℥ viii. cer. nov. ℥ viii ß. olei myrtill. ℔ iß. Then these things which follow, beeing finely powdred, are to bee sprinkled in.

℞ *Pulveris rosarum mali cydonij ana. corticis medium glandi. cornic. mediun. arb. glandi. ana ℥ ß. gallar. ℥ß. Cimini, Coriandri bene, myrtill. acaciæ rosar. sorbor. farinæ. ana ℥ ß. Trochiscorum de carabe, ℥ß. fiat Unguentum.* First, make a decoction of *corticis medium arboris quercus, acini rosar. rad. cichorij, endiviæ, folior. capillis Veneris, myrtil. folior. primi syluestris cort. folior. cortic. mediani glandi. cornic. radicis, & gallarum* in the Plain ale water for the space of two hours, then strain it, and divide the liquor into three parts, washing the Wax, dissolved with the oil of Myrtils seven times in the liquor being all spent, and the Wax and Oil beeing melted, then infuse the powders; *Cerussa bene ablutæ, corticis medium. querc. medium. cornic. glandi. cassiæ. gallar sorbor. ana ℥ ß. pulpæ cydoniorum myrtil. acaciæ rosar.* and at the last the Trochises *carabe.* after this manner shall you make this Ointment.

℞ *Olei chamæmeli, myrtilli, de spic. rosat. ana ℥ ß. folior. absinth. ros. maior. mandr. an. ℥ i. Caryoph, cinnamom. nucis. galang. an ʒ ß.* Powder those things which are to bee powdred, and with a sufficient quantity of Wax make a soft ointment, wherewith let the stomach be annointed one hour before meate continually. *Ung. pro stomacho.*

℞ *Olei laurini, chamæmeli, nardini, an. ℥ iß. myrtil. medul. cervi, an. ℥ ii. thuris, ℥ i. olei, ℔ ß.* Boil the ingredients in the oil to a mean consistence, then add to the Wax and Cerusse, and when it will not stick to the fingers, take it from the fire, and put in the *Medulla*, when it beginneth to cool, the *Myrrha* and *Thus*, beeing finely powdred, must bee cast in by little and little, and the ointment may bee put up for use. The chops of the fundament, and remoist Pessaries are like vnto it made of it, and it is verie good against the bitings of mad Dogs, and the punctures of nerves and tendons, keeping wounds so that they do not agglutinate. *Ung. ad morsus rubiosos, ex li. 2 Gal. de comp. sec. genera.*

℞ *Picis pinguis, ℔ i. Oppoponacis in aceto fortì, olei liliorum, & veteri porci axungiæ coct, ana ℥ iß. fiat Unguentum.* *Oleum ex pinu* is good against those bitings of mad beasts and punctured nerves for it doth open wounds when they are cicatrized. Ointments are used to overcome the contumacie of a stubborn evil by their firm and close sticking to, especially if there shall need no medicine to go further into the bodie. *3. De comp. med. sec. gen.*

CHAP. XXVII.

Of Cerots and Emplasters.

Much affinitie there is in the composition of a Cerot and Emplaster, that oftentimes the one is taken for the other, as is usually done in Ointments and Liniments. A Cerot is a composition more solid and hard then an ointment, and softer then a plaster, having his name from Wax, which taking away the fluidnesse of the oil, bringeth him to his consistence. The differences of Cerots are taken from sthem the parts by which they are called, as *Ceratum Sampsuchinum*; from from the effects, as *Ceratum refrigerans Galeni*; Others from the simple medicaments which are the chief in the composition, as *Cerotum Santalinum*. The proper matter of Cerots, new Wax and Oil, beeing appropriated to the ease of those, or both parts; so that Liniments and Ointments do scarce differ from Cerots, if they admit of Wax: for if ointment of Roses should have Wax added to it, it were no longer an Ointment but a Cerot. Where a Cerot is. The differences.

Cerots, which are made with Rosins, Gums, and Metals, do rather deserve the names of Emplasters then Cerots. And therefore *Ceratum ad Hernias*, are commonly call *Emplastra contra Rupturas*. If that pain or inflammation do grieve any part, we make Cerots of plaster, dissolved with Oil, least that the more hard and heavie consistence of the Emplaster should bee troublesom to the part, and hinder perspiration: and therefore laying aside the composition of Cerots, let us speak of Emplasters.

An Emplaster is a composition which is made up of all kinde of medicines, especially of fat and drie things, agreeing in one gross, viscous, solid, and hard bodie sticking to the fingers. The differences of Emplasters are taken from those things, which the varietie of ointments are taken from. Of those things which go into the composition of an Emplaster, some are onely used for their qualitie and facultie, as Wine, Vinegar, Juices. Others to make the consistence, as Litharge (which, according to *Galen*, is the proper matter of Emplasters) Wax, Oil, and Rosin. Others bee vsefull for both, as Gums, Metals, parts of fleshy Robin, Turpentine to digest, to cleanse, and drie. Of Emplasters, some are made by boiling, some are brought into a form without boiling; those which bee made without fire, do suddenly drie, nor are they viscous: they are made with meal and powders, with some juice, or with some humid matter mingled with them. But plasters of this kinde may rather bee called Cataplasms, or Cataplasmes: for plasters properly so called are boiled, some of them longer, some shorter, according to the nature of those things Emplasters.

which make up the compoſition of the Emplaſter: Therefore it will bee worth our labor to know what Emplaſters do ask more, or which leſs boiling. For roots, woods, leavs, ſtalks, flowers, ſeeds, beeing dried, and brought into powder, are to bee added laſt, when the plaſter is boiled as it were, and taken from the fire, leſt the virtue of theſe things bee loſt. But if green things are to bee uſed in a compoſition, they are to bee boiled in ſom liquor, and beeing preſſed forth, that which is ſtrained to bee mingled with the reſt of the compoſition; or if there bee juice to bee uſed, it is to bee bruiſed and preſſed forth, which is ſo to bee boiled with the other things, that nothing for the qualitie is to remain with the mixture, as wee uſe to do in *Empl. de Jama, ſeu Betonice, & Gratia Dei.* The ſame is to bee don with Mucilages, but that by their clammineſs they do more reſiſt the fire. But there doth much of oil and honie remain in their plaſters when they are made. Thoſe juices which are hardened by concretion, as, *Aloes, Hippocyſtis, Acacia,* when they are uſed in the compoſition of a plaſter, and bee yet new, they muſt bee macerated and diſſolved in ſom proper liquor, and then they are to bee boiled to the conſumption of that liquor. Gums, as, *Opopanax, Galbanum, Sagapenum, Ammoniacum,* muſt bee diſſolved in Wine, Vinegar, or *Aqua vitæ,* then ſtrained and boiled to the conſumption of the liquor, and then mixed with the reſt of the plaſter. And that they may have the exact quantitie of Gums and Pitch, it is neceſſarie that firſt they bee diſſolved, ſtrained, and boiled, becauſ of the ſticks and ſordid matter which are mingled with them. You muſt have reſpect alſo to the liquor you uſe to diſſolv them in; for Vinegar of the beſt Wine doth more powerfully penetrate, then that which is of weak and bad Wine.

Other Gums, which are drier, are to bee powdred, and are to bee mingled with plaſters laſh of all. Metals, as, *Æs uſtum, Chalcitis, Magnes, Bolus Armenus, Sulphur, Auripigmentum,* and others, which may bee brought to powder, muſt bee mingled laſt, unleſs advise bee given by long boiling to dull the fierce qualities of them. The like conſideration is to bee had of Roſin, Pitch, and Turpentine, which muſt bee put in after the Wax, and may not bee boiled but verie gently; but the fats are mingled whil'ſt the other things are boiling. The Litharge is to bee boiled with the oil to a juſt conſiſtence, if wee would have the plaſter drie without biting. Ceruſs may endure as long boiling, but then the plaſter ſhall not bee white, neither will the Litharge of ſilver make a plaſter with ſo good a color as Litharge of gold. Moreover, this order muſt bee obſerved in boiling up of plaſters: the Litharge muſt bee boiled to his conſiſtence; juices or mucilages are to bee boiled away, then add the fats, then the drie Roſin, Wax, Gums, Turpentine, and after them the powders: You ſhall know the plaſter is boiled enough by his conſiſtence, groſs, hard, glutinous, and ſticking to the fingers, beeing cooled in the air, water, or upon a ſtone. Alſo you ſhall know it by his exact mixtion, if that all the things becom one maſs hard to bee broken.

Signs of a plaſter perfectly boiled.

The quantitie of things to bee put into plaſters.

The quantitie of things which are to bee put into a plaſter can hardly bee deſcribed, but an artificial conjecture may bee given, by conſidering the medicaments, which make the plaſter ſtiff, and of a conſiſtence, and the juſt hardneſs and ſoftneſs they make beeing boiled. Wax is not put into ſuch plaſters wherein is *Labdanum*; for that is in ſtead of Wax. For if there ſhall bee in the compoſition of a plaſter ſom emplaſtick medicaments, the Wax ſhall bee the leſs: Contrariwiſe, if they ſhall bee almoſt all liquid things, the Wax ſhall bee increaſed ſo much, as ſhall bee neceſſarie for the conſiſtence of the plaſter. The quantitie of the Wax alſo muſt bee altered according to the time, or the air; therefore it is fit to leav this to the art and judgment of the Apothecarie. Emplaſters are ſomtimes made of ointments by the addition of wax, or drie roſin, or ſom other hard or ſolid matter. Som would that a handful of medicaments poudred, ſhould bee mingled with one ounce, or an ounce and an half of oil, or ſom ſuch liquor, but for this thing nothing can certainly bee determined: Onely in plaſters deſcribed by the Antients there muſt bee great care had, wherein hee muſt bee verie well verſed, who will not err in the deſcribing the doſe of them; and therefore wee will here give you the more common forms of plaſters.

Empl. de Vigo with Mercurie.

℞. *ol. chamæm, aneth. de ſpica, liliacei, an.* ℥ ii. *ol. de croco,* ℥ i. *pingued. porci,* ℔ i. *pingued. vitul.* ℔ ß. *euphorb.* ʒ v. *thuris,* ʒ x. *ol. lauri,* ℥ i ß. *ranar. viv.* nu. vi. *pingued. viper. vel ejus loco human.* ℥ ii ß. *lumbricor. lotor. in vino,* ℥ iii ß. *ſucci ebuli, enul. ana.* ℥ ii. *ſcœnanthi, ſtœchados, matricar. an.* m ii. *vini odoriferi,* ℔ ii. *litharg auri,* ℔ i. *terebinth. claræ.* ℥ iii. *ſtyracis liquid.* ℥ i ß. *argenti vivi exſtinctii,* ſo much as the preſent occaſion ſhall require, and the ſick ſhall bee able to bear, and make up the plaſter they do commonly add four ounces of quick-ſilver, yet for the moſt part they do increaſ the doſe, as they deſire the plaſter ſhould bee ſtronger: the worms muſt bee waſhed with fair water, and then with a little wine to cleanſ them from their earthie filth, of which they are full, and ſo the frogs are to bee waſh't and macerated in wine, and ſo boiled together to the conſumption of a third part; then the Squinanth muſt bee bruiſed, the Feverfew and the Stœchas cut ſmall, and they beeing added, to bee boiled to the conſumtion of one pint, and beeing boiled ſufficiently, the decoction beeing cooled ſhall bee ſtrained and kept; and the Litharge is to bee infuſed for twelv hours in the oil of Camomil, dill, Lilies, Saffron, and the unguia's above ſpoken of.

Then

Then boil them all with a gentle fire, by and by taking from it from the fire; and add one quart of the decoction above ſpoken of, then ſet it to the fire again that the decoction may bee conſumed, and then by degrees add to the reſt of the decoction: the oil of ſpike ſhall bee reſerved unto the laſt, which may give the plaſter a good ſmell. Then are added the juices of walwurt and enula, which muſt bee boiled until they bee waſted away. Afterwards it being taken from the fire, to the compoſition is added the frankincenſe and euphorbium, and white wax as much as ſhall ſuffice. When the whole maſs ſhall cool, then at laſt is mingled the quick-ſilver extinct, turpentine, oil of bitter almonds, baies, ſpike, of line, ſtyrax and axungia, being continually ſtirred, and it ſhall bee made up upon a ſtone into rolls. Unleſs the quick-ſilver bee well extinguiſhed, it will run all into one place, and unleſs you ſtirre until the compoſition cool, it will vapor away in fume.

℞. *croci*, ℥ii. *bdelli, maſtich. ammon. ſtyrac. liquid. an* ℥ ß. *ceræ alb.* ℔ ß8. *tereb.* ℥ vi. *medul. cruris vacce, adipis vnſerini, an* ℥i. *æſypi, vel ſi deſit axung. gallin.* ℥ix. *olei nard. quantum ſatis ad magmaleones formandos, expreſſionis ſcillæ*, ℥i ß. *olibani, ſevi vitul.* ℥ i. The *æſypus, ſepum, adeps, medulla, cera*, are to bee diſſolved together; when they cool, add the *ammoniacum* diſſolved in the decoction of fenugreek and camomil, half an ounce, and ſo much juice of ſquills, then put to the ſtyrax and turpentine, ſtirring them continually; then add the *bdellium, olibanum*, maſtich, aloës, brought into fine powder, and when they are perfectly incorporated into a maſs let them bee made up with *oleum nardinum* into rolls. *Ceratum æſypi ex Philogrio.*

℞. *terebinth.* ℔ ß, *reſin.* ℔i. *cer. alb.* ℥ iv. *maſtich.* ℥i. *fol. verben. betonic. pimpinel. an.* m i. The herbs being green, the tops are to bee cut and bruiſed in a ſtone-mortar, and boiled in red wine to the conſumption of one third part. To the ſtrained liquor add wax cut into ſmall pieces, and being diſſolved by the fire; the liquor being conſumed put to the roſin, when it ſhall cool add the Maſtich powdred, working it with your hands, by which it may bee incorporated with the reſt of the things. *De gratia Dei.*

℞. *ſucci beton. plantag. æqii, an.* ℔ i. *ceræ, picis, reſin. tereb. an.* ℔ ß. *fiat empl.* The juices are to bee mingled with the wax being diſſolved, and boiling them until three parts bee conſumed, add the roſin and pitch, which being diſſolved and hot, muſt bee ſtrained, and then add the turpentine, and make up the plaſter. *De jamua ſeu de Betonica.*

℞. *croci, picis com.* (or rather *picis navalis*, becauſe this emplaſter is uſed to diſcuſs and draw forth the matter which cauſeth the pain in the joints) *colophon. ceræ, an.* ℥ ii. *tereb. galb. ammon. thuris, myrrhæ, maſtich. an.* ℥ ß. The *cera, pix*, and *colophonia* are by little and little to bee diſſolved, to which add the gums diſſolved according to art, and mingled with the terebinth; and taking it from the fire add the *thus, myrrha*, and at laſt the *crocus* in fine powder, and then make it up into rowls with oil of worms. *Emplaſtrum ex croceum.*

℞. *ol. com.* ℔ ii. *ceruſ. ſubtiliſ.* ℔ i. boil them together with a gentle fire, ſtirring them up continually until they com to the bodie of an emplaſter: if you would have the plaſter whiter, take but ℥ ix. of the oil. *De ceruſa.*

℞. *lytharg. triti, acet. fortiſ. an.* ℔ ß. *ol. antiq.* ℔ i. *fiat emplaſtrum*: let the oil bee mingled with the litharge for the ſpace of twelv hours; then boil them to a good conſiſtence, putting in the vineger by little and little; but you ſhall not take it from the fire until the vineger bee quite waſted away. *Triphanicum, ſeu nigrum.*

℞. *ol. vet.* ℔ iii. *axung. vet. ſine ſale*, ℔ ii. *litharg. triti* ℔ iii. *vitriol.* ℥ iv. let the oil bee mingled with the litharge for the ſpace of twelv hours, and boil them to a good conſiſtence, then add to the axungia, ſtirring them continually with a ſpatter made of the palm-tree, reed, or willow, and being ſufficiently boiled, take it from the fire, and add the vitriol in fine powder. *Diapalma, ſeu diachalcitios.*

℞. *picis naval. aloes. an.* ℥ iii. *litharg. cetæ, colophon. galban. ammoniac. an.* ℥ ii. *viſci querni*, ℥ vi. *gypſi uſt. utriuſque ariſtoloch. ana*, ℥ iv. *myrrhæ, thuris, an* ℥ vi. *tereb.* ℥ ii. *pulveris pennium terreſtrium, gallar. utriuſq. comphol. bol. arm. an.* ℥ iv. *ſang. humani*, ℔ i. *fiat emplaſt.* If you would have it of a verie good conſiſtence, you may add of the oil of myrtils or maſtich, ℔ ß. you ſhall make it thus: Take the skin of a Ram cut in pieces, and boil it in an hundred pintes of water and vineger until it com to a glue of ſtiff gellie, in which you ſhall diſſolv the *viſc. quer.* then add the pitch and wax broken into ſmall pieces, and if you will you may add the oil with them, afterwards the *galban.* and *ammoniac.* diſſolved in vineger, being mingled with the terebinth, may bee added. Then add the litharge, *gypſum, bol. ariſtoloch. conſolida, vermes & ſang. humun.* At laſt the myrrh, *thus, colophon* and *aloë*, ſtirring them continually; and that they may bee the better mingled, work the plaſter with a hot peſtil in a mortar. *Contra vuptu à ram.*

℞. *mucag. ſem. lini, rad. alth. fœnug. mediar. corticis ulmi, an.* ℥iv. *olei liliacei, chamæ. aneth. an*, ℥iß. *ammon. opopanac. ſagap. ana* ℥ß. *croci*, ℥ii. *ceræ nov.* ℔ ß. *tereb.* ℥ ß. *fiat empl. Fernelius* hath ℥xx. of wax: the wax being cut ſmall muſt bee mingled with the oils and the mucilages, ſtirring them continually with a wooden ſpatter till the liquor bee conſumed. Then the gums diſſolved and mingled with the terebinthina, muſt bee added, and laſt of all the ſaffron finely powdered. *De mucaginibus.*

℞. *ol. roſ. myrtil. ung. populeon. ana*, ℥ iv. *pinguedinis gallin.* ℥ii. *ſebi urietis caſtrini, ſepi vaccini, an.* ℥vi. *pingued. porci*, ℥x. *litharg. auri, argenti, an.* ℥ iii. *ceruſ.* ℥ iv. *minii*, ℥ iii. *tereb.* ℥ iv. *ceræ, q. ſ. fiat emplaſtrum vel ceratum molle.* The *lithargirus, ceruſa*, and *minium* are to bee brought into fine powder, ſeverally being ſprinkled with a little roſe water, leſt the fineſt of it ſhould flie away, *De minio.*

theſe

these beeing mingled with the oil of roses and myrtles, with a gentle fire may bee boiled until they com to the consistence of honie; then add the axungia's, and boil them till the whole grow black, after add the *sebum*, and that beeing dissolved take it from the fire, and then add the *unguentum populeon*, and som wax if there bee need, and so bring it to the form of a plaster.

Diachylon magnum.

℞ *litharg. part. pul. ℥iii. ol. trin. chamæm. anetb. an ℥viii. mucag. sem. lini, fœnug. rad. alth. semin. pinq. uvar. passar. succi uvæ, scilic. asper, ichyocollæ, an. ℥ vii ℈ xxxvi, ℥ iii. ter. pini, cerus flavæ, an. ℥ ii. fiat emplastrum.* The litharge is to bee mingled with the oil before it bee set to the fire, then by a gentle fire it is to bee boiled to a just consistence; after the mucilage by degrees must bee put in, which beeing consumed the juices must bee added and the ichyocolla, and they beeing wasted too, then put to the wax, rosin, then taking the whole from the fire, add the oliban and terebinthina.

The use of plasters.

Wee use plasters when wee would have the remedie stick longer and firmer to the part, and would not have the strength of the medicament to flie away or exhale too suddenly.

CHAP. XXVIII.

Of Cataplasms and Pultisses.

The matter of cataplasms.

CAtaplasms are not much unlike to emplasters less properly so called, for they may bee spread upon linnen cloths and stoupe like them, and so applied to the grieved parts. They are composed of roots, leave, fruits, flowers, seeds, herbs, juices, oils, fats, marrows, meals, rosins. Of these som must bee boiled, others crude. The boiled are made of herbs boiled tender, and so drawn forth an hair-fearse, adding oils and axungia's thereto. The crude are made of herbs beaten, or their juices mixed with oil and flower, or other powders appropiate to the part or disease, as the Physician shall think fit. The quantitie of medicines entring these compositions can scarce bee defined, for that they must bee varied as wee would have the composition of a softer or harder bodie. Verily they ought to bee more gross and dense when as wee desire to ripen anie thing, but more soft and liquid when wee endevour to discuss. Wee use cataplasms to asswage pain, digest, discuss and resolv unnatural tumors and flatulencies. They ought to bee moderately hot and of subtil parts, so to attract and draw forth; yet their use is suspected the bodie beeing not yet purged, for thus they draw down more matter into the affected part. Neither must wee use these when as the matter that is to bee discussed is more gross and earthie, for thus the subtiler parts will bee onely discussed, and the gross remain impact in the part unless your cataplasm bee made of an equal mixture of things, not only discussing, but also emollient, as it is largely handled by *Galen*.

Their use.

Lib. 2. ad glauc. ubi de scirrho.

This shall bee largely illustrated by examples. As, ℞. *medul. panis, ℥ ß. decoquantur in lacte pingui, adde olei chamæm. ℥ ß. axung. galin. ℥ i. fiat cataplasma.* Or, ℞. *rad. alth. ℥ iii. fol. malv. fœnugr. an. m i. sem. lini, fœnug. an. ℥ ii. ficus, ping. nu. vi. decoquantur in aquæ, & per setaceum transmittantur, addendo olei liliac. ℥ ß. far. hord ℥ ii. axung. porcin. ℥ i ß. fiat cataplasma.* Or, ℞. *far. fab. & orob. an. ℥ iii. pulv. chamæm. & melil. an. ℥ iii. ol. trin. & unygd. amar. an. ℥ i. succi rut. ℥ ß. fiat cataplasma.* Pultisses differ not from cataplasms, but that they usually consist of meals boiled in oil, water, honie, or axungia. Pultisses for the ripening of tumors are made of the flour of barlie, wheat, and milk, especially in the affects of the entrails; or elſ to drie and binde, of the meal of rice, lentils, or *Orobus* with vinegar; or to cleanse, and they are made of honie, the flour of beans and lupines, adding thereto som old oil, or anie other oil of hot qualitie, and so make a discussing pultis. Also anodyne pultisses may bee made with milk; as thus for example, ℞. *farin. triticeæ, ℥ii. micæ panis purissimi, ℥ iii. decoquantur in lacte, & fiat pulticula.* ℞. *farin. hordei & fab. an. ℥ ii. far. orob. ℥ iii. decoquantur in hydromelite, addendo mellis quart. i. olei amyg. amar. ℥ ii. fiat pulticula.* Wee use pultisses for the same purpose as wee do cataplasms, to the affects both of the internal and external parts. Wee sometimes use them for the killing of worms, and such as are made of the meal of Lupines boiled in vinegar, with an ox's gall, or in a decoction of wormwood, and other such like bitter things.

An anodyne cataplasm.

A ripening cataplasm.

A discussing cataplasm.

How Pultisses differ from cataplasms.

A ripening cataplasm.

CHAP. XXIX.

Of Fomentations.

A *Fotus* or fomentation is an evaporation or hot lotion, chiefly used to mollifie, relax and asswage pain, consisting of medicines having these faculties. A fomentation commonly useth to bee moist, being usually made of the same things as embrocations, to wit, of roots, seeds, flowers, boiled in water or wine. The roots here used are commonly of mallows, marsh-mallows, and lilies. The seeds are of mallows, marsh-mallows, parsley, smallage, line, fenugreek. Flowers are of camomil, melilot, figs, raisins, and the like: all which are to bee boiled in wine, water, or lye, the consumption of the third part or the half: as,

℞. *Rad. alth. & lil. an. ℥ii. sem. lini, fœnug. cumin. an. ℥iii. ß. rhum. mell. & unct. an. p. i. fiunt. orig. m. ß. bulliant in aquæ partibus, aquæ & vini, aut in duabus partibus aquæ, & unā vini, aut in*

Lixivio

Lixivio cineris ſarmentorum, ad tertiæ partis conſumptionem, fiat fotus. In imitation hereof you may eaſily deſcribe other fomentations, as occaſion and neceſſitie ſhall require.

Wee uſe fomentations before wee applie cataplaſms, ointments or plaſters to the part, that ſo wee may open the breathing places or pores of the skin, relax the parts, attenuate the humor, that thus the waie may bee the more open to the following medicines. The bodie beeing firſt purged, fomentations may bee uſed to what parts you pleaſ. They may bee applied with a female-ſpunge, for it is gentler and ſofter then the male; with felt, woollen cloaths, or the like dipped in the warm decoction wrung out, and often renued; otherwiſe, you may fill a Swine's bladder half full (eſpecially in pains of the ſides) of the decoction, or elſe a ſtone-bottle, ſo to keep hot the longer; yet ſo, that the bottle bee wrapped in cotton, wool, or the like ſoft thing, that ſo it may not by the hardneſs and roughneſs offend the part, according to *Hippocrates*. Their uſe. 2. *De victu in acutis.*

CHAP. XXX.

Of Embrocations.

AN *Embroche*, or Embrocation is a watering, when as from on high wee (as it were) ſhewr down ſom moiſture upon anie part. This kinde of remedie is chiefly uſed in the parts of the head, and it is uſed to the coronal ſuture, for that the skull is more thin in that part, ſo that by the *ſpiracula* or breathing places of this ſuture, more open then thoſe of the other ſutures, the force of the medicine may more eaſily penetrate unto the *Meninges*, or membranes of the brain. The matter of Embrocations is roots, leavs, flowers, ſeeds, fruits, and other things, according to the intention and will of the Phyſician. They are boiled in water and wine, to the half or third part. Embrocations may alſo bee made of Lie or Brine againſt the cold and humid affects of the brain. Somtimes of oil and vineger, otherwhiles of oil onely. *℞. fol. plantag. & ſolan. an m. i. ſem. portul. & cucurb. an ʒii. myrtil. ʒi. flor. nymph. & roſ. an p. ß. fiat decoct. ad lbi. cum aceti ʒii. ſi altè ſubeundum ſit, ex quâ irrigetur pars inflammata.* What an Embrocation is.

In affects of the brain, when wee would repercuſe, wee often and with good ſucceſs uſe oil of Roſes with a fourth part of vineger.

Wee uſe Embrocations, that together with the air drawn into the bodie by the *Diaſtole* of the arteries, the ſubtler part of the humor may penetrate, and ſo cool the inflamed part: for the chief uſe of embrocations is in hot affects. Alſo wee uſe embrocations, when as for feat of an hæmorrhagie, or the flying aſunder of a broken or diſlocated member, wee dare not looſ the bandages wherewith the member is bound. For then wee drop down ſom decoction or oil from high upon the bandages, that by theſe the force of the medicine may enter into the affected member. Their uſe.

CHAP. XXXI.

Of Epithemes.

AN *Epithema*, or an Epitheme, is a compoſition uſed in the diſeaſes of the parts of the lower and middle bellie, like to a fomentation, and not much unlike an embrocation. They are made of waters, juices, and powders, by means whereof they are uſed to the heart, cheſt, liver and other parts. Wine is added to them for the more or leſs penetration, as the condition of the hot or cold affect ſhall ſeem to require: for if you deſire to heat, more wine muſt bee added, as in ſwooning by the clotting of blood, by the corruption of the ſeed, by drinking ſom cold poiſon: the contrarie is to bee don in a fainting by diſſipation of the ſpirits by feveriſh heats, alſo vineger may bee added. The matter of medicines proper to the entrails is formerly deſcribed, yet wee commonly uſe the *ſpecies* of electuaries, as the *ſpecies electi triaſantali* the liver beeing affected, and Diamargariton in affects of the heart. The proportion of the juices or liquors to the powders, uſe's to bee this, to everie pinte of them ʒi. or ʒiſs. of theſe, of wine or eli of vineger ʒi. You may gather this by the following example. What an Epitheme is. In the ſixth Chapter.

℞. *aqu. roſ. bugl. borag. an.* ʒiii. *ſucci ſcabioſ.* ʒii. *pul. electi. diamarg. frigid* ʒii. *cort. citri ſicci* ʒi. *coral. raſ. ebor. an.* ʒß. *ſem. citri & card. ben. an.* ʒiiſs. *croci & muſchi an gra.* 5. *addendo vini albi* ʒii. *fiat Epithema pro corde.* A cordial Epitheme.

Epithemes are profitably applied in hectick and burning fevers to the liver, heart, and cheſt, if ſo bee that they bee rather applied to the region of the lungs; then of the heart; for the heat of the lungs beeing by this means tempered, the drawn in air becom's leſs hot in peſtilent and drying fevers. They are prepared of humecting, refrigerating, and cordiall things, ſo to temper the heat, and recreate the vital facultie. Somtimes alſo wee uſe Epithemes to ſtrengthen the heart, and drive there-hence venenate exhalations, lifted or miſed up from anie part which is gangrenate or ſphacelate. Som cotton, or the like, ſteeped or moiſtened with ſuch liquors and powders warmed, is now and then to bee applied to the affected entrail; this kinde of remedie, as alſo all other topick and particular medicines, ought not to bee uſed, unleſs you have firſt premiſed general things. Their uſe.

CHAP.

CHAP. XXXII.

Of Potential Cauteries.

The uſe of potential cauteries.

THat kinde of Pyrotick, which is termed a Potential Cauterie, burn's, and cauſeth an eſchar. The uſe of theſe kindes of Cauteries is to make evacuation, derivation, revulſion, or attraction of the humors by thoſe parts whereto they are applied. Wherefore they are often and with good ſucceſs uſed in the punctures and bites of venemous beaſts, in a venemous, as alſo in a peſtilent *Bubo* and Carbuncle, unleſs the inflammation bee great: for the fire doth not onely open the part, but alſo retund's the force of the poiſon, call's forth, and plentifully evacuate's the conjunct matter. Alſo they are good in phlegmatick and contumacious tumors; for by their heat they take away the force and endevours of our weak heat. Alſo they are profitably applied to ſtanch bleeding, to eat or waſte the ſuperfluous fleſh of ulcers and wens, to bring down the callous lips of ulcers, and other things too long here to inſiſt upon.

The matter of them.

The materials of theſe Cauteries are Oke-aſhes, Pot-aſhes, the aſhes of Tartar, of Tithymals or ſpurges, the Fig-tree, the ſtalks of Colewurts and beans, cuttings of Vines, as alſo *ſal ammoniacum, alkali, axungia vitri, ſal nitrum*, Roman Vitriol, and the like; for of theſe things there is made a ſalt, which by it's heat is cauſtick and eſcharotick, like to an hot iron and burning coal: Therefore it violently looſe's the continuitie by eating into the skin, together with the fleſh there-under. I have thought good here to give you divers forms of them.

The forms of them.

Take of unquench't Lime exſtinguiſhed in a bowl of Barber's Lee three pounds: When the Lee is ſettled, let it bee ſtrained, and into the ſtraining put of *Axungia vitri*, or Sandiver, calcined Argol, of each two pounds, of *Sal nitrum & ammoniacum*, of each four ounces, theſe things muſt bee beaten into a groſs powder, then muſt they bee boiled over the fire, and after the boiling let them remain in the Lee for four and twentie hours ſpace, beeing often ſtirred about, and then ſtrained through a thick and double linnen-cloth, leſt anie of the earthlie droſs get thorow together with the liquor. This ſtrained liquor, which is as clear as water, they call *Capitellum*, and they put it in a braſen Baſin, ſuch as Barbers uſe, and ſo ſet it upon the fire, and aſſoon as it boil's, they keep it with continual ſtirring, leſt the ſalt ſhould adhere to the baſin; the *Capitellum* beeing half boiled away, they put in two ounces of powdred vitriol, ſo to haſten the falling of the eſchar, and ſo they keep the baſin over the fire until all the liquor bee almoſt waſted away. Then they cut into pieces the ſalt or that earthie matter, which remain's after the boiling away of the *Capellum*, and with a knife or hot iron ſpatula, form them into cauteries of ſuch figure and magnitude as they think fitting, and ſo they laie them up, or keep them for uſe in a viol or glaſs cloſely ſtopped, that the air get not in: Or,

Take a bundle or ſufficient quantitie of Bean-ſtalks or huſks, of Colewurt-ſtalks two little bundles, of cuttings of Vines four handfuls, burn them all to aſhes, which put into a veſſel of river-water, ſo let them infuſe for a daie's ſpace, beeing ſtirred ever now and then; to this adde two pounds of unquench't Lime, of *Axungia vitri* half a pound, of calcined Tartar two pounds, of *Sal niter* four ounces, infuſe all theſe, beeing made into powder, in the foreſaid Lee for two or three daies ſpace, often ſtirring it, then ſtrain the *Capitellum* or liquor through a thick cloth until it becom clear. Put it into a baſon, and ſet it over the fire, and when as the moiſture is almoſt wholly ſpent, let two or three ounces of vitriol bee added, when the moiſture is ſufficiently evaporated, make cauteries of that which remain's, after the formerly mentioned manner.

Take of the aſhes of ſound, knottie, old Oke as much as you pleaſ, make thereof a Lee; powr this Lee again upon other freſh aſhes of the ſame wood, let this bee don three or four times, then quench ſom Lime in this Lee, and of theſe two make a *Capitellum*, whereof you may make moſt approoved cauteries. For ſuch aſhes are hot in the fourth degree; and in like ſort the ſtones, whereof the lime by burning becom's fierie and hot to the fourth degree: Verily, I have made cauteries of Oke-aſhes onely, which have wrought quickly and powerfully. The *Capitellum* or Lee is thought ſufficiently ſtrong, if that an egg will ſwim therein without ſinking. Or,

The ſign of good *Capitellum*.

Take of the aſhes of bean-ſtalks three pounds, of unquench't lime, Argol, of the aſhes of Oke-wood, beeing all well burnt, of each two pounds. Let them for two daies ſpace bee infuſed into a veſſel full of Lee made of the aſhes of Oke-wood, and bee often ſtirred up and down. Let this Lee then bee put into another veſſel, having manie holes in the bottom thereof, covered with ſtrums or ſtraw-pipes, that the *Capitellum* flowing through theſe ſtrait paſſages may becom more clear. Let it bee put twice or thrice upon the aſhes, that ſo it may the better extract the heat and cauſtick qualitie of the aſhes. Then putting it into a Barber's baſin, ſet it over the fire, and when it ſhall begin to grow thick, the fire muſt bee increaſed, and cauteries made of this concreting matter.

The faculties of the ſilken cauterie.

The following cauteries are the beſt that ever I made trial of, as thoſe that applied to the arm in the bigneſs of a Peaſ, in the ſpace of half an hour without pain, eſpecially if the part of it ſelf bee painleſs and free from inflammation, eat into the skin and fleſh even to the bone,

bone, and make an ulcer of the bigness of ones finger's end, and they leav an eschar so moist and humid, that within four or five daies space it will fall away of it self without anie scarification. I have thought good to call these cauteries Silken or Velvet ones, not onely for that they are like Silk, gentle and without pain, but chiefly becaus I obteined the description of them of a certain Chymist, who kept it as a great secret, for som Velvet and much entreatie: Their description is this, The caus of the name.

Take of the ashes of Bean-stalks, of the ashes of Oke-wood well burnt, of each three pounds, let them bee infused in a prettie quantitie of river-water, and bee often stirred up and down, then add thereto of unquencht lime four pounds, which beeing quencht, stir it now and then together for two daie's space, that the *Capitellum* may becom the stronger, then strain it through a thick and strong linnen-cloth, and thus strained, put it three or four times upon the ashes, that so it may draw more of the causticke faculties from them, then boil it in a Barber's basin, or elss an earthen one well leaded, upon a good Char-coal-fire, until it becom thick. But a great part of the secret or art consist's in the manner and limit of this boiling; for this *Capitellum* becomming thick and concreating into salt, must not bee kept so long upon the fire, until all the moisture shall bee vanished and spent by the heat thereof: for thus also the force of the foresaid medicines, which also consist's in a spirituous substance, will bee much dissipated and weakned; therefore before it bee com to extreme drines, it shall bee taken off from the fire, to wit, when as yet there shall som thick moisture remain, which may not hinder the cauteries from beeing made up into a form. The made-up cauteries shall bee put up into a glass most closely luted up or stopped, that the air may not dissolv them, and so they shall bee laid up and kept in a drie place. Now, becaus the powder of Mercurie is neer to cauteries in the effects and faculdie thereof, which therefore is termed *Pulvis Angelicus* for the excellencie; therefore I have thought good to give you the description thereof, which is thus: Their description.

℞. *Auripigmenti citrini, floris æris, an.* ℥ii. *salis nitri,* ℔ iß. *alumin. rochæ,* ℔ ii. *vitrioli rom.* ℔ iii. Let them all bee powdred, and put into a Retort, having a large receiver well luted put thereto. Then set the Retort over a Furnace, and let the distillation bee made first with a gentle fire, then increased by little and little, so that the receiver may wax a little reddish. The description of Mercurie or Angelical powder.

℞. *Argenti vivi,* ℔ ß. *aquæ fortis,* ℔ i. *ponantur in phiala, & fiat pulvis, ut sequitur.*

Take a large earthen pot, whereinto put the viol or bolt-head wherein the *Argentum vivum* and *Aqua fortis* are conteined, setting it in ashes up to the neck thereof, then set the pot over a furnace, or upon hot coals, so that it may boil and evaporate away the *Aqua fortis*: neither in the *interim* will the glass bee in anie danger of breaking, when all the water is vanished away, which you may know is don when as it leav's smoaking; suffer it to becom cold, then take it forth of the ashes, and you shall finde calcined Mercurie in the bottom, of the color of red Lead, separated from the white, yellow or black excrement; for the white that concrete's in the top is called Sublimate, which if it should remain with the calcined Mercurie, you shall make it into powder, and put it in a brass-vessel upon som coals, stirring or turning it with a *spatula* for the space of an hour or two: for thus it will lose a great part of the acrimonie and biting, whence it will becom less painful in the operation.

CHAP. XXXIII.

Of Vesicatories.

Vesicatorie and rubrifying ointments, cataplasms, or plasters are made of acrid medicines, which have power to draw forth to the superficies of the bodie such humors as lie deep, by exulcerating the skin and causing blisters. Their matter is the same with septick medicines; as, *Sinapi, anacardus, cantharides, euphorb. radices scyllæ, bryon.* and the like, which with honie, turpentine, leaven, gum, or rosin, may bee made into cataplasms, ointments, or plasters; therefore the composure of vesicatories, or rather their consistence differ's not from that of hard or soft unguents. Therefore I will give you one example or description of them, which is thus: What vesicatorie and rubrifying medicines are.

℞. *cantharid. euphorbii, sinapi, an.* ß. *mellis anacardini,* ʒi. *modico aceti, & fermenti quod sit satis excipiantur, & fiat vesicatorium.* Som of the antients think it better to make up these medicines with water rather then with vineger, becaus experience teacheth that vineger abate's the strength of mustard. Wee use this kinde of medicine in long diseases, when as wee cannot anie thing prevail with other remedies; especially in the head-ach, megrim, epilepsie, *sciatica*, gout, the bites and punctures of venemous creatures, pestilent carbuncles, and other inveterate and contumacious diseases. The description of a vesicatorie. Their use.

Also wee use them when as wee would restore life and strength to a dead or decaied part, for thus they are drawn back together with the heat; for which purpose wee must make choise of more gentle vesicatories, as such which only rubrifie, so that the part may onely becom red, and not bee burnt: the part must first bee strongly rubbed, that the decaied and dull hew may bee rowzed and stirred up, the pores of the skin more opened, that the force of the medicine may enter the deeper into the bodie.

CHAP.

CHAP. XXXIV.

Of Collyria.

What a *collyrium* is.

A *Collyrium* is a medicine proper for the eies, made of powder finely levigated and groun'd into the form of *Alchohol*, as the Arabians and our Alchymiſts term it: yet the word in a more general acception is uſed for anie liquid medicine, made with liquors and powders, and applied or uſed to anie part. Wherefore *collyria*

The differences of them.

are of three kindes, ſom are moiſt or liquid, which are properly called *collyria*; others drie, which are of the ſame conſiſtence with Trochiſces; others have the conſiſtence

Their uſe.

of honie, or a liniment. The liquid ſerv for the greater and leſſer corners of the eies; thoſe of the conſiſtence of honie are meet for the apple of the eie; but the drie are to bee made into powder, and ſo blown into the eies: alſo ſomtimes they are to bee diſſolved in ſom juice, or other convenient liquor, that ſo they may bee made into a moiſt *collyria*.

Therefore *collyria* have diverſ uſes, and are applied to ſeveral parts according to the intention and counſel of the Phyſician: for liquid *collyria* put into the corners of the eies do more readily mitigate the heat of their inflammation, by reaſon they enter more eaſily by the tenuitie of their ſubſtance, ſuch things as have a more firm conſiſtence adhere more tenaciouſly,

Their matter.

and work more certainly. Moiſt *collyria* are made of juices, mucilages, waters of herbs, flowers, ſeeds, metalline bodies, galls, and other ſuch like medicines, which are repercuſſives, reſolvers, detergents, anodynes, and the like, according to the nature of the preſent diſeaſ.

Somtimes they are made of juices and diſtilled waters onely, otherwhiles powders, or drie *collyria* made into powder, are mixed with them, together with the white of an egg. Powders are preſcribed to ʒii. and liquors to ʒiv. or ʒv. in medicines for the eies; but for other parts, as when it is to bee injected into the urinarie paſſage, they may bee preſcribed to the quantitie of a pinte. Drie *collyria* are made of powders exceeding finely beaten or groun'd, and incorporated with ſom juice, whence it is that they differ little from Trochiſces. Wherefore the *collyrium album Rhaſis* is now uſually termed a Trochiſce, and kept with them. Catheretick powders are not applied in the form of a moiſt *collyrium*, but in the form of a liniment, that is, incorporated with fat or oil. All theſe things ſhall bee made more plainly by the following examples.

A repercuſſive *collyrium*. An anodyne. A detergent.

℞. *aq. plant. & roſar. an.* ʒii. *album. ovi unum, bene agitatum, miſce, fiat collyrium.* ℞. *aq. roſar. & viol. an.* ʒiii. *trochiſ. alb. Rhaſ. cum opio,* ʒii. *fiat collyrium.* Or, ℞. *decoct. fænug.* ʒiii. *muc. ag. ſem. lini,* ʒii. *ſaccar. cand.* ʒi. *croci,* ℈i. *fiat collyr.* ℞. *thuris, myrrh.* ℈ii. *tut. prepar. & antimon. lot. an.* ʒii. *cum ſucco chelidon. fiat collyrium in umbrâ ſiccand.* ℞. *fellis perdic. ant lepor.* ʒß. *ſucci fœnicul.* ʒi. *ſaccar. cand.* ʒii. *ſyrup. roſ. excipiantur, fiat collyrium.*

Wee uſe *collyria* in wounds, ulcers, fiſtula's, ſuffuſions, inflammations, and other diſeaſes of the eies.

CHAP. XXXV.

Of Errhines and Sternutatories.

What an errhine is. Their differences.

ERrhines are medicines appointed to bee put into the noſe to purge the brain of it's excrementitious humors by the noſtrils, or to deterge ſuch excrements as are therein, by reaſon of an *oxæna, polypus*, or the like diſeaſ. Errhines are either liquid or drie, or elſ hard, and of the conſiſtence of an emplaſter. Liquid errhines, which uſually are to purge the head, are made of the juices of herbs; as beets, colewurts, marjoram, pimpernel, hyſſop or balm, or of their decoctions taken alone, or mixed with wine, or ſyrup, as *oxymel ſcilliticum*, ſyrup of hyſſop, roſes, or *mel anthoſatum*: ſomtimes powders are mixed with theſe liquors; as of pepper, *euphorbium*, pellitorie of Spain, hore-hound, *nigella romana, caſtoreum*, myrrh, white ellebore, ſow-bread, and other like, in a ſmall quantitie, to wit, to ʒi. little more or leſs according to the vehemencie of the diſeaſ. Wee will make this more plain by examples.

The form of one.

℞. *ſucci betæ, majoran, braſſic. an.* ʒi. *depurentur, & modicè bulliant cum vini albi,* ʒii. *oxymelit. ſcillit.* ʒß. *fiat errhinum.* When as you deſire to attract more powerfully from the brain, you may diſſolv in errhines ſom purging medicines; as agarick, *diaphœnicon, ſenna, carthamus*, and the like: hence doth ariſe the diſtinction of errhines into ſuch as are meet to purge phlegm,

An errhine purging phlegm.

choler, and melancholie. This following example is ſet down by *Rondeletius*. ℞. *rad. pyreth. irid. an.* ʒi. *puleg. calam. origon. an.* m i. *agar. trochiſc.* ʒiii. *flor. anthos & ſtœchad. an.* p i. *fiat decoctio in colatur.* ℔i. *diſſolve mellis anthoſati & ſcillit. an.* ʒiii. *fiat caput purgium.* But it is better to this purpoſe to make uſe of purging ſimples; as agarick, turbeth, coloquintida, and the like, then of compoſitions; as *diaphœnicon*, for theſe make the decoction more thick, and leſs fit to enter the paſſages of the noſtrils, and the ſiev-like bones, but apt rather there to cauſ obſtruction, and intercept the freedom of reſpiration.

An errhine with powders.

℞. *ſucci betæ,* ʒi. *aq. ſalv. & beton. an.* ʒiiß. *pul. caſtor.* ℈ß. *piper. & pyreth. an.* ℈i. *fiat caput purgium.* Drie errhines that are termed ſternutatories, for that they cauſ ſneeſing, are made of powders onely, to which purpoſe the laſt mentioned things are uſed; as alſo aromatick

things

things in a small quantitie, as to ʒii. at the most: as, ℞. *major. nigel, caryoph. zinzib, an.* ℈i. *acor. pyreth. & panis porcin. an.* ℈ß. *euphorb.* ℈i. *terantur, & in nares mittantur, aut insufflentur.* Errhines of the consistence of Emplasters, by the Latins vulgarly called *Nasalia*, are made of the described powders or gums dissolved in the juice of som of the forementioned herbs, incorporated with turpentine and wax, that so they may the better be made into a pyramidal form to bee put into the nostrils. As, ℞. *majoran. salv. nigel.* ℈ii. *pip. alb. caryoph. galang. an.* ℈i. *pyreth. euphorb. an* ʒß. *panis porcin. ellebor. alb. an.* ℈i. *terantur, & in pulverem redigantur.* And then with turpentine and wax as much as shall bee sufficient, make them up into *Nasalia* of a pyramidal or taper-fashion. A sternutatorie. The matter of solid errhines.

Wee use errhines in inveterate diseases of the brain; as the epilepsie, fear of blindeness, an apoplexie, lethargie, convulsion, the lost sense of smelling; yet wee first use general remedies and evacuations, lest by sneesing and the like concussion of the brain for the exclusion of that which is offensive thereto, there should bee made a greater attraction of impuritie from the subjacent parts. Liquid things must bee drawn up into the nostrils warm out of the palm of the hand to the quantitie of ʒß. the mouth beeing in the interim filled with water, lest the attracted liquor should fall upon the palat, and so upon the lungs: drie errhines are to bee blown into the nose with a pipe or quill: solid ones must bee fastned to a thred, that they may bee drawn forth as need require's, when as they are put up into the nostrils. The morning (the bellie beeing emptie) is the fittest times for the use of errhines. If by their force the nose shall bee troubled with an itching, the pain thereof must bee mitigated by woman's milk, or oil of violets. The use of attractive errhines is hurtful to such as are troubled with diseases of the eies, or ulcers in the nose, as it oft-times fall's out in the *Lues venerea:* wherefore in this case it will bee best to use Apophlegmatisms, which may divert the matter from the nose. Their use. The manner of using them. To whom they are hurtful.

CHAP. XXXVI.

Of Apophlegmatisms, or Masticatories.

Apophlegmatismoi in Greek, and *Masticatoria* in Latine, are medicines which kept or held in the mouth and somwhat chawed, do draw by the mouth forth of the brain excrementitious humors, especially phlegm: now they are chiefly made four manner of waies; the first is when as the medicines are received in honie or wax, and formed into pills, and so given to chaw upon. The second is, when as the same things are bound up in a fine linnen-cloth, so to bee held in the mouth. The third is when as a decoction of acrid medicines is kept in the mouth for a prettie space. The fourth is when as som acrid medicine, or otherwise drawing phlegm, as pellitorie of Spain, mastich, and the like, is taken of it self to the quantitie of a hasel-nut, and so chawed in the mouth for som space. The matter of masticatories is of the kinde of acrid medicines; as of pepper, mustard, hyssop, ginger, pellitorie of Spain, and the like; amongst which you must make choice chiefly of such as are not troublesom by anie ingrate taste, that so they may bee the longer kept in the mouth with the less offence and loathing. Yet masticatories are somtimes made of harsh or acerb medicines; as of berberies, the stones of prunes or cherries, which held for som space in the mouth, draw no less store of phlegm then acrid things; for the verie motion and rowling them up and down the mouth attract's, becaus it heat's, compresse's, and expresse's: the quantitie of the medicine ought to bee from ʒß. to ʒiß: as, ℞. *pyreth. staphisag. an.* ʒiß. *mastich.* ʒß. *pulverentur & involventur nodulis in masticatoria.* Or, ℞. *zinzib. sinap. an.* ʒi. *euphorb.* ℈ii. *piper.* ʒß. *excipiantur melle, et fiant pastilli pro masticatoriis.* ℞. *hyssop. thym. origan. salv. an.* p i. boil them in water to wash the mouth withall. Or, ℞. *zinzib. caryoph. an* ʒi. *pyreth. pip. an* ʒß. *staphisagr.* ʒii. *mastiches*, ʒß. *excipiantur, fiant pastilli pro masticatoriis.* Wee use masticatories in old diseases of the brain, dimnes of the sight, deafnes, pustles of the head and face, and somtimes to divert the excrements which run to the nose beeing ulcerated. What an apophlegmatism is. The differences. The use of masticatories.

Masticatories are verie hurtful to such as have their mouths or throats ulcerated, as also to them whose longs are subject to inflammations, distillations and ulcers; for then errhines are more profitable to derive the matter of the disease by the nostrils. For though the humor drawn from the brain into the mouth by the means of the masticatorie, may bee thence cast forth by coughing and spitting, yet in the interim nature will bee so inured to that passage for the humor, so that it will run that waie when as wee sleep, and fall down upon the parts thereunder, weak either by nature, or by accident. To whom hurtful.

The time fittest for the use of Apophlegmatisms is the morning, the bodie beeing first purged: if anie ingrateful taste remain in the mouth, or adhere to the tongue by using of masticatories, you shall take it away by washing the mouth with warm water, or a decoction of liquorice and barlie.

CHAP. XXXVII.

Of Gargarisms.

A Gargle or gargarism is a liquid composition fit for to wash the mouth and all the parts thereof, to hinder defluction and inflammation, to heal the ulcers which are in those parts, to asswage pain. Their composition is two-fold, the first is of a decoction of roots, leavs, flowers, What a gargle is. The differences thereof.

flowers, fruits, and ſeeds fit for the diſeaſ; now the decoction is to bee made either in fair water alone, or with the admixture of white or red wine, or in the decoction of liquorice and barlie, or of pectoral things, as the intention of the Phyſician is to repel, cool, or hinder inflammation; as in the tooth-ach cauſſed by matter which is yet in motion; to diſcuſs, as in the tooth-ach already at the height; or to cleanſ, as in the ulcers of the mouth; or to drie and binde, as when it is fit to heal the ulcers already cleanſed.

Their matter. The other waie of making of gargariſms is without decoction, which is, when as wee make them either of diſtilled waters onely, or by mixing them with ſyrups, mucilages, milk, the whey of Goat's-milk carefully ſtrained. There are mixed ſomtimes, with a decoction, diſtilled waters and mucilages, *mel roſatum, oxymel ſimplex, diamoron, dianucum, biera, picra, oxyſaccharum, ſyrup. de roſis ſiccis, ſyrupus acetoſus*, and other things, as the preſent caſe ſhall ſeem to require; as alum, *balauſtia*, myrrh, *olibanum*, ginger, pepper, cinnamom, drie roſes, and manie ſuch things; even ſo that oft-times there enter into gargles ſuch medicines as have force to draw from the brain; as pellitorie of Spain, carthamus, turbith, and ſuch things as have no bitterneſs, which is the cauſ that neither agarick nor coloquintida ought to enter into gargariſms.

The quantitie of liquor for a gargariſm is commonly from ℔ ß. to ℔i. mix therewith ſom ʒii. of ſyrups, but put in powders ſparingly; as ſom ʒiii. Alum may ſomtimes bee put in to ʒvi. let mucilages bee extracted out of ʒii. of ſeeds: let theſe ſerv for ſom examples.

An aſtringent gargle. An anodyne gargle. ℞. *plant. polygon. oxalidis, an.* m i. *roſar. rub.* p ß. *hordei*, pi. *fiat decoctio ad* ʒviii. *in qua diſſolve ſyrupi myrtillorum*, ʒvi. *dianucum*, ʒß. *fiat gargariſma*, Or, ℞. *cham melil. aneth. an.* p i. *roſ. rub.* p ß. *paſſul. mund. & ficuum, an.* p iii. *decoquantur in æquis partibus vini & aquæ, ad* ʒvi. *addendo mucag. ſem. lini, & fænugr. an.* ʒii. *fiat gargariſma.*

Or elſ, ℞. *aq. plantag. liguſt. abſinth. an* ʒii. *mellis roſati colati*, ʒvi. *ſyrup. roſar. ſiccar. & de abſinth. an.* ʒvi. *fiat gargariſma.*

A deterſive. Wee uſe gargles in the morning faſting after general purgations; they are ſomtimes taken or uſed cold, when as malign, acrid, and thin humor fall's down, ſomtimes warm, but let theſe things bee don according as the Phyſician ſhall adviſe.

CHAP. XXXVIII.

Of Dentifrices.

What a dentifrice is. The differences. The matter whereof they conſiſt. DEntifrices are medicines prepared and ſerving divers waies for to cleanſ, whiten, and faſten the teeth; for from their uſe they take their name. Of theſe, ſom are drie, other ſom moiſt: of the drie, ſom have the form of opiats, others of powders groſly beaten, but the moiſt are commonly made by diſtillation: the matter of drie dentifrices is taken from detergent and drying things; ſuch as are coral white and red, hart's-horn, ſcuttle-bones, alum, cryſtal, pumice, ſal-nitre, myrrh, frankincenſ, *balauſtia*, acorns, all ſorts of ſhells of fiſhes: all theſe are to bee made into powder either by burning, or without it, for ſcuttle-bones burn't caſt forth a ſtinking and unpleaſant ſmell. To theſe for ſmell ſake are added certain aromatick things; as cinnamom, cloves, nutmegs, and the like: ſuch powders if mixed with ſom ſyrup; as *oxymel ſcilliticum*, or with mucilage of gum arabick and tragacanth, will becom opiats, to bee made into a pyramidal form of ſom finger's length, round or ſquare, and ſharp pointed, that dried they may ſerv for dentifrices.

Somtimes emollient roots are boiled with ſalt or alum, that dried again they may bee uſed for dentifrices: moiſt ones are made of drying herbs, diſtilled together with drying and aſtringent things.

A powder for a Dentifrice. All the differences ſhall appear by the following examples. ℞. *lapidis ſpong. pumicis, & cornu cervi uſt. an.* ʒii. *coral. rub. & cryſtal. an.* ʒi. *alum. & ſal. uſt. an.* ʒiß. *cinnamom. & caryoph. roſat. rub. pulver. an.* ℈ii. *fiat pulvis pro dentrificio.* Or, ℞. *oſſis ſepiæ*, ʒß. *maſtiches, coralli rubri uſti, an.* ʒii. *cornu cervi uſti*, ʒiß. *aluminis, carbonis, roriſmarini, an.* ʒi. *cinnamomi*, ʒii. *fiat pulvis pro dentifricio.* Or, ℞. *oſſis ſepiæ, alum. & ſalis uſti, an.* ui. *cryſtalli, glandium, myrrhæ, thuris, an.* ℈ii. *corticis granatorum, macis, cinnamomi, an.* ℈i. *fiat pulvis qui excipiatur mucagine gummi tragacanth. & formentur pyramides longæ, ſiccand. pro dentifricio.* Or, ℞. *rad. malvæ junioris, & bifmalvæ, an.* ʒii. *coquantur in aquâ ſalsâ aut aluminoſa, deinde ſiccentur in furno pro dentifricio.* ℞. *ſalis*, ʒvi. *alumin.* ʒiii. *thuris, maſtiches, ſanguis draconis, an.* ʒß. *aquæ roſ.* ʒvi. *diſtillentur in alembico vitreo pro dentrificio.*

Their uſe. Dentrifices are not onely good to poliſh, cleanſ, and ſtrengthen the teeth; but wee alſo oft-times uſe them for the tooth-ach, the diſeaſes of the mouth, and ulcers of gums. You may uſe them in the morning, before and after meat.

The ancients, of lentisk-wood made themſelvs tooth-picks, and ſuch deviſes to ſtrengthen their looſ teeth, which alſo at this daie is in uſe with thoſe of *Languedock*, with whom this wood is plentiful, ſo that it may bee brought thence for the uſe of Noblemen and Gentlemen; myrrh may alſo ſerv for this ſame uſe, and anie other aſtringent wood.

Our people commonly uſe the ſtalks of fennel; yet have they no facultie to faſten the teeth, but their ſmell is graceful.

CHAP. XXXIX.

Of Bags or Quilts.

PHyſicians term a bag or *ſaculus*, the compoſition or mixture of drie and powdred medicines put in a bag, therefore it is as it were a drie fomentation. Their differences are not drawn from anie other thing then from the varietie of the parts whereto they are applied: ſuch as are for the head muſt bee made into the faſhion of a cap, thoſe which bee for the whole ventricle muſt bee made into the form of a cithern; thoſe for the ſpleen, like to an ox's tongue: laſtly, ſuch as are for the liver, heart, and other parts, muſt bee made according to the figure of thoſe parts. Their matter is uſually taken from whole ſeeds fried in a frying-pan, or made into powder, there are ſomtimes added roots, flowers, fruits, rindes, cordial-powders, and other drie medicines, which may bee eaſily brought into powder, and conduce to the grieved parts; the quantitie is different according to the magnitude of the affected parts: In the books of practiſers it is commonly found preſcribed from ʒiii. to ʒviſs ſomtimes flowers, and drie herbs are preſcribed by handfuls and pugils: and here there is need of an artificial conjecture to conceiv and appoint a fit quantitie of powders: but let us give you ſom examples.

What a bag or quilt is. Their differences.

℞. *roſar. rub.* p i. *maſtich.* ʒſ. *corall rub.* ʒiii. *ſem. aniſi, & fenic. an.* ʒii. *nucis moſchat.* ʒi. *ſummitat. abſinth. & mentb. an.* m i. *tritis omnibus, fiat ſacculus conſutus & compunctus pro ventriculo.* A quilt for the ſtomach.

℞. *furfuris macri,* p i. *milii,* ʒi. *ſalis,* ʒii. *roſar. rub. flor. roriſmarini, ſtæchados, caryoph. an.* m ii. *fol. beton. & ſalv. an.* ʒiii. *tritis omnibus fiat cucupha, interſuta & calefacta fumo thuris, & ſandarache exuſtorum, capiti apponatur.* A cap for a cold head.

℞. *flor. borag. bugloſ. & violar. an.* p ii. *cortic. citri ſicci, macis, ligni aloës, raſuræ eboris, an.* ʒi. *oſſis de corde cervi, croci, an.* ℈ii. *fol. meliſ.* mſs. *pulveris diambræ.* ʒ ſs. *contritis omnibus fiat ſacculus è ſerico pro corde, irrorandus aquâ ſcabioſæ.* A quilt for the heart.

Their uſe.

Wee uſe bags for the ſtrengthening of the noble parts; as the brain, heart, liver: as alſo for thoſe leſs noble; as the ſtomach: laſtly for diſcuſſing flatulencies in what part ſoever; as in the collick, and in a baſtard pleuriſie proceeding from flatulencies. The powders muſt bee ſtrawed upon carded bombaſt, that they run not together, and then they muſt bee ſewed up or quilted in a bag of linnen or taffatie.

Wee often-times moiſten theſe bags in wine or diſtilled water, and ſomtimes not with the ſubſtance thereof, but by the vapor onely of ſuch liquors put into a hot diſh: thus oft-times the bags are heated by the vapor onely, and oft-times at the fire in a diſh by often turning them. Theſe, if intended for the heart, ought to bee of crimſon or ſcarlet ſilk, becauſe the ſcarlet-berrie, called by the Arabians *Kermes*, is ſaid to refreſh and recreate the heart. Certainly they muſt alwaies bee made of ſom fine thing, whether it bee linnen or ſilk.

CHAP. XL.

Of Fumigations.

Suffitus or fumigation is an evaporation of medicines having ſom viſcous and fattie moiſture: of fumigations ſom are drie, otherſom moiſt, the drie have the form of trochiſes or pills: their matter ought to bee fattie and viſcous, ſo that it may ſend forth a ſmoke by beeing burnt: ſuch are *ladanum*, myrrh, maſtich, pitch, wax, roſin, turpentine, *caſtoreum*, *ſtyrax*, frankincenſ, *olibanum*, and other gums, which may bee mixed with convenient powders: for they yeeld them a bodie and firm conſiſtence; the fumigations that are made of powders onely, yeeld neither ſo ſtrong nor long a fume. What a fumigation is. Their differences and matter.

The quantitie of the powders muſt bee from ʒſs. to ʒiſs. but the gums to ʒii. as, ℞. *ſandarachæ, maſtiches, roſar. an.* ʒi. *benioini, galang. an.* ʒiii. *terebinthina excipiantur, & fiant trochiſci, quibus incenſis ſuffumigentur tegumenta capitis.* ℞. *marchaſitæ,* ʒii. *bdellii, myrrhæ, ſtyracis, an.* ʒiſs. *ceræ flavæ, & terebinth. quod ſufficit, fiant formulæ pro ſuffumigio.* ℞. *cinnabaris,* ʒii. *ſtyracis & benzoini, an.* ʒii. *cum terebinth. fiant trochiſci pro ſuffumigio per embotum.* A cephalick fume. For the hatdneſs of the ſinews.

Wee uſe fumigations in great obſtructions of the brain, ulcers of the longs, the *aſthma*, an old cough, pains of the ſides, womb, and the diſeaſes of ſom other parts; ſomtimes the whole bodie is fumigated, as in the cure of the *Lues venerea* to procure ſweat: ſomtimes onely ſom one part whereto ſom relicks of the *Lues* adhere'a; ſuch fumigations are made of *cinnabaris*, wherein there is much *hydrargyrum*. The fume muſt bee received by a funnel, that ſo it may not bee diſperſed, but may all bee carried unto the part affected, as is uſually don in the affects of the womb and ears. For the relicks of the *Lues venerea*. The manner of uſing them.

In fumigations for the brain and cheſt, the vapor would bee received with open mouth; which thence may paſs by the weaſon into the cheſt, by the palat and noſtrils into the brain: but in the interim let the head bee vailed, that none of the vapor may flie away. Moiſt fumigations are made ſomwhiles of the decoction of herbs, otherwhiles of ſom one ſimple medicine boiled in oil, ſomtimes a hot fire-ſtone is quench't in vineger, wine, *aqua vitæ*, or the like liquor, ſo to raiſ a humid vapor. Wee oft-times uſe this kinde of fumigation in overcomming ſcirrous affects, when as wee would cut, diſcuſs, penetrate deep, and drie: take this as an example thereof.

The manner of a moiſt fumigation.

℞. *laterem unum ſatis craſſum, aut marchaſitam ponderis* ℔i. heat it red hot, and then let it bee quencht in ſharp vineger, powring thereon in the mean while a little *aquavitæ*, make a fumigation for the grieved part.

Fumes of the decoction of herbs do verie little differ from fomentations properly ſo called, for they differ not in the manner of their compoſure, but onely in the application to the affected parts: therefore let this bee an example of a humid fumigation.

A moiſt fume for the ears.

℞. *abſinth. ſalv. rut. origan. an.* p i. *rad. bryon. & aſar. an.* ℥ß. *ſem. ſinap. & cumin. an.* ʒii. *decoquantur in duabus partibus aquæ, & unâ vini pro ſuffitu auris cum emboto:* and oft-times ſuch fumigations are made for the whole bodie, whereof wee ſhall treat hereafter.

CHAP. XLI.

Of a particular, or half-bath.

What an *inſeſſus* is.

Semicupium or half-bath, is a bath for the one half of the bodie; that is, for the parts from the bellie downwards: it is called alſo an *inſeſſio*, becauſ the patient ſitteth to bathe in the decoction of herbs: in which form and reſpect a *ſemicupium* differ's from a fomentation; for it is compoſed of the ſame matter, to wit, a decoction of herbs, roots, ſeeds, fruits, but in this the quantitie of the decoction is the greater, as wee ſhall teach by the following example.

The matter.

A half-bath for the ſtone in the kidnies.

℞. *malv. biſmalv. cum toto, an.* m i ß. *beton. ſaxifrag. pariet. an.* m i. *ſem. melon. milii ſolis, alkekengi, an.* ʒiii. *cicer. rub.* p. ii. *rad. apii, graminis, faniculi, eryngii, an.* ʒ i. *decoquantur in ſufficiente aquæ pro inſeſſu.*

The uſe.

Wee uſe theſe half-baths in affects of the kidnies, bladder, womb, fundament, and lower bellie, or otherwiſe when as the patient by reaſon of weakneſs and fear of diſſipating the ſpirits, cannot ſuffer or away with a whole bath.

The manner of uſing it.

The manner of uſing it is thus: Fill ſom bags with the boiled herbs, or other parts of plants, and cauſ the patient to ſit upon them; yet in the interim keep the vapors from the head, leſt they ſhould offend it, by caſting over it a linnen-cloth, or elſ let him not enter thereinto until the vapor bee exhaled.

CHAP. XLII.

Of Baths.

The faculties of Baths.

Baths are nothing elſ then as it were a fomentation of the whole bodie, both for preſerving health, and the cure of diſeaſes: this is a verie commodious form of medicine, and among other external medicines much celebrated by the Greek, Arabian, and Latine Phyſicians. For a bath, beſides that it digeſt's the acrid humors, and ſootie excrements lying under the skin, mitigate's pains and wearineſs, and correct's all exceſs of diſtemper: moreover, in the cure of fevers, and manie other contumacious and inveterate diſeaſes it is the chief and laſt remedie, and as it were the refuge of health, ſtored with pleaſing delight.

Their differences.

Natural Baths

Baths are of two ſorts, ſom natural, others artificial: natural, are thoſe which of their own accord, without the operation or help of art, prevail or excel in anie medicinal qualitie. For the water which of it ſelf is devoid of all qualitie that is perceivable by the taſte, if it chance to bee ſtrained through the veins of metals, it furniſhe's and impregnate's it ſelf with their qualities and effects: hence it is that all ſuch water excel's in a drying faculcie, ſomtimes with cooling and aſtriction, and otherwhiles with heat and a diſcuſſing qualitie. The baths whoſe waters beeing hot or warm, do boil up, take their heat from the cavities of the earth and mines filled with fire; which thing is of much admiration whence this fire ſhould ariſe in ſubterrene places, what may kindle it, what feed or nouriſh it for ſo manie years, and keep it from beeing extinct. Som Philoſophers would have it kindled by the beams of the ſun, others by the force of lightning penetrating the bowels of the earth, others by the violence of the air vehemently or violently agitated, no otherwiſe then fire is ſtruck by the colliſion of a flint and ſteel. Yet it is better to refer the cauſ of ſo great an effect unto God the maker of the Univerſ, whoſe providence piercing everie waie into all parts of the World, enter's and govern's the ſecret parts and paſſages thereof. Notwithſtanding they have ſeemed to have com neareſt the truth, who refer the cauſ of heat in waters unto the ſtore of brimſtone conteined in certain places of the earth, becauſ among all minerals it hath moſt fire and matter fitteſt for the nouriſhing thereof. Therefore to it they attribute the flames of fire which the Sicilian mountain *Ætna* continually ſend's forth. Hence alſo it is that the moſt part of ſuch waters ſmell of Sulphur, yet others ſmell of Alum, others of Nitre, others of Tar, and ſom of Coperas.

How to know whence the Baths have their efficacie.

Now you may know from the admixture of what metalline bodies the waters acquire their faculties by their taſte, ſent, color, mud, which adhere's to the channels through which the water run's, as alſo by an artificial ſeparation of the more terreſtrial parts from the more ſubtil. For the earthie droſs which ſubſides or remain's by the boiling of ſuch waters, will retein the faculties and ſubſtance of brimſtone, alum, and the like minerals: beſides alſo, by the effects and the cure of theſe or theſe diſeaſes, you may alſo gather of what nature they are. Wherefore wee will deſcribe each of theſe kindes of waters by their effects, beginning firſt with the Sulphureous.

Sulphureous waters powerfully heat, drie, reſolv, open, and draw from the center unto the

ſurfas

ſurface of the bodie; they cleanſ the skin troubled with ſcabs and tetters; they ceaſ the itching of ulcers, and digeſt and exhauſt the cauſſes of the gout, they help pains of the colick and hardened ſpleens. But they are not to bee drunk, not onely by reaſon of their ungrateful ſmell and taſte, but alſo by reaſon of the malitiouſneſs of their ſubſtance, offenſive to the inner parts of the bodie, but chiefly to the liver. The condition of natural ſulphureous waters.

Aluminous waters taſte verie aſtrictively, therefore they drie powerfully, they have no ſuch manifeſt heat, yet drunk, they looſ the bellie: I beleev by reaſon of their heat and nitrous qualitie they cleanſ and ſtaie defluxions, and the courſes flowing too immoderately; they alſo are good againſt the tooth-ach, eating ulcers, and the hidden abſceſſes of the other parts of the mouth. Of aluminous waters.

Salt and nitrous waters ſhew themſelvs ſufficiently by their heat: they heat, drie, binde, cleanſ, diſcuſs, attenuate, reſiſt putrefaction, take away the blackneſs comming of bruiſes, heal ſcabbie and malign ulcers, and help all œdematous tumors. Of ſalt and nitrous.

Bituminous waters heat, digeſt, and by long continuance ſoften the hard'ned ſinews; they are different according to the various conditions of the bitumen that they waſh, and partake of the qualities thereof. Of bituminous.

Braſen waters, that is, ſuch as retain the qualities of braſs; heat, drie, cleanſ, digeſt, cut, binde, are good againſt eating ulcers, fiſtula's, the hardneſs of the eie-lids, and they waſte and eat away the fleſhlie excreſcences of the noſe and fundament. Of braſen.

Iron water's, cool, drie, and binde powerfully, therefore they help abſceſſes, hardened milts, the weakneſſes of the ſtomach and ventricle, the unvoluntarie ſhedding of the urine, and the too much flowing terms, as alſo the hot diſtemper of the liver and kidnies. Som ſuch are in Lucan territorie in *Italie*. Of iron.

Leaden water's, refrigerate, drie, and perform ſuch other operations as lead doth; the like may bee ſaid of thoſe waters that flow by chalk, plaſter, and other ſuch minerals, as which all of them take and perform the qualities of the bodies by which they paſs. Of Leaden.

Hot waters or baths help cold and moiſt diſeaſes; as the palſie, convulſion, the ſtiffneſs and attraction of the nervs, trembling, palpitations, cold diſtillations upon the joints, the inflations of the members by a dropſie, the jaundiſ by obſtruction of a groſs, tough, and cold humor, the pains of the ſides, colick, and kidnies, barrenneſs in women, the ſuppreſſion of their courſes, the ſuffocation of the womb, cauſleſs wearineſs: thoſe diſeaſes that ſpoil the skin; as tetters, the leproſie of both ſorts, the ſcab, and other diſeaſes ariſing from a groſs, cold, and obſtructing humor, for they provoke ſweats. Of hot baths

Yet ſuch muſt ſhun them as are of a cholerick nature, and have a hot liver, for they would cauſ a *Cachexia* and dropſie by over-heating the liver. Cold waters or baths heal the hot diſtemper of the whole bodie and each of the parts thereof, and they are more frequently taken inwardly then applied outwardly; they help the laxneſs of the bowels, as the reſolution of the retentive facultie of the ſtomach, entrals, kidnies, bladder, and they alſo add ſtrength to them. Wherefore they both temper the heat of the liver, and alſo ſtrengthen it, they ſtaie the *Diarrhœa*, Dyſenterie, Courſes, unvoluntarie ſhedding of urine, the *Gonorrhœa*, Sweats, and Bleedings. In this kinde are chiefly commendable the waters of the Spaw in the countrie of *Liege*, which inwardly and outwardly have almoſt the ſame facultie, and bring much beneſit without anie inconvenience, as thoſe that are commonly uſed in the drinks and broths of the inhabitants. To whom hurtful. The faculties of cold-baths. The Spaw.

In imitation of natural baths, there may in want of them bee made artificial ones, by the infuſing and mixing the powders of the formerly deſcribed minerals; as, Brimſtone, Alum, Nitre, *Bitumen*: alſo you may manie times quench in common or rain-water, iron, braſs, ſilver and gold heated red hot, and ſo give them to bee drunk by the patient, for ſuch waters do oft-times retein the qualities and faculties of the metals quenched in them; as you may perceiv by the happie ſucceſs of ſuch as have uſed them againſt the Dyſenterie. Of artificial baths.

Beſides theſe, there are alſo other baths made by art of ſimple water, ſomtimes without the admixture of anie other thing, but otherwhiles with medicinal things mixed therewith, and boiled therein. But after what manner ſoever theſe bee made, they ought to bee warm, for warm-water humect's, relaxe's, mollifie's the ſolid parts, if at anie time they bee too drie, hard, and denſ; by the aſcititious heat it open's the pores of the skin, digeſt's attract's, and diſcuſſes fuliginous and acrid excrements remaining between the fleſh and the skin. It is good againſt ſun-burning and wearineſs, whereby the ſimilar parts are dried more then is fit. To conclude, whether wee bee too hot or cold, or to drie, or bee nauſeous, wee finde manifeſt profits by baths made of ſweet or warm-water, as thoſe that may ſupplie the defect of frictions and exerciſes: for they bring the bodie to a mediocritie of temper, they increaſ and ſtrengthen the native color, and by procuring ſweat diſcuſs flatulencies: therefore they are verie uſeful in hectick fevers, and in the declenſion of all fevers, and againſt raving and talking idlely, for the procureing ſleep. But becauſ water alone cannot long adhere to the bodie, let oil bee mixed or put upon them, which may hold in the water, and keep it longer to the skin. The faculties of a bath of warm-water. Why wee put oil into baths.

Theſe baths are good againſt the inflammations of the lungs and ſides, for they mitigate pain, and help forward that which is ſuppurated to excluſion, when as general remedies according to art have preceded, for otherwiſe they will cauſ a greater defluxion on the afflicted parts:

for a bath (in *Galen's* opinion) is profitably uſed to diſeaſes when as the morbifick matter is concocted. To this purpoſe is choſen rain-water, then river-water, ſo that it bee not muddie, and then fountain-water; the water of ſtanding-lakes and fens is not approoved of, for it is fit that the water which is made choiſ of for a bath of ſweet water, ſhould bee light and of ſubtil parts, for baths of waters which are more then immoderately hot or cold yeeld no ſuch commoditie; but verily they hurt in this, that they ſhut up or cloſe the pores of the bodie, and keep in the fuliginous excrements under the skin; other baths of ſweet or freſh water conſiſt of the ſame matter as fomentations do, whence it is that ſom of them relax, others mitigate pain, others cleanſ, and otherſom procure the contrarie, that is compounded of a decoction of ingredients or plants having ſuch operations. To theſe there is ſomtimes added wine, other whiles oil, ſomtimes freſh butter or milk, as when the urine is ſtopped, when nephiritick pains are violent, when the nervs are contracted, when the habit of the bodie waxes and wrinkles with a hectick drineſs, for this corrugation is amended by relaxing things, but it is watred, and as it were fatted by humecting things, which may penetrate and transfuſe the oilie or fattie humiditie into the bodie thus rarified and opened by the warmneſs of a bath.

Anodyne baths are made of a decoction of medicines of a middle nature, ſuch as are temperate and relaxing things, with which wee may alſo ſomtimes mix reſolving things; they are boiled in water and wine, eſpecially in pains of the colick proceeding from vitreous phlegm, or groſs and thick flatulencies conteined or ſhut up in the bellie, kidnies, or womb. In ſuch baths it is not fit to ſweat, but onely to ſit in them ſo long until the bitterneſs of the pain bee aſſwaged or mitigated, leſt the powers, weakned by pain, ſhould bee more reſolved by the breaking forth of ſweat: emollients are ſomtime mixed with gentle detergents, when as the skin is rough and cold, or when the ſcails or cruſt of ſcabs is more hard then uſual, then in concluſion, wee muſt com to ſtrong deterſives and driers; laſtly to drying and ſomwhat aſtrictive medicines ſo to ſtrengthen the skin, that it may not yeeld it ſelf ſo eaſie and open to receiv defluxions. By giving you one example the whole manner of preſcribing a bath may appear.

Why wee muſt not continue in the bath till wee ſweat.

A mollifying and anodyne bath.

℞. *rad. lilior. abbor. biſmalv. an.* ℔ii. *malv. pariet. violar. an.* mß *ſem. lini, fœnug. biſmalv. an.* ℔i. *flor. cham. melil. anetb. an.* p vi. *fiat decoctio in ſufficienti aquæ quantitate, cui permiſcito olei liliorum & lini ana,* ℔ii. *fiat balneum in quo diutiùs natet æger.*

Cautions to bee obſerved in the uſe of baths.

Baths though noble remedies approoved by uſe and reaſon, yet unleſs they bee fitly and diſcreetly uſed in time, plentie, and qualitie, they do much harm; for they cauſ ſhakings and chilneſs, pains, denſitie of the skin, or too much rarefaction thereof, and oft-times a reſolution of all the faculties. Wherefore a man muſt bee mindeful of theſe cautions before hee enter into a bath: Firſt, that there bee no weakneſſe of anie noble and principal bowel, for the weak parts eaſily receiv the humors which the bath hath diffuſed and rarified, the waies lying open which tend from the whole bodie to the principal parts. Neither muſt there bee anie plentie of crude humors in the firſt region, for ſo they ſhould bee attracted and diffuſed over all the bodie: therefore it is not onely fit that general purgations ſhould precede, but alſo particular by the bellie and urine: beſides, the patient ſhould bee ſtrong, that can faſting endure a bath as long as it is needful. Laſtly, the bath ought to bee in a warm and ſilent place, leſt anie cold air by it's blowing, or the water by it's cold appulſ, cauſ a ſhivering or ſhaking of the bodie whence a fever may enſue.

The fitteſt time for bathing.

The morning is a fit time for bathing, the ſtomach beeing faſting and emptie, or ſix hours after meat, if it bee requiſite that the patient ſhould bathe twice a daie, otherwiſe the meat yet crude would bee ſnatched by the heat of the bath out of the ſtomach into the veins and habit of the bodie. Manie, of all the ſeaſons of the year, make choiſ of the ſpring and end of ſummer and in theſe times they chuſe a clear daie, neither troubled with ſtormie windes, nor too ſharp an air. As long as the patient is in the bath, it is fit that hee take no meat, unleſs peradventure to comfort him hee take a little bread moiſtened in wine, or the juice of an orange, or ſom damask-prunes to quench his thirſt: his ſtrength will ſhew how long it is fit that hee ſhould ſtaie in, for hee muſt not ſtaie there to the reſolution of his powers, for in baths the humid and ſpirituous ſubſtance is much diſſipated. Comming forth of the bath, they muſt preſently get them to bed, and bee well covered, that by ſweating, the excrements, drawn unto the skin by the heat of the bath, may break out: the ſweat cleanſed, let them uſe gentle frictions, or walking, then let him feed upon meat of good juice and eaſie digeſtion, by reaſon that the ſtomach cannot but bee weakned in ſom ſom ſort by the bath.

How to order the patient comming forth of the bath.

That quantitie of meat is judged moderate, the weight whereof ſhall not oppreſs the ſtomach: venerie after bathing muſt not bee uſed, becauſ to the reſolution of the ſpirit by the bath, it add's another new cauſ of further ſpending or diſſipating them. Som wiſh thoſe that uſe the bath by reaſon of ſom contraction, pain, or other affects of the nerve, preſently after bathing, to dawb or beſmear the affected nervous part with the claie or mud of the bath, that by making it up as it were in this paſte, the virtue of the bath may work more effectually, and may more throughly enter into the affected part.

Theſe cautions beeing diligently obſerved, there is no doubt but the profit by baths will bee great and wonderful: the ſame things are to bee obſerved in the uſe of ſtoves or hot-houſes, for the uſe and effect of baths and Hot-houſes is almoſt the ſame, which the antients therefore uſed by turn, ſo that comming forth of the bath they entred a ſtove and called it alſo

by

by the name of a bath, as you may gather from sundrie places of *Galen* in his *Methodus med.* wherefore I think it fit in the next to speak of them.

CHAP. XLIII.

Of Stoves or Hot-houses.

The differences of Stoves. How made.

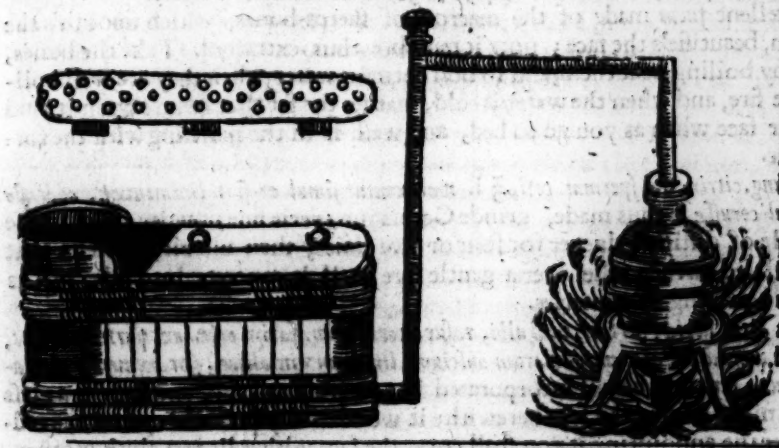
SToves are either drie or moist: Drie, by raising a hot and drie aerie exhalation, so to imprint their faculties in the bodie, that it thereby waxeth hot, and the poces being opened, run down with sweat. There are divers wales to rais such an exhalation: as *Paris*, and wheresoever there are stoves or publick hot-houses, they are raised by a clear fire put under a vaulted furnace, whence it being presently diffused, heat's the whole room; Yet everie one may make himself such a stove as hee shall judge best and fittest.

Also you may put red hot cogle-stones or bricks into a tub, having first laid the bottom thereof with bricks or iron-plates, and so set a seat in the mid'st thereof, wherein the patient sitting, well covered with a canopie drawn over him, may receiv the exhalation arising from the stones that are about him, and so have the benefit of sweating: but in this case wee must oft look to and see the patient, for it sometimes happen's that som, neglected by their keepers otherwise emploied, becoming faint, and their sens failing them by the dissipation of their spirits by the force of the hot exhalation, have sunk down with all their bodies upon the stones lying under them, and so have been carried half dead and burn't into their beds. Som also take the benefit of sweating in a furnace or oven, as soon as bread is drawn out thereof. But I do not much approov of this kind of sweating, becauf the patient cannot as hee will, much less as hee pleaseth, lie or turn himself therein.

A vaporous stove or bath.

Humid stoves or sudatories are those wherein sweat is caused by a vapor or moist heat: this vapor must bee raised from a decoction of roots, leavs, flowers, and seeds, which are thought fit for this purpose; the decoction is to bee made in water or wine, or both together. Therefore let them all bee put into a great vessel well luted, from the top of whose cover iron or tin-pipes may com into the bathing-tub standing near thereto, betwixt the two bottoms thereof, by means whereof the hot vapor may enter thereinto, and diffuse it self therein. Now it is fit the bathing-tub should bee furnished with a double bottom, the one below and whole, the other somwhat higher and perforated with manie holes, whereupon the patient sitting may receiv a sudorifick vapor over all his bodie: now this vapor, if at anie time it becom too hot, must bee tempered by opening the hole, which must for the same purpose bee made in the top of the pipe, that so it may bee opened and shut at pleasure. In the interim the tub shall bee closely covered wherein the patient sit's, hee putting forth onely his head, that so hee may draw in the cool air. In defect of such pipes, the herbs shall bee boiled by themselvs in a caldron or kettle, and this shall bee set thus hot into the bathing-tub at the patient's feet, and so by casting into it heated stones, a great and sudorifick vapor shall bee raised.

The delineation of a bathing Tub, having a double bottom, with a vessel near thereto, with pipes comming therefrom, and entring between the two bottoms of the Tub.



CHAP. XLIV.

Of Fuci, *that is washes, and such things for the smoothing and beautifying of the skin.*

THis following discourf is not intended for those women which addicted to filthie lust, seek to beautifie their faces, as baits and allurements to filthie pleasures: but it is intended for those onely, which the better to restrain the wandring lusts of their husbands, may endevour by art to take away those spots and deformities which have happened to fall on their faces either by accident or age.

As the color of the skin is such is the humor that is thereunder.

The color that appear's in the face, either laudable or illaudable, abundantly shew's the temper both of the bodie, as also of those humors that have the chief dominion therein: for everie humor die's the skin of the whole bodie, but chiefly of the face with the color thereof: for choler bearing swale in the bodie, the face look's yellowish; phlegm ruling, it look's whitish or pale; if melancholie exceed, then blackish or swarth; but if blood have

have the dominion, the color is freſh and red. Yet there is other things happening externally which change the native color of the face, as ſun-burning, cold, pleaſure, ſorrow, fear, watching, faſting, pain, old diſeaſes, the corruption of meats and drinks: for the flouriſhing color of the cheeks is not onely extinguiſhed by the immoderate uſe of vineger, but by drinking of corrupt waters the face becom's ſwoln and pale.

On the contrarie, laudable meats and drinks make the bodie to bee well colored and comly, for that they yield good juice, and conſequently a good habit. Therefore if the ſpots of the face proceed from the plenitude and ill diſpoſition of humors, the bodie ſhall bee evacuated by blood-letting; if from the infirmitie of anie principal bowel, that muſt firſt of all bee ſtrengthened; but the care of all theſe things belong's to the Phyſician: wee here onely ſeek after particular remedies which may ſmooth the face, and take away the ſpots, and other defects thereof, and give it a laudable color.

Waters wherewith to waſh the face.

Firſt the face ſhall bee waſhed with the water of lillie-flowrs, of bean-flowers, water-lillies, of diſtilled milk, or elſ with the water wherein ſom barlie or ſtarch hath been ſteeped. The dried face ſhall bee anointed with the ointments preſently to bee deſcribed; for ſuch waſhing cleanſeth and prepareth the face to receiv the force of the ointments, no otherwiſe then an alumed lee prepair's the hairs to drink up and retein the color that wee deſire. Therefore the face beeing thus cleanſed and prepared, you may uſe the following medicines, as thoſe that have a facultie to beautifie, extend, and ſmooth the skin: as,

Compound liquors where with to waſh the face.

℞. *gum. tragacanth. conquaſſ.* ʒii. *diſtemperentur in vaſe vitrio cum* ℔ ii. *aquæ communis, ſic gummi diſſolventur, inde albeſcet aqua.* Or elſ. ℞. *litharg yri auri,* ʒii. *ceruſ. & ſalis com. an.* ʒ ß. *aceti aquæ plantag. an.* ʒ ii. *caphur.* ʒ ß. *macerentur litharg yros & ceruſa in aceto ſeorſim per tres aut quatuor horas, ſal verò et camphora in aqua quam inſtituto tuo aptam delegeris:* then filter them both ſeveral, and mix them together beeing ſo filtred, when as you would uſe them.

Virgin's milk.

℞. *lactis vaccini,* ℔ ii. *aranciorum et limon. an.* nu. iv. *ſaccari albiſsimi, et alum, roch. an.* ʒ i. *diſtillentur omnia ſimul:* let the limmons and oranges bee cut into ſlices, and then bee infuſed in milk, adding thereto the ſugar and alum; then let the mall bee diſtilled together in *balneo Mariæ*; the water that com's thereof will make the face ſmooth and lovelie. Therefore about bedtime it will bee good to cover the face with linnen-clothes dipped therein. A water alſo diſtilled of ſnails gathered in a vine-yard, juice of limmons, the flowers of white mullain mixed together in equal proportion with a like quantitie of the liquor contained in the bladders of Elm-leavs, is verie good for the ſame purpoſe. Alſo this,

℞. *micæ panis albi,* ℔ iv. *flor. fabar. roſar. alb. flor. nenuph. lilior. & in ireos, an.* ℔ ii. *lactis vaccini,* ℔ vi' *ova.* nu. viii. *aceti opt.* ℔ i. *diſtillentur omnia ſimul in alembico vitreo, & fiat aqua ad faciei et manuum lotionem.* Or, ℞. *olei de tartaro,* ʒ iii. *mucag. ſem. pſilii,* ʒ i. *ceruſ. in oleo roſ. diſſolut.* ʒ iß. *borac. ſal. gem. an.* ʒ i. *fiat linimentum pro facie.* Or, ℞. *caponem vivum, et caſeum ex lacte caprino recentur confectum, limon.* nu. iv. *ovor.* nu. iv. *ceruſ lot. in aq. roſar.* ʒ ii. *boracis,* ʒ i ß. *camph.* ʒ ii. *aq. flor. fabar.* ℔ iv. *fiat omnium infuſio per* xxiv. *horas, poſtea diſtillentur in alembico vitreo.*

The marrow of ſheeps-bones good to ſmooth the face.

There is a moſt excellent *fucus* made of the marrow of ſheeps-bones, which ſmooth's the roughneſs of the skin, beautifie's the face; now it muſt bee thus extracted. Take the bones, ſevered from the fleſh by boiling, beat them, and ſo boil them in water, when they are well boiled, take them from the fire, and when the water is cold, gather the fat that ſwim's upon it, and therewith anoint your face when as you go to bed, and waſh it in the morning with the formerly preſcribed water.

How to make *Salceruſſæ.*

℞. *ſalis ceruſſ.* ʒ ii. *ung. citrin. vel ſpermat. ceti,* ʒ i. *malaxentur ſimul. et fiat linimentum, addendo olei ovor.* ʒ ii. The *Sal ceruſſæ* is thus made, grinde Ceruſs into verie fine powder, and infuſe ℔ i. thereof in a pottle of diſtilled vineger for four or five daies, then filter it, then ſet that you have filtred in a glaſed earthen veſſel over a gentle fire until it concrete into ſalt, juſt as you do the *capitellum* in making of cauteries.

℞. *excrementi lacert. oſsis ſepiæ, tartari, vini albi, raſur. corn. cerv. farin. oriz. an. partes æquales, fiat pulvis, infundatur in aqua diſtillata amygdalarum dulcium, limacum vinialium, flor. nenuph. huic addito mellis albi par pondus:* let them bee all incorporated in a marble mortar, and kept in a glaſs or ſilver veſſel, and at night anoint the face herewith; it wonderfully prevails againſt the redneſs of the face, if after the annointing it you ſhall cover the face with a linnen cloth moiſtened in the former deſcribed water.

℞. *ſublim.* ʒ i. *argent. viv. ſaliv. extinct.* ʒ ii. *margarit. non perforat.* ʒ i. *caph.* ʒ i ß. *incorporentur ſimul in mortario marmoreo, cum piſtillo ligneo, per tres horas ducantur et fricentur, reducantúrque in tenuiſſimum pulverem, confectus pulvis abluatur aquâ myrti et deſiccetur, ſervetúrque ad uſum, adde foliorum auri et argenti,* nu. x. When as you would uſe this powder, put into the palm of your hand a little oil of maſtic, or of ſweet-almonds, then preſently in that oil diſſolv a little of the deſcribed powder, and ſo work it into an ointment, wherewith let the face bee anointed at bed-time: but it is fit firſt to waſh the face with the formerly deſcribed waters, and again in the morning when you riſe.

How to paint the face.

When the face is freed from wrincles and ſpots, then may you paint the cheeks with a roſie and flouriſhing color: of the commixture of white and red ariſeth a native and beautiful color: for this purpoſe take as much as you ſhall think fit of braſil, and alchunet; ſteep them in alum-water, and therewith touch the cheeks and lips, and ſo ſuffer it to drie in: there is

alſo

alſo ſpaniſh red made for this purpoſe; others rub the mentioned parts with a ſheep's-skin died red: moreover the friction that is made by the hand onely, cauſeth a pleaſing redneſs in the face, by drawing thither the blood and ſpirits.

CHAP. XLV.

Of the Gutta Roſacea, *or a fierie face.*

THis treatiſe of *Fuci* put's mee in minde to ſaie ſomthing in this place of helping the preternatural redneſs which poſſeſſeth the noſe and cheeks, and oft-times all the face beſides, one while with a tumor, otherwhiles without, ſomtimes with puſtles and ſcabs, by reaſon of the admixtion of a nitrous and aduſt humor. Practitioners have termed it *Gutta roſacea*. This ſhew's both more and more uglie in winter then in ſummer, becauſ the cold cloſeth the pores of the skin, ſo that the matter contained therevnder is pent up for want of tranſpiration, whence it becom's acrid and biting, ſo that as it were boiling up, it lift's or raiſeth the skin into puſtles and ſcabs; it is a contumacious diſeaſ, and oft-times not to bee helped by medicine. Why worſ in winter then in ſummer.

For the general method of curing this diſeaſ, it is fit that the patient abſtein from wine, and from all things in general that by their heat inflame the blood, and diffuſe it by their vaporous ſubſtance: hee ſhall ſhun hot and verie cold places, and ſhall procure that his bellie may bee ſoluble, either by nature or art. Let blood firſt bee drawn out of the *baſilica*, then from the *vena frontis*, and laſtly from the vein of the noſe. Let leeches bee applied to ſundrie places of the face, and cupping-glaſſes with ſcarification to the ſhoulders. Diet.

For particular or proper remedies, if the diſeaſ bee inveterate, the hardneſs ſhall firſt bee ſoft'ned with emollient things, then aſſaulted with the following ointments, which ſhall bee uſed or changed by the Chirurgian as the Phyſitian ſhall think fit. Remedies.

℞. *ſucci citri*, ℥iii. *ceruſ. quantum ſufficit ad eum inſpiſſandum, argenti vivi cum ſaliva et ſulphure vivo extincti*, ℥ß. *incorporentur ſimul, et fiat unguentum.* An approved ointment.

℞. *boracis*, ʒ ii. *farin. cicer. et fabar. an.* ʒ i ß. *caph.* ʒ i. *cum melle et ſucco cepæ fiant trochiſci*: when you would uſe them, diſſolv them in roſe and plantain-water and ſpread them upon linnen clothes, and ſo applie them on the night-time to the affected parts, and ſo let them oft times bee renued.

℞. *unguenti citrini recenter diſpenſati*, ℥ ii. *ſulphuris vivi*, ℥ ß. *cum modico olei ſem. cucurb. et ſucci limonum, fiat unguentum*; with this let the face be anointed when you go to bed, in the morning let it bee waſhed away with roſe-water, beeing white by reaſon of bran infuſed therein: moreover, ſharp vineger boiled with bran and roſe-water, and applied as before, powerfully take's away the redneſs of the face.

℞. *ceruſ. & litharg. auri, ſulphuris vivi pulveriſati, an.* ℥ ß. *panantur. in phiala cum aceto & aqua roſarum*: linnen cloths dipped herein ſhall bee applied to the face on the night, and it ſhall bee applied to the face on the night, and it ſhall bee waſhed in the morning with the water of the infuſion of bran: this kind of medicine ſhall bee continued for a month.

℞. *ſanguinis tauri*, ℔ i. *butyri recentis*, ℔ ß. *fiat diſtillatio, utatur.* The liquor which is diſtilled for the firſt daies is troubled and ſtinking, but theſe paſſed, it becometh clear and well ſmelling. Som boil bran in vineger and the water of water-lilies, and in this decoction they diſſolv of *ſulphur* and camphire a fit proportion to the quantitie of the decoction, and they applie cloths moiſtened in this medicine to the face in the evening.

℞ *albm. ovor.* nu. ii. *aquæ roſ.* ℥ i ß. *ſucci plantag. & lapath. acut. an.* ℥ i ß. *ſublimati*, ℈ i. *incorporentur in mortario marmoreo.* ℞. *axung. porci decies in aceto lotæ*, ℥iv. *argenti vivi*, ℥ i. *aluminis, ſulphuris vivi, an.* ℥ i. *piſtentur omnia diu in mortario plumbeo, & fiat unguentum; argentum vivum non debet niſi extremo loco affundi.* ℞. *rad. lapath. acut. & aſphodel. an.* ℥ ii. *coquantur in aceto ſcillitico, poſtea tundantur, et ſetaceo trajiciantur, addendo auripigmenti*, ℥ ii. *ſulphuris vivi*, ℥ x. let them bee incorporated and make an ointment to bee uſed to drie up the puſtles.

℞. *rad. liliorum ſub cineribus tectorum*, ℥ iv. *piſtillo tuſis, et ſetaceo trajectis, adde butyri recentis, et axung. porci, lotæ in aceto, an.* ℥ i. *ſulphuris vivi*, ℥ iii. *camphor.* ℈ iii. *ſucci limonum quantum ſufficit, malaxentur ſimul et fiat unguentum.* ℞. *lactis virginalis*, ℔ ß. *aluminis*, ℥ ß. *ſulphuris vivi*, ℥ i. *ſucci limonum*, ℥ iv. *ſalis com.* ℥. ß. let them all bee diſtilled in a glaſs alembick, and the water kept for the forementioned uſes. To drie up the puſtles.

℞. *lapath. acut. plantagin. et aſphodel. an.* ℥ i ß. *olei vitel. evor.* ℥ i. *terebinth. venet.* ℥ ß. *ſucci limonum*, ℥ iii. *aluminis combuſt.* ℥ i. *argenti vivi extincti.* ℥ i. *olei liliorum*, ℥ ß. *tundantur omnia in mortario plumbeo, addendo ſub finem argent. viv. ne mortario adhæreſcat.* The juice of onions beaten with ſale, or the yelks of eggs are good for the ſame purpoſe.

For ſtaying and killing of Ring-worms and Tetters, the leaves of hellebore beaten with vineger are good, the milk of the fig-tree is good of it ſelf, as alſo that of the ſpurges, or muſtard diſſolved in ſtrong vineger with a little ſulphur. Or, To kill tetters.

℞. *ſulphuris, calcanthi, & aluminis, an.* ʒ i. *macerentur in aceto forti, trajiciantur per linteum*, applie the expreſſed juice. Others macerate an egg in ſharp vineger, with coperas and *ſulphur vivum* beaten into fine powder, then they ſtrain or preſs it through a linnen cloth.

But ſeeing the forementioned medicines are acrid, and for the moſt part eating and corroding,

ding, it cannot bee but that they must make the skin harsh and rough, therefore to smooth and levigate it again, you shall make use of the following ointment.

To smooth the skin. ℞. *tereb. ven. tam diu lotæ, ut acrimoniam nullam habeat, butyri salis expertis, an.* ʒ i ß. *olei vitel. ovor.* ʒ i. *axung. porci in aquâ rosarum lotæ,* ʒ ß. *ceræ parum, fiat linimentum ad usum.* To the same purpose you may also make use of som of the forementioned medicines.

CHAP. XLI.

To black the hair.

What things are fit to die the hair. AT first the hairs, (to take the *fucus* or tincture, and to retain it) must bee prepared with Lie, wherein a little roch-Alum is dissolved. Thus the fattie scales may bee washed and taken away, which hinder, and (as it were) keep away the *fucus*, that it cannot adhere or penetrate into the bodie of the hair. Then must wee com to particular or proper and fitting medicines for this purpose. These ought to bee aromatick and cephalick, and somwhat stiptick, that by their odoriferous & astringent power they may strengthen the animal facultie. Furthermore, they must beof subtil parts, that they may enter even into the inner roots of the hairs.

℞. *Sulphuris, vitrioli, gallarum, calcis vivæ, litbargyri, an.* ʒ ii. *scoriæ ferri,* ʒ ß. *in pollinem reducantur, et cum aq. communi incorporentur, ut indè fiat massa:* with this at bed time let the hairs bee rubbed, and in the morning let them bee smoothed with the same.

℞. *calcis lotæ,* ʒ i *litbargyri utriusq;* ʒ ß. *cum decocto gallarum, corticum, nucum, fiat massa, addendo olei chamem.* ʒ ii. ℞. *lytbarg. auri,* ʒ ii. *ciner clavellat.* ʒ i ß. *calcis viv.* ʒ i. *dissolve omnia cum urina hominis donec acquirant consistentiam unguenti pro unctione capillorum.* ℞. *calcis lotæ,* ʒ. ii. *cum decoct. salv. et cort. granat. fiat pasta ad formam pultis satis liquidæ:* let the hair at bed-time bee died herewith, and washed in the morning with wine and water.

How to wash lime. Now the manner of washing lime is thus: Infuse in ten or twelv pints of fair water one pound of lime, then pour out the water by stooping the vessel, putting more in the stead thereof; the third time in stead of common water pour thereon the water of the decoction of sage and galls, let the lime lie therein for so manie hours, then in like manner pour it off by stooping the vessel; and thus you shall have your lime well washed. There is also found a way how to die or black the hair by onely powring of som liquor thereon: as, ℞. *argenti purissimi,* ʒ ii, *reducantur in tenuissimas laminas, ponantur in ampulla vitrea cum* ʒ ii. *aquæ separationis auri et argenti,* A water to black the hair. *et aquæ rosar.* ʒ vi. The preparing of this water is thus, put into a viol the water of separation and the silver, and set it upon hot coals so to dissolv the silver, which beeing don then take it from the fire, and when it is cold, add thereto the rose-water But if you would black it more deeply, add more silver thereto, if less, then a smaller quantitie; to use it, you must steep the comb wherewith you comb your head in this water.

℞. *plumbi usti,* ʒ ii. *gallarum non perforat. cortic. nucum, an.* ʒ iß. *terræ sigil ferret. bispan. an.* ʒ ii. *vitriol. rom.* ʒ vi. *salis gem.* ʒ i ß. *caryoph. nucis mosch. an.* ʒ i. *salis ammon. aloes, an.* ʒ ß. *fiat pulvis subtilissimus:* let this powder bee macerated in vinegar for three daies space, then distil it all in an alembick, the water that com's therefrom is good for the forefald use. The following medicine is good to make the hairs of a flaxen color. ℞. *flor. genist. sacchad. et cardamom. an.* ʒ i. *lupinor. conquassat. rasur. buxi, corticis citri, rad. gentian. et berber. an.* ʒ i ß. *cum aquâ nitri fiat lenta decoctio:* herewith bathe and moisten the hairs for manie daies. To make the hair of a flaxen color.

CHAP. XLVII.

Of Psilothra, *or Depilatories: and also of sweet-waters.*

A depilatorie. MEdicines to fetch off hair, which by the Greeks are termed *Psilothra*, and *Depilatoria* in latine vulgarly, are made as you may learn by these following examples. ℞. *calcis vivæ,* ʒ iii. *auripigmenti,* ʒ i. let the lime bee quench'd in fair water, and then the orpiment added with som aromatic thing: have a care that the medicine lie not too long upon the part, otherwise it will burn; and this medicine must bee made to the consistence of a pultis and applied warm, first fomenting the part with warm water; for then the hair will fall off by gentle rubbing or washing it with warm water: but if there happen anie excoriation thereupon, you may help it by the use of *unguentum rosatum*, or som other of the like facultie.

Another. ℞. *calcis viv. aurip. citrin. an.* ʒ i. *amyl. spumæ argent. an.* ʒ ß, *terantur et incorporentur cum aq. communi bulliant simul:* you shall certainly know that it is sufficiently boiled, if putting thereinto a goose's quill, the feathers com presently of: som make into powder equal parts of unquench'd lime and orpiment, they tie them up in a cloth, with which beeing steeped in water they besmear the part, and within a while after by gently stroaking the head, the hairs fall away of it self

Sweet-waters. The following waters are verie fitting for to wash the hands, face, and whole bodie, as also linnen, becaus they yield a grateful smel: the first is lavander-water thus to bee made. ℞. *flor. lavend.* ℔iv. *aq. rosar. & vini alb. an.* ℔ ii. *aq. vitæ,* ʒ iv. *misceantur omnia simul, & fiat distillatio in balneo Mariæ:* the same water may also bee had without distillation, if you put som lavander-flowers in fair water, and so set them to sun in a glass, or put them in *balneo*, adding a little oil of spike and musk. Clove-water is thus made. ℞. *caryoph.* ʒ ii. *aq. rosar.* ℔ iii. *macerentur spatio* xxiv. *horarum, et distillentur in balneo Mariæ.* Sweet-water commonly so called, is made of divers odoriferous things put together; as thus, ℞. *menthæ, majoranæ, hyssopi, salviæ, rorismarini, lavendulæ, an.* m ii. *radicis irid.* ʒ ii. *caryophyllorum, cinamoni, nucis moschatæ, ana,* ʒ ß. *limonum, nu.* iv. *macerentur omnia in aquæ rosarum, spacio viginti quatuor horarum, distillentur in balneo Mariæ, addendo Moschi,* ʒ ß.

Lavender-water.

Clove-water.

Sweet-water.

The end of the Twentie sixth Book.

Of DISTILLATIONS.

The Twentie seventh Booke.

CHAP. I.

What Distillation is, and how manie kindes thereof there bee.

HAving finish'd the Treatise of the faculties of medicines, it now seem's requisite that wee speak somwhat of Chymistrie and such medicines as are extracted by fire. These are such as consist of a certain fit effence separated from their earthie impuritie by Distillation, in which there is a singular, and almost divine efficacie in the cure of diseases. So that of so great an abundance of the medicines there is scarce anie which at this daie Chymists do not distil, or otherwise make them more strong and effectual then they were before. Now distillation is a certain Art or way by which the liquor or humid part of things, by the virtue and force of fire or som semblable heat (as the matter shall seem to require) is extracted and drawn, being first resolved into vapor and then condens'd again by cold. Som call this art *Sublimation* or subliming, which signifie's nothing elſ, but to separate the pure from the unpure; the parts that are more subtil and delicate from those that are more corpulent, grosse and excrementious; as also to make those matters whose substance is more grosse, to becom more pure and sincere, either for that the terrestrial parts are ill-united and conjoined, or otherwise confused into the whole and dispersed by the heat and so carried up, the other grosser parts remaining together in the bottom of the vessel. Or a distillation is the extraction or effusion of moisture distilling drop by drop, from the nose of the Alembeck or anie such like vessels. Before this effusion or falling down of the liquor there goe's a certain concoction performed by the virtue of heat, which separate's the substances of one kinde from those of another that were confusedly mixed together in one bodie, and so bring's them into one certain form or bodie, which may bee good and profitable for divers diseases. Som things require the heat of a clear fire, others a flame, others the heat of the Sun; others of ashes, or sand, or the filings of iron; others horſ-dung, or boiling water, or the oilie vapor or steam thereof. In all these kinds of fires, there are four considerable degrees of heat. The first is contained in the limits of warmth, and such is warm water, or the vapor of hot water. The second is a little hotter, but yet so as the hand may abide it, without anie harm, such is the heat of Ashes. The third exceed's the vehemencie of the second, wherefore the hand cannot long endure this without hurt, and such is the heat of sand. The fourth is so violent, that it burneth anie thing that commeth near, and such are the filings of Iron.

What distillation is.

Four degrees of heat.

The first degree is most convenient to distil such things as are subtil and moist as flowers. The second such as are subtil and drie as those things which are odoriferous and aromatical, as Cinnamom, Ginger, Cloves. The third is fittest to distil such things as are of a more dense substance and fuller of juice; such as are som Roots, and gums. The fourth is fit for metals and minerals, as Allum, Vitriol, Amber, Jet, &c. In like manner you may distil without heat, as wee use to do in those things which are distilled by straining, as when the more pure is drawn and separated from that which is most unpure and earthie, as wee do in *Lac Virginale*, and other things which are strained through an hypocras-bag, or with a piece of cloth cut in form of a tongue, or by settling, or by a vessel made of Ivie wood: somtimes also somthings may bee distilled, by coldnes and humiditie, and so wee make the oil of Tartar, Myrrh and Vitriols, by laying them upon a marble in a cold and moist place.

What heat fittest for what things.

CHAP. II.

Of the matter and form of Fornaces.

THe matter and form of Fornaces use's to bee divers. For som Fornaces use to bee made of bricks and clais, other som of clais onely, which are the better and more lasting, if so bee the clais bee fat and well tempered with whites of Eggs and hair. Yet in sudden occasions when there is present necessitie of distillation, Fornaces may bee made of bricks, so laid together that the joints may not agree, but bee unequal; for so the structure will bee the stronger. The best and fittest form of a Fornace for distillation is round; for so the heat of the fire carried up equally diffuse's it self every wais, which happen's not in a Fornace of another figure, as square or triangular, for the corners disperſ and separate the force of the fire. Their magnitude must bee such as shall bee fit for the receiving of the vessel. For their thicknes; so great as necessitie shall seem to require. They must bee made with two bottoms, distinguish'd as it were into two forges; one below which may receiv the ashes of the coals or the like other fuel,

The matter the best for Fornaces.

A round form the best for Fornaces.

fuel, the other above to contein the burning coals or fire. The bottom of this upper must either be an iron-grate, or elſe it must bee perforated with manie holes, that ſo the aſhes may the more eaſily fall down into the bottom, which otherwiſe would extinguiſh the fire; yet ſom Fornaces have three partitions, as the Fornace for reverberation. In the firſt and loweſt the aſhes are received, in the ſecond the coals are put, and in the third the matter which is calcin'd or elſe diſtilled. The third ought to have a ſemicircular cover, that ſo the heat or flame may bee reflected upon the conteined matter. The lower partition ſhall have one or more doors, by which the fallen-down aſhes may bee taken forth. But the upper must have but one, whereby the coals or wood may bee put in. But in the top or upper part of the Fornace where it ſhall ſeem moſt fit, there ſhall bee two or three holes made, that by them you may blow the fire, and that the ſmoak may more freely paſs out. But theſe fore-mentioned doors muſt have their ſhutters, much like an oven's mouth. But in defect of a fornace or fit matter to build one withall, wee may uſe a kettle, ſet upon a treefoot, after the manner that wee ſhall preſently declare, when wee com to ſpeak of that diſtillation which is to bee made by *Balneum Mariæ*.

CHAP. III.

Of veſſels fit for Diſtillation.

VEſſels for Diſtillation conſiſt of different matter and form, for they are either of Lead, Tin, or Braſs; or elſe earthen veſſels and theſe are ſomtimes leaded, ſomtimes not: or elſe they are of Gold, Silver, or Glaſs. Now for leaden veſſels they are worſt then the reſt, and utterly to bee refuſed, eſpecially when as the liquors which are drawn by them are to bee taken into the bodie by the mouth, by reaſon of the malignant qualities which are ſaid to bee in Lead; by which occaſion *Galen* condemn's thoſe waters which run, and are conteined in leaden pipes, which by reaſon of their ſaltiſhneſs and acrimonie which ſavor's of quickſilver, they cauſ dyſenteries. Therefore you may perceiv ſuch waters as are diſtilled through a leaden head to bee indued with a more acrid and violentp-iercing vapor, by reaſon the portion of that ſaltiſhneſs diſſolved in them, and as it were ſhaved from the Alembeck or head, defile's the diſtilled liquors, and whiten's and turn's them into a milkie ſubſtance: but copper or braſs-heads are more hurtful then Lead, for they make the waters that com through them to ſavor or participate of braſs. Thoſe that are of gold and ſilver are leſs hurtful; but the greatneſs of the coſt hinder's us from making heads of ſuch metals; therefore wee muſt have a care that our veſſels for diſtillation bee either of potters-metal leaded, or elſe of braſs, or of that jug metal which is commonly called *terra betovacenſis*, and theſe rather then of lead or anie other metal. Verily glaſſes are thought the beſt; and next to them earthen veſſels leaded, then of jug-metal, and laſtly theſe of tin. There is great varietie of veſſels for diſtillation in form and figure; for ſom are of an oval or cylindrical figure, that is, of a round and longiſh; others are twined and crooked, others of other ſhapes, as you may ſee in the beaks of the Chimiſts. Of this almoſt infinite varietie of figures I will in fit place give you the delineation and uſe of ſuch as ſhall ſeem to bee moſt neceſſarie.

Leaden veſſels ill.

Braſs worſ.

The beſt veſſels for diſtillation.

CHAP. IIII.

What things are to bee conſidered in diſtillation.

FIrſt make choiſ of a fit place in your houſ for the fornace, ſo that it may neither hinder anie thing, nor bee in danger of the falling of anie thing that ſhall lie over it. When you ſhall diſtil anie thing of a malign or venenate qualitie, yee ſhall ſtand by it as little as you may, leſt the vapor ſhould do you anie harm: when you provide glaſs-veſſels for diſtillation, make choiſ of ſuch, as are exquiſitely baked, without flaws or cracks, and ſuch as are everie where ſmooth. Let not the fire at firſt bee verie violent, not onely for fear of breaking the veſſels, but alſo for that the firſt fire in diſtillation muſt bee gentle, and ſo increaſed by little and little. The things to bee diſtilled, ought not to bee put in too great quantitie into the bodie of the Still, leſt they ſhould riſe up or flie over. Hot things that they may bee more effectual muſt bee twice or thriſe diſtilled, by powring upon them their own diſtilled water or other freſh materials, or elſe by diſtilling them ſeverally and by themſelvs: of this kinde are gums, wax, fats, or oils.

Hot things muſt bee often diſtilled.

But in each other repeated diſtillations you muſt ſomthing leſſen the force of the fire, for the matter attenuated by the former diſtillation cannot afterward endure ſo great heat: but aromatick things, as Cloves, Cinnamom, &c. as alſo the chimical oils of Sage, Roſemarie, Tyme, &c. ought not to bee diſtilled or rectified over again, for that wee muſt preſently after the firſt diſtillation have a diligent care to ſeparate them from the phlegm, that is, the more watrie ſubſtance of the whole liquor, to which purpoſe wee muſt have regard to that which is diſtilled, for there are ſom things which ſend over their phlegm as Vineger, others, wherein it com's laſt, as * *aqua vitæ*.

* By *aqua vitæ* in this and moſt other places is meant nothing but the ſpirit of wine.

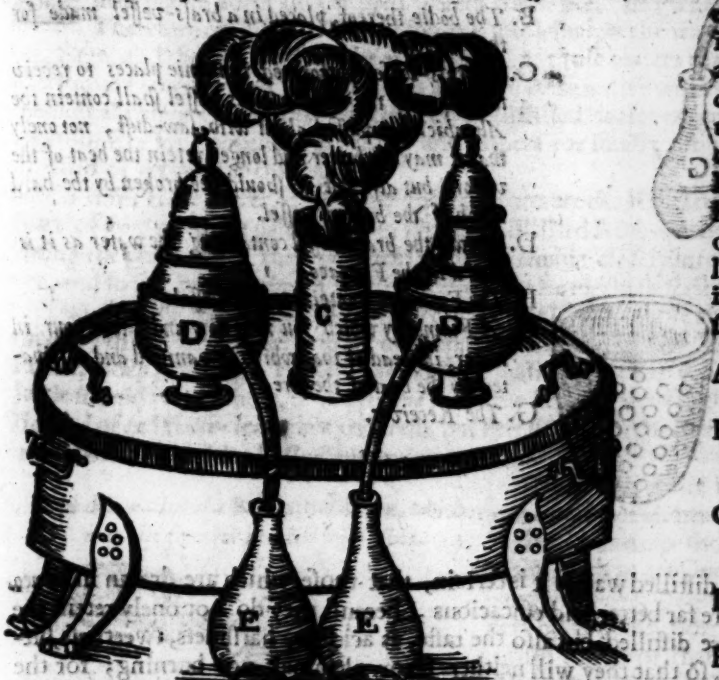
If you would give to things to bee diſtilled another taſte or ſmell then that which they have naturally, you may mix with them ſom odoriferous thing, as Cinnamom, Camphire, or Muſk, or the like, as you pleaſ, and ſo diſtil them together. The diſtilled liquors are drawn by the heat

heat of ashes or sand, savor of and retain a certain *empyreuma*, or smatch of the fire; for the helping of which, you shall put them into glasses close stopt, and so expose them to the sun, and now and then open the glasses that this fierie impression may exhale, and the *phlegmon* bee consumed, if that there shall bee anie. But though in all distillation, there are manie things to bee observed, yet are there two things, chiefly worthie of note. The first is, the matter that is to bee distilled and brought upon, that is, of what kinde it is, and what the nature thereof may do and suffer. The other is the Fornace, which ought to bee provided of a convenient matter and figure of that which is to bee distilled: for you cannot draw anie thing of anie matter, neither of everie matter being distilled can you rightly expect oil or water. For mix't bodies do not consist of an equal portion of the four Elements, but some are more aierie, others more fatie, some participate more of the water, others more of the earth, and that presently from their first original. Therefore as watrie things yield more water, so dirie and fiarie things yield more oil when they are distilled; neither are all instruments fit for the extracting of everie liquor. Moreover you must note, that the watrie liquor comming forth in the first place, and presently after by the help of a stronger fire follows the oilie, which wee finde happen's as often as the plant or parts of the plants, which are distilled, are of a cold temperament; for in hot things it happen's otherwise, for the first liquor which com's forth is oilie, and the following watrish.

CHAP. V. *Of what fashion the vessels for the distilling of waters ought to bee.*

FOr the distilling of anie kinde of waters, two kinde of vessels are necessarie, which are comprehended under this one generall name of an Alembick. They call one of them the bodie, or conteining vessel, the other the head, that is, the cap or top wherein the ascending vapors are condensated or turned into water. It is called the head, because it stands over the bodie, like as an head; from the head there com's out a pipe or nose whereby the distilled liquor flow's drop by drop into the receiver, as you may see by the figure. The parts of an Alembick.

The Fornace for a Balneum Mariæ with the alembick, and their receivers.



A. *Shew's a brass kettle full of water.*

B. *The cover of the kettle perforated in two places to give passage forth to the vessels.*

C. *A pipe or Chimnie added to the kettle, wherein the fire is conteined to heat the water.*

D. *The Alembick, consisting of his bodie and head.*

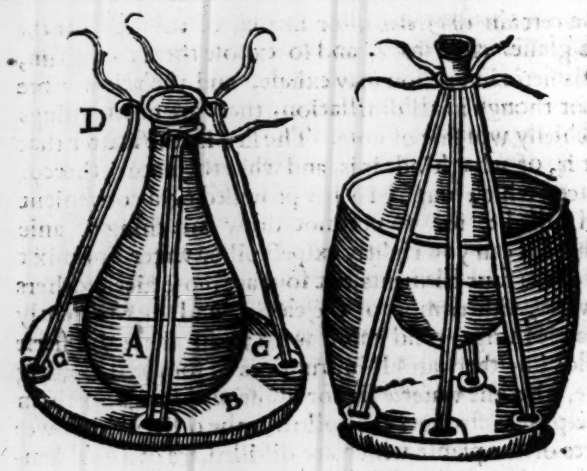
E. *The receiver, whereinto the distilled liquor run's.*

The effigies of another balneum Mariæ, *not so easily to bee removed as the former.*

A. *Shew's the vessel or Copper that contein's the water.*

B. *The Alembick set in water.*

But lest the bottom of the Alembick being half full, should float up and down in the water, and so stick against the sides of the Kettle; I have thought good to shew you the wale and means to prevent that danger.



A. *Shew's the vessel or glass-Alembick.*
B. *A plate of lead whereon it stand's.*
C. *Strings that binde the Alembick to the plate.*
D. *Rings through which the strings are put to fasten the Alembick.*

You may distil the liquors of things by the vapor or stream of boiling water, if so bee that you bee provided of Vessels and forms made after this following manner,

A Fornace with his vessels to distil liquors with the steam of boiling water.

A. *Shew's the head of the Alembick.*
B. *The bodie thereof, placed in a brass-vessel made for that purpose.*
C. *A brass-vessel perforated in manie places to receiv the vapor of the water. This vessel shall contein the Alembick compassed about with saw-dust, not onely that it may the better and longer retein the heat of the vapor, but also lest it should bee broken by the hard touch of the brasen vessel.*
D. *Shew's the brass vessel containing the water as it is plac'd in the Fornace.*
E. *The Fornace, containing the vessel.*
F. *A Funnel by which you may now and then pour in water, in stead of that which is vanish'd and dissipated by the heat of the fire.*
G. *The Receiver.*

Why those things that are distilled in *Balneo* retein more of the strength of things.

Now for the faculties of distilled waters it is certain, that those which are drawn in *Balneo Mariæ* or a double vessel, are far better and efficacious, becaus they do not onely retein the smell of the things which are distilled, but also the taste, as aciditie, harshness, sweetness, bitterness, and other qualities, so that they will neither savor of smoak nor burning; for the milde and gentle heat of a bath contein's by his humiditie, the more subtil parts of the plants that are distilled, that they may not bee dissipated and exhaled, contrarie to which it usually happen's in things which are distilled by the burning heat of wood or coals. For these have a certain nitrous and acrid taste, savoring of the smoak of fire. Besides, they acquire a malign qualitie from the vessels out of which they are distilled, especially if they bee of Lead, whence they contract qualities hurtful to the principal, vital, and natural parts.

Therefore the plants which are thus distilled, if they bee bitter by nature, presently becom insipid, as you may perceiv by wormwood-water thus distilled. Those things which are distilled in *Balneo Mariæ* are contained in a glass-vessel, from which they can borrow no malign qualitie. Therefore the waters so drawn are more effectual and pleasing in taste, smel, and sight. You may draw waters not onely from one kinde of plant, but also from manie compounded and mixed together: of these som are alimentarie, others medicinal, yea and purging; others acquir'd for smell, others for washing or smoothing of women's faces, as wee shall shew hereafter.

CHAP. VI.

How the materials must bee prepared before Distillation.

THings before they bee put into the Alembick must undergo a preparation, that is, they must bee cut small, beaten and macerated, that is, steeped in som liquor, that so they may bee the more easily distilled and yield the more water, and retein their native smell

and

and faculties; yet such preparation is not convenient for all things; for there bee som things, which need no infusion or maceration, but must rather bee dried before they bee distilled, as Sage, Tyme, Rosemarie, and the like, by reason of their too much humiditie; it will bee sufficient to sprinkle other things with som liquor onely. In this preparation there are two things observable, to wit, the time of the infusion, and condition of the liquor wherein these things ought to bee infused. The time of the infusion is different according to the varietie of the matter to bee macerated; for things that are hard, solid, drie or whole, must bee longer macerated, then such as are tender, freshly gathered or beaten: whence it is that roots and seeds require a longer time of infusion; flowers and leavs a shorter, and the like of other things. The liquors wherein infusion must bee made, ought to bee agreeable to the things infused. For hot ingredients require hot liquors, and cold such as are cold wherein they may bee infused.

What things need not to bee macerated before they bee dissolved.

Such things as have not much juice, as Betonie, wormwood and the like, or which are verie odoriferous, as all aromatick things, would bee infused in wine, so to preserv their smell, which otherwise by the force of the fire, by reason of the tennitie of the substance easily vanishe's. But if wee desire that the distilled liquor should more exactly retein and have the facultie of the things whereof it is distilled, then must you infuse it in the juice thereof, or som such appropriate liquor, that it may swim in it whilest it is distilled, or at least let it bee sprinkled therewith.

The macerati-on of plants in their own juice.

CHAP. VII.

Of the Art of distilling of waters.

BEfore I describe the manner how to distil waters, I think it not amiss briefly to reckon up how manie sorts of distilled waters there bee, and what the faculties of them are. Therefore of distilled waters som are medicinal, as the waters of Roses, Plantain, Sorrel, Sage, and the like: others are alimentarie, as those waters that wee call restauratives; othersom are composed of both, such as are these restaurative waters which are also mixed with medicinal things; others are purging, as the distilled water of green and fresh Rubarb; othersom serv for smoothing the skin, and others for smell; of which sort are those that are distilled of aromatick things.

The varieties of stilled wa-ters.

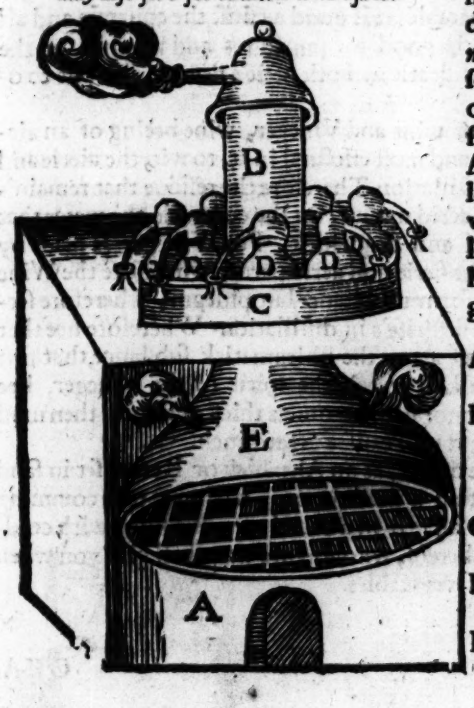
To distil Rose-water, it will bee good to macerate the Roses before you distil them for the space of two or three daies, in som formerly distilled Rose-water, or their pressed-out juice, luting the vessel close; then put them into an Alembic closely luted to his head and his Receiver, and so put into a *Balneum Mariæ*, as wee have formerly described.

Rose-water.

The distilled Alimentarie liquors are nothing elf than those that wee vulgarly call Restauratives; this is the manner and art of preparing them. Take of Veal, Mutton, Kid, Capon, Pullet, Cock, Patridg, Phesant, as much as shall seem fit for your purpose; cut it small, and lest it should require heat, or *empyreuma* from the fire, mix therewith a handful of French-Barlie, and of red Rose-leaves drie and fresh, but first steeped in the juice of Pomgranats, or citrons and Rosewater with a little Cinnamom, as much.

Restauratives.

The delineation of a Balneum Mariæ, *which may also serv for to distil with ashes.*



But if you desire that this restaurative should not onely bee alimentarie, but also medicinal, you shall add thereto such things as shall resist the disease, such as are Cordial powders as of *El. Diamargarit. frigid. De gemmis, Aromaticum Rosat.* Conserv of Bugloss, Borrage, roots, herbs, seeds and other things of that kinde. But if it bee in a pestiferous season, Triacle, Mithridate and other Antidotes shall bee added; each of these shall bee laid in ranks or orders one over another, which is vulgarly termed *stratum super stratum*, in a glass Alembick, and distilled in *balneo Mariæ* with the heat of Ashes, or elf of warm sand, as the figure shew's.

A. *Shew's the Fornace with the hole to take forth the the Ashes.*

B. *Shew's another Fornace, as it were set in the other: now it is of Brass, and run's through the midst of the kettle made also of brass, that so the conteined water or ashes may bee the more easily heated.*

C. *The kettle wherein the water, ashes, or sand are conteined.*

D. *The Alembick set in the water, ashes, or sand, with the mouths of the receivers.*

E. *The bottom of the second brass Fornace, whose top is marked with* B. *which contein's the fire.*

Another waie of making reſtaurative Liquors.

There may bee made other reſtauratives in ſhorter time with leſs labor and coſt. To this purpoſe the fleſh muſt bee beaten and cut thin, and ſo thruſt through with a double thred, ſo that the pieces thereof may touch each other; then put them into a glaſs, and let the thred hang out; ſo ſtop up the glaſs cloſe with a linnen cloth, Cotten or Tow, and lute it up with paſte made of meal and the whites of eggs; then ſet it up to the neck in a kettle of water, but ſo that it touch not the bottom, but let it bee kept upright by the formerly-deſcribed means: then make a gentle fire there-under, until the conteined fleſh by long boiling ſhall bee diſſolved into juice, and that will commonly bee in ſom four hours ſpace. This beeing don, let the fire bee taken from under the kettle, but take not forth the glaſs before the water bee cold, leſt it beeing hot ſhould bee broken by the ſudden appulſ of the cold air. Wherefore when as it is cold, let it bee opened, and the thred with the pieces of fleſh bee drawn forth, ſo that onely the juice may bee left remaining; then ſtrain it through a bag, and aromatize it with Sugar and Cinnamom, adding a little juice of Citron, Verjuice or Vineger, as it ſhall beſt like the patient's palate.

After this manner you may quickly, eaſily, and without great coſt have and prepare all ſorts of reſtauratives aſwell medicated as ſimple. But the force and faculcie of purging medicines is extracted after a clean contrarie manner then the oils and waters which are drawn of Aromatick things, as Sage, Roſemarie, Tyme, Aniſeeds, Fennel, Cloves, Cinnamom, Nutmegs, and the like. For the ſtrength of theſe, as that which is ſubtil and aierie, flie's upwards in diſtillation; but the ſtrength of purging things, as Turbith, Agarick Rubarb and the like, ſubſide in the bottom. For the purgative faculcie of theſe purgers inſeparably adhere's to the bodies and ſubſtances.

Now for ſweet waters and ſuch as ſerv to ſmooth the skin of the face, they may bee diſtilled in *Balneo Mariæ* like as Roſe-water.

CHAP. VIII.

How to diſtil Aqua vitæ or the ſpirits of Wine.

TAke of good White or Claret-wine or Sack which is not ſowr nor muſtie, nor otherwiſe corrupt, or of the Lees, that quantitie which may ſerv to fil the veſſel wherein you make the diſtillation to a third part; then put on your head furniſhed with the noſe or pipe, and ſo make your diſtillation in *Balneo Mariæ*. The oftner it is diſtilled, or (as they term it) rectified, the more noble and effectual it becom's. Therefore ſom diſtil it ſeven times over.

Spirit of wine ſeven times rectified.

At the firſt diſtillation it may ſuffice to draw a fourth or third part of the whole; to wit, of twentie four pintes of Wine or Lees, draw ſix or eight pintes of diſtilled liquor.

At the ſecond time the half part of that is three or four pintes.

At the third diſtillation the half part again, that is, two pints; ſo that the oftner you diſtil it over, the leſs liquor you have, but it will bee a great deal the more efficacious. I do well like that the firſt diſtillation bee made in Aſhes; the ſecond in *Balneum Mariæ*. To conclude, that *aqua vitæ* is to bee approoved of, neither is it anie oftner to bee diſtilled, which put into a ſpoon or ſaucer, and there ſet on fire, burn's wholly away and leav's no liquor, or moiſture in the bottom of the veſſel; if you drop a drop of oil into this ſame water, it continually fal's to the bottom; or if you drop a drop into the palm of your hand, it will quickly vaniſh away, which are two other notes of the probation of this liquor.

The faculties of the ſpirit of wine.

The faculties and effects of *aqua vitæ* are innumerable, it is good againſt the epilepſie and all cold diſeaſes, it aſſwage's the pains of the teeth, it is good for punctures and wounds of the Nervs, faintings, ſwoonings, gangreens and mortification, both of it's fleſh, as alſo put to other medicines for a vehicle.

There is this difference between the diſtilling of wine and Vineger, wine beeing of an aierie and vaporous ſubſtance, that which is the beſt and moſt effectual in it, to wit, the aierie and fierie liquor, com's from it preſently at the firſt diſtillation. Therefore the reſidue that remain's in the bottom of the veſſel, is of a cold drie and acrid nature; on the contrarie, the water that com's firſt from Vineger beeing diſtilled is inſipid and flegmatick. For Vineger is made by the corruption of wine, and the ſegregation of the fierie and aerie parts; wherefore the Wine becoming ſowr, there remain's nothing of the former ſubſtance but phlegm; wherefore ſeeing phlegm is chiefly predominant in Vineger, it firſt riſe's in diſtillation. Wherefore hee that hope's to diſtil the ſpirit of Vineger, hee muſt caſt away the phlegmatick ſubſtance, that firſt ſubſtance that firſt riſe's, and when by his taſte hee ſhall perceiv the ſpirit of the Vineger, hee ſhall keep the fire there-under, until the flowing liquor ſhall becom as thick as honie; then muſt the fire bee taken away, otherwiſe the burning of it will cauſ a great ſtinch.

The diſtilling of Wine and Vineger is different.

The veſſels fit to diſtil *aqua vitæ* and Vineger are divers, as an Alembick or Retort ſet in ſand or Aſhes; a Copper or braſs-bottom of a Stil, with a head thereto, having a pipe comming forth thereof which run's into a worm, or pipe faſt'ned in a barrel or veſſel filled with cold-water, and having the lower end comming forth thereof, whoſe figure wee ſhall give you when as wee com to ſpeak of the drawing of oils out of vegetables.

CHAP. IX.

Of the manner of rectifying, that is, how to increase the strength of waters, that have been once distilled.

TO rectifie the waters that have been distilled in *Balneo Mariæ*, you must set them in the Sun in glasses well stopped and half filled, being set in sand to the third part of their height, that the water waxing hot by the heat of the Sun may separate it self from the phlegm mixed therewith, which will bee performed in 20. or 30 daies. The first way. There is another better waie to do this, which is to distil them again in *Balneo* with a gentle fire, or if you will put them into a Retort furnished with his receiver, and set them upon chrystal or iron-bowls, or in an iron-mortar directly opposite to the beams of the Sun, as you may learn by these ensuing signs. The second.

A Retort with his receiver standing upon Chrystal-bowls, just opposite to the Sun-beams.

A. *Shew's the Retort.*
B. *The receiver.*
C. *The Crystal bowls.*

Another Retort with his receiver standing in a Marble or Iron-mortar, directly opposite to the Sun.

A. *Shew's the Retort.*
B. *The marble, or Iron-mortar.*
C. *The receiver.*

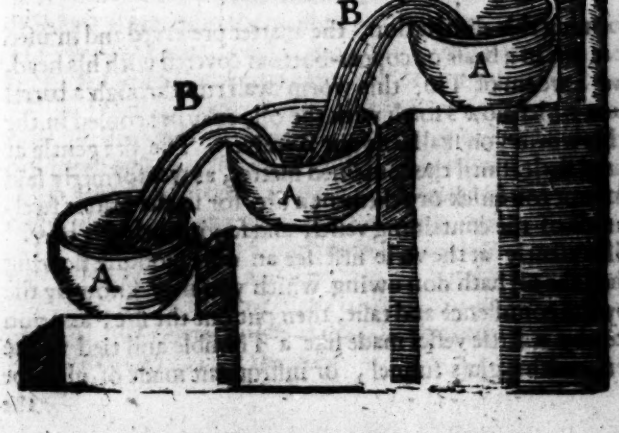
CHAP. X.

Of distillation by filtring.

YOu shall set three bafins or vessels of convenient matter in that fine and order that each may bee higher than other; that which stand's in the highest place, shall contein the liquor to bee distilled, and that which stand's lowest shall receiv the distilled liquor. Out of the first and second vessel shall hang shreds or pieces of cloth or cotten, with their broader ends in the liquor or upper vessel; and the other sharper ends hanging down, whereby the more subtil and defecate liquor may fall down by drops into the vessel that stand's under it, but the grosser and more feculent part may subside in the first and second vessel. You by this means may at the same time distil the same liquor divers times, if you place manie vessels one under another after the fore-mentioned manner, and so put shreds into each of them, so that the lowest vessel may receiv the purified liquor. In stead of this distillation Apothecaries oft-times use bags.

This manner of distillation was invented to make more clear and pure waters, and all juices and compositions, which are of such a liquid consistence. You may take an example from *Lac. virginis*, or Virgin's-milk, of which this is the description. *Lac Virginis.*

The description of vessels to perform the distillation or filtration by shreds.



R. litharg. auri diligenter pulveri s. ℥iii. macerentur in aceti boni ℥vi. tribus horarum spatio, seorsim etiam in aqua plantaginis, solani, rosarum, aut communi sal infundatur; then distil them both by shreds, then mix the distilled liquors, and you shall have that which for the milkie whitenes is termed Virgin's milk, being good against the redness and pimples of the face, as wee have noted in our Antidotarie. Cap. 44. of that.

A. *Shew's the vessel.*
B. *The Cloths or shreds.*

CHAP. XI.

What and how manie waies they are to make oils.

YOu may by three means especially draw to extract the oils that you desire. The first is by expression, and so are made the oils of Olives, nuts, seeds, fruits and the like. Under this is thought to bee conteined elixation, when as the beaten materials are boiled in water, that so the oil may swim aloft, and by this means are made the oils of the seeds of Elder and danewort, and of Baie-berries. Another is by infusion, as that which is by infusing the parts of plants and other things in oils. The third is by distillation, such is that which is drawn by the heat of the fire, whether by assent or by descent, or by concourse; The first waie is known by all; now it is thus, take almonds in their husks, beat them, work them into a mass, then put them into a bag made of hair, or else of strong cloth first steeped in water or in white-wine, then put them into press and so extract their oil. You may do the same in pine-apple-kernels, Hazel-nuts, Coco-nuts, nutmegs, peach-kernels, the seeds of gourds and cucumbers, pistick-nuts, and all such oilie things. Oil of baies may bee made of ripe baie-berries newly gathered, let them bee beaten in a mortar and so boiled in a double vessel, and then forthwith put into press, so to extract oil as you do from Almonds, unless you had rather get it by boiling as wee have formerly noted. Oile of Eggs is made of the yelks of Eggs boiled verie hard; when they are so, rub them to pieces with your fingers, then frie them in a pan over a gentle fire, continually stirring them with a spoon until they becom red, and the oil bee resolved and flow from them; then put them into a hair-cloth, and so press forth the oil. The oils prepared by infusion are thus made, make choise of good oil wherein let plants, or creatures, or the parts of them bee macerated for som convenient time, that is, until they may seem to have transfused their faculties into the oil, then let them bee boiled, so strained or pressed out. But if anie aquositie remain, let it bee evaporated by boiling. Som in compounding of oils add gums to them, of which though wee have formerly spoken in our Antidotarie, yet have I thought good to give you this one example. ℞. *flor. hyper.* ℞ ß. *immittantur in phialam cum flo. cent. & gum. elemi, an.* ℥ii. *olei com.* ℔ ii. Let them bee exposed all the heat of Summer to the Sun. If anie will add *aqua vitæ* wherein som Benzoin is dissolved, hee shall have a most excellent oil in this kind. Oil of Mastich is made *Ex olei rosati* ℥xii. *mastich.* ℥iii. *vini optimi* ℥viii. Let them all bee boiled together to the consumption of the wine, then strain the oil and reserv it in a vessel.

Oils by expression.

By infusion.

By distillation.

Oil of Baie-berries.

Of Eggs.

Oil of S. *John's-wurt.*

CHAP. XII.

Of extracting of Oils of vegetables by Distillation.

ALmost all herbs that carrie their flowers and seeds in an umble, have seeds of of a hot, subtil and aierie substance, and consequently oilie. Now becaus the oilie substance that is conteined in simple bodies is of two kindes, therefore the manner also of extracting is twofold. For som is gross, earthie, viscous, and wholly confused and mixt with the bodies out of which they ought to bee drawn, as that which wee have said is usually extracted by expression; this becaus it most tenaciously adhere's to the grosser substance, and part of the bodie, therefore it cannot by reason of this natural grossnes, bee lifted up, or assend. Othersom are of a slender and aierie substance, which is easily severed from their bodie, wherefore beeing put to distillation it easily rise's: such is the onely substance of aromatick things, as of Juniper, Aniseeds, Cloves, Nutmegs, Cinnamom, Pepper, Ginger, and the like odoriferous and spicie things. This is the manner of extracting oils out of them; let your matter bee well beaten and infused in water to that proportion, that for everie pound of the material, there may bee ten pints of water; infuse it in a copper-bottom, having a head thereto either tinned or silvered over, and furnished with a couller filled with cold-water. Set your vessel upon a fornace having a fire in it, or else in sand, or ashes. When as the water conteined in the head shall wax hot, you must draw it forth, and put in cold, that so the spirits may the better bee condensed, and may not flie away: you shall put a long-neck't receiver to the nose of the Alembick, and you shall increas the fire, until the things contained in the Alembick boil.

What oils are to bee drawn by expression.

The first manner of drawing oils by distillation.

There is another manner of performing this distillation, the matter preserved and infused as wee have formerly declared, shall bee put in a brass or copper-bottom covered with his head, to which shall bee fitted or well luted, a worm of Tin, this worm wall run through a barrel filled with cold-water, that the liquor which flow's forth with the oil, may bee cooled in the passage forth; at the lower end of this worm you shall set your Receiver. The fire gentle at the first, shall bee increased by little and little, until the conteined matter, as wee formerly said do boil; but take heed that you make not too quick or vehement a fire, for so the matter swelling up by boiling may exceed the bounds of the conteining vessel, and so violently flie over.

Another waie.

Observing these things, you shall presently at the verie first see an oilie moisture flowing forth together with the watrish. When the oil hath don owing which you may know by the color of the distilled liquor, as also by the consistence and taste, then put out the fire; and you may separate the oil from the water by a little vessel made like a Thimble and tied to the end of a stick; [or, which is better, with a glass-funnel, or instrument made of glass for the

the same purpose.] Here you must also note that there bee som oils that swim upon the top of the water; as oil of aniseeds; otherson on the contrarie, which fall to the bottom; as oil of Cinnamom, Mace, and Cloves. What oils fall to the bottom

Moreover you must note, that the watrish moisture, or water that is distilled with oil of Aniseed and Cinnamom, is whitish, and in succes of time, will in som small proportion turn into oil. Also these waters must bee kept several, for they are far more excellent then those that are distilled by *Balneum Mariæ*, especially those that first com forth together with the oil. Oils are of the same faculties with the bodies from whence they are extracted, but much more effectual; for the force which formerly was diffused in manie pounds of this, or that medicine, is after distillation contracted into a few drams. For example, the faultie that was dispersed over i. pound of Cloves, will bee contracted into two ounces of oil at the most; and that which was in a pound of Cinnamom will bee drawn into ʒiß. or ʒii. at the most of oil. But to draw the greater quantitie with the lesser charge, and without fear of breaking the vessels, whereto glasses are subject, I like that you distil them in copper-vessels, for you need not fear that the oil which is distilled by them will contract an ill qualitie from the copper, for the watrish moisture that flow's forth together therewith will hinder it, especially if the copper shall bee tinned or silvered over. I have thought good to describe and set before your eyes, the whole manner of this operation.

A Furnace with set vessels to extract the Chymical oils, or spirits of Sage, Rosemarie, Tyme, Lavander, Aniseeds, Fennel-seeds, Cloves, Nutmegs, Cinnamom, Pepper, Ginger, and the like; as also to distil the spirit of Wine, of Vineger and Aqua vitæ. *In stead of the barrel and worm, you may use a beak with a bucket or rowler about it.*

A. *Shew's the bottom, which ought to bee of Copper and tinned on the in-side.*

B. *The head.*

C. *The Barrel filled with cold water to refrigerate and condensate the water and oil that run through the pipe or worm that is put through it.*

D. *A pipe of brass or lattin, or rather a worm of Tin running through the Barrel.*

E. *The Alembick set in the furnace with the fire under it.*

Now becaus wee have made mention of Cinnamom, Pepper, and other spices which grew not here with us, I have thought good to describe these out of *Thevet's* Cosmographie, hee having seen them growing. Pepper grow's upon shrubs in *India*, these shrubs send forth little branches whereon hang clusters of berries, like to Ivie-berries, or bunches of small black grapes, or currans the leavs are like those of the Citron-tree, but sharpish and pricking. The descripti. on of Pepper.

The *Indians* gather those berries with great diligence, and stow them up in large cellars, as soon as they com to perfect maturitie. Wherefore it oft-times happen's, that there are more then 200. ships upon the coast of the lesser *Iava* an Island of that countrie, to carrie thence Pepper and other spices. Pepper is used in Antidotes against poisons, it provoke's urine, digest's, attract's, resolv's, and cure's the bites of Serpents. It is properly applied and taken inwardly against a cold stomach; in sauces it help's concoction and procure's appetite; you must make choise of such as is black, heavie, and not flaccid. The trees which bear white, and those that bear black pepper, are so like each other, that the natives themselvs know not which is which, unless when they have their fruit hanging upon them, as the like happen's upon our Vines which bear white and black grapes. The uses thereof.

The tree that yeeld's Cinnamom grow's in the mountain's of *India*, and hath leavs verie like to baie-leavs; branches and shoots at certain times of the year are cut from this tree, by the appointment of the King of that Province, the bark of which is that wee term Cinnamom. This is sold to no stranger unless at the King's pleasure and hee setting the price thereof, it is not lawful for others to cut thereof. The Cinnamom tree.

Galen

7. ſimp. *Galen* write's that Cinnamom is of verie ſubtil parts, hot in the third degree, and partaking of ſom aſtriction; therefore it cut's and diſſolv's the excrements of the bodie, ſtrengthen's the parts, provoke's the courſes when as they ſtop by reaſon of the admixture of groſs humors; it ſweeten's the breath, and yeeld's a fine taſte and ſmell to medicines, hippocras, and ſauces. Of Cinnamom there is made an excellent water againſt all cold diſeaſes, & alſo againſt ſwoonings, the plague and poiſons. The compoſition thereof is this. Take of the choiſeſt and beſt Cinnamom one pound, beat it groſly, and put thereto of Roſe-water four pintes, of white-wine half a pinte, being thus mixed, put them into a glaſs and ſo let them ſtand in infuſion 24. hours, often ſtirring of them. Then diſtil them in *Balneo Mariæ*, cloſely luting the receiver and veſſels leſt the ſpirit ſhould flie away.

An excellent Cinnamom-tree.

CHAP. XIII.

Another manner how to draw the eſſence and ſpirits of herbs, flowers, ſeeds, and ſpices; as alſo of Rubarb, Agarick, Turbith, Hermodactyls, and other Purgers.

YOu may extract the eſſences and ſpirits of the things mentioned in the title of this Chapter, as thus. Take Sugar, Rubarb, Cinnamom, or anie other material you pleaſ; cut it ſmall, or elſ beat it, then put it into a glaſs with a long neck, and pour thereupon as much *aqua vitæ* as ſhall bee ſufficient to cover the materials or ingredients, and to over-top them ſom fingers bredth, then ſtop up the glaſs verie cloſe that no air enter thereinto; Thus ſuffer it to infuſe for eight daies in *balneo* with a verie gentle heat; for thus the *aqua vitæ* will extract the faculties of the ingredients, which you ſhall know that it hath don, when as you ſhall ſee it perfectly tinctured with the color of the ingredients. The eight daies ended, you ſhall put this ſame *aqua vitæ* into another veſſel filled with the like quantitie of the ſame materials prepared after the ſame manner, that it may alſo take forth the tincture thereof, and do thus three or four times, untill the *aqua vitæ* bee deeply tinctured with the color of the infuſed Ingredients.

A ſign that the ſpirit of wine hath fetcht out the ſtrength of the ingredients.

But if the materials from whence you deſire to extract this ſpirit or eſſence, bee of great price; as *Lignum Aloës*, *Rubarb*, &c. You muſt not think it ſufficient to infuſe it once onely, but you muſt go over it twice, or thrice, until all the efficacie bee extracted out thereof; you may know that it is all wholly inſipid.

A ſign that the ingredients have loſt their ſtrength.

Theſe things thus don, as is fitting, put all the liquor tinctured and furniſhed with the color and ſtrength of the ingredients, into an Alembick, fitted and cloſely luted to it's head, and ſo put into *Balneum Mariæ*, that ſo you may extract or draw off the *aqua vitæ*, to keep for the like purpoſe, and ſo you ſhall have the ſpirit, and eſſence remaining in the bottom.

Now if you deſire to bring this extract to the height of honie, ſet it in an earthen-pot well leaded, upon hot aſhes, ſo that the thin part thereof may bee evaporated, for thus at length, you ſhall have a moſt noble and effectual eſſence of that thing which you have diſtilled, whereof one ſcruple will bee more powerful in purging, then two or three drams of the thing its ſelf.

CHAP. XIV.

How to extract oil out of Gums, condenſed juices, and roſins, as alſo out of ſom woods.

What a Retort is.

ALL oils that are drawn out of gums, oilie-woods and metals, are extracted by that veſſel which wee vulgarly term a Retort. It muſt bee made of glaſs, or jug's-metal well leaded, and of ſuch bigneſs as ſhall bee convenient for the operation you intend, though commonly it ſhould bee made to hold ſom gallon and an half of water; the neck thereof muſt bee a foot and a half, or at leaſt a foot long. The receiver is commonly a vial whereinto the neck of the Retort is fitted and inſerted. Then the Retort ſhall bee ſet in an earthen pan filled with aſhes, or ſand, and ſo ſet into a furnace, as you may ſee by the following figure.

The figure of a Furnace, with his earthen-pan and receiver.

A. *Shew's the furnace.*

B. *The earthen-pan, or veſſel to ſet the Retort in.*

C. *The Retort or Cucurbite.*

D. *The Receiver.*

Of

Of gums, ſom are liquid, ſom ſolid; and of the ſolid, ſom are more ſolid then otherſom; thoſe that are ſolid are more troubleſom to diſtil then the liquid, for they are not ſo eaſily diſſolved or melted, neither do they yeeld ſo well to the fire, ſo that oft-times they are burnt before they bee diſſolved; whence it is that ſom for everie pound of ſolid gum add two or three pounds of moſt clear and liquid oil of Turpentine. Beſides, liquid things are alſo hard to bee diſtilled, becauſ when as they com to bee throughly hot at the fire, they ſwell up ſo much, that they exceed, or run out of the Retort; and ſo fall into the Receiver, as they were put into the Retort, eſpecially if ſo bee that the fire bee too hot at the firſt. Manie to ſhun this inconvenience add to the things put into the Retort, ſom ſand, as it were, to balaſt it withal. The differences of Gum. Cautions in diſtilling of Gums.

Oil of Roſin and Turpentine is thus made; take two or three pounds of Turpentine, and put it into a Retort of ſuch largeneſs that three parts thereof might remain emptie, and for everie pound of Turpentine add three or four ounces of ſand; then place the Retort in an earthen-pan, filled with ſifted aſhes, and ſet it upon the fornace as is fit, and to the neck thereof fit and cloſely lute a Receiver. Laſtly, kindle there-under a ſoft fire at the firſt, leſt the conteined materials ſhould run over; increaſ this fire by little and little, and take heed that the things becom not too hot on a ſudden. At the firſt, a clear and acid liquor will drop out, wherein a certain ſediment uſe's to concrete; then will flow forth a moſt clear oil, ſomwhat reſembling the watrie and phlegmatick liquor; then muſt the fire bee ſomwhat increaſed, that the third oillie, clear, thin and verie golden colored liquor may riſe and diſtil; but then alſo a clearer and more violent fire muſt bee raiſed, that ſo you may extract an oil that will bee red like a carbuncle, and of a conſiſtence indifferently thick. Thus therefore you may extract four kindes of liquors our of Turpentine, and receiv them beeing different in ſeveral Receivers; yet I judg it better to receiv them all in one, that ſo by diſtilling them again afterwards you may ſeparate your defired oil; now there will ten or twelv ounces of oill flow from an ounce of Turpentine. This kinde of oil is effectual againſt the Palſie, Convulſions, punctures of the nervs, and wounds of all the nervous parts. How to make oil of Turpenti. &c.

But you ſhall thus extract oil out of wax; Take one pound of wax, melt it, and put it into a glaſs-Retort ſet in ſand, or aſhes, as wee mentioned a little before in drawing of oil of Turpentine, then diſtil it, by increaſing the fire by degrees. There diſtil's nothing forth of wax, beſides an ollie ſubſtance and a little *Phlegma*, yet portion of this oilie ſubſtance preſently concrete's into a certain butter-like matter, which therefore would bee diſtilled over again; you may draw ℥vi. or viii. of oil, from one pound of wax. How to make oil of wax.

This oil is effectual againſt Contuſions, and alſo verie good againſt cold affects. The faculties thereof.

CHAP. XV.

Of extracting of Oils out of the harder ſorts of Gums; as myrrh, maſtich, Frankincenſ, and the like.

SOm there bee who extract theſe kindes of oils with the Retort ſet in aſhes or ſand, as wee mentioned in the former Chapter of Oils of more liquid Gums, adding for everie pound of Gum two pintes of *Aqua vitæ*, and two or three ounces of Oil of Turpentine, then let them infuſe for eight or ten daies in *Balneo mariæ*, or elſ in horſ-dung; then ſet it to diſtil in a Retort. Now this is the true manner of making of Oils of Myrrh; Take Myrrh made into fine powder, and therewith fill hard Eggs in ſtead of their yelks beeing taken out; then place the Eggs upon a gridiron, or ſuch like grate in ſom moiſt place as a cellar, and ſet under them a leaden-earthen-pan; the Myrrh will diſſolv into an oilie-water, which beeing preſently put into a glaſs and well ſtopped, with an equal quantitie of rectified *Aqua vitæ*, and ſo ſet for three or four months in hot horſ-dung, which paſt the veſſel ſhall bee taken forth, and ſo ſtopped that the conteined liquor may bee poured into an Alembick, for there will certain groſs ſettling by this means remain in the bottom, then ſet your Alembick in *Balneo* and ſo draw off the *Aqua vitæ* and phlegmatick liquor, and there will remain in the bottom a pure and clear oil, whereto you may give a curious color by mixing therewith ſom Alkanet, and a ſmell by dropping thereinto a little oil of Sage, Cinnamom, or Cloves. How to make oil of myrrh. How to give it a pleaſing color and ſmell.

Now let us ſhew the compoſition and manner of making of balſams by giving you one or two examples; the firſt of which is taken out of *Veſalius* his Surgerie; and is this.

℞. *terebinth. opt.* ℔ i. *ol. laurini* ℥iiii. *gum. elem.* ℥iiiiß. *thuris, myrrhæ, gum. heredæ, centaur. majoris, ligni aloës, an.* ℥iii. *galangæ, caryophyll. conſolidæ majoris, Cinnamomi, nucis maſchat. zedoariæ, zinzib. dictamni albi, an.* ℥i. *olei vermium terreſtrium,* ℥ii. *aquæ vitæ* ℔vi. *Veſalius* his Balſam.

The manner of making it is this; Let all theſe things bee beaten and made ſmall, and ſo infuſed for three daies ſpace in *Aqua vitæ*, then diſtilled in a Retort juſt as wee ſaid, you muſt diſtil oil of Turpentine and Wax. There will flow hence three ſorts of liquors; the firſt watriſh and clear, the other thin, and of pure golden color: the third of the color of a Carbuncle, which is the true Balſam. The firſt liquor is effectual againſt the weakneſs of the ſtomach comming of a cold cauſ, for that it cut's phlegm and diſcuſſe's flatulencies; the ſecond help's freſh and hot bleeding wounds, as alſo the palſie. The third is chiefly effectual againſt theſe ſame effects. The compoſition of the following *Balſamum* is out of *Fallopius*; and is this. ℞. *terebinth. claræ*, ℔ ii. *olei de ſemine lini* ℔ i. *reſinæ pini*, ℥vii. *thuris, myrrhæ, aloës, maſtiches,* *Fallopius* his Balſam.

maſticbes, ſarcocollæ, an. ℥iii. *macis, ligni Aloës, an.* ℥ii. *croci,* ℥ß. Let them all bee put into a glaſs-Retort, ſet in aſhes and ſo diſtilled. Firſt there will com forth a clear water, then preſenly after a reddiſh oil, moſt profitable for wounds.

Now you muſt know that by this means, wee may eaſily diſtil all Axungia's, fats, parts of creatures, woods, all kindes of barks and ſeeds, if ſo bee that they bee firſt macerated as they ought to bee, yet ſo that there will com forth more watrie then oilie humiditie. Now for that wee formerly frequently mentioned *Thus* or Frankincenſ, I have here thought good out of *Thevet's* Coſmographie to give you the deſcription of the tree from which it flow's. The Frankincenſ-tree (ſaith hee) grow's naturally in *Arabia*, reſemble's a Pine, yeelding a moiſture that is preſently hardened, and it concrete's into whitiſh clear grains, fattie within, which caſt into the fire, take flame. Now Frankincenſ is adulerated with Pine-roſin and Gum, which is the cauſ that you ſhall ſeldom finde that with us, as it is here deſcribed; you may finde out the deceit as thus, for that neither Roſin nor anie other Gum take's flame, for Roſin go's away in ſmoak, but Frankincenſ preſently burn's. The ſmell alſo bewrai's the counterfeit, for it yeeld's no grateful ſmell as Frankincenſ doth. The *Arabians* wound the tree that ſo the liquor may the more readily flow forth, whereof they make great gain. It fill's up hollow ulcers and cicatrize's them; wherefore it enter's as a chief ingredient into artificial balſam; Frankincenſ alone made into powder and applied, ſtanche's the blood that flow's out of the wounds.

What Frankincenſ is.

The faculties thereof.

Mathiolus ſaith, that it beeing mixed with Fuller's-earth, and oil of Roſes, is a ſingular remedie againſt the inflammation of the breaſts of women lately delivered of childe.

CHAP. XVI.

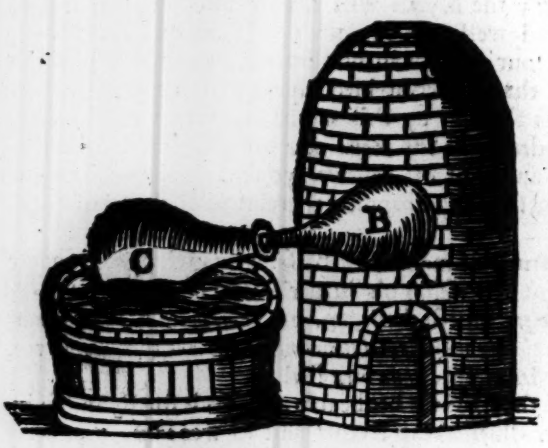
The making of oil of Vitriol.

TAke ten pounds of Vitriol, which beeing made into powder, put it into an earthen-pot, and ſet it upon hot coals, untill it bee calcined, which is when as it becom' reddiſh; after ſom five or ſix hours, when as it ſhall bee throughly cold, break the pot, and let the Vitriol bee again made into powder, that ſo it may bee calcined again, and you ſhall do thus ſo often and long untill it ſhall bee perfectly calcined, which is when as it ſhall bee exactly red; then let it bee made into powder, and put into an earthen-Retort, like that wherein *aqua fortis* is uſually drawn, adding for everie pound of your calcined Vitriol of tile-ſhreds, or powdered-brick 1 quarter; then put the Retort furniſhed with it's receiver into a Fornace of Reverberation, alwaies keeping a ſtrong fire, and that for the ſpace of 48. hours, more or leſs according to the manner and plentie of the diſtilling liquor. You ſhall know the diſtillation is finiſhed when as the Receiver ſhall begin to recover his native perſpicuitie, beeing not now filled with vaporous ſpirits, wherewith as long as the humor diſtil's it is repleniſhed and look's white.

The ſign of perfectly calcined vitriol.

Now for the Receiver there are two things to bee obſerved. The firſt is, that it bee great and verie capacious, that it may not bee diſtended and broken by the abundant flowing of vaporous ſpirits, as it doth oft-times happen; another thing is, that you ſet it in a veſſel filled with cold water, leſt it ſhould bee broken by beeing over hot; you may eaſily perceiv all this by the enſuing figure.

A Fornace or Reverberation furniſhed with his Retort and Receiver.



A. *Shew's the Fornace.*

B. *The Retort.*

C. *The Receiver.*

D. *The veſſel filled with cold water.*

CHAP.

CHAP. XVII.

A Table or Catalogue of Medicines and Instruments serving for the cure of Diseases.

MEdicines, and Medicinal meats fit for the cure of Diseases, are taken from living Creatures, Plants and Minerals. From living creatures are taken,

Horns. Hoofs. Hairs. Feathers. Shells. Scales. Sweats. Skins. Furs. Flesh. Blood. Entrails. Urine. Bones. Extreme parts. Hearts. Liver. Lungs. Brain. Womb. Secundine. Testicles. Pizzle. Bladder Sperm. Tail. Coats of the Ventricle. Excrements. Bristles. Silk. Webs. Tears. Spittle. Honie. Wax. Eggs. Milk. Butter. Cheese. Marrow. Rennet.

Smells whether they bee stinking or sweet, as also Poisons whole creatures themselves: as,

Foxes. Whelps. Hedg-hogs. Frogs. Worms. Crabs. Crabe-fishes. Scorpions. Horseleeches. Swallows. Dungs.

From Plants, that is, Trees, Shrubs, and Herbs, are taken

Roots. Moss. Pith. Stems. Buds. Stalks. Leaves. Flowers. Cups. Fibers, or hairie-threds. Ears. Seeds. Bark. Wood. Meal. Juices. Tears. Oils. Gums. Rosins. Rottenness. Mass or spissament. Manna, *which falling down like dew upon plants, presently concrete's. Whole plants, as Mallows. Onions, &c.*

Metals, or Minerals, are taken either from the Water, or Earth; and are either kindes of Earth, Stones, or Metals, &c. The kindes of Earth are,

Bole-Armenick. Terra sigillata. Fullers-earth. Chalk. Okar. Plaster. Lime.

Now the kindes of Stones are

Flints. Lapis Judaicus. Lapis Lyncis. *The Pumice.* Lap. Hæmatites. Amiantus. Galactites. *Sponge-stones. Diamonds. Saphire. Chrysolite. Topace. Load-stone. The Pyrites or fire-stone. Alablaster. Marble. Crystal, and manie other pretious stones.*

The kindes of Salts as well Natural as Artificial are

Common salt. Sal nitrum. Sal Alkali. Sal Ammoniacum. *Salt of Urine. Salt of tartar and generally all salts that may bee made of anie kinde of Plants.*

Those that are commonly called Minerals are

Marchasite. Antimonie. Muscovie-Glass, Tuttie. Arsnick. Orpiment. Luzure, or blue. Rose-agar. Brimstone. Quick-silver. White-Copras. Chalcitis. *Psorie. Roman Vitriol.* Colcother, *vitriol, or green coperas;* Alumen scissile, *Common Alum.* Alumen rotundum. *Round Alum.* Alumen liquidum. Alumen plumosum. Borax, *or* Barrace. Bitumen, Naphtha. Cinnabaris, *or Vermillion. Lythage of Gold. Lythage of Silver.* Chrysocolla. Scandarcha. *Red-lead. White-Lead, and divers other.*

Now the Metals themselves are

Gold, Silver, Iron, Lead, Tin, Brass, Copper, Steel, Latten and such as arise from these; as the scales, verdigreas, rust, &c.

Now from the Waters; as the Sea, Rivers, Lakes and Fountains, and the mud of these waters, are taken divers medicines, as white and red Corral, Pearls, and infinite other things which Nature the hand-maid of the great Architect of this world, hath produced for the cure of diseases; so that into what part soever you turn your eies, whether to the surface of the earth, or the bowels thereof, a great multitude of remedies present themselves to your view. The choise of all which is taken from their substance, or quantitie, qualitie, action, place, season, smell, taste, fire, figure, and weight, other circumstances, as *Sylvius* hath abundantly shewed in his Book written upon this Subject. Of these Simples are made diverse Compositions; as,

Collyria. Caputpurgia. Eclegmata. *Dentifrices.* Dentiscalpia. Apophlegmatismi. *Gargarisms. Pills. Boles. Potions. Emplasters. Unguents. Cerats. Liniments. Embrocations. Fomentations. Epithemes. Attractives. Resolvers. Suppuratives. Emollients. Mundificatives. Incarnatives. Cicatrizers. Putrifiers. Corrosives. Agglutinatives. Anodynes. Apozemes. Julips. Syrups. Powders. Tablets. Opiats. Conserves. Preserves. Confections. Rowls. Vomits. Sternutatories. Sudorificks. Glysters. Pessaries. Suppositories. Fumigations. Trochisces. Frontrals. Caps. Stomachers. Bags. Baths. Half-baths. Virgins-milk.* Fucli. *Implications. Depilatories. Vesicatories. Potential cauteries. Nose-gaies. Fans. Canopies, or extended cloths to make winde. Artificial fountains, to distil or drop down liquors.*

Now these that are thought to bee nourishing Medicines, are,

Restauratives. Cullisses. Expressions. Gellies. Prisans. Barlie-creams. Panadoes. Almond-milk. marchpains. Wafers. Hydrolacchar. Hydromel, *and such other drinks. Mucilages.* Oxymel. *Oxycrate. Rose-Vineger.* Hydrælium. *Methoglin. Cider. Drink of Servisses, Ale. Beer. Vineger. Verjuice. Oil. Steeled water. Water brewed with bread-crums. Hippocras, Perrie, and such like.*

Waters and distilled oils, and divers other Chymical extractions.

As the waters and oils of hot, drie and aromatick things, drawn in a copper-Alembick, with a cooler, with ten times as much water in weight as of herbs; now the herbs must bee drie, that the distillation may the better succeed.

Waters are extracted out of flowers put into a Retort, by the heat of the Sun, or of Dung, or of an heap of prested-out Grapes, or by *Balneo*, if there bee a Receiver put and closely luted thereto. All kindes of salt of things calcined, dissolved in water, and twice or thrice filtred, that so they may become more pure and fit to yeeld oil.

Other distillations are made either in Cellars by the coldness or moisture of the place, the things being laid either upon a marble, or else hanged up in a bag; and thus is made oil of Tartar, and of salts, and other things of an Aluminous nature.

Bones must bee distilled by descent, or by the joining together of vessels. All woods, roots, barks,

barks, ſhells of fiſhes, and ſeed, or grains; as of corn, broom, beans, and other things whoſe juice cannot bee got out by expreſſion, muſt bee diſtilled by deſcent, or by the joining together of veſſels in a Reverberatorie Fornace.

Metals calcined and having acquired the nature of ſalt, ought to bee diſſolved and filtred, and then evaporated till they bee drie; then let them bee diſſolved in diſtilled vineger, and then evaporated and dried again; for ſo they will eaſily diſtil in a Cellar upon a Marble, or in a bag. Or elſ by putting them into a glaſſie Retort, and ſetting it in ſand, and ſo giving fire thereto by degrees until all the watrie humiditie bee diſtilled; then change the receiver, and lute another cloſe to the Retort, then increaſ the fire above and below, and thus there will flow forth an oil verie red colored: Thus are all metalline things diſtilled, as Alums, ſalts, &c.

Gums, *axungia*, and generally all roſins are diſtilled by Retort ſet in an earthen veſſel filled with Aſhes upon a Fornace; now the fire muſt bee increaſed by little and little according to the different condition of the diſtilled matters.

The Veſſels and Inſtruments ſerving for Diſtillations are commonly theſe.

Bottoms of Alembicks. The heads of them, from whence the liquors drop. Refrigeratories. Veſſels for ſublimation. For Reverberation. For diſtilling by deſcent. Crucibiles and other ſuch. Veſſels for Calcination. Hair-ſtrainers. Bags. Earthen-platters. Veſſels for circulation, as Pelicanes. Earthen-Baſins for filtring. Fornaces. The ſecret Fornaces of Philoſophers. The Philoſopher's egg. Cucurbites. Retorts. Bolt-heads. Urinals. Receivers. Veſſels ſo fitted together that the lowermoſt receiv's the mouth of the uppermoſt, whence they may bee termed conjoined Veſſels: They are uſed in diſtilling *per deſcenſum*. Marbs exquiſitely ſmooth for diſtillations to bee made in Cellars. Pots to diſſolv calcined metalls in.

A Catalogue of the Surgeon's Inſtruments mentioned in this whole work.

RIngs wherein little Lancets lie hid, to open Impoſtumes. Trunks or hollow Inſtruſtruments going with ſprings. A vent, or cooler for the womb made like a peſſarie. Hollow tents. Sundrie Cauteries; as flat, round, ſharp-pointed, cutting, &c. Conſtrictorie rings to twitch or binde the Columella. *Speculum Oris. Ocul. Ani. Uteri.* A trunk or pipe with an actual Cauterie in it. Crooked Knives. A pipe in form of a quill. Divers truſſes, with one or more boulſters. A ſhoulder-band to bee put about the neck, to hold up a truſs. A needle to draw through a golden wier, &c. Pipes with feneſtels, and needls fit for ſutures. Cutting mullets. Mullets onely to hold and not to cut. Mullets to take forth ſplinters of bones. Mullets to draw teeth. An inciſion-knife. Scrapers to plain or ſmooth the bones, or elſ to cut them. Cutting or hollow Scrapers. A leaden mallet to drive the Scrapers or Chizzels into the ſcull. A Gimblet in ſhape and uſe reſembling that which Coopers uſe to lift up the ſunk ſtaves of their cask withal. Levatories, of which kinde is the three-footed one. Old Levatories, which taken by their handls, and their tongues put under the depreſt bones, lift them up. Saws. A deſquamatorie Trepan. Pliers to take forth ſplinters of bones. A Gimblet to perforate the ſcull. A Trepan fit to divide the ſcull, with the ſcrue, point, or piercer, brace, and cover or cap that keep's it from running in too far. A plate to ſet one foot of the Compaſs upon. A cutting pair of Compaſſes both open and ſhut. A fit inſtrument to depreſs the *Dura mater* without hurting thereof. A ſyringe to make injection withal. A pair of Pincers with holes through them to take up the skin for making a Seton. Setons as well drie, as moiſtned with ointments. The Beaks of Crows, Parrats, Swans, Ducks, Lizards, Cranes, are either ſtraight, crooked, toothed, or ſmooth. Catch-bullets, and Pliers to draw forth pieces of mail, and ſplinters of bones that lie deep in. Hollow and ſmooth Dilaters diverſly made for the different wounds of the parts. Probes fit for to put flamula's into wounds; and theſe are either ſtraight or crooked, perforated or unperforated. Scrued mullets to draw forth barbed heads of arrows, and the like. Lancets to let blood, and ſcarrifie as well ſtraight, as crooked. A *pyulcos*, or Matter-drawer. Ligatures, bands, ſwathes, thongs of leather, woollen, linnen, round, ſlit, ſown together; again ſom are upper-binders, others under-binders. Again theſe are either expreſſing, or elſ conteining, and that either the applied medicine, or the lips of wounds, or members put in a fit poſture, which therefore they call a ſarcotick Ligature. Thred. Bottoms, or clews of thred, or yarn. Pledgets, compreſſes, boulſters, doubled cloaths. *Ferule*, or Splints. Caſſes. Boxes. Junks. Gloſſocomies. *Ambi*, a kinde of Gloſſocomie. A pullie with it's wheels, and wooden and iron-pins, whereon the wheels may run. Ropes as well to draw & extend, as hold up the member, &c. Scrue-pins. A hand-vice. Hooks. Buttons or ſtaies to faſten to the skin to hold together the lips of the wounds. Lint. Cuſhions, pillows, linnen-cloths. Files. *Dentiſcalpia, Dentifricia, Dentiſpiſcia.* Catheters, guiders of the work. A bathing chair or ſeat, bathing-tubs, half-tubs, caldrons, funnels, with all other circumſtances belonging to a bath. Stoves, or hot-houſes to ſweat in. Cocks to turn and let out water. A Gimblet to break the ſtone. Hooks. Hollow probes ſlit on the upper-ſides. Winged Inſtruments to draw forth ſtones. An inſtrument to cleanſ the bladder. Spathula's ſtraight and crooked. Cupping-glaſſes. Horns. Pipes or catheters to wear Caruncles. Artificial members, as eies of gold enamelled, &c. An Urinal, or caſe to ſave the water in. An artificial yard. Crutches. Nipples, or leaden covers for ſore breaſts. Griffins talons to draw forth a *mola*, out of the womb. A ſucking-glaſs to draw a breaſt withal. Peſſaries, both long and oval. Syringes to give glyſters, as alſo to make injection into the ears and womb.

The

The Effigies of HIPPOCRATES of Coos the Prince of Physicians.

Hippocratis (Hippocratis) quòd te potuere superbæ
Eoï nunquam flectere Regis opes.
Cecropidæ frontí ex auro fulgente coronam
Promeriti memores imposuere tuæ.
Gratia sed levior est, debes tantus Athenis
Nec fuit hinc mi, quàm tibi partus honos.
Nam quod quæ recreent languentia corpora morbo
Pœonias fueris promere largus opes.
Sed tua tam fundit, quàm magni machina mundi
Gratia, & insignis tam tua fama volat.

BON. GRA. PARIS, MEDIC.

Select Aphorisms concerning Surgerie, collected out of the Aphorisms of the great Hippocrates,

Aphor. 27. sect. 6.

WHosoever being suppurate or hydropical, are burnt, or cut therefore, if all the matter, or water flow forth at once, they certainly die.

31. 6. The drinking of wine, or a bath, fomentation, blood-letting, or purging, help the pains of the eies.

38. 6. Such as have hidden, or not ulcerated Cancers, had better not to cure them. For healed they quickly die, not cured they live the longer.

55. 6. Gootie-pains usually stir in the Spring and Fall.

28. 6. Eunuchs are not troubled with the Gout, neither do they becom bald.

49. 6. Whosoever are troubled with the Gout, have ease in fortie daies, the inflammation ceasing.

66. 5. In great and dangerous wounds, if no swelling appear, it is ill.

67. 5. Soft tumors are good, but crude ones ill.

25. 6. For an *Erysipelas*, or inflammation to return from without inwards, it is not good; but to com from within outwards, is verie good.

19. 7. An *Erysipelas* comming upon the bearing of a bone, is evil.

20. 7. Putrefaction, or suppuration comming upon an *Erysipelas*, is ill.

21. 6. If *Varices* or Haemorrhoides happen to such as are mad, their madnes ceases.

21. 7. A flux of blood ensuing upon a great pulsation in ulcers is ill.

26. 2. It is better that a fever happen upon a convulsion, then a convulsion upon a fever.

4. 6. Those Ulcers that have the skin smooth or shining about them, are evil.

18. 6. The wound is deadlie whereby the bladder, brain, heart, midriff, anie of the small guts, stomach, or Liver are hurt.

45. 6. Whatsoever ulcers are of a year's continuance or more, the bone must necessarily scale, and the scars becom hollow.

2. 7. The bone being affected, if the flesh bee livid, it is ill.

14. 7. Stupiditie and lack of sense, upon a blow of the head, is evil.

24. 7. A *Delirium* happen's if a bone (to wit, the skull) bee cut even to the hollowness thereof.

Whil'st *Pus*, or matter is in generating, pains and fevers happen rather then when it is alreadie made.

18. 5. Cold things are hurtful to the bones, teeth, nerv, brain, spinal marrow, but hot things are good.

46. 2. Two pains meeting together, but not in one place, the more vehement obscure's the other.

74. 7. A corruption or abscess of the bone is caused by the corruption of the flesh.

506. *Coacæ.* A livid or drie ulcer, or yellowish, is deadlie.

19. 6. When as a bone, or gristle, or nerv, or small portion of the cheek, or the prepuce is cut asunder, it neither increase's, nor grow's together.

24. 6. *Aph.* & 513. *Coacæ.* If anie of the small guts bee cut, it knit's not again.

50. 7. Those that have the brain shaken, that is, corrupt, they die within three daies; if they escape these, they recover.

9. 7. Bleeding at a wound causing a convulsion, is the fore-tellar of death.

20. 5. Cold is biting to ulcers; harden's the skin, cause's pain, not easily comming to suppuration, blackness, agnish shakings, convulsions, cramps.

508. *Coac.* Those who have the temples cut, have a convulsion upon the part contrarie to the section.

44. 7. Whosoever being suppurate are burnt or cut, if pure and white quitture shall flow forth they escape; but if that which is bloodie, feculent, and stinking, then they die.

Galen. Comment. ad Aphor. 29. 3. It is not fit to take in hand to cure such as are in a desperate case, but to leav them, one fore-telling the end of the disease.

Celsus, Cap. 10. *Lib.* 2. It is better to trie a doubtful remedie then none at all.

The Effigies of Galen the Prince of Physicians next to Hippocrates,

Quum *erat Hippocratem divino è ſemine Divum,*
Orbem muneribus conciliare ſibi:
Scripta ſed in volvit tam multo ænigmate, verum
Ut quamvis ſolers nullus habere queat;
Pergameï auxilio niſi ſint monimenta Galeni,
Qui doctâ ambages ſuſtulit arte ſenis.
Ergò macte eſto virtute, arcana reſolvens,
Quæ nulli fuerant nota (Galene) priûs;
Obſtringénſque orbem æterno tibi munere totum,
Æternis ſacras te quoque temporibus.

Bon. Gra. Paris. Medic.

Rules of Surgerie by the Autor.

1 PRactice is an operation agreeable to the Rules and Laws of the Theorie.

2 Health is not received by Words, but by Remedies fitly used.

3 Remedies known and approoved by use and reason, are to bee preferred before such as are unknown, or but lately found out.

4 Science without experience get's the Physician no great credit with the Patient.

5 Hee that would perform anie great and notable work, must diligently applie himself to the knowledg of his subject.

6 It is the part of a good Physician to heal the disease, or certainly to bring it to a better pass, as nature shall give leav.

7 The Surgeon must bee active, industrious, and well-handed, and not trust too much to Books.

8 Hee that hath not been versed in the operations of the Art, nor a frequent auditor of the Lectures of such as are learned therein, and set's forth himself for a brave Surgeon, for that hee hath read much, hee is either much deceived or impudent.

9 Hee shall never do anie thing praise-worthie, that hath got his masterie in Surgerie by gold, not by use.

10 You shall comfort the Patient with hope of Recoverie, even when as there is danger of death.

11 To change Physicians and Surgeons is troublesom, but not good for the Patient.

12 Though the disease proov long, yet it is not fit that the Physicians give over the patient

13 Great wounds of large vessels are to bee judged deadlie.

14 Everie contusion must bee brought to suppuration.

15 As the nature or kinde of the disease must bee known, so also must the remedie.

16 An Abscess of the bone of the palat, is in danger to caus a stinking-breath.

87 Bleeding caussed by heat must bee represt by cold.

18 Wounds of nervous parts require medicines which by the subtiltie of the parts may enter in and draw from far.

19 It is not fit for such as have Ulcers in their Legs, neither to walk, stand nor sit, but to rest themselvs in bed.

20 All biting and acrid medicines are offensive to clean Ulcers.

21 For restoring of dislocations you must hold them fast, stretch them out, and force them in.

22 A great Gangrene admit's no cure, but cutting.

23 A monster is a thing dissenting from the laws of nature.

24 Wounds of the Chest presently becom sanious and purulent.

25 The wounds made by all venemous creatures are dangerous.

26 The south-winde blowing, wounded members easily becom mortified.

27 Such as are wounded, and desire to bee quickly whole, must keep a spare diet.

28 Untemperate bodies do not easily recover of diseases.

29 Round Ulcers, unless they bee drawn into another figure, do not easily heal up.

30 An Erysipelatous Ulcer require's purgation by stool.

31 Crying is good for an infant, for it serv's in stead of exercise and evacuation.

32 Grief is good for none but such as are verie fat.

33 Idleness weaken's and extinguisheth the native heat.

24 An ill-natured Ulcer yeeld's not unless to a powerful remedie.

35 A bath resolv's and discusses humors, and gently procure's sweat.

36 Cold diseases are troublesom to old people, and hard to bee helped; but in young bodies they are neither so troublesom, not contumacious.

37 Exercised bodies are less subject to diseases

38 Moist bodies though they need small nourishment, yet stand they in need of large evacuation.

39 Sick people die sooner of an hot distemper then of a cold, by reason of the quick and active operation of fire.

40 The quitture that flow's from an ulcer is laudable, which is white, smooth and equal.

The end of the twentie seventh Book.

How to make Reports, and to Embalm the Dead.

The Twentie eighth Book.

NOw it onely remain's that wee inſtruct the Surgeon in making and framing his Report, or opinion, either of the death of anie perſon, or of the weakneſs, or deprivation of anie member in the function or execution of its proper office and dutie. Herein it is meet that hee bee verie conſiderate that is to ſaie, ingenious or wiſe in making his Report, becauſ the events of diſeaſes are often-times doubtful and uncertain, neither can anie man fore-tel them certainly, whether they will bee for life or death, by reaſon of the manifold nature of the ſubject of which wee ſpeak, and alſo the uncertain condition of the humors both in their kinde and motion. Which was the cauſ why *Hippocrates* even in the firſt of his Aphoriſms pronounceth, that judgment is difficult. But firſt of all, it is verie expedient that a Surgeon bee of an honeſt minde, that hee may alwaies have before his eies a careful regard of true pietie; that is to ſaie, the fear of God and faith in Chriſt, and love toward his neighbors, with hope of life everlaſting, leſt that hee beeing carried away by favor, or corrupted with monie or rewards, ſhould affirm or teſtifie thoſe wounds to bee ſmall that are great, and thoſe great that are ſmall; for the report of the wound is received of the Surgeon according to the Civil Law.

Why a Surgeon muſt bee careful in making of Reports.

What judgment is difficult.

It is recorded in the works of antient Phyſicians that wounds may bee called great for three reſpects.

Wounds termed great for three reſpects.

The firſt is by reaſon of the greatneſs of the diſſolved Unitie or reſolution of Continuitie; and ſuch are theſe wounds which made by a violent ſtroke with a back-ſword have cut off the arm, or leg, or overthwart the breaſt. The ſecond is by reaſon of the dignitie or worthineſs of the part; now this dignitie dependeth on the excellencie of the action; therefore thus anie little wound made with a bodkin, knife, in anie part whoſe ſubſtance is noble: as in Brain, Heart, Liver or anie other part whoſe action and function is neceſſarie to preſerv life, as in the Weaſant, Lungs, or Bladder, is judged great. The third is, by reaſon of the greatneſs and ill habit, or the abundance of ill humors or debilitie of all the wounded bodie; ſo thoſe wounds that are made in the nervous parts, and old decaied people, are ſaid to bee great. But in ſearching of wounds let the Surgeon take heed that hee bee not deceived by his probe. For manie times it cannot go into the bottom of the wound but ſtoppeth, and ſticketh in the waie, either becauſ hee hath not placed the patient in the ſame poſture, wherein hee was when hee received his hurt; or elſ for that the ſtroke beeing made down right, ſlipt aſide to the right or left hand, or elſ from below upwards, or from above downwards, and then hee may exſpect that the wound is but little and will bee cured in a ſhort time, when it is like to bee long in curing, or elſ mortal. Therefore from the firſt daie it behooveth him to ſuſpend his judgment of the wound until the ninth, for in time the accidents will ſhew themſelvs manifeſtly, whether they bee ſmall or great, according to the condition of the wound, or wounded bodies, and the ſtate of the air according to his primitive qualities, or venemous corruption.

How long a Surgeon muſt ſuſpend his judgment in ſom caſes.

But generally the ſigns, whereby wee may judg of diſeaſes, whether they bee great or ſmall, of long or ſhort continuance, mortal or not mortal, are four. For they are drawn either from the nature and eſſence of the diſeaſ, or from the cauſ or effects thereof, or elſ from the ſimilitude, proportion, and compariſon of thoſe diſeaſes with the ſeaſon or preſent conſtitution of the times. Therefore if wee are called to the cure of a green wound, whoſe nature and danger is no other but a ſimple ſolution of Continuitie in the muſculous fleſh, wee may preſently pronounce that wound to bee of no danger, and that it will ſoon bee cured. But if it have an Ulcer annexed unto it, that is, if it bee ſanious, then wee may ſaie it will bee more difficult and long in curing; and ſo wee may pronounce of all diſeaſes, taking a ſign of their eſſence and nature. But of the ſigns that are taken of the cauſſes, let this bee an example. A wound that is made with a ſharp-pointed and heavie weapon; as with an halberd beeing ſtricken with great violence muſt bee accounted great, yea and alſo mortal, if the accidents bee correſpondent.

General ſigns whereas by wee judg of diſeaſes.

But if the patient fall to the ground through the violence of the ſtroke, if a cholerick vomiting follow thereon, if his ſight fail him, together with a giddineſs, if blood com for at his eies and noſtrils, if diſtraction follow with loſs of memorie and ſenſ of feeling: wee may ſaie, that all the hope of life remaineth in one ſmall ſign which is to bee deduced from the effects of the wound. But by the comparing it unto the ſeaſon that then is, and diſeaſes that then aſſault mans bodie, wee may ſaie, that all thoſe that are wounded with gun-ſhot are in danger of death, as it happened in the skirmiſhes at the ſiege of *Roan*, and at the battel of Saint *Denis*. For at that time, whether it were by reaſon of the fault of the heavens, or air, through the

Wounded men lie by the fault of the air.

the evil humors of man's bodie, and the disturbance of them; all wounds that were made by gun-shot, were for the most part mortal. So likewise at certain seasons of the year, wee see the small-pocks and meazels break forth in children, as it were by a certain pestilent contagion to the destruction of children onely, inferring a most cruel vomit and lask; and in such a season the judgment of those diseases is not difficult. But you by the following signs may know what parts are wounded. If the patient fall down with the stroke, if hee lie sensles, as it were asleep, if hee avoid his excrements unwittingly, if hee bee taken with giddiness, if blood com out at his ears, mouth, and nose, and if hee vomit choler, you may understand that the scull is fractured, or pierced through, by the defect in his understanding and discours. You also may know when the scull is fractured, by the judgment of your external senses, as if by feeling it with your finger you finde it elevated or depressed beyond the natural limits, if by striking it with the end of a probe, when the *Pericranium* or nervous film that inveileth the scull is cut cross-wise; and so divided there from it, yeeld a base and unperfect sound like unto a pot-sheard that is broken, or rather like unto an earthen-pitcher that hath a cleft, or rent therein.

Signs of a fractured scull.

Signs of death by a wound on the head.

But wee may say, that death is at hand if his reason and understanding fail him, if hee bee speechless, if his sight forsake him, if hee would tumble head-long out of his bed, beeing not at all able to remoov the other parts of his bodie; if hee have a continual fever, if his tongue bee black with drines, if the edges of the wound bee black or drie, and cast forth no sanious matter, if they resemble the color of salted-flesh, if hee have an apoplexie, phrensie, convulsion or palsie, with an involuntarie excretion, or absolute suppression of the urine and excrements. You may know that a man hath his throat, that is, his weason and winde-pipe cut. First by the sight of his wound, and next by the abolishment of the function or office thereof both waies, for the patient can neither speak nor swallow anie meat or drink; and the parts that are cut asunder, divide themselvs by retraction upwards or downwards one from another, whereof commeth sudden or present death. You may know that a wound hath pierced into the breast or concavitie of the bodie, if the air com forth at the wound making a certain whizzing noise, if the patient breathe with great difficultie, if hee feel a great heavines or weight on or about the midriff, whereby it may bee gathered, that a great quantitie of blood lieth on the place or midriff, and so causeth him to feel a weight or heavines, which by little and little, will bee cast up by vomiting. But a little after a fever commeth, and the breath is unsavorie, and stinking, by reason that the putrifying blood is turned into *sanies*: the patient cannot lie but on his back, and hee hath an often desire to vomit, but if hee escape death, his wound will degenerate into a Fistula, and at length will consume him by little and little.

Signs that the throat is cut.

Signs that a wound hath pierced in the concavitie of the chest.

Signs that the Lungs are wounded.

That the Heart is wounded.

Wee may know that the Lungs are wounded by the foaming and spumous blood comming out both at the wound and cast up by vomiting; hee is vexed with a grievous shortnes of breath and with a pain in his sides. Wee may perceiv the Heart to bee wounded by the abundance of blood that commeth out at the wound, by the trembling of all the whole bodie, by the faint and small pulse, paleness of the face, cold sweat, with often swooning, coldnes of the extreme parts, and sudden death.

The Midriff.

When the midriff (which the Latines call *Diaphragma*) is wounded, the patient feeleth a great weight in that place, hee raveth and talketh idlely, hee is troubled with shortnes of winde, a cough, and fit of greevous pain, and drawing of the intrals upwards. Wherefore when all these accidents appear, wee may certainly pronounce that death is at hand.

The *Vena Cava* and great Arterie.

Death appeareth suddenly, by a wound of the hollow Vein, or the great Arterie, by reason of the great and violent evacuation of blood and spirits, whereby the functions of the Heart and Lungs are stopped and hindered.

The spinal marrow.

The marrow of the back bone beeing pierced, the patient is assaulted with a palsie or convulsion verie suddenly, and sence and motion faileth in the parts beneath it, the excrements of the bladder are either evacuated against the patients will, or elf are altogether stopped.

The Liver.

When the Liver is wounded, much blood commeth out at the wound, and pricking-pain dispersеth it self even unto the sword-like gristle, which hath it's situation at the lower end of the breast-bone called *Sternon*: the blood that falleth from thence down into the intestines doth often-times infer most malign accidents, yea, and sometimes death.

The Stomach.

When the stomach is wounded, the meat and drink com out at the wound, there followeth a vomiting of pure choler, then commeth sweating and coldnes, of the extreme parts, and therefore wee ought to prognosticate death to follow such a wound.

The Spleen.

When the Milt or Splene is wounded, black and gross blood cometh out at the wound, the patient will bee verie thirstie, with pain on the left side, and the blood break's forth into the bellie, and there putrifying causeth most malign and greevous accidents, and oten-times death to follow.

The Guts.

When the guts are wounded, the whole bodie is griped and pained, the excrements com out at the wound, whereat also often-times the guts break forth with great violence.

The Kidnies.

When the Reins or Kidnies are wounded, the patient will have great pain in making his urine, and the blood commeth out together therewith; the pain commeth down even unto the groin, yard, and testicles.

The Bladder.

When the Bladder and Ureters are wounded, the pain goeth even unto the entrails; the

parts

parts all about, and belonging to the groin are diſtended, the urine is bloodie that is made, and the ſame alſo commeth oftentimes out of the wound.

When the womb is wounded, the blood commeth out at the privities, and all other accidents appear, like as when the bladder is wounded. The womb.

When the ſinews are pricked or cut half aſunder, there is great pain in the affected place, and there followeth a ſudden inflammation, flux, abceſs, fever, convulſion, and oftentimes a gangrene or mortification of the part, whereof commeth death, unleſs it bee ſpeedily prevented. The nervs.

Having declared the ſigns and tokens of wounded parts, it now remaineth that wee ſet down other ſigns of certain kindes of death that are not common, or natural, whereabout when there is great ſtrife and contention made, it oftentimes is determined and ended by the judgment of the diſcreet Phyſician or Surgeon.

Therefore if it chance, that a nurſe either through drunkenneſs, or negligence, lie's upon her infant lying in bed with her and ſo ſtifle's or ſmother's it to death: If your judgment bee required, whether the infant died through the default, or negligence of the nurſe: or through ſom violent or ſudden diſeaſes that laie hidden and lurking in the bodie thereof? You ſhall finde out the truth of the matter by theſe ſigns following. Signs that an infant is ſmothered, or over-laid.

For if the infant were in good health before; if hee were not froward or crying; if his mouth and noſtrils, now being dead, bee moiſt'ned or bedewed with a certain foam, if his face bee not pale, but of a Violet or Purple color; if when the bodie is opened the Lungs bee found ſwoln and puffed up, as it were with a certain vaporous foam and all other intrals ſound; it is a token that the infant was ſtifled, ſmothered or ſtrangled by ſom outward violence.

If the bodie or dead corps of a man bee found lying in a field, or houſ alone, and you bee called by a Magiſtrate to deliver your opinion, whether the man were ſlain by lightning or ſom other violent death? You may by the following ſigns finde out the certaintie hereof.

For everie bodie that is blaſted, or ſtricken with lightning, doth caſt forth or breathe out an unwholſom, ſtinking or ſulphureous ſmel, ſo that the birds or fowls of the air, nor dogs will not once touch it, much leſs preie or feed on it: the part that was ſtricken oftentimes ſound, and without a wound, but if you ſearch it well, you ſhall finde the bones under the skin to bee bruiſed, broken or ſhivered in pieces. Signs of ſuch as are ſlain by lightning.

But if the lightning hath pierced into the bodie, which making a wound therein (according to the judgment of *Plinie*) the wounded part is far colder then all the reſt of the bodie. For lightning driveth the moſt thin and fierie air before it, and ſtriketh it into the bodie with great violence, by the force whereof the heat that was in the part is ſoon diſperſed, waſted and conſumed. Lightning doth alwaies leav ſom impreſſion or ſign of ſom fire either by uſtion or blackneſs: for no lightning is without fire. *Lib.2.cap.54.*

Moreover whereas all other living creatures when they are ſtricken with lightning fall on the contrarie ſide, onely man falleth on the affected ſide, if hee bee not turned with violence toward the coaſt or region from whence the lightening came.

If a man bee ſtricken with lightening while hee is aſleep, hee will bee found with eies open; contrariwiſe, if hee bee ſtricken while hee is awake, his eies will bee cloſed, as *Plinie* writeth. *Philip Commines* writeth that thoſe bodies that are ſtricken with lightning are not ſubject to corruption as others are.

Therefore in antient time it was their cuſtom neither to burn, nor burie them, for the brimſtone which the lightning bringeth with it, was unto them in ſtead of ſalt, for that by the drieneſs and fierie heat thereof it did preſerv them from putrefaction.

Alſo it may bee inquired in judgement, Whether anie that is dead and wounded, received theſe wounds alive or dead. Truely the wounds that are made of a living man, if hee die of them, after his death will appear red and bloodie, with the ſides or edges ſwoln, or pale round about: contrariwiſe, thoſe that are made in a dead man, will bee neither red, bloodie, ſwoln, nor puffed up. For all the faculties and functions of life in the bodie do ceaſe and fall together by death; ſo that thenceforth no ſpirits nor blood can bee ſent, or flow into the wounded place. Therefore by theſe ſigns which ſhall appear it may bee declared that hee was wounded dead or alive. Signs of wounds given to a living and dead man

The like queſtion may com in judgment when a man is found hanged, whether hee were dead, or alive. Therefore if hee were hanged alive, the impreſſion or print of the rope will appear red, pale, or black, and the skin round about it will bee contracted or wrinkled, by reaſon of the compreſſion which the cord hath made; alſo oftentimes the head of the *aſpera arteria* is rent and torn, and the ſecond ſpondyl, and the neck luxated or moved out of his place. Alſo the arms and legs will bee pale, by reaſon of the violent and ſudden ſuffocation of the ſpirits: moreover there will bee a foam about his mouth, and a ſtranie and filthie matter hanging out of his noſtrils, being ſent thither both by reaſon that the lungs are ſuddenly heated and ſuffocated, as alſo by the convulſion and concuſſion of the brain like as it were in the falling ſickneſs. Contrariwiſe if hee bee hanged dead, none of theſe ſigns appear: for neither the print of the rope appear's red or pale, but of the ſame color as the other parts of the bodie are, becauſ in dead men the blood and ſpirits do not flow to the grieved parts. Signs whether one bee hanged alive or dead.

Who-

Whether one found dead in tha water came therein alive or dead.

Whoſoever is found dead in the waters, you ſhall know whether they were thrown into the water alive or dead. For all the bellie of him that was thrown in alive, will bee ſwoln and puffed up by reaſon of the water that is conteined therein; certain clammie excrements com out at his mouth and noſtrils, the ends of his fingers will bee worn and excoriated, becauſ that hee died ſtriving and digging or ſcraping in the ſand or bottom of the river, ſeeking ſomwhat whereon hee might take hold to ſave himſelf from drowning. Contrariwiſe if hee bee thrown into the waters, beeing dead before, his bellie will not bee ſwol'n, becauſ that in a dead man all the paſſages and conduits of the bodie do fall together, and are ſtopped and cloſed, and for that a dead man breathe's not, there appeareth no foam nor filthie matter about his mouth and noſe, and much leſs can the tops of his fingers bee worn and excoriated, for when a man is alreadie dead, hee cannot ſtrive againſt death.

But as concerning the bodies of thoſe that are drowned, thoſe that ſwim on the upper part of the water beeing ſwoln or puffed up, they are not ſo by reaſon of the water that is conteined in the bellie, but by reaſon of a certain vapor, into which a great portion of the humors of the bodie are converted by the efficacie of the putrifying heat. Therefore this ſwelling appeareth not in all men which do periſh, or elſ are caſt out dead into the waters, but onely in them which are corrupted with the filthineſs or muddineſs of the water, long time after they were drowned, and caſt on the ſhore.

Of ſuch as are ſmothered by Charcoal.

But now I will declare the accidents that com to thoſe that are ſuffocated and ſtifled or ſmothered with the vapor of kindled or burning-charcoals, and how you may fore-tel the cauſſes thereof by the hiſtorie following. In the yeare of our Lord God 1575. the tenth daie of May, I with *Robert Greauline* Doctor of Phyſick, was ſent for by Maſter *Hamel* an Advocate of the Court of Parlament of *Paris*, to ſee and ſhew my opinion on two of his ſervants, of whom the one was his Clerk, and the other his Horſ-keeper. All his familie ſuppoſed them dead, becauſ they could not perceiv or feel their Arteries to beat, all the extreme parts of their bodies were cold, they could neither ſpeak nor moov, their faces were pale and wan, neither could they bee raiſed up with anie violent beating or plucking by the hair. Therefore all men accounted them dead, and the queſtion was onely of what kinde of death they died, for their maſter ſuſpected that ſom bodie had ſtrangled them, others thought that each of them had ſtopped one another's winde with their hands: and others judged that they were taken with a ſudden apoplexie. But I preſently inquired whether there had been anie fire made with coals in the houſ lately, whereunto their maſter giving ear, ſought about all the corners of the chamber (for the chamber was verie little and cloſe) and at laſt found an earthen-pan with charcoal half burned: which when wee once ſaw, wee all affirmed with one voice, that it was the cauſ of all this misfortune, & that it was the malign fume and venemous vapor, which had ſmothered them, as it were by ſtopping the paſſages of their breath. Therefore I put my hand to the regions of their hearts, where I might perceiv that there was ſom life remaining by the heat and pulſation that I felt though it were verie little, wherefore wee thought it convenient to augment and increaſ it. Therefore firſt of all, artificially opened their mouths, which were verie faſt cloſed, and ſticking obſtinately together; and thereinto both with a ſpoon and alſo with a ſilver-pipe, wee put *aqua vitæ* often diſtilled with diſſolved *hiera* and triacle; when wee had injected theſe medicines often into their mouths, they began to moov and to ſtretch themſelvs, and to caſt up and expel manie viſcous excremental and filthie humors at their mouth and noſtrils, and their lungs ſeemed to bee hot, as it were in their throats.

Therefore then wee gave them vomitories of a great quantitie of *Oxymel*, and beat them often violently on the laſt ſpondil of the back, and firſt of the loins, both with the hand and knee (for unto this place the orifice of the ſtomach is turned) that by the power of the vomitorie medicine, and concuſſion of the ſtomach, they might bee conſtrained to vomit. Neither did our purpoſe fal us, for preſently they voided clammie, yellow and ſpumous phlegm and blood.

But wee not beeing content with all this, blowed up into their noſtrils, out of a Gooſquil, the powder of *Euphorbium*, that the expulſive faculti*e* of the brain might bee ſtirred up to the expulſion of that which oppreſſed it; therefore preſently the brain beeing ſhaken, or mooved with ſneeſing and inſtimulated thereunto by rubbing the chymical oil of mints on the palate and on the cheeks, they expelled much viſcous and clammie matter at their noſtrils.

Then wee uſed frictions of their arms, legs, and back-bones; and miniſtred ſharp glyſters, by whoſe efficacie the bellie beeing abundantly looſened, they began preſently to ſpeak and to take things that were miniſtred unto them of their own accord, and ſo came to themſelvs again.

In the doing of all theſe things, *James Guillemeau* Surgeon unto the King, and of *Paris*, and *John* of Saint *Germanes* the Apothecarie, did much help and further us.

In the afternoon that the matter beeing well begun might have good ſucceſs, *John Hautie*, and *Lewis Thibaut*, both moſt learned Phyſicians, were ſent for unto us, with whom wee might conſult on other things that were to bee don. They highly commended all things that wee had don alreadie, thought it verie convenient that cordials ſhould bee miniſtred unthem, which, by ingendring of laudable humors, might not onely generate new ſpirits, but

alſo

alſo attenuate and purifie thoſe that were groſs and cloudie in their bodies. The reſt of our conſultation was ſpent in the inquirie of the cauſ of ſo dire a miſchance. For they ſaid it was no new or ſtrange thing, that men may bee ſmothered with the fume and cloudie vapor of burning-coals.

For wee reade in the works of *Fulgoſius*, *Volaterenus* and *Egnatius*, that as the Emperor *Jovinian*, travelled in winter-time towards Rome, hee beeing wearie in his journie, reſted at a village called *Didaſtanes*, which divideth *Bithynia* from *Galatia*, where hee laie in a chamber that was newly made, and plaiſtered with lime, wherein they burn'd manie coals, for to drie the work or plaſtering, that was but as yet green on the walls or roof of the chamber. Now hee died the verie ſame night beeing ſmothered or ſtrangled with the deadlie and poiſonous vapor of the burned charcoal, in the mid'ſt of the night; this happened to him in the eight month of his reign, the thirtieth year of his age, and on the twentieth daie of Auguſt. But what need wee to amplifie this matter by the antient hiſtories, ſeeing that not manie years ſince three ſervants died in the houſ of *John Bigine* goldſmith, who dwelleth at the turning of the bridge of the Change, by reaſon of a fire made of coals in a cloſe chamber, without a chimnie where they laie. And as concerning the cauſſes, theſe were alledged. Manie were of opinion that it happened by the default of the vapor proceeding from the burned coals, which beeing in a place void of all air or winde, infer's ſuch like accidents as the vapor or muſt of new wine doth, that is to ſaie, pain, and giddineſs of the head. For both theſe kinds of vapor beſides that they are crude, like unto thoſe things whereof they com, can alſo verie ſuddenly obſtruct the original of the Nervs, and ſo cauſ a convulſion, by reaſon of the groſſneſs of their ſubſtance. *Lib.9. cap.12. lib.23. An hiſtorie.*

For ſo *Hipocrates* writing of thoſe accidents that happen by the vapor of new wine, ſpeaketh. If anie man beeing drunken do ſuddenly becom ſpeechleſs and hath a convulſion, hee dieth unleſs hee have a fever therewithal; or if hee recover not his ſpeech again when his drunkenneſs is over. *Sect. 5. Aph. 5.*

Even on the ſame manner the vapor of the coals aſſaulting the brain cauſſed them to bee ſpeechleſs, unmoovable and void of all ſenſ, and had died ſhortly unleſs by miniſtring and applying warm medicines into the mouth and to the noſtrils, the groſſneſs of the vapor had been attenuated, and the expulſive faculties mooved or provoked to expel all thoſe things that were noiſom: and alſo although at the firſt ſight the Lungs appeared to bee grieved more then all the other parts, by reaſon that they drew the malign vapor into the bodie, yet when you conſider them well, it will manifeſtly appear that they are not grieved, unleſs it bee by the ſympathie or affinitie that they have with the brain when it is verie grievouſly afflicted.

The proof hereof is, becauſ preſently after, there followeth an interception or defect of the voice, ſenſ and motion: which accidents could not bee unleſs the beginning or original of the nervs were intercepted or letted from performing its function, beeing burthened by ſom matter contrarie to nature.

And even as thoſe that have an apoplexie do not die but for want of reſpiration, yet without anie offence of the Lungs, even ſo theſe two young men's deaths were at hand, by reaſon that their reſpiration or breathing was in a manner altogether intercepted, not through anie default of the Lungs, but of the brain and nervs diſtributing ſenſ and motion to the whole bodie and eſpecially to the inſtruments of reſpiration. Others contrariwiſe contended and ſaid, that there was no default in the brain, but conjectured the interception of the vital ſpirits letted or hindered from going up into the brain from the heare, by reaſon that the paſſages of the Lungs were ſtopped, to bee the occaſion that ſufficient matter could not bee afforded for to prefery and feed the animal-ſpirit. Which was the cauſ that thoſe young men were in danger of death, for want of reſpiration, without which there can bee no life. *The occaſion of the death of ſuch as have the apoplexie.*

For the heart beeing in ſuch a caſe, cannot deliver it ſelf from the fuliginous vapor that encompaſs it, by reaſon that the Lungs are obſtructed by the groſſneſs of the vapor of the coals, whereby inſpiration cannot well bee made, for it is made by the compaſſing air drawn into our bodies: but the air that compaſſeth us doth that which nature endevoureth to do by inſpiration, for it moderateth the heat of the heart, and therefore it ought to bee endued with four qualities. The firſt is, that the quantitie that is drawn into the bodie bee ſufficient. The ſecond is, that it bee cold, or temperate in quantitie. The third is, that it bee of a thin and mean conſiſtence. The fourth is, that it bee of a gentle and benign ſubſtance.

But theſe four conditions were wanting in the air which theſe two young men drew into their bodies beeing in a cloſe chamber.

For firſt, it was little in quantitie, by reaſon that ſmall quantitie that was conteined in that little cloſe chamber, was partly conſumed by the fire of coals, no otherwiſe then the air that is conteined in a cupping-glaſs is conſumed in a moment by the flame ſo ſoon as it is kindled. *Conditions of the air good to breathe in.*

Furthermore it was neither cold nor temperate, but as it were inflamed with the burning fire of coals.

Thirdly,

Thirdly, it was more grois in conſiſtence then it ſhould bee by reaſon of the admixtion of the groſſer vapor of the coals: for the nature of the air is ſo that it may bee ſoon altered, and will verie quickly receiv the forms and impreſſions of thoſe ſubſtances that are about it.

Laſtly, it was noiſom and hurtful in ſubſtance, and altogether offenſive to the aierie ſubſtance of our bodies. For Charcoals are made of green wood burnt in pits under ground, and then extinguiſht with their own fume or ſmoak, as all Colliers can tell. Theſe were the opinions of moſt learned men although they were not altogether agreeable one unto another, yet both of them depended on their proper reaſons. For this at leaſt is manifeſt, that thoſe paſſages, which are common to the breſt and brain, were then ſtopped with the groſſneſs of the vapors of the coals: whereby it appeareth that both theſe parts were in fault, for as much as the conſent and connexion of them with the other parts of the bodie is ſo great, that they cannot long abide ſound and perfect without their mutual help by reaſon of the loving and friendlie ſympathie and affinitie that is between all the parts of the bodie one with another.

Wherefore the ventricles of the brain, the paſſages of the lungs and the ſleepie Arteries beeing ſtopped, the vital ſpirit was prohibited from entring into the brain, and conſequently the animal ſpirit retained and kep't in, ſo that it could not com or diſperſ it ſelf through the whole bodie, whence happened the defect of two of the faculties neceſſarie for life.

Of the ſigns of virginitie. It manie times happeneth and is a queſtion too frequently handled concerning women's maiden-heads; whereof the judgement is verie difficult. Yet ſom ancient women and Midwives will brag that they aſſuredly know it by certain and infallible ſigns. For (ſaie they) in ſuch as are virgins there is a certain membrane of parchment-like ekin in the neck of the womb, which will hinder the thruſting in of the finger if it bee put in anie thing deep, which membrane is broken when firſt they have carnal copulation, as may afterwards bee perceived by the free entrance of the finger. Beſides, ſuch as are defloured have the neck of their womb more large and wide; as on the contrarie, it is more contracted, ſtrait and narrow in virgins. But how deceitful and untrue theſe ſigns and tokens are, ſhall appear by that which followeth; for this membrane is a thing preternatural, and which is ſcarce found to bee in one of a thouſand from the firſt conformation. Now the neck of the womb will bee more open or ſtrait according to the bigneſs and age of the partie. For all the parts of the bodie have a certain mutual proportion and commenſuration in a well-made bodie.

Lib. de error. popul. *Joubertus* hath written, that at *Lectoure* in *Gaſconie*, a woman was delivered of a child in the ninth year of her age, and that ſhee is yet alive and called *Joan de Perié* being wife to *Videau Beche* the receiver of the amercements of the King of *Navare*: which is a moſt evident argument, that there are ſom women more able to accompanie with a man at nine years old, then manie other at fifteen, by reaſon of the ample capacitie of their womb and the neck thereof; Beſides alſo, this paſſage is enlarged in manie by ſom accident, as by thruſting their own fingers more ſtrongly thereinto by reaſon of ſom itching, or by the putting up of a Nodule, or Peſſarie of the bigneſs of a man's yard, for to bring down the courſes. Neither to have milk in their breſts is anie certain ſign of loſt virginitie; For *Hippocrates* thus write's; But if a woman which is neither with child, nor hath had one, have milk in her breſts, then her courſes have failed her.

Aph. 39. ſect. 5.

Lib. 4. de hiſt. animal. c. 20. Lib. 12. de ſubtilitate. Moreover, *Ariſtotle* report's that there bee men who have ſuch plentie of milk in their breſts, that it may bee ſucked or milked out.

Cardan write's, that hee ſaw at *Venice* one *Antonie Buſſey* ſom 30. years old, who had milk in his breſts in ſuch plentie, as ſufficed to ſuckle a child, ſo that it did not onely drop, but ſpring out with violence like a woman's milk. Wherefore let Magiſtrates beware leſt thus admoniſhed, they too raſhly aſſcent to the reports of women. Let Phyſicians and Chirurgions have a care leſt they do too impudently bring Magiſtrates into an error, which will not redound ſo much to the judge's diſgrace, as to their's.

But if anie deſire to know, whether one bee poiſoned, let him ſearch for the Symptoms and ſigns in the foregoing and particular treatiſ of poiſons. But that this doctrine of making reports may bee the eaſier, I think it fit to give preſidents, in imitation whereof the young Chirurgion may frame others. The firſt preſident ſhall bee of death to enſue; a ſecond of a doubtful judgement of life and death; the third of a impotencie of a member; the fourth of the hurting of manie members.

A certificate of death. I *A.P.* Chirurgion of *Paris*, this twentieth daie of Maie by the command of the Counſel, entred into the houſ of *John Broſſey*, whom I found lying in bed, wounded on his head, with a wound in his left temple, piercing the bone with a fracture and effracture, or depreſſion of the broken bone, ſcales and *meninges* into the ſubſtance of the brain, by means whereof, his pulſ was weak, hee was troubled with raving, convulſion, cold ſweat, and his appetite was dejected. Whereby may bee gathered that certain and ſpeedie death is at hand. In witneſs whereof I have ſigned this Report with my own hand.

Another in a doubtful caſe. By the Coroner's command I have viſited *Peter Lucey*, whom I found ſick in bed, beeing wounded with a Halbert on his right thigh. Now the wound is of the bredth of three fingers and ſo deep that it pierce's quite through his thigh with the cutting alſo of the vein and arterie whence enſued much effuſion of blood, which hath exceedingly weakned him, & cauſſed him to

ſwound

swound often; now all his thigh is swoln, livid, and give's occasion to fear worse symptoms, which is the cause that the health and safetie of the partie is to bee doubted of.

By the Judice's command I entred into the house of *James Bertie*, to visit his own brother, I found him wounded in his right arm, with a wound of som four fingers bigness, with the cutting of the tendons besides the leg, and of the veins, arteries, and Nerve. Wherefore I affirm also hee is in danger of his life, by reason of the malign symptoms that usually happen upon such wounds, such as are great pain, a fever, inflammation, ablcets, convulsion, gangrene and the like. Wherefore hee stands of provident and carefull dieting, by benefit whereof if hee escape death, without doubt hee will continue lame, during the remainder of his life, by reason of the impotencie of the wounded part. And this I affirm under my hand. In the loss of a member.

Wee the Surgeons of *Paris*, by the command of the Senate, this twentieth date of March, have visited *Mathieu Iuleio Venetum*, whom wee found hurt with five wounds. The first in the top of his head, in the middle of his fore-head-bone, to the bignesse of three fingers, and it penetrated down to the frontale, so that wee were forced to pluck away three splinters of the same bone. The other was in his right cheek, and reacheth from his ear to the mid lip of his nose, wherefore wee stitched it with four stitches. The third is on the mid it of his belly of the bignesse of two fingers, but so deep that it ascends into the capacitie of the belly, so that wee were forced to cut away portion of the Gall, comming out thereat, to the bignes of a walnut, being both a mortal colour, it grew black and putrified. The fourth was upon the back of his left hand, the bignesse of four fingers, with the cutting of the veins, arteries, nerves, and part of the bone of that part; whence it is, that hee will bee lame of that hand, notwithstanding carefull and diligent dieting. Another in the hurts of divers parts.

Now because by hurting the spinal marrow, men become lame, sometimes of a leg; it is fit you know that the spinal marrow descends from the brain like a river for the distribution of the nerves, who might distribute sense and motion to all the parts under the head, wherefore if by hurting the spinal marrow, the patient's arme, or hand are reduced to motion wholly without sense, it is a sign that the nerve which comforth of the neck, hath received some wrong of the neck. But if the same accidents happen to the thigh, leg or foot with retardation, so that the accustomed voluntarily, without the patient's knowledge, or all are totally suppressed, it is a sign that the nerves which proceed from the *ventricle* of the loins and hollow bone are hurt, or in fine, so that the animal faculty flowing from the brain and motion upon the whole bodie, and the benefit of opening and shutting to the thinner mantle of the [illegible] and midriff, cannot there arrive to their parts, by which means sudden death happens, especially if there be difficultie of breathing thereunto.

Being to make report of a childe killed with the mother, bidden care that you make a discreet report, whether the childe were perfect in all the parts and members thereof, that the Judge may equally punish the author thereof. For he merits the greater punishment who hath killed a childe perfectly shaped and made in all the members, than he, hee which hath killed a five childe, these kinds which hath killed an *Embryde*, that is, a certain concretion of the spermatick bodie. For *Moses* punisheth the former with death, as that hee should give life for life, but the other with a pecuniarie mulct. But I judge it fit to exemplifie this report by a Precedent. A caution in making report of a woman with childe being killed.

A. D. By the Judges commanded I visited Mistris *Margaret Edmarie*, whom I found sick in bed, having a strong fever upon her, with a convulsion and effuse of blood out of her womb, by reason of a wound in the lower bellie, below the navil on the right side, penetrating into the capacitie of the bellie, and the wound in the womb in such wise as it hath come to pass, that hee was delivered before her time of a male childe, perfect in all his members but dead, being killed by the same wound, glansing through his scull into the marrow of the brain. Which in a short time will bee the death of the mother also. In testimonie wherof, I have put my hand and seal.

The manner how to Embalm the Dead.

Had determined to finish this my tedious work with the precedent Treatis of Reports, but a better thought came into my head, which was, to bring Man, whose cure I had undertaken, from his Infancie, to his End, and even to his Grave; so that nothing might bee here defective which the Surgeon ought by his profession, perform about man's bodie either alive, or dead. Verily there hath never been a Nation so barbarous, which hath not only been careful for the burial, but also for the Embalming or preserving of their dead bodies. For the verie *Scythians*, who have seemed to exceed other Nations in barbarousness and inhumanitie, have don this; for (according to *Herodotus*) the *Scythians* burie not the corps of their King, before that being embowelled and stuffed full of Bettel Cypres, Frankincens, the seeds of Parsley, and Anis, hee bee also wrapped in fair cloths. The like care hath also possessed the minds of the *Ethiopians*; for having embowelled the corps of their friends, of their intrails and fleshy they plastered them over, and then having thus roughcast them, they painted them over with colors so to express the dead to the life; they inclosed them The care of the *Scythians* in the Embalming of dead. The like care of the *Ethiopians*.

them thus adorned in a hollow pillar of glass, that thus inclosed they might bee seen and yet not annoie the spectators with their smell. Then were they kept the space of a year, in the hands of their next kindred; who, during this space, offered and sacrificed to them. The year ended, they carried them forth of the cittie, and placed them about the walls each in his proper vault, as *Herodotus* affirm's. But this pious care of the dead, did far otherwise affect the *Egyptians*, then it did other nations. For they were so studious to preserv the memorie of their ancestors, that they Embalmed their whole bodie with aromatick ointments, and set them in translucent Urns, or glass-Cells in the more eminent and honored part of their houses, that so they might have them daily in their sight, and might bee as monuments, and inciters to stir them up to imitate their Father's and Grandsire's virtues. Besides also the bodies thus embalmed with aromatick and balsamick ointments, were in stead of a most sure pawn, so that if anie *Egyptian* had need of a great sum of monie, they might easily procure it of such as knew them and their neighbors, by pawning the dead bodie of som of their dead parents. For by this meanes the creditor was certain, that hee which pawned it would sooner lose his life, then break his promise. But if all things so unhappily succeeded with anie, so that through povertie hee could not fetch home his pawn again, but was forced to forgo it, hee was so infamous amongst all men, during the rest of his life, as one banished, or forlorn; and losing his freedom hee shall become a servant, yea, scorned and reviled of all men, hee should bee accounted unworthie to enjoie the light and societie of men. And certainly the *Egyptians* understanding the life which wee here lead, to bee of short continuance, comparison being made with that which wee are to live after the separation of the soul from the bodie, they were more negligent in building their houses they dwelt in, but in rareing the pyramids which should serv them in stead of sepulcres, they were so beyond reason sumptuous and magnificent, that for the building of one of their edifices so renowned over all the world, which King *Cheopes* began, a hundred thousand men were everie three monthes, for twentie yeers space there kept at work. He was five furlongs, and beeing square, each side was 800. foot long, and so much in height. Almost all the pieces of marble went to the building thereof, were thirtie foot long, engraven and carved with various workmanship, as *Herodotus* report's. But befor the bodies were committed to these magnificent Sepulcres, they were carried to the Salters and Embalmers, who for that purpose had allowance of out of the publick stock. These besmeared them with Aromatick and Balsamick ointments, and sewed up the incisions they made, then strewed them over with salt, and then covered them with brine for 70. daies; which being expired, they washed them; being taken thence, and all the filth being taken off, they wrapped them in Cotton-cloths, glued together with a certain gum; then their kinsmen placed them thus ordered in a wooden Coffin carved like to a man. This was the sacred and accustomed rite of Embalming and burying dead bodies amongst the *Egyptians* which were of the richer sort. Our countrie-men the *French*, stirred up with the like desire, embalm the bodies of their Kings and Nobles with spices and sweet ointments. Which custom they may seem piously and christianly to have taken from the Old and New Testament, and the antient and laudable custom of the *Jews*, for you may read in the New Testament that *Joseph* bought a fine linnen cloth, and *Nicodemus* brought a mixture of myrrh and Aloës about 100. pound weight, that they might embalm and burie the bodie of *Jesus Christ* our Saviour, for a sign and argument of the renovation and future integritie which they hoped for by the resurrection of the dead. Which thing the Jews had received by tradition from their ancestors. For *Joseph* in the old Testament commanded his Physicians, they should embalm the dead bodie of his father with spices.

Lib. 3. Of the *Egyptians.*

The reason of building the *Egyptians* Pyramids.

Lib. 2.

John 19. 39.

Gen. 50. 2.

The manner of embalming for a long continuance.

But the bodie which is to bee embalmed with spices for yet a long continuance must first of all bee embowelled, keeping the heart apart, that it may bee embalmed and kept as the kinsfolks shall think fit. Also the brain, the scull beeing divided with a saw, shall bee taken out. Then shall you make deep incisions along the arms, thighs, legs, back, loins and buttocks, especially where the greater veins and arteries run, first that by this meanes the blood may bee pressed forth, which otherwise would putrefie and give occasion and beginning to putrefaction to the rest of the bodie; and then that there may bee space to put in the aromatick powders; the whole bodie shall bee washed over with a spunge dipped in *aqua vitæ*, and strong vineger, wherein shall bee boiled wormwood, aloës, coloquintida, common salts and alum. Then these incisions, and all the passages and open places of the bodie, and the three bellies shall bee stuffed with the following spices grosly powdered. R. *pul. rosar. rubr. mem. melil. balsami, menthæ, anethi, salviæ, lavend. roris mar. marjoran. thymi, absinthii, cyperi, calami aromat. gentianæ, ireos florent. assæ odoratæ, caryophyll. nucis moschat. cinnamomi, styracis, calamitæ. benjoini. myrrhæ, aloës, santal. omnium quod sufficit.* Let the incisions bee sowed up and the open spaces that nothing fall out; then forthwith let the whole bodie bee annointed with Turpentine dissolved with oil of Roses and Camomil, adding, if you shall think it fit, som Chymical oils of spices, and then let it bee again strewed over with the fore-mentioned powder; then wrap it in a linnen-cloth, and then in seare-cloths.

How to embalm bodies when as wee want spices.

Lastly, let it bee put in a Coffin of Lead, sure soudered and filled up with drie sweet herbs. But if there bee no plentie of the fore-mentioned spices, as it usually happen's in besieged towns, the Surgeon shall bee contented with the powder of quenched lime, common ashes made of oke-wood.

For

For thus the bodie beeing over and above washed in strong vinegar, or Lee, shall bee kept a long time, if so bee that a great dissolving heat do not bear swaie, or if it bee not put in a hot and moist place. And this condition of time and place is the caus why the dead bodies of Princes and Kings, though embalmed with Art and cost, within the space of six or seven daies, in which they are kept to bee shewed to the people after their embalming, do cast forth so greevous a sent, that none can indure it; so that they are forced to bee put in a leaden Coffin. For the air which incompasseth them groweth so hot by reason of the multitude of people flowing to the spectacle, and the burning of lights night and daie, that the small portion of the native heat which remaineth beeing dissipated, they easily putrefie, especially when as they are not first moistened and macerated in the liquor of aromatick things, as the *Ægyptians* antiently used to do, steeping them in brine for 70 daies, as I formerly told you out of *Herodotus*. I put in minde hereby, use, that so the embalming may becom the more durable, to steep the bodies (beeing embowelled, and pricked all over with sharp bodkins, that so the liquor hindering putrefaction may penetrate the deeper into them) in a wooden tub filled with strong vinegar of the decoction of aromatick and bitter things, as Alöes, Rue, Wormwood, and Coloquintida; and there keep them for twentie daies, pouring thereinto eleven or twelv pintes of *Aqua vitæ*. Then taking it forth, and setting it on the feet, I keep it in a clear and drie place. I have at home the bodie of one that was hanged, which I begged of the Sheriff, embalmed after this manner, which remaine's sound for more then 25 yeers, so that you may tell all the muscles of the right side, (which I have cut up even to their heads, and plucked them from those that are next them for distinction's sake, that so I may view them with my eies, and handle them with my hands as often as I please, that by renuing my memorie I may work more certainly and surely, when as I have anie more curious operation to bee performed) the left side remain's whole, and the Lungs Heart, *Diaphragma*, stomach, splene, kidnies, beard, haiers, yea and the nails; which beeing pared, I have often observed to grow again to their former bigness.

Why the bodies of our Princes, how well soever embalmed, corrupt in a few daies.

And let this bee the bound of this our immens labor's and by God's favor, our rest, to whom Almightie, all-powerful, immortal and invisible, bee ascribed all honor and glorie for ever, and ever, *Amen*.

Labor improbus omnia vincit.

The end of the Treatis of reports, and embalming the dead.

The Apologie and Treatis, conteining the voiages made into divers places. By *Ambrose Pare* of *Laval* in *Maine*, Counsellor and chief Chirugion to the King.

The twentie ninth Book.

Of what the Adversarie accuseth the Autor.

TRuely I had not put my hand to the pen, to write on such a thing, were it not that som have impudently injured, taxed, and more through particular hatred, disgraced mee, then for zeal or love they bear to the publick good; which was, concerning my manner of tying the Veins and Arteries, writing thus as followeth.

The words of the Adversarie.

Malè igitur & nimium arroganter inconsultus & temerarius quidam, vasorum ustionem post emortui membri resectionem à veteribus omnibus plurimùm commendatam & semper probatam damnare ausus est, novum quendam deligandi vasa modum, contra veteres omnes medicos sine ratione, experientiâ & judicio docere cupiens, nec animadvertit majora multò pericula ex ipsa vasorum deligatione quam acu partem sanam profundè transfigendo administrari vult, imminere quàm ex ipsa ustione. Nam si acu nervosam aliquam partem, vel nervum ipsum pupugerit, dum ità novo & inusitato modo venam absurdè conatur constringere, nova inflammatio necessariò consequetur, à qua Convulsio & convulsione cita mors. Quorum symptomatum metu Galenus nunc ante transversa vulnera fuere audebat (quod tamen minùs erat periculosum) quàm musculorum apouevroses denudâsset. Adde quòd forcipes quibus post sectionem iterum carnem dilacerat, cùm retracta versùs originem vasa se posse extrahere somniat, non minorem adferant dolorem quàm ignita ferramenta admota. Quod si quis laniatum expertus incolumis evaserit, is Deo optimo maximo, cujus Beneficentiâ crudelitati istâ & carnificinâ liberatus est, maximas gratias habere & semper agere debet; which is thus: All then, and too arrogantly a certain indiscreet and rash person would blame and condemn the cauterizing of vessels after the amputation of a rotten and corrupted member, much praised and commended and alwaies approved by the Antients; desiring to shew and teach us without reason, judgment, and experience, a new waie to tie the vessels, against the opinion

of the Antient Phyſicians, taking no heed, nor being well adviſed, that there happen's far greater perils, and accidents, through this new waie of tying the veſſels (which hee will have to bee made with a needle, piercing deeply the ſound part) then by the burning and uſtion of the ſaid veſſels; for if the needle ſhall prick anie nervous part, yea the nerv it ſelf, when hee ſhall by this new and unaccuſtomed waie abſurdly conſtrein the vein by bindeing it, there muſt neceſſarily follow a new inflammation; from an inflammation, a convulſion; from a convulſion, death: for fear of which accidents, *Galen* never durſt ſtitch tranſverſal wounds, (which notwithſtanding were leſs dangereus) before hee had diſcovered the Aponeuroſes of the muſcles. Moreover the pincers with which, after the ſection, the fleſh is again dilacerated, while hee think's to draw the veſſels out which are drawn in toward their original, bring no leſs pain then the cautering irons do. And if anie one having experimented this new manner of cruelti̇e have eſcaped danger, hee ought to render thanks to Almightie God for ever, through whoſe goodneſs hee hath been free'd from ſuch tyrannie, feeling rather his executioner then his methodical Chirurgion.

The Autors anſwer. O what ſweet words are here for one, who is ſaid to bee a wiſe and learned Doctor? hee remember's not that his white beard admoniſheth him, not to ſpeak anie thing unworthie of his age, and that hee ought to put off and drive out of him all envie and rancor conceived againſt his neighbor. So now I will prove by autoritie, reaſon and experience, that the ſaid Veins and Arteries ought to bee tied.

Autorities.

AS for Autorities, I will com to that of that worthie man *Hippocrates*, who will's and command' the cure of Fiſtula's in the fundament by ligature, as well to conſume the callofitie, as to avoid hemorragie. In the book of Fiſtula's of the fundament chap. 3. book. 5. leaf 4.

Galen, Treatiſ 2. chap. 17. in his method, ſpeaking of a flux of blood made by an outward cauſ, of whom ſee here the words, It is (ſaith hee) moſt ſure to tie the root of the veſſel, which I underſtand to bee that which is moſt near to the Liver, or the heart.

Avicen, Treatiſ 3. doct. 1. chap. 3. command's to tie the vein and the Arterie, after it is diſcovered towards his original.

Guido of *Cauliac*, ſpeaking of the wounds of the Veins and Arteries, injoineth the Chirurgion to make the ligature in the veſſel.

Maſter *Hollier* in the 3. book, chap. 4. of the matter of Chirurgerie, ſpeaking of a flux of blood, command's expreſſly to tie the veſſels.

Calmetheus in the 12. chap. of the wounds in the Veins and Arteries, tel's a moſt ſure waie to ſtaie a flux of blood, by ligature of the veſſel.

Celſus, chap. 26. book 5. from whom the ſaid Phyſician hath ſnatched the moſt part of his book, chargeth expreſſly, to tie the veſſels in a flux of blood happening to wounds, as a remedie moſt eaſie & moſt ſure.

Veſalius in his Chirurgerie, chap. 4 book 3. willeth that the veſſels bee tied in a flux of blood.

John de Vigo, book 1. treatiſ 1. treating of a hemorragie in bleeding wounds, command's to tie the Vein, and the Arterie.

Tegaultius chap. 12. book 2. treating of the means to ſtaie the flux of blood, command's to pinch the Vein or Arterie with a Crow or Parrat's-bill, then to tie it with a verie ſtrong thred.

Peter of *Argillata* of *Bullougne*, treatiſ 4. chap. 11. book. 1. diſcourſing of a flux of blood, and the means to ſtop it, giveth a fourth waie expreſſly, which is made by ligature of the veſſels.

John Andreas a Cruce, a *Venetian*, book 1. ſect. 3. chap. 16. pag. 5. upon the 88. chap. of the book of *Paul* make's mention of a method, to ſtaie a flux of blood by the ligature of the veſſels.

D' Alechamp command's to tie the Veins and Arteries.

See then (my little good man) the autorities which command you to tie the veſſels. As for the reaſons, I will debate of them.

The hemorragie (ſaie you) is not ſo much to bee feared in the ſection of the Call, as that of the Varices, and the inciſion of the temporal Arteries, as after the amputation of a member. Now you your ſelf command that in cutting the Varices, the flux of blood bee ſtopped by the ligature of the veſſels. In the book 2, chap. of Angealogie, leaf 176. You command the ſame in the book of Stitches 1. chap. ſpeaking of the ſtitch, with the amputation and ſection of the Call, changed by the outward air, ſee heer your own words: After that muſt bee conſidered concerning the Call: for if there bee anie part corrupted, putrified, withered, or blackiſh: Firſt having tied, for fear of a flux of blood, you do not bid afterward to have it cauteriſed; but to ſaie the truth, you have your eies ſhut, and all your ſenſes dulled, when you would ſpeak againſt ſo ſure a method, and that it is not but through anger, and an ill will. For there is nothing which hath more power to drive reaſon from her ſeat, then choler and anger. Moreover when one come's to cauteriſe and diſmember the parts, oftentimes when the Eſchar come's to fal off, there happen's a new flux of blood: As I have ſeen divers times, not having yet been inſpired by God, with ſo ſure a means then, when I uſed the heat of fire. Which if you have not found, or underſtood this method in the books of the Antients, you ought not thus to tread it under your feet, and ſpeak unluckely of one who all his life hath preferred the profit of the Common-wealth before his own particular. It is not more then reaſonable to bee founded upon the ſaying of *Hippocrates*; in the chapter of burning, 2 book leaf 206. upon whoſe autoritie you ſerv your ſelf, which is thus That what the medicament cureth not the iron doth, and what the iron doth not amend, the fire exterminateth: It is a thing which ſavor's not of a Chriſtian, to fall to burning at the firſt daſh without ſtaying for anie more gentle remedies. As you your ſelf write, in the firſt book leaf 5. ſpeaking of the conditions required in a Chirurgion to cure well; which paſſage you borrow from ſom other place: for that which may bee don gently without fire, is much more commended then otherwiſe. Is it not a thing which all ſchools hold as a Maxim, that wee

muſt

Galen in 4. book of the Meth. and in the book of Art of Medecin. Aphor. the 2. book 2. In the book of *anaperus.*

must alvvaies begin vvith moſt eaſie remedies, vvhich if they bee not ſufficient, vvee muſt then com to extreme, followving the doctrine of *Hippocrates*? *Galen* command's in the place before alledged, to treat or dreſs the diſeaſed quickly, ſafely, and with the leaſt pain that is poſſible. *Let us com to Reaſon.*

NOvv ſo it is, that one cannot applie hot irons but vvith extreme and vehement pain in a ſenſible part void of a Gangrene, vvhich vvould bee cauſ of a Convulſion, Fever, yea oft-times of Death. Moreover it vvould bee a long vvhile aftervvards before the poor patients vvere cured, becauſ that by the action of the fire there is made an eſchar, vvhich proceed's from the ſubject fleſh, vvhich beeing fallen, nature muſt regenerate a nevv fleſh in ſtead of that vvhich hath been burned; as alſo the bone remain's diſcovered and bare; and by this means, for the moſt part there remain's an ulcer incurable. Moreover there is yet another accident. It happeneth that oftentimes the cruſt beeing faln off, the fleſh not beeing vvell renued, the blood iſſueth out as it did before. But vvhen they ſhall bee tied, the ligature fal's not off until the firſt fleſh have verie vvell covered them again: vvhich is proved by *Galen* in the 5. book of his *Meth.* ſaying, that eſcharotick medicines vvhich cauſ a cruſt or eſchar, vvhenſoever they fall off, leav the part more bare then the naturzl habit require's. For the generation of a cruſt proceed's from the parts ſubject, and which are ſituate round about it, beeing alſo burned, as I may ſaie: wherefore by how much the part is burnt, by ſo much it loſeth the natural heat. Then tell mee when it is neceſſarie to uſe eſcarotick medicines, or cautering irons? 'Tis when the flux of blood is cauſed by eroſion, or ſom Gangrene or putrefaction. Now is it thus? In freſh bleeding wounds there is neither Gangrene, nor putrefaction. Therefore, the cauteries ought not to bee there applied. And when the Antients commanded to applie hot irons to the mouths of the veſſels, it hath not been onely to ſtaie the flux of blood, but chiefly to correct the malignitie, or gangrenous putrefaction which might ſpoil the neighboring parts. And it muſt bee here noted, that if I had known ſuch accidents to happen, which you have declared in your book, in drawing and tying the veſſels, I had never been twice deceived; nor would I ever have left by my writings to poſteritie, ſuch a waie of ſtopping a flux of blood. But I writ it after I had ſeen it don & did it verie often, with happie ſucceſs. See then what may happen through your inconſiderate counſel, without examining, or ſtanding upon the facilitie of tying the ſaid veſſels. For ſee, heer's your ſcope and propoſition, to tie the veſſels after amputation is a new remedie, ſaie you; then it muſt not bee uſed, it is an ill argument for a Doctor.

Of what the eſchar is made

Words of the adverſarie.

Propoſitions of the Adverſarie.

But as for that (ſaie you) one muſt uſe fire after the amputation of members, to conſume and drie the putrefaction, which is a common thing in Gangrenes, and mortifications, that indeed hath no place here, becauſ the practice is to amputate the part above that which is mortified, and corrupted; as *Celſus* write's and command's, to make the amputation upon the ſecond part, rather then to leav anie whit of the corrupted. I would willingly ask you, if when a vein is cut tranſverſ, and that it is verie much retracted towards the original, whether you would make no conſcience to burn till that you had found the orifice of the vein, or arterie; and if it bee not more eaſie onely with a Crow-bil to pinch and draw the veſſel, and ſo tie it? In which you may openly ſhew your ignorance, and that you have your minde ſeazed with much rancor and choler. Wee daillie ſee the ligature of the veſſels practiſed with happie ſucceſs after the amputation of a part, which I will now verifie by experiences and hiſtories, of thoſe to whom the ſaid ligature hath been made, and perſons yet living.

In 5. book c. 26. and 7. book c. 33.

In the ch. of cutting-book the 2.

Experiences.

A notable hiſtorie.

THe 16. of *June* 1582. in the preſence of M. *John Liebaud* doctor in the facultie of Phyſick at *Paris*, *Claud Viard* ſworn Surgeon, M. *Maiburin Huron*, Surgeon of Monſieur *de Souvray*, and I, *John Charbonel* M. Barber-Surgeon of *Paris*, well underſtanding the *Theorick*, and *Practick* of Surgerie, did with good dexteritie amputate the left leg of a woman tormented the ſpace of three years with extreme pain, by reaſon of a great *Caries* which was in the bone *Aſtragal*, *Cyboides*, great and little *focil*, and through all the nervous parts, through which ſhee felt extreme and intolerable pains night and dale: ſhee is called *Marie* of *Hoſtel*, aged 28. years, or thereabouts, wife of *Peter Herve*. Eſquire of the Kitchin to the Ladie *Ducheſs* of *Uzez*, dwelling in the ſtreet of *Verbois* on the other ſide S. *Martin* in the fields, dwelling at the ſign of the S. *John*'s-head; where the ſaid *Charbonel* cut off the ſaid leg, the bredth of 4. large fingers below the knee, & after that hee had inciſed the fleſh, & ſawed the bone, hee griped the vein with the Crow-bil, then the Arterie, then tied them; from whence I proteſt to God (which the companie that were there, can witneſs) that in all the operation that was ſuddenly don, there was not ſpilt one porrenger of blood; and I bid the ſaid *Charbonel* to let it bleed more, following the precept of *Hippocrates*, that it is good, in all wounds and alſo in inveterate ulcers, to let the blood run; by this means, the part is leſs ſubject to inflammation. The ſaid *Charbonel* continued the dreſſing of her, who was cured in two months, without anie flux of blood happening unto her, or other ill accident; and ſhee went to ſee you at your lodging beeing perfectly cured.

The operation of *Charbonel.*

In the 7. ſent. of the book of ulcers.

Another Hiſtorie.

Another hiſtorie of late memorie, of a ſinging-man of our Ladie's Church named M. *Colt*, who broke both the bones of his leg which were cruſht in divers pieces, inſomuch that there was no hope of cure, to vvithſtand a gangrene and mortification, and by conſequence death. Monſieur *Helin* Doctor Regent in the facultie of Phyſick, a man of honor and good knovvledg, *Claud Viard*, & *Simon Peter*, ſvvorn Surgeons of *Paris*, men vvell exerciſed in Surgerie; and *Balthazar* of *Leſtre*, and *Leonard de Leſcbenal*, M. Barber-Surgeons, vvell experimented in the operations of Surgerie, vvere all of opinion, to vvithſtand the accidents aforeſaid, to make entire amputation of the vvhole leg, a little above the broken & ſhivered bones & the torn nerva, veins, arterie; the operation was nimbly don, by the ſaid *Viard* and the blood ſtanch't by the ligature of the veſſels in the preſence of the ſaid *Helin*, and M. *Tonſard* great vicar of our Ladie's Church, and was continually dreſt by the ſaid *Leſcbenal*, and I went to ſee him otherwhiles; hee was happily cured without the application of hot irons, and walketh luſtily on a wooden leg.

Operation don by Viard.

Another Historie. IN the year 1583. the 10. daie of *December*, *Toussaint Poſſon* born at *Ronieville*, at this preſent dwelling at *Beauvais* near *Dourdan*, having his legg all ulcered, and all the bones cariez'd and rotten, praied mee for the honor of God to cut off his leg by reaſon of the great pain which hee could no longer endure. After his bodie was prepared, I cauſſed his leg to bee cut off, four fingers below the *rotula* of the knee, by *Daniel Powlet*, one of my ſervants, to teach him and to imbolden him in ſuch works; and there hee readily tied the veſſels to ſtaie the bleeding, without application of hot irons, in the preſence of *James Guilemeau*, ordinarie Surgeon to the King, and *John Charbonell* maiſter-Surgeon of *Paris*; and during the cure was viſited by M. *Laſſile* and M. *Gourtin* Doctors, Regents in the facultie of medicine at *Paris*. The ſaid operation was made in the houſ of *John Gobel* Inn-keeper, dwelling at the ſign of the white-horſ in the Greve. I will not here forget to ſaie, that the Ladie Princeſs of *Montpenſier*, knowing that hee was poor, and in my hands, gave him monie to paie for his chamber and diet. Hee was well cured, God bee praiſed, and is returned home to his houſ with a woodden-leg.

Another Hiſtorie. Gangreen happening by an Antecedent cauſ. A Gangreen happened to half of the leg to one named *Nicolas Meſnager* aged 76. years, dwelling in S. *Honores* ſtreet, at the ſign of the Basket; which happened to him through an inward cauſ, ſo that wee were conſtrained to cut off his leg to ſave his life: and it was taken off by *Antonie Renaud*, maiſter Barber-Surgeon of *Paris* the 16. daie of *December* 1583. in the preſence of M. *Le Fort*, and M. *La Noie*, ſworn Surgeons of *Paris*; and the blood was ſtanched by the Ligature of the veſſels, and hee is at this preſent cured and in health, walking with a wooden-leg.

Another Hiſtorie. Operation don by *Guillemau*. A Water-man at the Port of *Neſſe*, dwelling near *Monſieur de Mas*, Poſt-maſter, named *John Bouſſereau*, in whoſe hands a Muſket brake aſunder, which broke the bones of his head, and rent and tore the other parts in ſuch ſort that it was needful and neceſſarie to make amputation of the hand two fingers above the wriſt: which was don by *James Guilleman* then Surgeon in ordinarie to the King, who dwelt at that time with mee. The operation likewiſe beeing readily don, and the blood ſtanch'd by the Ligature of the veſſels without burning irons, hee is at this preſent living.

Another Hiſtorie. Operation don by the Antor. A Merchant Grocer dwelling in S. *Denis*-ſtreet at the ſign of the great *Tournois* named the Judg, who fell upon his head, where was made a wound near the temporal muſcle, where hee had an arterie opened, from whence iſſued forth blood with great impetuoſitie, inſomuch that common remedies would not ſerv the turn; I was called thither, where I found M. *Raſſe*, M. *Cointeret*, M. *Viard*, ſworn Surgeons of *Paris*, to ſtaie blood; where preſently I took a needle and thred, and tied the arterie, and it bled no more after that, and was quicklie cured. M. *Rouſſelet* can witneſs it, not long ſince Deacon of your Facultie, who was in the cure with us.

Another Hiſtorie. Another operation. A Sergeant of the Chaſtlet dwelling near S. *Andrew des Arts*, who had a ſtroak of a ſword upon the throat in the Glacks medow, which cut aſunder the jugular vein extern, as ſoon as hee was hurt hee put his handkercher upon the wound, and came to look mee at my houſ, and when hee took awaie his handkercher the blood leaped out with great impetuoſitie: I ſuddenly tied the vein toward the root; hee by this means was ſtanched and cured, thanks bee to God. And if one had followed your manner of ſtanching blood by cauteries, I leav it to bee ſuppoſed whether hee had been cured; I think hee had been dead in the hands of the operator. If I would recite all thoſe whoſe veſſels were tied to ſtaie the blood which have been cured, I ſhould not have ended this long time; ſo that mee thinks there are Hiſtories enough recited to make you believ the blood of veins and arteries is ſurely ſtanched without applying anie outward cauteries.

Du Bartas. *Hee that doth ſtrive againſt experience,*
Daign's not to talk of anie learned ſcience.

Book 6. c. 45. book 2. c. 4. book 3. c. 9. ſect. 7. NOw my little maſter, ſeeing that you reproch mee that I have not written all the operations of Surgerie in my works which the Ancients write of, I ſhould bee verie ſorrie for it: for then indeed might you juſtly call mee *Carnifex*. I have left them becauſ they are too cruel, and am willing to follow the moderns, who have moderated ſuch crueltie: which notwithſtanding you have followed ſtep by ſtep, as appeareth by the operations here written, extracted from your book, which you have drawn here and there from certain ancient Autors, ſuch as followv, and ſuch as you have never practiſed nor ſeen.

The firſt operation.

In the 2 book of the chap. of *Hypoſpatiſm*, book 14 ch. laſt of the Meth. In the 4 ch. of the 16 book of my work. Book 6. c. 7. Book 2. c. 5. TO inveterate fluxions of the eies, and Migrimes, *Paulus Ægineta* as alſo *Albucaſis* command to make *Arteriotomie*, ſee here the vvords of the ſame *Æginete*. You mark the Arteries vvhich are behind the ears, then divide them in cutting to the verie bone, and make a great inciſion the bredth of tvvo fingers, even till the Arterie bee found, as you command to bee don in your book; but I holding the opinion of *Galen*, vvho command's to dreſs the diſeaſed quickly, ſafely, and vvith the leaſt pain that is poſſible, I teach the young Surgeon the means to remedie ſuch evils in opening the Arteries behinde the ears, & thoſe of the temples, vvith one onely inciſion, as a letting blood, and not to make a great inciſion, & cut out vvork for a long time.

The ſecond.

In the 2. book chap. of *Periſcychiſm*. TO fluxions which are made a long time upon the eies, *Paul Æginete* and *Albucaſis* command to make inciſion which they call *Periſcethiſmos* or *Augiologie* of the Greeks; and ſee heer the words of *Paul*; In this operation firſt the head is ſhaved, then taking heed of touching the temporal muſcles, a tranſverſ inciſion muſt bee made, beginning at the left temple and finiſhing at the right, which you have put in your book word for word, without changing anie thing: which ſheweth openly you are a right wound-maker; as may bee ſeen in the Chapter which you call the Crown cut, which is made half round under the Coronal ſuture from one temple to another even to the bone. Now I do not teach ſuch a cruel kinde of remedie, but inſtruct the operator by reaſon, autoritie and notable proof of a ſure and certain waie to remedie ſuch affections without butchering men in this kinde.

In the 26. ch. of the 9. book of my works.

In

The third. Book 6. ch. 44 book 2. ch. 3. book 3. ch. 22

IN the cure of *Empyema*, *Paul Æginet*, *Albucraſis* and *Celſus* commanded to applie ſom thirteen, others fifteen Cauteries to give iſſue to the matter conteined in the breſt, as the ſaid *Celſus* in the afore-ſaid place appointeth for Aſthmatick people, which is a thing out of all reaſon (which reſpect to their honor bee it ſpoken) that ſince the Surgeon's ſcope is to give iſſue to the matter therein conteined, there is no other queſtion then to make apertion, to evacuate the matter in the moſt inferiour part, I have ſhewed the young Surgeon the means to do it ſafely, without tormenting the patients for nothing.

The fourth. *Guido* of *Cauliac* the 2. treatiſe, Doct. 1. chap. 1.

IN Paps that are too great, *Paul Æginet* and *Albucraſis* command's to make a croſs-inciſion, to take out all the fat, and then join together the wound by ſtitch: in brief, it is to flea a man alive, which I have never practiſed, nor counſel it to bee don by the young Surgeon.

Book 7. chap. 10. book 6. chap. 46. book 2. chap. 47.

The fifth. In the firſt book, chap. 29. and 30.

Albucraſis and *Paul Æginet* will cauterize the Liver and the Splene with hot irons, which the moderns have never practiced; for indeed reaſon is manifeſtly repugnant thereunto.

also in book 2. chap. 32. book 6. chap. 67. and 68.

The ſixth. In the 5. book chap. 1. *De internis morbis.* book 1. chap. 33. book 3. ſect. 2. chap. 89. book 6. chap. 50. In the 3. book 12. ch. 69.

IN the *Paracenteſis* which is made in the third kinde of Dropſie called *Aſcites*, *Celius Aurelianus* commandeth divers apertions to bee made in the bellie. *Albucraſis* applie's nine actual cauteries, that is to ſaie, four about the Navel, one upon the Stomach, one upon the Splene, one upon the Liver, two behinde the ſpondyls, one of them near the breſt, the laſt near the ſtomach. *Ætius* is likewiſe of the ſame opinion, to open the bellie with divers cauteries. *Paul Æginet* command's to applie five actual cauteries to make the ſaid *Paracenteſis*. But abhorring ſuch a kinde of burning, of which you ſpeak much in your third book, I ſhew another kinde of practice, the which is don by making a ſimple inciſion in the ſaid bellie, as may bee ſeen in my works, with happie ſucceſs. I do not teach young men in my works the manner of burning, which the Antients have called *inſibulare*, that is not in practice though *Celſus* writeth of it.

The ſeventh. In the 7. book c. 25. book 6. c. 76. book 2. c. 72. upon the ſentence 49. of the 1. ſection of the book of Arts.

IN the Sciatick proceeding from an internal cauſ and becauſ the viſcous humors diſplace the bones, *Paul* command's to burn or cauterize the ſaid joint to the bone: *Diaſcorides* command's the ſame, Which I do not find expedient, taking indication from the ſubjacent parts: for there where one would burn, 'tis in the place of four twin-muſcles, under which paſſeth the great Nerv deſcending from the Holie-bone; which beeing burnt, I leav it to your cenſure what might happen, as *Galen* remarketh ſpeaking of the *uſtion* which muſt bee made in the ſhoulders called *humerus*.

The eighth. Sentence the 22 and 24. of the 3. ſection of the book of the joints c. 56. of the 35. book.

IN the outward laxation of the Spondyls, *Hippocrates* command's to binde the man right upon a Ladder, the Arms and Legs tied and bound: then afterwards having raiſed the Ladder to the top of a tower, or the ridg of an houſ, with a great rope in a pullie, then to let the patient fall plumb down upon the hard pavement; which *Hippocrates* ſaie's was don in his time. But I do not ſhew of anie ſuch waie of giving the ſtrapado to men, but I ſhew the Surgeon, in my works, the waie to reduce them ſurely, and without great pain. Moreover I ſhould bee ſorrie to follow the ſaying of the ſaid *Hippocrates*, In the third book *De morbis*, who command's in the diſeaſ called *Volvulus* to cauſ the bellie to bee blown with a pair of bellows, putting the noſel of them into the *inteſtinum rectum*, and then blow there till the bellie bee much ſtretcht, afterwards to give an emollient glyſter, and to ſtop the fundament with a ſponge. Such practice as this is not made now a daies, therefore wonder not if I have not ſpoken of it. And you not beeing contented to patch together the operations of the above-ſaid Autors, you have alſo taken divers in my works, as everie man may know: which ſheweth manifeſtly that there is nothing of your own in your Surgeon's Guide. I leav out divers other unprofitable operations which you quote in your book, without knowing what beaſts they are, in never having ſeen them practiſed; but becauſ you have found them written in the books of the Antients, you have put them into your book.

Moreover you ſaie that you will teach me my leſſon in the operations of Surgerie, which I think you cannot do: becauſ I have not onely learned them in my ſtudie, and by the hearing of manie years the leſſons of Doctors of Phyſick: but as I have ſaid before in my epiſtle to the Reader, I was reſident the ſpace of 3. years in the Hoſpital of *Paris*, where I had the means to ſee and learn divers works of Surgerie, upon divers diſeaſes, together with the Anatomie, upon a great number of dead bodies, as oftentimes I have ſufficiently made trial publickly in the Phyſicians ſchool at *Paris*, and my good luck hath made mee ſeen much more. For beeing called to the ſervice of the King of France (four of which I have ſerved) I have been in companie at battels, skirmiſhes, aſſaults, and beſeiging of cities and fortreſſes; as alſo I have been ſhut up in cities with thoſe that have been beſieged, having charge to dreſs thoſe that were hurt. Alſo I have dwelt manie years in this great and famous cittie of *Paris*, where, thanks bee to God, I have lived in verie good reputation amongſt all men, and have not been eſteemed the leaſt in ranck of men of my profeſſion, ſeeing there was not anie cure, were it never ſo difficult and great, where my hand and my counſel have not been required, as I make it appear in this my work. Now dare you (theſe things beeing underſtood) ſaie you will teach mee to perform the works of Surgerie, ſince you never went further then your ſtudie? The operations of the ſame are four in general (as wee have declared heretofore) where you may make but three, that is to ſaie, join that which is ſeparated, ſeparate that which was conjoined, and to take awaie that which is ſuperfluous, and the fourth which I make, is as much neceſſarie as induſtrious invention, to add to nature that which is wanting, as I have ſhewed here above. Alſo it is your will that the Surgeon make but three operations above-ſaid without medling to ordain a ſimple Cataplaſm, ſaying it is that which com's to your part belonging to the Phyſician: And that the Antients (in the diſcourſ which you have made to the Reader) have divided the practice of Phyſick

into three kindes, that is to ſay, Diet, Medicine, and Chirurgerie. But I would willingly demand of you who hath made the partition, and where anie thing ſhould bee don, who are thoſe which are content with their part, without anie enterprize upon the other? For *Hippocrates, Galen, Ætius, Avicen*, in brief, all the Phyſicians, as well Greeks and Latins as Arabians, have never ſo treated of the one, that they have not treated of the other, for the great affinitie and tie that there is between them two, and it ſhould bee verie difficult to do otherwiſe. Now when you will vilifie Chirurgerie ſo much, you ſpeak againſt your ſelf; for in your Epiſtle which you have dedicated to Monſieur of *Martignes*, you ſay, that Chirurgerie is the moſt noble part of Phyſick, as well by reaſon of the original antiquitie, neceſſitie, as certaintie in her actions; for ſhee work's *Luce apertâ*, as learnedly writeth *Celſus* in the beginning of his ſeventh book; therefore it is to bee believed you never went out of your ſtudie, but to teach *Theorick* (if you have been able to doe it.)

A fair ſimilitude.

The operations of Chirurgerie are learnt by the eie, and by the touch. I will ſay that you much reſemble a yong Lad of low *Britanie*, of plump buttocks, where was ſtuff ſufficient, who demanded leav of his father to com to *Paris*, to take *France*; beeing arrived the Organiſt of our Ladies Church met with him at the Pallace-gate, who took him to blow the Organs, where hee was remaining three years: hee ſaw hee could ſomwhat ſpeak *French*, hee return'a to his Father, and told him that hee ſpake good *French*, and moreover hee knew well, to plaie on the Organs: his father received him verie joifully, for that hee was ſo wiſe and learned in ſo ſhort a time. Hee went to the Organiſt of their great Church, and praied him to permit his ſon to plaie on the Organs, to the end hee might know whether his ſon was becom ſo skilful a maſter, as hee ſaid hee was; which the Organiſt agreed to verie willingly. Beeing entred to the Organs, hee caſt himſelf with a full leap to the bellows, the maſter Organiſt bid him plaie, and that hee would blow; then this good maſter anſwer's, Let him plaie himſelf on the organs if hee would for him, hee could do nothing but plaie on the bellows. I think alſo my little maſter, that you know nothing elſ, but to prattle in a chair; but I will plaie upon the keies, and make the Organs ſound (that is to ſay) I will do the operations of Chirurgerie, that which you cannot in anie wiſe doe, becauſ you have not gon from your ſtudie or the ſchoole, as I have ſaid before. But alſo, as I have ſaid alreadie in the Epiſtle to the Reader, that the laborer doth little profit by talking of the ſeaſons, diſcourſ of the manner of tilling the earth, to ſhew what ſeeds are proper to each ſoil; all which is nothing if hee put not his hand to the Plough, and couple the Oxen together. So likewiſe is it no great matter if you do not know the *Practick*, for a man may execute Chirurgerie well, although hee have no tongue at all. As *Cornelius Celſus* hath verie well remarked in his firſt book when hee ſaith, *Morbos non eloquentiâ, ſed remediis curari: quæ ſi quis elinguis, uſu diſcretus bene norit, hunc aliquanto majorem medicum futurum, quàm ſi ſine uſu linguam ſuam excoluerit*; that is to ſay; Diſeaſes are not to bee cured by eloquence, but by remedies well and duely applied, which if anie wiſe and diſcreet man though hee have no tongue know well the uſe thereof, this man in time ſhall becom the greater Phyſician, than if without practiſe his tongue were dip't with oratorie; the which you your ſelf confeſs in your ſaid book by a Tetraſtick which is thus:

To talk's not all in Chirurgions Art,
But working with the hands;
Aptly to dreſs each grieved part,
And guid, fire, knife, and bands.

Ariſtotle in the firſt book of his Metaphyſicks the firſt chapter ſaith, Experience is almoſt like unto ſcience, and by the ſame, Art and ſcience have been invented. And indeed wee ſee theſe which are experimented, attain ſooner to that which they intend, then thoſe which have reaſon and not experience, becauſ that the ſaid experience is a knowledg of ſingular and particular things, and ſcience on the contrarie is a knowledg of things univerſal. Now that which is particular is more healable then that which is univerſal therefore thoſe which have experience are more wiſe and more eſteemed, then thoſe which want it, by reaſon they know what they do. Moreover I ſay, that ſcience without experience, bringeth no great aſſurance.

Alciat a Doctor of *Milan*, boaſted one daie of himſelf, that his glorie was greater and more famous then that of Counſellors, *Preſidents*, maſters of Requeſt: becauſ that it was by his ſcience, and his inſtructions that they became ſuch: but hee was anſwered by a Counſellor, that he was like unto a whetſtone, which made the knife ſharp and readie to cut, not beeing able ſo to do it ſelf, and alledged the verſes of *Horace* that;

Fungebatur vice cotis, acutum
Reddere quæ ferrum valet, exors ipſa ſecandi.

See you now (my little maſter) my anſwers to your calumniations, and pray you, if you bear a good minde (to the publick good) to review and correct your book, as ſoon as you can, and not to hold young Chirurgions in this error by the reading of the ſame, where you teach them to uſe hot irons after the amputation of members, to ſtaie a flux of blood, ſeeing there is another means, and not ſo cruel and more ſure and eaſie. Moreover if to daie after an aſſault of a Citie, where diverſ Souldiers have had arms and leggs broken, and ſhot off by Cannon-bullets, Cutlas and other inſtruments of war; to ſtaie the flux of blood, if you ſhould uſe hot irons, it would bee needful to have a forge, and much coals to heat them: and alſo the ſouldiers would hold you in ſuch horror for this crueltie, that they would kill you like a Calf, even as in times paſt they did one of the chiefeſt Chirurgions of *Rome*, which may bee found written before in the third chapter of the Introduction of Surgerie, the 1. book. Now leſt the Sectators of your writings ſhould fall into ſuch inconveniencie, I praie them to follow the method aforeſaid, the which I have ſhewed to bee true and certain, and approoved by autoritie, reaſon and experience.

The

The voiage of Thurin. 1535.

MOreover, I will here ſhew to the readers the places where I have had means to learn the Art of Surgerie, for the better inſtructing of the young Surgeon: and firſt in the year 1536. the great King *Francis* ſent a great Armie to *Thurin*, to recover the Cittie and Caſtles, which the Marqueſs of *Guaſt*, Lieutenant-General of the Emperor had taken: where the high Conſtable of *France* the great Maſter, was Lieutenant-General of the Armie, and Monſier *de Montain* Colonel-General of the Foot, of which I was then Surgeon. A great part of the Armie arrived in the Countrie of *Suze*; wee found the enemie which ſtopt the paſſage, and had made certain Forts, and Trenches, inſomuch that to hunt them out and make them leav the place, wee were forced to fight; where there were divers hurt and ſlain, as well of the one ſide as of the other: but the enemies were conſtrained to retire, and get into the Caſtle, which was cauſſed partly by one Captain *Rat*, who climed with divers of the ſouldiers of his companie upon a little Mountain; there where hee ſhot directly upon the enemies, hee received a ſhot upon the ankle of his right foot, wherewith preſently hee fell to the ground; and ſaid then, Now is the *Rat* taken. I dreſſed him, and God healed him. Wee entred the throng in the Cittie, and paſſed over the dead bodies, and ſom which were not yet dead, wee heard them crie under our horſe's feet, which made my heart relent to hear them. And truly I repented to have forſaken *Paris* to ſee ſo pitiful a ſpectacle. Being in the Cittie, I entred into a ſtable thinking to lodg my own, and my man's horſ, where I found four dead ſouldiers, and three which were leaning againſt the wall, their faces wholly diſfigured, and neither ſaw nor heard, nor ſpoke: and their clothes did yet flame with gun-powder which had burnt them. Beholding them with pittie, there happened to com an old Souldier, who asked mee if there were anie poſſible means to cure them, I told him no: hee preſently approached to them, and cut their throats without cholet. Seeing this great crueltie, I told him hee was a wicked man, hee anſwered mee that hee praied to God, that whenſoever hee ſhould bee in ſuch a caſe, that hee might finde ſom one that would doe as much to him, to the end that hee might not miſerably languiſh. And to return to our former diſcourſ, the enemie was ſummoned to render, which they ſoon did, and went out, their lives onely ſaved, with a white ſtaff in their hands; the greateſt part whereof went and got to the Caſtle of *Villan*, where there was about 200. Spaniards; Monſier the Conſtable would not leav them behinde, to the end that the waie might bee made free. This Caſtle is ſeated upon a little mountain, which gave great aſſurance to them within, that one could not plant the Ordnance to beat upon it, and were ſummoned to render, or that they ſhould bee cut in pieces; which they flatly refuſed, making anſwer, That they were as good and faithful ſervants to the Emperor, as Mounſier the Conſtable could bee to the King his maſter. Their anſwer heard, they made by force of arm, two great Cannons to bee mounted in the night with cords and ropes, by the Swiſſers and Lanſquenets; when as the ill-luck would have it, the two Cannons beeing feared, a Gunner by great negligence ſet on fire a great bag of gun-powder; wherewith hee was burned together with ten or twelv ſouldiers; and moreover the flame of the powder was a cauſ of diſcovering the Artillerie, which made them, that all night they of the Caſtle did nothing but ſhoot at that place where they diſcovered the two pieces of Ordnance, wherewith they kil'd & hurt a great number of our people.

The ſtoring of the enemie.

Brave anſwer of the ſouldiers.

The next daie early in the morning a Batterie was made, which in a few hours made a breach, which beeing made, they demanded to parlie with us; but 'twas too late for them: For in the mean time our French foot ſeeing them amazed, mounted to the breach, and cut them all in pieces, except a fair young luſtie maid of *Piedmont*, which a great Lord would have kept and preſerved for him to keep him companie in the night, for fear of the greedie wolf. The Captain and Enſign were taken alive, but ſoon after were hanged upon the gate of the Cittie, to the end they might give example and fear to the Imperial ſouldiers not to bee ſo raſh and fooliſh, to bee willing to hold ſuch places againſt ſo great an Armie. Now all the ſaid ſouldiers of the Caſtle, ſeeing our people comming with a moſt violent furie, did all their endevour to defend themſelv, they kil'd and hurt a great companie of our ſouldiers, with pikes, muskets, and ſtones, where the Surgeons had good ſhare of work cut out. Now at that time I was a freſh water ſouldier, I had not yet ſeen wounds made by gun-ſhot at the firſt dreſſing. It is true, I had read in *John de Vigo*, in the firſt book of Wounds in General, the eighth Chapter, that wounds made by weapons of fire did participate of Venenoſitie, by reaſon of the powder, and for their cure commands to cauterize them with oil of Elder ſcalding-hot, in which ſhould bee mingled a little treacle; and not to fail, before I would applie of the ſaid oil, knowing that ſuch a thing might bring to the patient great pain, I was willing to know firſt, before I applied it, how the other Surgeons did for the firſt dreſſing, which was to applie the ſaid oil the hoteſt that was poſſible into the wounds, with tents and ſetons; inſomuch that I took courage to do as they did. At laſt I wanted oil, and was conſtrained in ſtead thereof, to applie a digeſtive of yelks of eggs, oil of roſes, and turpentine. In the night I could not ſleep in quiet, fearing ſom defaut in not cauterizing, that I ſhould finde thoſe to whom I had not uſed the burning-oil dead inpoiſoned; which made mee riſe very early to viſit them, where beyond my expectation, I found thoſe to whom I had applied my digeſtive medicine, to feel little plain, and their wounds without inflammation or tumor, having reſted reaſonable well that night: the other to whom was uſed the ſaid burning-oil, I found them feverish, with great pain and tumor about the edges of their wounds. And then I reſolved with my ſelf, never ſo cruelly to burn poor men wounded with gun-ſhot. Being at *Thurin*, I found a Surgeon, who had the fame above all others, for the curing of wounds of gun-ſhot, into whoſe favor I found means to inſinuate my ſelf, to have the recait of his Balm, as hee called it, wherewith hee dreſſed wounds of that kinde, and hee held mee of the ſpace of two years, before I could poſſible draw the Recait from him. In the end by gifts and preſents hee gave it mee, which was this; to boil young whelps neve popped, in

Counſel of de Vigo.

Experience of a bold man's happie ſucceſs.

oil

Receit of an excellent balm for wounds with gun ſhot.

oil of Lilies, prepared earth-worms, with Turpentine of *Venice*. Then was I joiful and my heart made glad, that I had underſtood his remedie, which was like to that which I had obtained by great chance. See then how I have learned to dreſs wounds made with gun-ſhot, not by books. My Lord Marſhal of *Montian* remained Lieutenant-General for the King in *Piedmont*, having ten or twelv thouſand men in garriſon through the Citties and Caſtles; who often combated with ſwords and other weapons, as alſo with muskets; and if there were four hurt, I had alwaies three of them; and if there were queſtion of cutting off an arm or a leg, or to trepan, or to reduce a fracture or diſlocation, I brought it well to paſs. The ſaid Lord Marſhal ſent mee one while this waie, another while that waie, for to dreſs the appointed Souldiers which were beaten as well in other Citties as that of *Thurin*, inſomuch that I was alwaies in the Countrie one waie or other. Monſieur the Marſhal ſent for a Phyſician to *Milan*, who had no leſs reputation in the medicinal Art (then the diſeaſed Monſieur *le Grand*) to take him in hand for an hepatical flux, whereof at laſt hee died. This Phyſician was a certain while at *Thurin* to deal with him, and was often called to viſit the hurt people, where hee alwaies found mee, and I conſulted with him, and ſom other Surgeons, and when wee had reſolved to do anie ſerious work of Surgerie, 'twas *Ambroſe Pare* that put his hand thereto, where I did it promptly and with dexteritie, and with a great aſſurance, in ſo much that the ſaid Phyſician admired mee, to ſee mee ſo readie in the operation of Surgerie, ſeeing the ſmall age which I had. One daie diſcourſing with the ſaid Lord Marſhal, hee ſaid to him, *Signor tu, hai un Chirurgico giovane di anni, ma egli è veckio di ſapere è di eſperientia. Guarda lo bene, perche egli ti fara ſervicio & honore.* That is to ſaie, Thou haſt a young Surgeon of age, but hee is old in knowledg and experience, preſerv him well, for hee will do thee ſervice and honor. But the old man knew not that I had dwelt three years in the Hoſpital of *Paris*, there to dreſs the diſeaſed. In the end Monſieur *Marſhal* died with his hepatical flux. Beeing dead, the King ſent Monſieur the Marſhal of *Annebaut* to bee in his place, who did mee this honor to praie mee to dwell with him, and that hee would uſe mee as well or better, then Monſieur the Marſhal *Montian*; which I would not do for the grief I had for the loſs of my maſter who loved mee intimately, and I him in the like manner; and ſo I came back to *Paris*.

Witneſs of the dexteritie of the Autor

The death of Marſhal *Montian*.

The Voiage of Marolle and of low Britanie, 1543.

I Went to the Camp of *Marolle*, with the deceaſed Monſieur *de Roban*, where King *Francis* was in perſon; and I was Surgeon of the companie of the ſaid Monſieur *de Roban*. Now the King was advertiſed by Monſieur *de Eſtampes*, governor of *Britanie*, that the *Engliſh* had hoiſt ſail to land in Low *Britanie*, and praied him that hee would ſend Monſieur *de Roban*, and Monſieur *de Laval* for ſuccour, becauſ they were the Lords of that Countrie, and for their ſakes thoſe of that Countrie would beat back the enemie and keep them from landing. Having received this advertiſement, his Majeſtie diſpatched to ſend the ſaid Lords for the relief of their Countrie, and to each was given as much power as to the Governor; in ſo much that they were all three the King's Lieutenants. They took willingly this charge upon them, and ſpeedily went away in Poſte, and lead mee with them to *Landreneau*, there where wee found everie one in arms, the Alarum-bells ſounding on everie ſide, yea, five or ſix leagues about the *Harbors*, that is to ſaie, *Breſt*, *Conquet*, *Crozon*, *Le Fou Doulac*, *Laudanec*, each of them well furniſht with Artillerie; as Cannons, Demie-cannons, Culverins, Sakers, Serpentines, Falcons, Harquebuzes: in brief, there was nothing wanting in Artillerie, or Souldiers, as well *Britains* as *French*, to hinder that the Engliſh made no landing, as they had reſolved at their parting from England. The enemie's Armie came unto the verie mouth of the Cannon, and when wee perceived them that they would land, they were ſaluted with Cannon-ſhot, and wee diſcovered our men of War, together with our Artillerie, they fled to Sea again: where I was glad to ſee their veſſels hoiſ ſail again, which was in a great number and in good order, and ſeemed like a forreſt which marched upon the Sea. I ſaw a thing alſo whereat I marvelled much, which was, that the bullets of great peeces made great rebound's, and grazed upon the water as upon the ground. Now to make the matter ſhort, the Engliſh did us no harm, and returned whole and ſound into England, and left us in peace. Wee ſtai'd in that Conntrie in garriſon, till wee were aſſured that their Armie was diſperſed. In the mean time our horſ-men exerciſed their feats of activitie; as to run at the ring, fight in duel, and others, ſo that there was ſtill ſomthing to emploie mee withal. Monſieur *de Eſtampes*, to make ſport and pleaſure to ſaid Monſieur *de Roban*, and *Laval*, and other gentlemen, cauſſed diverſ Countrie wenches, to com to the feaſts, to ſing ſongs in the Low *Braitain* tongue, where their harmonie was like the croaking of Frogs, while they are in love. Moreover made them dance the *Britanie Triorie*, without moving feet or Buttocks, hee made them hear and ſee much good. Otherwhiles they cauſſed the Wraſtlers of the Citties, and Towns, to com where there was a Prize for the beſt, and ſport was ſeldom ended, but that one or other had a leg or arm broken, or the ſhoulder or hip diſplaced: there was a little man of Low *Britanie* of a ſquare bodie and well ſet, who held a long time the credit of the field, and, by his skill and ſtrength, threw five or ſix to the ground; there came to him a great ſchool-maſter, who was ſaid to bee one of the beſt Wraſtlers of all *Britanie*: hee entred into the liſts, having taken off his long jacket, in hoſe and doublet, and beeing neer the little man, hee ſeemed as if hee had been tied to his girdle. Notwithſtanding when each of them took hold of the collar, they were a long time without doing anie thing, and they thought they would remain equal in force and skill: but the little man caſt himſelf with an ambling leap under this great Pedant, and took him on his ſhoulder, and caſt him on his kidnies ſpread abroad like a frog, and then all the companie laugh't at the skill and ſtrength of the little fellow. This great *Dativo* had a great ſpight, for beeing caſt by ſo little a man; hee roſe again in choler, and would have his revenge. They took hold again of each other's collar, and were again a good while at their hold without falling to the ground: in the end this great man let himſelf

Dances of the Countrie wenches.

Wraſtlers: little *Britain* a good wraſtler.

The little Britain kil'd.

himself fall upon the little, and in falling put his elbow upon the pitch of his stomach, and burst his heart, and kil'd him stark dead. And knowing hee had given him his death's blow, took again his long cassock, and went away with his tail between his legs and hid himself, seeing that the little man came not again to himself, either for wine, vinegar, or anie other thing that was presented unto him; I drew near to him, and felt his pull which did not beat at all, then I said hee was dead: then the *Britain* who assisted the wrastling said aloud in their jabbering, that is not in the sport. And som said that the said Pedagoge was accustomed to do so, and that but a year passed hee had don the like in a Wrastling. I would need's open the bodie to know the caus of this sudden death, where I found much blood in the *Thorax* and in the inferior bellie, and I strived to finde out anie apertion in the place, from whence might issue so great a quantitie of blood, which I could not do for all the diligence I could make. Now I believ it was *per Diapedesin* or *Anastomosin*; that is to saie, by the apertion of the mouths of the vessels, or by their porosities; the poor little Wrastler was buried. I took leav of *Messieurs de Robain, de Laval*, and *Estamps*. Monsieur *de Robain* gave mee a present of fiftie double duckets, and an ambling horse; and Monsieur *de Laval* another for my man, and Monsieur *de Estamps*, a Diamond of thirtie Crowns, and so I returned to my hous at *Paris*.

The little Britain opened by the Autor.

The voiage of Parpignan. 1543.

A Little while after Monsieur *de Robain* took mee with him poste, to the camp of *Parpignan*; being there, the enemie made a Sallie forth, and came and inclosed three pieces of our Artillerie, where they were beaten back to the gates of the citie: which was not don without hurting and killing manie, and amongst the rest *de Brissac*, (who was then chief maister of the Artillerie) received a musket shot upon the shoulder: returning to his Tent, all the others that were hurt followed him, hoping to bee dresst by the Surgeons, that ought to dress them. Being com to his Tent and laid on his bed, the bullet was searched for by three or four the most expert Surgeons of the Armie, who could not finde it, but said it was entred into his bodie.

Address of the Autor.

In the end hee called for mee, to see if I were more skilful then them, becaus hee had known mee before in *Piedmont*: by and by I made him rise from his bed, and praied him to put his bodie into that posture as it was then when hee received his hurt, which hee did, taking a javelin between his hands as hee held the Pike in the skirmish. I put my hand about the wound, and found the bullet in the flesh, making a little tumor under the *Omoplate*: having found it I shewed them the place where it was, and it was taken out by Master *Nicolas Lavernaut* Surgeon to Monsieur the *Dolphin*, who was the King's Lieutenant in that armie, yet notwithstanding the honor remained to mee for finding it.

Notice.

I saw one thing of great remark, which is this: That a souldier in my presence gave to one of his fellows a stroke with an Halbard upon the head, penetrating even to the left ventricle of the brain, without falling to the ground. Hee that stroke him said, Hee had heard that hee had cheated him, and that hee had drawn a great sum of monie, and that it was his custom to cheat. I was called to dress him, which I did as it were for the last, knowing well that hee would quickly die: having dresst him hee returned all alone to his lodging, which was at least two hundred paces distant: I bid one of his companions send for a Priest to dispose of the affairs of his soul; hee help'd him to one who staid with him to the last gasp. The next daie the patient sent for mee by his free-friend in a boie's apparel to com to dress him, which I would not do, fearing hee should die under my hands; and to put it on, I said I must not take of the dressing till the third daie, by reason hee would die though hee were never touched. The third daie hee came staggering, and found mee in my Tent accompanied with his wench, and praied mee most affectionately to dress him: And shewed mee a purs wherein hee had an hundred or sixscore pieces of gold, and that hee would content mee to my desire; for all that, yet notwithstanding I left not off to defer the taking off his dressing, fearing lest hee should die at the same instant. Certain gentlemen desired mee to go dress him, which I did at their request, but in dressing him hee died under my hands in a Convulsion. Now this Priest accompanied him until death, who seazed upon the purs left another should take it, saying, Hee would saie Masses for his soul. Moreover hee furnisht himself with his cloaths, and with all the rest of his things. I have recited this Historie as a monstrous thing, that the Souldier fell not to ground when hee had received this great stroke, and was in good senses even till death. Soon after, the Camp was broken for divers causses; the one, becaus wee were advertised that four companies of *Spaniards* were entred into *Parpignan*; the other, that the plague began much in our camp; and it was told us by the people of the countrie, that shortly there would bee a great over-flowing of the Sea, which might drown us all; and the presage which they had, was a verie great winde from Sea, which arose in such manner that there remained not one Tent which was not broken and overthrown; for all the strength and diligence that could bee given; and the Kitchins beeing all uncovered, the winde raised so the dust and sand, which salted and poudered our meat in such sort, that wee could not eat it, so that wee were constrained to boil it in pots and other vessels well covered.

Now wee did not un-camp our selvs in so good time, but that there were many Carts and Carters Mules, and Mule-drivers drowned in the Sea, with great loss of baggage. The Camp broken, I returned to *Paris*.

The voiage to Landresy. 1544.

KIng *Francis* raised a great Armie to victual *Landresy*: on the other side, the Emperor had no less people, yea much more; that is to saie, eighteen thousand *Germans*, ten thousand *Spaniards*, six thousand *Walons*, ten thousand *English*, and a matter of thirteen or fourteen thousand Horse. I saw the two Armies near one another, within Cannon-shot, and it was thought they would never part without giving battel. There were som certain foolish gentlemen who would approach the enemie's Camp; certain shot was made at them, and som died at the place, others had their legs or armes carried away. The King having don what hee desired, which was to victual *Landresy*, retired

tired himſelf with his armie to *Guiſe*, which was the daie after *All-Saints*, one thouſand five hundred fortie four, and from thence I returned to *Paris*.

The Voiage of Boulogne. 1545.

A Little while after wee went to *Boulogne*, where the Engliſh ſeeing our Armie, left the Forts which they had, that is to ſaie, *Moulambert*; the little Paradiſe, *Monplaiſir*, the fort of *Shatillon*, the *Portet*, the fort *Dardelot*. One daie going through the Camp to dreſs my hurt people, the enemies who were in the Tower of *Order*, ſhot off a piece of Ordnance, thinking to kill horſmen which ſtai'd to talk one with another. It happened that the bullet paſſed verie near one of them, which threw him to the ground, and 'twas thought the ſaid bullet had toucht him, which it did not at all, but onely the winde of the ſaid bullet in the mid'ſt of his coat, which went with ſuch a force that all the outward part of the thigh became black and blue, and had much ado to ſtand. I dreſt him, and made him divers Scarifications to evacuate the contuſed blood, which the winde of the ſaid bullet had made; & the rebounds that it made on the ground, kil'd four ſouldiers which remained dead in the place. I was not far from this ſtroke, ſo that I felt ſomwhat the moved air, without doing mee anie harm, then a little fear which made mee ſtoop my head verie low, but the bullet was alreadie paſſed far beyond mee.

The Souldiers mockt mee to bee afraid of a bullet alreadie gon. (My little Maſter) I think if you had been there, that I had not been afraid alone, and that you would have had your ſhare of it. What ſhall I ſaie more? Monſieur the Duke of *Guiſe*, *Francis* of *Lorrain*, was hurt before *Bullogne* with a ſtroke of a Lance, which above the right eie, declining towards the noſe, entered and paſſed quite through on the other between the *nucha* and the ear, with ſo great a violence, that the head of the Lance with a great part of the wood was broken and remained within, in ſuch ſort that it could not bee drawn out but with great force, yea, with Smith's pincers. Notwithſtanding all this violence which was not don without breaking of bones, nervs, and arteries, and other parts; my Said Lord, by the help of God, was cured: the Said Lord went alwaies with open face, which was the cauſ that the Lance went through on the other ſide.

The hurt of Monſieur de Guiſe.

The Voiage of Germanie. 1552.

I Went the Voiage to *Germanie* in the year 1552. with Monſieur *de Roban* Captain of fiftie horſ, where I was Surgeon of his companie, which I have ſaid alreadie. In this voiage Monſieur the high Conſtable of *France* was General of the Armie: Monſieur *de Chaſtillon*, ſince Admiral, was chief Colonel of the Foot, having four Regiments of Lanſquenets, under the Conduct of theſe Captains, *Recrod* and *Ringrave*, having each of them two Regiments, each Regiment was of ten Enſigns, and each Enſign of five hundred men. And beſides theſe, was Captain *Chartel*, who conducted the troops that the Proteſtant-Princes had ſent to the King. This was a verie companie on foot, accompanied with fifteen hundred Horſ, with the following of each one two Archers, which might make four thouſand and five hundred Horſ, beſides two thouſand Light horſ, and as manie muſketeers on horſ-back, of whom Monſieur *de Aumalle* was General, beſides the great number of Nobilitie who came for their pleaſure. Moreover, the King was accompanied with two hundred Gentlemen of his houſ, and likewiſe with divers Princes; there was alſo for his troop that ſerved him, the *French*, *Scottiſh*, and *Swiſſers* Guards, amounting to ſix hundred men on foot, and the Companies of Monſieur the *Dolphin*, *Meſſieres de Guiſe*, *de Aumalle*, and of the Marſhal of Saint *Andrew*, which amounted to four hundred Lances, which was a marvellous thing to ſee ſuch a fair Companie; and in this equipage the King entered into *Thou* and *Mets*. I will not omit to tell that it was ordained, that the Companions of *Meſſieres de Roban*, of the Count of *Sancerr*, of *Iarnac*, which was each of them of fiftie horſ, went by the Wings of the Camp; and God know's wee had ſcarcitie of victuals, and I proteſt to God, that at three divers times I had thought I ſhould have been famiſht, and it was not for want of monie, for I had enough, and wee could not have victuals but by force, by reaſon that the *Peſants* withdrew it all into the Cities and Caſtles.

One of the ſervants of a Captain of the companie of Monſieur *de Roban*, went with others thinking to enter into a Church where the *Peſants* were retired, thinking to finde victuals by force or love: but amongſt the reſt this man was well beaten, and returned with ſeven wounds, with a ſword in the head; the leaſt of which penetrated the ſecond table of the ſcull, and hee had four other upon the arms, and upon the right ſhoulder, which cut more then one half of the blade-bone, or *Omoplate*. Hee was brought back to his maſter's lodging, who ſeeing of him ſo wounded, and they were to depart thence the morrow after at the break of daie, and not thinking ever hee could bee cured, made him a grave, and would have caſt him therein, ſaying that, or elſ the *Peſants* would maſſacre and kill him; I mov'd with pittie, told him, that hee might bee cured if hee were well dreſt: divers Gentlemen of the companie praied him that hee would cauſ him to bee brought along with the Baggage, ſeeing I had the willingneſs to dreſs him; to which hee agreed, and after that I had cloth'd him, hee was put up into a cart upon a bed well covered and well accommodated, which one horſ did draw. I did the office of a Phyſician, Apothecarie, Surgeon, and Cook; I dreſt him even to the end of his cure, and God cured him, in ſo much that all theſe three Companies admired at this cure. The horſ-men of the companie of Monſieur *de Roban*, the firſt muſter that was made, gave mee each one, one Crown, and the Archers half a Crown.

The Voiage of Danvilliers. 1552.

AT the return from the *German* Camp, King *Henrie* beſieged *Danvilliers*, thoſe within would not render. They were well beaten, and our powder failed us, in the mean time they ſhot much at our people. There was a Culverin-ſhot paſſed a traverſ the Tent of Monſieur *de Roban*, vvhich hit a Gentleman's Leg, vvhich vvas of his train; vvhich I vvas fain to finiſh the cutting off, the vvhich vvas don vvithout applying hot irons.

Another Hiſtorie.

The King ſent for povvder to *Sedan*, vvhich beeing com, they began a greater batterie then before, in ſuch ſort that they made a breach. *Meſſiers de Guiſe*, and the high Conſtable beeing

in

in the King's Chamber, told him they concluded the next daie to make aſſaule, and that they were aſſured they ſhould enter into it, and that they ſhould keep it ſecret leſt the enemie were advertiſed. And all of them promiſed not to ſpeak of it to anie one. Now there was a groom of the King's chamber who laie under the King's bed in the Camp to ſleep, underſtood that they reſolved the next daie to give an aſſaule, hee preſently revealed it to a certain Captain, and told him that for certain, the daie following aſſaule ſhould bee given, and that hee had heard it of the King, and praied the ſaid Captain that hee would not ſpeak a word of it to anie bodie, which hee promiſed; but his promiſe was not kept, for at the ſame inſtant, hee went and declared it to a Captain, and this Captain to another Captain, and from the Captains to ſom of the ſouldiers, ſaying alwaies, ſaie nothing. It was ſo well hid that the next daie early in the morning, there was ſeen the greateſt part of the Souldiers with their round hoſe and their breeches cut at knee for the better mounting at the breach. The King was advertiſed of the rumor which run through the Camp, that the aſſaule muſt bee given, whereof hee much marvelled, ſeeing there were but three of that adviſe, which had promiſed one to another, not to tell it to anie one. The King ſent for Monſieur *de Guiſe*, to know if hee had not talked of this aſſaule; hee ſwore and affirmed to him hee had not told it to anie bodie; and Monſieur the Conſtable ſaid as much; who ſaid to the King, hee muſt expreſsly know who had declared this ſetret Counſel; ſeeing they were but three. Inquiſition was made from Captain to Captain, in the end the truth was found; for one ſaid 'twas ſuch a one told mee, another ſaid as much, till at length they came to the firſt, who declared hee had learned it of a Groom of the King's-Chamber, named *Guyard*, born at *Blois*, the ſon of the deceaſed King *Francis* his Barber. The King ſent for him into his Tent, in the preſence of Monſieur *de Guiſe*, and of Monſieur the Conſtable, to underſtand from him whence hee had it, and who told him that this aſſaule was to bee given. The King told him, that if hee did not tell the truth, that hee would cauſ him to bee hanged; then hee declared, hee laie down under his bed thinking to ſleep, and ſo having heard it, hee declared it to a Captain who was a friend of his, to the end hee might prepare himſelf with his Souldiers the firſt for the aſſaule. After the King knew the truth; hee told him hee ſhould never ſerv him again, and that hee deſerved to bee hanged, and forbid him ever to com again to the Court. My Groom of the Chamber went away with this ſad newe, and laie with one of the King's Surgeons in Ordinarie, named Maſter *Lewis*, and in the night gave himſelf ſix wounds with a knife, and cut his throat; yet the ſaid Surgeon perceived nothing till morning, till hee ſaw the bed bloodie, and the dead bodie by him: hee much marvelled at this ſpectacle upon his waking, and was afraid leſt they ſhould ſaie hee was the cauſ of this murther; but was ſoon free'd, knowing the cauſ to bee from deſperation, having loſt the good amitie which the King bore to him. The ſaid *Guyard* was buried. And thoſe of *Dauvilliers* when they ſaw the breach large enough for them to enter in, and the Souldiers prepared for the aſſaule, yeelded themſelvs to the mercie of the King. The chief of them were priſoners, and the Souldiers ſent away without arms. The Camp beeing broken up I returned to *Paris* with my Gentleman whoſe leg I had cut off, I dreſt him and God cured him; I ſent him to his houſ merrie with his wooden leg, and was content, ſaying that hee eſcaped good cheap, not to have been miſerable burnt, as you write in your book, my little Maſter.

What it is to reveal the Secrets of Princes.

The Voiage of Caſtle du Coupt, 1553.

The King of *Navarre* praied the Author to follow him

A Little while after, King *Henrie* levied an Armie of thirtie thouſand men, to go make a ſpoll about *Hedin*. The King of *Navarre* who was then called Monſieur *de Vendoſme*, was chief of the Armie, and the King's Lieutenant. Beeing at S. *Denis* in *France*, ſtaying while the Companies paſſed by, hee ſent for mee to *Paris* to com ſpeak with him; beeing there, hee praied mee, and his requeſt was a command, that I would follow him this Voiage; and I about to make my excuſe, told him my wife was ſick in her bed; hee made mee anſwer, That there were Phyſicians at *Paris* for to cure her; and that hee as well left his own, who was as well deſerved as mine; promiſing mee that hee would uſe mee well, and forthwith gave command that I ſhould bee lodged as one of his Train. Seeing this great affection, which hee had to lead mee with him, I durſt not refuſe him. I went and met with him at the Caſtle of *Coupt*, within three or four leagues of *Hedin*, there where there was the Emperor's Souldiers in garriſon with a number of *Peſants* round about: hee cauſed them to bee ſummoned to render themſelvs; and they made anſwer they ſhould never have them but by pieces, and let them do their worſt, and they would do their beſt to defend themſelvs. They put confidence in their ditches full of water, and in two houre with a great number of Bavins, and certain emptie Caſks, waie was made to paſs over the Foot: when they muſt go to the aſſaule and were beaten with five pieces of Cannon, till a breach was made large enough to enter in, where they within received the aſſaule verie valiantly, and not without killing and hurting a great number of our people with muſket-ſhot, pikes, and ſtones. In the end when they ſaw themſelvs conſtreined, they put fire to their powder and munition, which was the cauſ of burning manie of our people, and their's likewiſe, and they were all almoſt put to the ſword. Notwithſtanding ſom of our Souldiers had taken twentie or thirtie, hoping to have ranſom for them. That was known, and ordered by the Counſel, that it ſhould bee proclamed by the Trumpet through the Camp, that all Souldiers who had anie *Spaniards* priſoners, were to kill them, upon paln to bee hanged and ſtrangled, which was don upon cold blood. From thence wee went and burnt divers Villages, whoſe barns were full of all kinde of grain, to my great grief. Wee went along even to *Tournehan*, where there was a verie great Tower where the Enemies retired, but there was no man found in it, all was pillaged, and the Tower was made to leap by a Mine, and then with gun-powder turned topſie-turvie. After that, the Camp was broken up, and I returned to *Paris*. I will not yet forget to write that the daie after the Caſtle of *Coupt* was taken, Monſieur *de Vendoſme* ſent a Gentleman to the King to make repore to

Hiſtorie of deſperate people.

The taking of Caſtle of Coupt.

him

him of all which had paſſed, and amongſt other things, told the King that I had greatly don my dutie in dreſſing thoſe that were wounded, and that I had ſhewed him eighteen bullets which I had taken or drawn out of the hurt bodies, and that there were divers more which I could neither finde, nor draw out, and told more good of mee then there was by half. Then the King ſaid hee would have mee into his ſervice, and commanded Monſieur *de Goguier* his chief Phyſician to write mee down as entertained one of his Surgeons in ordinarie, and that I ſhould go meet with him at *Rheimes* within ten or twelv daies; which I did, where hee did mee the honor to command mee that I would dwell near him, and that hee would do mee good. Then I thank'd him moſt humbly for the honor it pleaſed him to do mee, in calling mee to his ſervice.

The Voiage of Mets, 1552. The names of the Princes who were at the ſiege of Mets.

THe Emperor having beſieged *Mets*, and in the hardeſt time of winter, as each one know's of freſh memorie: and that there was in the Cittie five or ſix thouſand men, and amongſt the reſt ſeven Princes; that is to ſaie, Monſieur the Duke of *Guiſe* the King's Lievtenant, *Meſſieurs d' Anguien, de Conde, de Montpenſier, de La Roch upon Yon*, Monſieur *de Nemours*, and divers other Gentlemen, with a number of old Captains of War, who often made ſallies forth upon the enemies, (as wee ſhall ſpeak of hereafter) which was not don without ſlaying manie, as well on the one ſide as the other. For the moſt part all our wounded people died, and it was thought the medicaments, wherewith they were dreſſed, were poiſoned; which cauſſed Monſieur *de Guiſe* and other Princes to ſend to the King for mee, and that hee would ſend mee with Drogues to them, for they beleeved their's were poiſoned, ſeeing that of their hurt people few eſcaped. I do not beleev there was anie poiſon, but the great ſtrokes of the Cutlaſſes, musket-ſhot, and the extremitie of cold was the cauſe. The King cauſſed one to write to Monſieur the Marſhal of S. *Andrew* which was his Lievtenant at *Verdun*, that hee found ſom means to make mee enter into *Mets*. The ſaid Lord Marſhal of S. *Andrew* and Monſieur the Marſhal of old *Ville*, got an *Italian* Captain, who promiſed them to make mee enter in, which hee did, and for which hee had fifteen hundred Crowns: the King having heard of the promiſe which the *Italian* Captain had made, ſent for mee, and commanded mee to take of his Apothecarie named *Daigue*, ſuch, and as manie Drogues as I ſhould think fit for the hurt who were beſieged, which I did, as much as a poſt-horſe could carrie. The King gave mee charge to ſpeak to Monſieur *de Guiſe*, and to the Princes, and Captains who were at *Mets*. Beeing arrived at *Verdun*, a few daies after the Monſieur the Marſhal of S. *Andrew*, cauſſed horſes to bee given to mee, and my man, and for the *Italian*, who ſpake verie good high *Dutch*, *Spaniſh*, and *Wallon*, with his own natural tongue. When wee were within eight or ten Leagues of *Mets*, wee went not but in the night, and beeing near the Camp, I ſaw a league and a half off bright fires about the Cittie, which ſeemed as if all the earth were on fire, and I thought wee could never paſs through thoſe fires without beeing diſcovered, and by conſequent bee hanged and ſtrangled, or cut in pieces, or paie a great ranſom. To ſpeak truth, I wiſhed my ſelf at *Paris*, for the imminent danger which I fore-ſaw. God guided ſo well our affairs that wee entred into the Cittie at midnight with a certain Token, which the Captain had with another Captain of the companie of Monſieur *de Guiſe*: which Lord I went to, and found him in bed, who received mee with great thanks, beeing joiful of my comming. I did my meſſage to him of all that the King had commanded mee to ſaie to him; I told him I had a little letter to give to him, and that the next daie I would not fail to deliver it him. That don, hee commanded mee a good lodging, and that I ſhould bee well uſed, and bid mee I ſhould not fail to bee the next daie upon the Breach, where I ſhould meet with all the Princes, and divers Captains, which I did; who received mee with great joie, who did mee the honor to imbrace mee, and tell mee I was verie welcom, adding withal, they did not fear to die if they ſhould chance to bee hurt. Monſieur *de la Roch upon Yon* was the firſt that feaſted mee, and inquired of mee what they ſaid at the Court concerning the Cittie of *Mets*: I told him what I thought good. Then preſently hee deſired mee to go ſee one of his Gentlemen, named Monſieur *de Magnane*, at this preſent Knight of the King's Order, and Lievtenant of his Majeſtie's Guard; who had his leg broken by a Cannon-ſhot. I found him in his bed, his leg bended and crooked, without anie dreſſing upon it; becauſe a Gentleman promiſed him cure, having his name, and his girdle, with certain words. The poor Gentleman wept, and cried with pain which hee felt, not ſleeping either night or daie, in four daies: then I mock't at this impoſture and falſe promiſe. Preſently I did ſo nimbly reſtore and dreſs his Leg, that hee was without pain and ſlept all night, and ſince (thanks bee to God) was cured, and is yet at this preſent living, doing ſervice to the King. The ſaid Lord of the *Roch upon Yon* ſent mee a tun of wine to my lodging, and bid tell mee, when it was drunken hee would ſend mee another. That don, Monſieur *de Guiſe* gave mee a liſt of certain Captains and Lords, and commanded mee to tell them what the King had given Mee in charge; vvhich I did, vvhich vvas to do his commendations and a thankſgiving for the dutie they had don, and did in the keeping of the Cittie of *Mets*, and that hee vvould acknovvledg it. I vvas more then eight daies in acquitting my charge, becauſ they vvere manie; firſt to the Princes and others; as the Duke of *Horace*, the Count of *Martigues*, and his brother, Monſieur *de Bauge*, the Lords *Montmorancy*, and *d' Auville*, then Marſhal of *France*, Monſieur *de La Chapel*, *Bonnivet Carong* novv Governor of *Roban*, the *Vadaſme* of *Chartres*, the Count of *Lude*, Monſieur *de Biron* novv Marſhal of *France*, Monſieur *de Randan* the *Rochfoucaut*, *Boxdaille d'Etrez*, the younger, Monſieur *de S. John* in *Dolphiny*, and manie others vvhich it vvould bee too long to recite; and chiefly to divers Captains vvho had verie vvell don their dutie in defenſ of their lives and Cittie. I demanded afterwards of Monſieur *de Guiſe*, vvhat it pleaſed I ſhould do vvith the Drogues vvhich I had brought, hee bid mee impart them to the Surgeons and Apothecaries, and chiefly to the poor hurt Souldiers in the Hoſpital vvhich vvere in great number; vvhich I did, and can aſſure you, I could not do ſo much as go and ſee them, but they

Commiſſion of the Autor.

Hiſtorie.

ſent

ſent for mee to viſit and dreſs them. All the beſieged Lords praied mee carefully to ſollicite above all others Monſieur *de Pienne* who was hurt at the breach by a ſtone raiſed by a Cannon-ſhot in the Temple with a fracture, and depreſſing of the bone. They told mee that preſently when hee received the ſtroak, hee fell to the earth as dead, and caſt blood out of his mouth, noſe, and ears with great vomitings, and was fourteen daies without ſpeaking one word, or having anie reaſon; there happened to him alſo ſtartings ſomwhat like Convulſions, and had all his face ſwell'd and livid. Hee was trepan'd on the ſide of the temporal muſcle upon the *Os Coronale*. I dreſt him with other Surgeons, and God cured him; and is at this daie living, God bee thanked. The Emperor cauſſed batterie to bee made with fortie double Cannons, where they ſpared no powder night nor daie. Preſently when Monſieur *de Guiſe* ſaw the Artillerie ſeated to make a breach, hee made the neareſt houſes to bee pulled down to make Rampars, and the poſts and beams were ranged end to end, and between two clods of earth, beds and packs of wool, and then other poſts and beams were put again upon them as before. Now much wood of the houſes of the Suburbs, which had been put to the ground for fear leſt the enemie ſhould bee lodged; cloſe covered, and that they ſhould not help themſelvs with anie wood) ſerved well to repair the Breach. Everie one was buſied to carried earth to make the Ramparts night and daie. *Meſſieres* the Princes, Lords and Captains, Lievtenants, Enſigns, did all carrie the Basket, to give example to the Souldiers and Citizens to do the like, which they did: yea, both Ladies and Gentlewomen, and thoſe which had not baskets, helpt themſelvs with kettles, panniars, ſacks, ſheets, and with what elſ they could to carrie earth; in ſo much that the enemie had no ſooner beaten down the Wall, but hee found behinde it a Rampart more ſtrong. The Wall beeing faln, our Souldiers cried to thoſe without, the Fox, the Fox, the Fox, and ſpake a thouſand injuries one to another. Monſieur *de Guiſe* commanded upon pain of death that no man ſhould ſpeak to them without, for fear leſt there ſhould bee ſom Traitor who would give them intelligence what was don in the Cittie; the command made, they tied living Cats at the end of their Pikes, and put them upon the Wall, and cried with the Cats, miau, miau.

The hurt of Monſieur *de Pienne*, trepan'd and cured.

Princes carried the Baskets.

Truly the Emperialiſts were verie much vexed to have been ſo long making a Breach, and at ſo great expenſ, which was the breach of fourſcore ſteps, to enter fiftie men in front, where they found a Rampart more ſtrong then the wall; they fell upon the poor Cats and ſhot at them with their muskets as they uſe to do at birds. Our people did oftentimes make ſallies by the command of Monſieur *de Guiſe*. The daie before there was a great preſs to make themſelvs enrowled, who muſt make the ſallie, chiefly of the young Nobilitie, lead by well experimented Captains. Inſomuch that it was a great favor to permit them to ſallie forth and run upon the enemie: and they ſallied forth alwaies the number of one hundred, or fixſcore armed men with Cutlaſſes, Muskets, Piſtols, Pikes, Partiſans and Halberds, which went even to their trenches to awaken them. Where they preſently made an alarum throughout all their Camp, and their Drums ſounded, plan, plan, ta, ti, ta, ta, ta, ti, ta, tou, touf, touf: likewiſe their Trumpets and Cornets ſounded, to the ſaddle, to the ſaddle, to the ſaddle, to horſ, to horſ, to horſ, to the ſaddle, to horſ. And all their ſouldiers cri'd, Arm, arm, arm, to arms, to arms, to arms, arm, to arms, arm, to arms, arm to arms, like the crie after Wolvs, and all divers tongues, according to their Nations: and they were ſeen to go out from their tents, and little lodgings, as thick as little Bees, when their hive is diſcovered; to ſuccor their fellows, who had their throats cut like ſheep. The horſ-men likewiſe came from all parts, a great gallop, patati, patata, patati, patata, ta, ta, patata, patata, and carried well, that they might not bee in the throng, where ſtroaks were imparted to give and receiv. And when our men ſaw they were forced, they returned into the Citie, ſtill fighting, and thoſe who run after were beaten back with the Artillerie which they had charged with flint-ſtones, and four-ſquare pieces of iron; and our ſouldiers who were upon the ſaid Wall made a vollie of ſhot, and ſhowred down their bullets upon them like hail, to ſend them back to their lodging, where divers remained in the place of the combat, and alſo our men did not all com with whole skins, and there ſtill remained ſom for the Tithe, who were jolful to die in the bed of honor. And where there was a horſ hurt, hee was flaied, and eaten by the Souldiers in ſtead of beef and Bacon, and it was fit I muſt run to dreſs our hurt men. A few daies after other ſallies were made, which did much anger the enemies, becauſ they did not let them ſleep but little in ſafetie. Monſieur *de Guiſe*, made a war-like ſtratagem, which was, Hee ſent a Peſant who was none of the wiſeſt with two pair of letters toward the King, to whom hee gave ten Crowns, and promiſed the King ſhould give him an hundred, provided hee gave him the letters. In the one, hee ſent word that the enemie made no ſign of retiring himſelf, and by all force made a great Breach, which hee hoped to defend, yea, to the loſing of his life, and of all thoſe that were within; and that the enemie had ſo well placed his Artillerie in a certain place which hee named, that with great difficultie was it kept that they had not entered into it, ſeeing it was a place the moſt weak of all the Cittie: but hee hoped quickly to fill it up again in ſuch ſort, that they cannot bee able to enter. One of theſe Letters was ſewed in the lining of his doublet, and hee was bid to take heed that hee told it not to anie man. And there was alſo another given to him; wherein the ſaid Monſieur *de Guiſe* ſent word to the King, that hee and all the beſieged did hope well to keep the Citie, and other matters which I ceaſ to ſpeak of. They made the Peſant go forth in the night, and preſently after hee was taken by one that ſtood Sentinel, and carried to the Duke of *Alba*, to underſtand what was don in the Cittie, and they asked him if hee had anie letters, hee ſaid, yes, and gave them one; and having ſeen it, hee was put to his oath, whether hee had anie other, and hee ſwore, not; then they felt and ſearch't him, and found that which was ſewed to his doublet, and the poor meſſenger was hanged.

The ſaid letters were communicated to the Emperor, who cauſſed his counſel to bee called there, where

it was resolved, since they could do nothing at the first breach, that presently the Artillerie should bee drawn to the place which they thought the most weak, where they made great attempts to make another breach, and dig'd and undermined the wall, and endevoured to take the Tower of Hell, yet they durst not com to the assault. The Duke of *Albe* declared to the Emperor that the souldiers died daily, yet more then the number of two hundred, and that there was but little hope to enter into the Citie, seeing the season, and the great quantitie of Souldiers that were there. The Emperor demanded what people they were that died, and if that they were gentlemen of remark or qualitie: answer was made, that they were all poor souldiers; then said hee, It make's no matter if they die, comparing them to catepillers and grashoppers, which eat the buds of the earth. And if they were of anie fashion, they would not bee in the Camp for twelv shillings the month, and therefore no great harm if they died. Moreover hee said, Hee would never part from before that Cittie, till hee had taken it by force or famine, although hee should lose all his Armie; by reason of the great number of Princes which were therein, with the most part of the Nobilitie of *France*. From whom hee hoped to draw double his expens, and that hee would go once again to *Paris*, to visit the Parisiens, and make himself King of all the Kingdom of *France*. Monsieur *de Guise* with the Princes, Captains, and Souldiers, and generally all the Citizens of the Cittie, having understood the intention of the Emperor, which was to extirpate us all, they advised of all they had to do: And since it was not permitted to the Souldiers, nor Citizens, no nor to the Princes, nor Lords themselvs to eat either fresh-fish, or venison, as likewise som partridges, woodcocks, larks, plovers, for fear lest they had gathered som pestilential air which might give us anie contagion; but that they should content themselvs with the ammunition-fare; that is to saie, with bisquet, Beef, poudered-cows, lard, and gammons of bacon: Likewise fish; as green-fish, salmon, sturgeon, anchovies, pilchers and herrings, also peas, beans, rise, garlike, onions, prunes, cheese, butter, oil, salt, pepper, ginger, nutmegs, and other Spiceries to put into pies, chiefly to horse-flesh, which without that would have had a verie ill taste; divers Cittizens having gardens in the Cittie sowed therein great Raddishes, Turnips, Carrots, and Leeks, which they kept well and full dear, against the extremitie of hunger. Now all these ammunition-victuals were distributed by weight, measure, and justice, according to the qualitie of the person, becaus wee knew not how long the siege would last. For having understood from the mouth of the Emperor, that hee would never part from before *Mets*, till hee had taken it by force or famine; the victuals were lessened, for that which was wont to bee distributed to three, was now shared amongst four, and defens made they should not sell what remained after their dinner, but 'twas permitted to give it to the wenches that followed the Camp, And rose alwaies from table with an appetite, for fear they should bee subject to take Physick. And, before wee would yeeld our selvs to the mercie of our enemies, had resolved to eat our Asses, Mules, Horses, Dogs, Cats and Rats; yea, our boots and other skins which wee could soften and frie. All the besieged did generally resolv to defend themselvs with all sorts of Instruments of War; that is to saie, To rank, and charge the Artillerie, at the entrie of the Breach, with bullets, stones, cart-nails, bars, and chains of iron. Also all kindes and differences of artificial Fire; as Boertes, Bariquado's, Granado's, Ports, Lances, Torches, Squibs, burning-faggots. Moreover, scalding-water, melted-lead, powder of unquenched lime to blinde their eies. Also they were resolved to have made holes through and through their houses, there to lodg musketeers, there to batter in the flank and hasten them to go, or elf make them lie for altogether. Also there was order given to the women to unpave the streets, and to cast them out at their windows, billets, tables, tressles, forms, and stools, which would have troubled their braine: moreover, there was a little further, a strong Court of Guard, fil'd with carts and pallisado's, pipes and hogsheads fil'd with earth for barriquado's to serv to interlaie with faulcons, faulconets, field-pieces, harquibuzes, muskets, and pistols, and wilde-fire, which would have broken legs and thighs, insomuch that they had been beaten in head, in flank, and in tail; and where they had forced this Court of Guard, there was others at the crossing of the streets, each distant an hundred paces, who had been as bad companions as the first, and would not have been without making a great manie Widdows and Orphans. And if fortune would have been so much against us, as to have broken our Courts of Guard, there was yet seven great Bastallions ordered in square, and triangle, to combate altogether, each one accompanied with a Prince to give them boldness, and encourage them to fight, even till the last gasp, and to die altogether. Moreover it was resolved, that each one should carrie his treasure, rings and jewels, and their household-stuff of the best, to burn them in the great place, and to put them into ashes rather then the enemie should prevail, and make Trophies of their spoils; likewise there was people appointed to put fire to the munition, and to beat out the heads of the Wine-cask, others to put the fire in each hous, to burn our enemies and us together: The Cittizens had accorded it thus, rather then to see the bloodie knife upon their throat, and their Wives and Daughters violated, and to bee taken by force, by the cruel and inhumane *Spaniards*. Now wee had certain prisoners which Monsieur *de Guise*, sent away upon their faith, to whom was secretly imparted our last resolution, will, and desperate mindes; who beeing arrived in their Camp, do not defer the publishing; which bridled the great impetuositie, and will of the souldiers to enter anie more into the Cittie to cut our throats, and to enrich themselves of our pillags. The Emperor having understood this deliberation of the great Warriour, the Duke of *Guise* put water in his wine, and restreined his great choler and furie, saying, Hee could not enter into the Cittie without making a great slaughter and butcherie, and spill much blood, as well of the defendents, as of the assailants, and that they should bee dead together, and in the end could have nothing elf but a few ashes, and that afterward it might bee spoken of that, as of the destruction *Jerusalem* alreadie made by *Titus* & *Vespatian*. The Emperor then having understood our last resolution, & seeing their

little

little prevailing by their batterie and undermining, and the great plague which was in his whole armie, and the indiſpoſition of the time, and the want of victuals and monie, and that his ſouldiers forſook him, and went away in great companies; concluded in the end to retire themſelvs accompanied with the Cavallerie of his Vantgard, with the greateſt part of his Artillerie, and the Battalia: The Marqueſs of *Brandeborg* was the laſt which uncampt, mainteined by certain bands of *Spaniards*, *Bohemians*, and his *Germane* companies, and there remained one daie and a half after, to the great grief of Monſieur *de Guiſe*, who cauſſed four pieces of Artillerie to bee brought out of the Cittie, which hee cauſſed to bee diſcharged at him on one ſide; and the other to haſten them to bee gon, which hee did full quickly, with all his Troops. Hee being a quarter of a league from *Mets* was taken with a fear leſt our Cavallerie ſhould fall upon him in the Rere, which cauſſed him to put fire to his munition-powder, and leav certain pieces of Artillerie, and much baggage which hee could not carrie, becauſ the Vantgard, and the Battalia, and great Cannons had too much broken the waie. Our horſ-men would by all means have gon out of the cittie to have faln upon their breech. But Monſieur *de Guiſe* would never permit them, but on the contrarie wee ſhould rather make plain their waie, and make them bridges of gold and ſilver, and let them go, beeing like to a good ſhepherd, who will not loſe one of his ſheep. See now how our well-beloved Imperialiſts went away from before the Cittie of *Mets*, which was the daie after *Chriſtmas* daie, to the great contentment of the beſieged, and honor of Princes, Captains, and Souldiers, who had endured the travels of this ſiege the ſpace of two months. Notwithſtanding they did not all go, there wanted twentie thouſand who were dead, as well by Artillerie, by the ſword, as alſo by the plague, cold, and hunger, and for ſpight they could not enter into the Cittie to cut our throats, and have the pillage: and alſo a great number of their horſes died, of which they had eaten a great part in ſtead of Beef and Bacon. They went where they had been encamped, where they found divers dead-bodies not yet buried, and the earth all digged like S. *Innocent's* Church-yard in the time of the plague. They did likewiſe leav in their lodgings, pavillions and tents, divers ſick people: alſo bullets, arms, carts, waggons, and other baggage, with a great manie of munition-loavs, ſpoiled and rotten by the rain and ſnow, yet the ſouldiers had it but by weight and meaſure; and likewiſe they left great proviſion of wood, of the remainders of the houſes of the Villages which they had pluckt down two or three miles compaſs, likewiſe divers other houſes of pleaſure belonging to the Citizens, accompanied with fair gardens, graſs-plats fil'd with fruit-trees, for without that they had been ſtarv'd with cold, and had been conſtreined to have rais'd the ſiege ſooner. The Said Monſieur *de Guiſe* cauſſed the dead to bee buried, and dreſs their ſick people; likewiſe the enemies left in the Abbie of S. *Arnoul* divers of their hurt ſouldiers which they could not lead with them: the Said Monſieur *de Guiſe* ſent them all victuals enough, and commanded mee and other Surgeons to go dreſs them and give them medicines; which wee willingly did, and think they would not have don the like toward others (becauſ the *Spaniard* is moſt cruel, perfidious, and inhumane, and therefore enemie to all Nations) which is proved by *Lopez* a *Spaniard*, and *Benzo* of *Milan*, and others who have written the hiſtorie of *America*, and the Weſt-*Indies*, who have been conſtreined to confeſs, that the crueltie, avarice, blaſphemie, and wickedneſs of the *Spaniards*, have altogether alienated the poor *Indians* from the Religion which the Said *Spaniards* are ſaid to hold. And all write, they are leſs worth then the Idolatrous *Indians*, by the cruel uſage don to the ſaid *Indians*.

And a few daies after wee ſent a Trumpet to *Thionville* toward the enemie, that they ſhould ſend back for their wounded men in ſafetie, which they did with Carts and Waggons, but not enough. Monſieur *de Guiſe* cauſſed them to have Carts and Carters, to help to carrie them to the Said *Thionville*. Our Said Carters beeing returned back, brought us word that the waie was paved with dead bodies, and that they never lead back the half, for they died in their Carts, and the *Spaniards* ſeeing them at the point of death, before they had caſt out their laſt gaſp, caſt them out of their Carts, and buried them in the mud and mire, ſaying, They had no order to bring back the dead. Moreover our Said Carters ſaid, they met by the waie divers Carts loaden with baggage ſticking in the mire, which they durſt not ſend for back, for fear leſt thoſe of *Mets* ſhould fall upon them. I will again return to the cauſ of their mortalitie, which was principally through hunger, plague, and cold; for the ſnow was two foot thick upon the earth, and they were lodged in the caves of the earth, onely covered with a little ſtraw. Notwithſtanding each Souldier had his field-bed, and a covering ſtrewed with glittering ſtars, more bright then fine gold, and everie daie had white ſheets, and lodged at the ſign of the Moon, and made good cheer when they had it, and paid their hoſte ſo well over-night, that in the morning they went away quite, ſhaking their ears, and they needed no comb to take away the down [illegible] of their hairs either of head or beard, and found alwaies a white table-cloth, loſing good [illegible] want of Victuals. Alſo the greateſt part of them had neither boots, nor buskins, ſlippers [illegible] or ſhooes, and divers had rather have none then have them, becauſ they were alwaies [illegible] half wale of the leg; and becauſ they went bare-leg'd, wee called them the Emperor's [illegible] After the Camp was wholly broken, I diſtributed my patients into the hands of the [illegible] of the Cittie, to finiſh their cure: then I took leav of Monſieur *de Guiſe*, who came [illegible] the King, who received mee with a loving countenance, and demanded of mee [illegible] I did enter into the Cittie of *Mets*. I recounted to him all that I had don, [illegible] cauſed two hundred crowns to bee given mee, and one hundred I had at my going out, and told mee hee would not leav mee poor; then I thanked him moſt humbly for the good and the honor which hee pleaſed to do mee.

The Voiage of Metz. 1553. *Charls* the Emperor cauſſed the Cittie of *Theroenne* to bee beſieged, where Monſieur, the Duke of *Savoy*, was General of the whole Armie. It was taken by aſſaule where there

was a great number of our men ſlain and priſoners. The King willing to prevent that the enemie ſhould not alſo com to beſiege the Cittie and Caſtle of *Hedin*, ſent *Meſſiers* the Duke *Boüillion*, the Duke *Horace*, the Marqueſs of *Villars*, a number of Captains, and about eight hundred ſouldiers, and during the ſiege of *Therouenne*, the Said Lords fortified the ſaid Caſtle of *Hedin*, in ſuch ſort that it ſeemed impregnable. The King ſent mee to the Said Lord to help them with my Art, if there were anie need. Now ſoon after the taking of *Therouenne*, wee were beſieged with the Armie: there was a quick clear fountain or Spring, within Cannon-ſhot, where there was about fourſcore whores, and wenches of the enemies, who were round about it to draw water. I was upon a Rampart beholding the Camp, and ſeeing ſo manie idlers about the ſaid fountain, I praied Monſieur *de Pont* Commiſſarie of the Artillerie, to make one Cannon-ſhot at that roguiſh companie, hee made mee much denial, anſwering mee that ſuch kinde of people were not worth the powder they ſhould waſte. Again I praied him to level the Cannon, telling of him, the more dead, the fewer enemies; which hee did through my requeſt, and at that ſhot fifteen or ſixteen were kil'd, and manie hurt. Our ſouldiers ſallied forth upon the enemies, where there was manie kil'd and ſlain with muſket-ſhot and ſwords, as well on the one ſide, as of the other, and our ſouldiers did often make ſallies forth upon the enemies before their trenches were made; where I had much work cut out, ſo that I had no reſt night nor daie for dreſſing the wounded. And I will tell this by the waie, that wee had put manie of them in a great Tower, laid upon a little ſtraw, and their pillows were ſtones, their coverlets were their cloaks, of thoſe that had anie. Whil'ſt the batterie was making, as manie ſhot as the Cannons made, the patients ſaid they felt pain in their wounds, as if one had given them blows with a ſtaff, the one cri'd his head, the other his arm, and ſo of other parts; divers of their wounds bled a freſh, yea in greater quantitie then firſt when they were wounded, and then it was I muſt run to ſtaie their bleeding. My little maſter, if you had been there, you had been much troubled with your hot-irons, you had need to have had much charcoal to make them red hot, and beleev they would have ſlain you like a Calf for this crueltie. Now through this diabolical tempeſt of the Eccho from theſe thundering Inſtruments, and by the great and vehement agitation of the colliſion of the air reſounding and reverberating in the wounds of the hurt people, divers died, and others becauſ they could not reſt by reaſon of the groans and cries that they made night and daie; and alſo for want of good nouriſhment, and other good uſage neceſſarie to wounded people. Now my little maſter, if you had been there you would hardly have given them gellie, reſtauratives, culliſes, preſſures, panado, cleanſed barlie, white meat, almond-milk, prunes, raiſins, and other proper meats for ſick people: your ordinance would onely have been accompliſht in paper, but in effect they could have had nothing but old Cow-bief, which was taken about *Hedin* for our munition, ſalted and half-boiled, in ſo much that who would have eat it, hee muſt pull it with the force of his teeth, as birds of Preie do carrion. I will not forget their linnen wherewith they were dreſt, which was onely rewaſhed everie daie, and dried at the fire, and therefore drie and ſtubborn like Parchment, I leav you to think how theſe wounds could heal well. There were four luſtie whores to whom charge was given to waſh their linnen, who diſcharged their dutie under penaltie of the batoon, and alſo they wanted both ſope and water. See then how the ſick people died for want of nouriſhments, and other neceſſarie things. One daie our enemies feigned to give us a general aſſault, to draw our Souldiers upon the breach, to the end, to know our countenance & behaviour: everie one ran thither, wee had made great proviſion of artificial fire to defend the breach; a Prieſt belonging to Monſieur *de Boüillon* took a granado, thinking to throw it on the enemies, and ſet it on fire ſooner then it ought to have don: it brake aſunder, and the fire fell amongſt our fire-works, which were put into a houſ hear the breach; which was to us a marvellous diſaſter, becauſ it burned divers poor ſouldiers: it alſo took hold on the houſ it ſelf, and wee had been all burned had not great help been uſed for to quench it; there was but one Well there wherein was water in our Caſtle, which was almoſt quite dried up, and in ſtead of water wee took beer and quenched it: then afterwards wee had great ſcarcitie of water, and to drink the reſt that remained which wee muſt ſtrain through napkins.

Now the enemie ſeeing this ſmoak and tempeſt of the fire-works which cait a verie great flame and clashing noiſ, beleeved wee had put the fire on purpoſe for the defenſ of our breach, to burn them, and that wee had great ſtore of others. That made them to bee of another opinion, then to take us by aſſault; they did undermine, and dig into the greateſt part of our walls, ſo that it was the waie to overthrow wholly the Caſtle to the ſe-ſurvie, and when the mines were finiſht, and that their Artillerie ſhot, the whole Caſtle did ſhake under us like an earth-quake, which did much aſtonith us. Moreover hee had levelled five pieces of Artillerie which they had ſeated upon a little hill, to plaie upon our backs when wee ſhould go to defend the breach.

The Duke *Horace* had a Cannon-ſhot upon one ſhoulder, which carried away his arm on one ſide and the bodie on the other, without beeing able to ſpeak one onely word. His death was to us a great diſaſter for the rank which hee held in his place.

Likewiſe Monſieur *de Martigues* had a ſtroak with a bullet which pierc't through his Lungs; I dreſt him, as I will declare hereafter. Then wee demanded Parl, and a Trumpet was ſent toward the Prince of *Piedmont*, to know that compoſition it pleaſed him to make us: His anſwer was, that all the chief, as Gentlemen, Captains, Lieytenants, and Enſigns, ſhould bee taken for raanſom, and the Souldiers ſhould go out without Armes; and if they refuſed this fair and honeſt proffer, the next daie wee ought to bee aſſured they would have us by aſſault or otherwiſe. Counſel was held, where I was called to know if I would ſign as divers Captains, Gentlemen, and others, that the place ſhould bee rendered up. I made anſwer it was not poſſible to bee held, and that I would ſign it with my proper blood, for the little hope that I had, that wee could remove the enemies force, & alſo for the great deſire which I had to bee

out

out of this torment, and hell; for I slept not either night or daie, by reason of the great number of hurt people, which were about two hundred. The dead bodies yeelded a great putrefaction, beeing heaped one upon the other like fagots, and not beeing covered with earth becaus wee had it not; and when I entred into one lodging, Souldiers attended mee at the door to go dress others at another; when I went forth, there was striving who should have mee, and they carried mee like a holie bodie not touching the ground with my foot in spight one of another; nor could I satisfie so great a number of hurt people. Moreover I had not what was necessarie to dress them withal; for it is not sufficient that the Surgeon do his dutie towards the patients, but the patient must also do his, and the assistance, and all exterior things; witness *Hippocrates* in his first *Aphorisme*. Now having understood the resolution of the yeelding up of our place, I knew our affaire went not well; and for fear of beeing known, I gave a velvet coat, a Satin doublet, a verie fine cloth cloak lin'd with velvet, to a souldier, who gave mee a fourvie old torn doublet cut and slasht with using, and a leather jerkin well examined, and an ill favored hat, and a little cloak; I smutcht the collar of my shirt with water in which I had mingled a little soot; likewise I wore out my stockings with a stone at the knees and the heels as if they had been worn a long time, and I did as much to my shooes, in so much, that they would rather take mee for a Chimnie-sweeper, then a King's Surgeon. I went in this Equipage towards Monsieur *de Martigues*, where I praied him that hee would take order that I might remain near him to dress him, which hee agree'd to most willingly, and had as much desire I should remain with him as my self. Soon after, the Commissioners, who had charge to cleer the prisoners, entred into the Castle, the seventeenth daie of *Julie* one thousand five hundred fiftie three, where they made *Messeurs* the Duke of *Bouillon*, the Marquess of *Villars*, the Baron of *Culan*, Monsieur *du Pont* Commissarie of the Artillerie, and Monsieur *de Martigues*, and I to bee taken through the request that hee made to them, and all other Gentlemen which they could perceiv were able to paie anie ransom, and the most part of the Souldiers and the chief of the Companies, having such, and so manie prisoners as they would.

Afterward the *Spanish* Souldiers entered by the Breach without anie resistance, for our eiemen they would hold their faith and composition that they should have their lives saved. They entred in with a great furie to kill, pillage, and to rifle all they received: some hoping to have ransom, they tied their stones with Arquebuse cords, which was taft over a pike which two held upon their shoulders, then pulled the said cord with a great violence and derision, as if they would ring a bell, telling them that they must put themselv to the ransom, and tell of what houses they were; and if they saw they could have no profit, made them cruelly die between their hands, or presently after their genital parts would have fain into a gangrene, and total mortification; but they kil'd them all with their daggers, and cut their throats. See now their great cruelty and perfidiousnesse, let him trust to it that will. Now to return to my purpose, being led from the Castle to the Citie with Monsieur *de Martigues*, there was a Gentleman of the Duke of *Savoye*, who asked mee if Monsieur *de Martigues* wound was curable, I answered not; who presently went and told the Duke of *Savoye* how I thought hee would send Physicians and Surgeons to visit and dress my Said Monsieur *de Martigues*: in the mean time I thought with my self whether I ought to make it nice, and not to acknowledg my self a Surgeon; for fear lest they should not in mee to dress their wounded, and in the end they would know I was the King's Surgeon; and that they would make mee paie a great ransom. On the other side I feared, if I should not make my self known to bee a Surgeon, and to have carefully dressed Monsieur *de Martigues*, they would cut my throat, so that I took a resolution to make it appeer to them hee should not die for want of good dressing and looking to. Soon after, see, there arrive divers Gentlemen accompanied with the Physician and Surgeon to the Emperor, and those of the said Duke of *Savoy*, with six other Surgeons following the Armie, to see the hurt of the said Lord of *Martigues*, and to know of mee how I had dressed him, and with what medicines. The Emperor's Physician bid mee declare the essence of the wound, and how I had dress it. Now all the assistance had a verie attentive ear to know if the wound were mortal or not; I began to make a discourse that Monsieur *de Martigues* looking over the wall to perceiv them that did undermine it, received a shot from an Arquebuse quite through the bodie; presently I was called to dress him, I saw hee cast blood out of his mouth, and his wounds: Moreover hee had a great difficultie of breathing, and cast out winde by the said wounds with a whistling, in so much that it would blow out a candle, and hee said, hee had a most sharp pricking pain at the entrance of the bullet I do beleev and think it might bee som little pieces of bones which prickt the Lungs. When they made their Systole and Diastole, I put my finger into him; where I found the entrance of the bullet to have broken the fourth Rib in the middle, and scales of bones which the said bullet had thrust in, and the out-going of it had likewise broken the fift Rib with pieces of bones which had been driv'n from within outward; I drew out som, but not all, becaus they were verie deep and adherent. I put in each wound a Tent, having the head verie large, tied with a thred, left by the inspiration it might bee drawn into the capacitie of the *Thorax*, which hath been known by experience to the detriment of the poor wounded; for being faln in, it cannot bee taken out, which is the cause that engender's putrefaction, a thing contrarie to nature. The said Tents were annointed with a medicine composed of yelks of eggs, *Venice* Turpentine, with a little oil of Roses: My intention for putting the Tents was to staie the flux of blood, and to hinder that the outward air did not enter into the brest, which might have cooled the Lungs and by consequent the heart. The said Tents were also put, to the end that issue might bee given for the blood that was spilt within the *Thorax*. I put upon the wound great Emplaisters of *Diacalthea* in which I had relented oil of Roses and Vinegar to the avoiding of inflammation, then I put great stupes of *Oxycrate*, and bound him up, but not hard, to the end hee might have easie respirations; that don, I drew from

him five porrengers of blood from the Basilick vein of the right arm, to the end, to make revulsion of the blood which run's from the wounds into the *Thorax*, having first taken indication from the wounded part, and chiefly his forces, considering his youth and his sanguine temper; Hee presently after went to stool, and by his urine and siege cast great quantitie of blood. And as for the pain which hee said hee felt at the entrance of the bullet, which was as if hee had been pricked with a bodkin, that was becaus the Lungs by their motion beat against the splinters of the broken Rib. Now the Lungs are covered with a coat comming from the membrane called *Pleura*, interweaved with nerve of the *first Conjugation* from the brain, which was cauſ of the extreme pain hee felt; likewiſe hee had great difficultie of breathing, which proceeded from the blood which was ſpilt in the capacitie of the *Thorax*, and upon the *Diaphragm*, the principal inſtrument of reſpiration, and from the dilaceration of the muſcles which are between each Rib, which help alſo to make the exſpiration and the inſpiration; and likewiſe becauſ the Lungs were torn and wounded by the bullet, which hath cauſed him ever ſince to ſpit black and putrid blood in coughing. The fever ſeazed him ſoon after hee was hurt, with faintings and ſwoonings. It ſeemed to me that the ſaid fever proceeded from the putredinous vapors ariſing from the blood which is out of his proper veſſels, which hath faln down, and will yet flow down. The wound of the Lungs is grown great and will grow more great, becauſ it is in perpetual motion, both ſleeping and waking, and is dilated and compreſt to let the air to the heart, and caſt fuliginous vapors out: by the unnatural heat is made inflammation, then the expulſive virtue is conſtreined to caſt out by cough whatſoever is obnocious unto it: for the Lungs cannot bee purged but by coughing, and by coughing the wound is dilated, and grow's greater, from whence the blood iſſues out in great abundance, which blood is drawn from the heart by the vein arterial to give them nouriſhment, and to the heart by the vein *cava*; his meat was baſſie-broth, ſtued prunes, ſometimes *panado*, his drink was Priſan: Hee could nouſle but upon his back which ſhewed hee had a great quantitie of blood ſpilt within the capacitie of the *Thorax*, and being ſpread or ſpilled along the ſpondyls, doth not ſo much preſs the Lungs as it doth being laid on the ſides or breſt.

What ſhall I ſaie more, but that the Said Lord *Martigus* ſince the time hee was hurt hath not repoſed one hour onely, and hath alwaies caſt out bloodie urines and ſtools. Theſe things then alwayes conſidered, one can make no other prognoſtick but that hee will die in a few daies, which is to my great grief. Having ended my diſcourſ, I dreſt him as I was wont; having diſcovered his wounds, the Phyſicians and other aſſiſtants preſently knew the truth of what I had ſaid.

The ſaid Phyſicians having felt his pulſ and known his forces to bee almoſt ſpent and abolliſhed, concluded with mee that in a few daies hee would die; and at the ſame inſtant went all toward the Lord of *Savoy*, where they all ſaid, that the ſaid Lord *Martigues* would die in a ſhore time; hee anſwered, it were poſſible if hee were well dreſt hee might eſcape: Then they all with one voice ſaid, hee had been verie well dreſt, and ſolicited with all things neceſſarie for the curing of his wounds, and could not bee better, and that it was impoſſible to cure him, and that his wound was mortal of neceſſitie. The Monſieur *de Savoy* ſhewed himſelf to bee verie much diſcontented and wept, and asked them again if for certain they all held him deplored and remedileſs, they all anſwered, yes. Then a certain *Spaniſh* impoſtor offered himſelf, who promiſed on his life that hee would cure him, and if hee failed to cure him, they ſhould cut him in an hundred pieces; but hee would not have anie Phyſicians, Surgeons, or Apothecaries with him. And at the ſame inſtant the Said Lord of *Savoy* told the Phyſicians and Surgeons they ſhould not in anie wiſe go anie more to ſee the Said Lord of *Martigues*. Alſo hee ſent a Gentleman to mee to forbid mee upon pain of life not to touch anie more the Said Lord of *Martigues*, which I promiſed not do; wherefore I was verie glad, ſeeing hee ſhould not die in my hands, and commended the ſaid Impoſtor to dreſs the ſaid Lord of *Martigues*. And that hee ſhould have no other Phyſicians nor Surgeons but him; hee came preſently to the ſaid Lord of *Martigues*, who told him,

Señor Cavallero el ſenor Duque me ha mandado que veniſſe á curar voſtra herida, yo os juro á Dios que antes de ocho dias yo os haga ſubir á Cavallo con la lanſa en puno conſiguo no ago que yo quiera tegna, Comereis y bebereis todas comidas que fueren de voſtro guſto y yo hare la dieta por V. m. y deſto os de vea aſeguirar ſobre de mi, yo he ſanado muchos que tenian mayores heridas que la voſtra. That is to ſaie, Lord *Cavallere*, Monſieur the Duke of *Savoy*, hath commanded mee to com dreſs thy wound; I ſwear to thee by God, that before eight daies I will make thee mount on horſ-back with thy Lance in thy hand, provided that no man may touch thee but my ſelf; thou ſhalt eat and drink anie thing thou haſt a minde to, I will perform thy diet for thee, and of this thou maieſt bee aſſured upon my promiſe, I have cured divers who have had greater wounds then thine: and the Lord replied, God give you grace to do it.

Hee demanded of the Said Lord a ſhirt, and tore it in little rags, which hee put a croſs, muttering and murmuring certain words over the wounds; and having dreſt him, permitted him to eat and drink what hee would, telling him hee would obſerv a diet for him, which hee did, eating but ſix prunes and ſix bits of bread at a meal, and drinking but beer. Notwithſtanding, two daies after, the Said Lord of *Martigues* died; and my *Spaniard*, ſeeing of him in the Agonie, eſcap'd himſelf and got away without bidding farewel to anie bodie; and I beleev if hee had been taken, hee had been hang'd for his falſ promiſes, which hee had made to Monſieur the Duke of *Savoy*, and to divers other gentlemen.

Hee died about ten of the clock in the morning, and after dinner, the Said Lord of *Savoy*, ſent Phyſicians, and Surgeons, and his Apoſthecarie, with a great quantitie of Drogues, to embalm him; they came accompanied with divers Gentlemen and Captains of the Armie.

The Emperor's Surgeon came neer to mee, and praied mee kindly to open the bodie; which I refuſed, telling him I was not worthie to carrie his plaiſter-box after him: hee praied mee again, which then I did for his ſake, if it ſo liked him. I would yet again have excuſed my ſelf, that ſeeing hee was not

willing

willing to embalm him, that hee would give this charge to another Surgeon of the companie; hee made mee yet answer, that hee would it should bee I, and if I would not do it, I might hereafter repent it: knowing this his affection, for fear hee should not do mee anie displeasure, I took the rasor and presented it to all in particular, telling them I was not well practised to do such operations which they all refused.

The bodie beeing placed upon a table, truely I purposed to shew them that I was an Anotomist, declaring to them divers things, which should bee here too long to recite. I began to tell all the companie that I was sure the bullet had broken too ribs, and that it had pass'd through the lungs, and that they should finde the wound inlich enlarged, becaus they are in perpetual motion, sleeping or waking, and by this motion the wound was the more dilacerated. Also that there was great quantitie of blood spilt in the capacitie of the breast, and upon the midriff, and spinners of the broken ribs which were beaten in at the entrance of the bullet, and the issuing forth of it, had carried out. Indeed all which I had told them was found true in the dead bodie.

One of the Physicians asked mee, which way the blood might pass to bee cast out by urine, beeing contained in the *Thorax*. I answered him that there was a manifest conduit, which is the *Vena Azygos*, who having nourish'd the ribs, the rest of the blood descends under the *Diaphragm*, & on the left side is conjoined to the emulgent vein, which is the vale by which the matter in *pleurisies* and in *Empiema*, do manifestly emptie themselves by urine and stool. As it is likewise seen, the pure milk of the breits of women newly brought to bed, to descend by the *Mammillarie* Veins, and to bee evacuated downwards by the neck of the womb without beeing mixt with the blood. And such a thing is don (as it were by a miracle of nature) by her expulsive and sequestring virtue, which is seen by experience of two glass vessels called Mountaines; let the one bee filled with water, and the other with Claret wine, and let them bee put the one upon the other, that is to sale, that which shall bee filled with water, upon that which shall be filled with wine; and you shall apparently see the wine mount up to the top of the vessel quite through the water, and the water descend a travel the wine, and go to the bottom of the vessel without mixture of both; and if such a thing bee don so exteriorly and openly to the sens of our eie, by things without life: you must believ the same in our understanding. That nature can make matter and blood to pass, having bean out of their vessels, yea, through the bones, without beeing mingled with the good blood.

Our discourse ended, I embalmed the bodie, and put it into a coffin; after that the Emperor's Surgeon took mee apart, and told mee if I would remain with him that hee would use mee verie well; and that hee would clothe mee anew, also that I should ride on horse-back. I thank'd him verie kindly for the honor hee did mee, and told him that I had no desire to do service to strangers, and enemies to my countrie; then hee told mee I was a fool, and if hee were prisoner to I, hee would lev the devil to get his liberte. In the end I told him flat that I would not dwell at all with him.

The Emperor's Physician returned toward the said Lord of *Savoy*, where hee declared the cause of the death of the said Lord of *Martiguer*, and told him that it was impossible for all the men in the world to have cured him; and confirmed again, that I had don what was necessarie to bee don, and praied him to win mee to his service, and spake better of mee then I deserved.

Having been perswaded to take mee to his service, hee gave charge to one of his stewards named Monsieur *du Bocher*, to tell mee, if I would dwel in his service that hee would use mee kindely. I answered him that I thank'd him most humbly, and that I had resolved not to dwel with anie stranger. This my answer being heard by the Duke of *Savoy*, hee was somwhat in choler, & said he would send mee to the Gallies.

Monsieur *de Vandeville*, Governor of *Grabelin*, and Colonel of the seventeen Ensigns of foot, praied him to give mee to him, to dres him of an ulcer which hee had in his leg this six or seven years; Monsieur *de Savoy* told him becaus I was of worth, that hee was content, and if I rankled his leg it would bee well don; Hee answered that if hee perceived anie thing hee would cut my throat to bee cut.

Soon after, the said Lord of *Vandeville* sent for mee by four Germane Halberdiers, which affrighted mee much, not knowing whither they led mee, they spake no more *French* then I high *Dutch*, beeing arrived at his lodging, hee told mee I was welcom, and that I was his; and as soon as I should have cured him of that ulcer in his leg, that hee would give mee lev to bee gon without taking anie ransom of mee. I told him that I was not able to pale anie ransom.

Then hee made his Physicians and Surgeons in ordinarie to shew mee his ulcerated leg; having seen and considered it, wee went apart into a chamber where I began to tell them, that the said ulcer was annual, not being simple but complicated: that is of a round figure and scalie, having the lips hard and callous, hollow and sordid: accompanied with a great varicous vein which did perpetually feed it; besides a great tumor, and a phlegmonious distemper verie painful through the whole leg, in a bodie of cholerick complexion; as the hair of his face and beard demonstrated. The method to cure it, (if cured it could bee) was to begin with universal things, that is, with purgation and bleeding, and with this order of diet, that hee should not use anie wine at all, nor anie fat meats, or of great nourishment, chiefly these which did heat the blood: afterward the cure must begin with divers scarifications about the ulcer, and totally cutting away the callous edges or lips, and giving a long or a triangular figure, for the round will verie hardly cure, as the Ancients have left it in writing, which is seen by experience. That don, the filth must bee mundified, as also the corrupted flesh, which should bee don with *Ungentum Ægyptiacum*, and upon it a bolster dipt in juice of Plantain and Nightshade and *Oxycrate*, and roul the leg beginning at the foot, and finishing at the knee, not forgetting a little bolster upon the *Varicous* vein, to the end no superfluities should flow to the ulcer. Moreover that hee should take rest in his bed, which is commanded by *Hippocrates*, who saith, that those who have sore legs should not use much standing or sitting, but lying along. And after these things don and the ulcer well mundified, a plate of Lead rubbed with

quickfilver

quicksilver should bee applied. See then the means, by which the said Lord *Vaudeville* might bee cured of the said ulcer; all which they found good. Then the Physician left mee with the Surgeon, and went to the Lord *Vaudeville*; to tell him that hee did assure him I would cure him, and told him that I had resolved to do for the cure of his ulcer: whereof hee was verie joyful. Hee made mee to bee called to him, and asked mee if I was of the opinion that this ulcer could bee cured, and I told him, yes, provided hee would bee obedient to what hee ought. Hee made mee a promise hee would perform all things which I would appoint; and as soon as his ulcer should bee cured, hee would give mee libertie to return without paying anie ransom. Then I beseech'd him to com to a better composition with mee, telling him that the time would bee too long to bee in libertie, if I staied till hee was perfectly well, and that I hoped with in fifteen daies the ulcer should bee diminished more then one half, and it should bee without pain, and that his Physicians and Surgeons would finish the rest of the cure verie easily. To which hee agree'd, and then I took a piece of paper, and cut it the largenes of the ulcer, which I gave him, and kept as much my self. I praied him to keep promise, when hee should finde his busines don: Hee swore by the faith of a Gentleman hee would doe it; then I resolved to dres him well according to the method of *Galen*, which was, that after all strange things were taken out of the ulcer, and that there wanted nothing but filling up with flesh, I dres't him but once a daie, and hee found that verie strange. And likewise his Physician which was but a fresh man in those affairs, who would perswade mee with the patient, to dres him two or three times a daie, I praied him to let mee do what I thought good; and that it was not to prolong the cure, but on the contrarie to hasten it, for the great desire I had to bee in libertie. And that hee would look in *Galen* in the fourth book of the composition of medicaments *secundum genera*, who saith, that if a medicine do not remain long upon the part it profit's not so much, as when it doth continue long; a thing which manie Physicians have been ignorant of, and have thought it hath been better to change the Plaster often. And this ill custom is so inveterate and rooted, that the Patients themselvs accuse often-times the Surgeons of negligence, becaus they do not oftner remove their emplasters; But they are deceived. For as you have read in my works in divers places: The qualities of all bodies which mutually touch, operate one against another, and both of them suffer somthing, where one of them is much stronger then the other, by means whereof the said qualities are united, they familiarise with the time, although they are much differing from the manner, that the qualitie of the medicament doth unite, and somtimes becom's like to that of the bodie, which is a verie profitable thing. Therefore they saie hee is to bee praised much who first invented not to change the plaster so often, becaus it is known by experience, this is a good invention.

Moreover it is said, great fault is commited to dres ulcers often in wiping of them hard, for one take's not away onely the unprofitable excrement, which is the *pus* or *Sanies* of the ulcer, but the matter whereof the flesh is engendred; wherefore for the reasons aforesaid, it is not needful to dres ulcers so often.

The said Lord *Vaudeville*, would see whether that which I alleged out of *Galen* were true, and commanded the said Physician to look there; for that hee would knovv it; hee caused the book to bee brought upon the table, vvhere my saying vvas found true, and then the Physician vvas ashamed, and I verie joyful. So that the said Lord of *Vaudeville* desired not to bee dressed but once a daie, insomuch that within fifteen daies the ulcer was almost cicatrized; the composition beeing made between us, I began to be merrie. Hee made mee eat & drink at his Table, when there were not men of more great rank with him.

Hee gave mee a great red scarf, which hee commanded mee to wear. I may saie I was as glad of it as a dog that hath a clog, for fear hee should go into the vineyard and eat the grapes. The Physician and Surgeon led mee through the Camp to visit their hurt people, where I took notice what our enemies did; I perceived they had no more pieces of Cannon, but onely thentie five or thirtie pieces for the field.

Monsieur *de Vaudeville* held Monsieur *de Bauge* prisoner, the brother of Monsieur *de Martigues* who died at *Hedin*. The said Lord of *Bauge* was prisoner in the Castle of the heap of wood belonging to the Emperor, who had been taken at *Therouenne* by two *Spanish* Souldiers. Now the said Lord of *Vaudeville* having looked well upon him, conceived hee must bee a Gentleman of som good hous, and to bee the better assured, hee caussed him to have his stockings pulled off, and seeing his stockings and his feet clear and neat, together with his white fine sock, it confirmed him the better in his opinion, that it was a man was able to paie som good ransom. Hee demand's of the Souldiers if they would take thirtie Crowns for their prisoner, and that hee would give it to them presently, to which they agree'd willingly, becaus they had neither means to keep him, nor feed him; besides they knew not his worth, therefore they delivered their prisoner into the hands of the said Lord of *Vaudeville*, who presently sent him to the Castle of the heap of wood with a guard of four Souldiers with other Gentlemen prisoners of ours. The said Lord *Bauge* would not discover himself, who hee was, and endured verie much, beeing kept but with bread and water, and laie upon a little straw. The said Lord of *Vaudeville* after the taking of *Hedin*, sent word to the said Lord *Bauge* and other prisoners, that the place of *Hedin* was taken, and the list of those that had been slain, and amongst the rest, Monsieur *de Martigues*: and when the said Lord of *Bauge* heard the sound of the death of his brother the Lord *Martigues*, hee began much to weep and lament; his keeper demanded of him, vvhy hee made so manie and so great lamentations? Hee declared unto them that it vvas for Monsieur *de Martigues* his brother's sake. Having understood that, the Captain of the Castle dispatch'd a man avvaie quickly, to tell it to Monsieur *de Vaudeville* that hee had a good prisoner; vvho having received this good nevvs rejoiced greatly, and the next daie sent mee vvith his Physician and four Souldiers to the Wood-castle to knovv if his prisoner vvould give him fifteen thousand Crovvns for a ransom; hee vvould send him free to his ovvn hous, and for the present hee desired but the securi-

tie

tie of two Merchants of *Antwerp*, that hee would name. The ſaid Lord *Vaudeville* perſwaded mee that I would make his agreement with his priſoner. See then why hee ſent mee to the wooden Caſtle, and commanded the Captain of the Caſtle to uſe him well, and to put him into a Chamber hung with Tapeſtrie, and that they ſhould make the guard more ſtrong, and from that time they made him good chear at his expence.

The anſwer of the Said Lord of *Bauge* was, that to put himſelf to ranſom hee was not able; and that, that depended upon Monſieur *d'Eſtamps* his Uncle, and of Miſtris *de Breſſure* his Aunt, and than hee had not anie means to paie ſuch a ranſom. I returned with my keepers to the ſaid Lord *Vaudeville*, and told him the anſwer of his ſaid priſoner, who told mee, Perhaps hee ſhould not out at ſo good a rate, which was true, for hee was diſcovered. And forthwith the Queen of *Hungarie*, and the Duke of *Savoy* ſent word to the Lord *Vaudeville*, that this morſel was too great for him, and that hee muſt ſend him to them, (which hee did) and that hee had enough priſoners beſides him: hee was put to fourtie thouſand Crowns ranſom beſides other expenſes.

Returning toward the Said Lord *Vaudeville* I paſſed by S. *Omer*, where I ſaw their great pieces of batterie, whereof the greateſt part was flawed and broken. I came back alſo by *Therouenne*, where I did not ſee ſo much as ſtone upon ſtone, unleſs the mark of a great Church. For the Emperor gave commandment to the countrie people within five or ſix leagues about, that they ſhould emptie and carrie awaie the ſtones; inſomuch, that now one may drive a cart over the Cittie, as is likewiſe don at *Hedin*, without anie appearance of Caſtle or Fortreſs. See then the miſchief which com's by the ware.

And to return to my purpoſe, preſently after my ſaid Lord *Vaudeville* was verie well of his ulcer and little wanted of the entire cure, which was the cauſ hee gave mee my leav, and made mee bee conducted with a Paſs-port by a Trumpet to *Abbeville*, where I took poſt, and went and found the King *Henrie* my Maſter at *Auſimon*, who received mee with joie, and a good countenance.

Hee ſent for the Duke of *Guiſe* the high Conſtable of *France*, and Monſieur *d'Eſtrez*, to underſtand by mee what had paſt at the taking of *Hedin*; and I made him a faithful report, and aſſured them I had ſeen the great pieces of Batterie, which they had carried to S. *Omer*. Whereof the King was verie joyful, becauſ hee feared leſt the enemie ſhould com further into *France*. Hee gave mee two hundred Crowns to retire my ſelf to my own houſ, and I was verie glad to bee in libertie and out of this great torment and noiſ of thunder from the Diabolick artillerie, and far from the Souldiers, blaſphemers and deniers of God. I will not omit to tell here that, after the taking of *Hedin*, the King was advertiſed that I was not ſlain, but that I was a priſoner, which his Majeſtie cauſſed to bee written to my wife by Monſieur *du Gouſier* his chief Phyſician, and that ſhee ſhould not bee in anie trouble of minde for mee, for that I was ſafe and well, and that hee would paie my ranſom.

The hunt of S. Quintin, 1557.

After the battel of S. *Quintin*, the King ſent for mee to the Fere in *Tarenois* toward Monſieur the Marſhal of *Bourdillon*, to have a paſs-port by the Duke of *Savoie*, to go to dreſs Monſieur the Conſtable, who was grievouſly hurt with a Piſtol-ſhot in the back, whereof hee was like to die, and remained a priſoner in his enemie's hands. But the Duke of *Savoy* would not give conſent that I ſhould go to the Said Lord Conſtable, ſaying, hee ſhould not remain without a Surgeon; and that hee doubted I was not ſent onely to dreſs him, but to give him ſom adverteſement, and that hee knew I underſtood ſomthing elſ beſides Surgerie, and that hee knew mee to have been his priſoner at *Hedin*. Monſieur the Marſhal of *Bourdillon* advertiſed the King of the Duke's denial, by which means the King writ to the ſaid Lord of *Bourdillon*, that if my Ladie, the Lord high Conſtable's wife, did ſend anie bodie of her houſ, which was an able man, that I ſhould give him a letter, and that I ſhould alſo have told him by word of mouth, what the King and monſieur the Cardinal of *Lorraine* had given mee in charge. Two daies after there arrive's a ſervant of the Lord Conſtables chamber, who brought him ſhirts, and other linnen, for which the ſaid Lord Marſhal gave paſs-port, to go to the Said Lord Conſtable; I was verie glad thereof, and gave him my letter, and gave him his leſſon, of that which his Maſter ſhould do, beeing priſoner. I had thought beeing diſcharged of my embaſſage to return toward the King. But the ſaid Lord of *Bourdillon* pra'd mee to ſtaie with him at the Fere to dreſs a great number of people who were hurt, and were thither retired after the battel; and that hee would ſend word to the King, the cauſ of my ſtaie; which I did. The wounds of the hurt people were greatly ſtinking, and full of worms with Gangrene and putrefaction; ſo that I was conſtreined to com to my knife to amputate that which was ſpoil'd, which was not without cutting off arms and legs, as alſo to Trepan divers. Now there were not anie medicines to bee had at the Fere, becauſ the Surgeons of our Camp had carried all with them; I found out that the Charlot of the Artillerie carried behinde at the Fere, nor had it yet been touched. I pra'd the Lord Marſhal that hee would cauſ ſom of the drogues to bee delivered to mee which were in it, which hee did, and there was given to mee one half at a time. Five or ſix daies after I was conſtreined to take the reſt, neither was there half enough to dreſs ſo great a number of the people, and to ſtaie and ſtaie the putrifaction, and to kill the worms that were entred into their wounds; I waſhed them with *Egyptiacum* diſſolved in wine and *Aqua vitæ*, and did for them, all which I could poſſible, yet notwithſtanding all my diligence, verie manie of them died.

There were Gentlemen at the Fere who had charge to finde out the dead bodie of Monſieur *de Lois-Dalphin* the elder, who had been ſlain in the battel; they pra'd mee to accompanie them to the Camp to finde him out amongſt the dead, if it were poſſible, which indeed was impoſſible; ſeeing that the bodies were all diſfavoured and overwhelmed with putrefaction. Wee ſaw more then half a league about us the earth covered with dead bodies, neither could wee abide long there, for the cadaverous ſmels, which did ariſe from the dead bodies, as well of men as of horſes. And I think wee were the cauſ, that ſo great a num-

a number of flies, roſe from the dead bodies, which were procreäted by their humiditie and the heat of the Sun, having their tails green and blew; that beeing up in the air made a ſhadow in the Sun. Wee heard them buz, or hum, which was much marvel to us. And I think it was enough to cauſ the Plague, where they alighted. (My little maſter) I would you had been there as I was, to diſtinguiſh the ordures and alſo to make report to them which were never there. Now beeing cloied and annoied in that Countrie, I prai'd Monſieur the Lord Marſhal, to give mee my leav to bee gon, and that I was affraid I ſhould bee ſick, by reaſon of my too great pains, and the ſtinks which did ariſe from the wounded bodies, which did almoſt all die, for what diligence ſoever was uſed unto them. Hee made other Surgeons to com finiſh the dreſſing of the ſaid hurt people, and I went away with his good grace and favor. Hee wrote a letter to the King, of the pains hee had taken with the poor wounded. Then I returned to *Paris*, where I found yet manie Gentlemen who had been hurt, and were there retired after the battel.

The voiage of the camp of *Amiens*. 1558

THe King ſent mee to *Dourlan*, and made mee bee conducted by Captain *Govaſt* with fiftie men in arms, for fear I ſhould bee taken by the enemies. And ſeeing that in the waie wee were alwaies in alarms, I cauſſed my man to alight, making him to bee my maſter for that time, and I got upon his horſ, which carried my mail, and took his cloak and hat, and gave him my ambling Mare. My man beeing put upon her back, one would have taken him for the maſter, and I for the ſervant. Thoſe of *Dourlan* ſeeing us far off, thought wee were enemies, and let flie their Cannon-ſhot at us. Captain *Govaſt* my conductor, made ſign with his hat, that wee were not enemies, ſo that they left ſhooting, and wee entred into *Dourlan* with great joie. Thoſe of *Dourlan* made a ſallie forth, upon the enemies five or ſix daies before, who kil'd and hurt divers of our Captains, and good ſouldiers; and amongſt the reſt Captain St. *Aubin* valiant at the ſword, whom Monſieur *de Guiſe* loved verie well, and for whom chiefly the King ſent mee thither, who beeing in the fit of a quartan fever, would needs go out to command the greateſt part of his companie: a *Spaniard* ſeeing him that hee commanded, perceived hee was a Captain, and ſhot a musket-bullet quite through his neck; my Captain St. *Aubin* thought with this ſtroak hee was dead, and with the fear (I proteſt to God) hee loſt his quartan ague, and was altogether free'd from it. I dreſſed him with *Antonie Portal* Surgeon in ordinarie to the King, and divers other Souldiers: ſom died, others eſcaped quite with the loſs of a leg, or an arm, or the loſs of an eie, and they ſaid they eſcaped good cheap, eſcape that can. When the enemie had broke their Camp, I returned to *Paris*. Here I hold my peace of my little maſter, who was more at eaſ in his houſ, then I at the Wars.

The voiage of *Harbur* of Grace. 1563.

YEt I will not omit to ſpeak of the voiage of the *Harbor* of Grace; then when they made the approches to plant the Artillerie, the Engliſh who were within it kil'd ſom of our Souldiers, and divers Pioners, who undermined, who when they were ſeen to bee ſo hurt that there was no hope of curing, their fellows ſtript them and put them yet alive, in the Mines, which ſerved them for ſo much filling earth. The *Engliſh* ſeeing they could not withſtand an aſſault, becauſ they were verie much attainted with diſeaſes, and chiefly with the plague, they yielded, their lives and jewels ſaved. The King cauſſed them to have ſhips to return to *England*, beeing glad to bee out of this place infected with the Plague: the greateſt part died, and carrid the plague into *England*, and ſince have not yet been exempted. Captain *Sarlabous* maſter of the Camp, was left there in garriſon, with ſix Enſigns on foot, who had no fear of the plague, and were verie joiful to enter therein, hoping there to make good cheer. My little maſter had you been there you had don as they.

The voiage to Roüen. 1562.

NOw for the taking of *Roüen* they kil'd divers of ours before the aſſault, and at the aſſault the daie after they entred into the Cittie, I trepaned eight or nine, who were hurt at the breach with the ſtroaks of ſtones. There was ſo malignant an air, that divers died, yea of verie ſmall hurts, inſomuch that ſom thought they had poiſoned their bullets: thoſe within ſaid the like by us, for although they were vvell treated in their neceſſities vvithin the cittie, yet they died alſo as vvell as thoſe vvithout. The King of *Navar* vvas hurt in the ſhoulder vvith a bullet ſom few daies before the aſſault; I viſited and helpt to dreſs him, vvith his ovvn Surgeon, named M. *Gilbert* one of the chief of *Monpelier*, and others. They could not finde the bullet, I ſearch'd for it verie exactly, I perceived by conjeſture, that it vvas entred by the head of the *Adjutorium*, and that it had run into the cavitie of the ſaid bone, vvhich vvas the cauſ vvee could not finde it. The moſt part of them ſaid it vvas entred and loſt vvithin the cavitie of the bodie. Monſieur the Prince of the *Rock upon Yon*, vvho intimately loved the King of *Navar*, drevv mee to one ſide, and askt mee if the vvound vvas mortal. I told him yea, becauſ all vvounds made in great joints, and principally contuſed vvounds, vvere mortal according to all Antors vvho had vvritten of them. Hee inquired of the others vvhat they thought, and chiefly of the ſaid *Gilbert*, vvho told him that hee had great hope that the king his maſter vvould bee cured, and the Said Prince vvas verie joyful. Four daies after the King and the Queen-mother, Monſieur the Cardinal of *Bourbon* his brother, Monſieur the Prince of *Rock upon Yon*, Monſieur *de Guiſe*, and other great perſonages, after vvee had dreſſed the King of *Navar*, cauſſeda conſultation to bee made in their preſences, vvhere there vvere divers Phyſicians and Surgeons: each man ſaid vvhat ſeemed good unto him, and there vvas not one of them, vvho had not good hope of him, ſaying that the King vvould bee cured, & I perſiſted alvvaies on the contrarie.

Monſieur the Prince of the *Rock upon Yon* vvho loved mee, vvithdrevv mee aſide, and ſaid I vvas onely againſt the opinion of all the reſt, and praied mee not to bee obſtinate againſt ſo manie vvorthie men. I anſvvered him, that vvhen I ſavv anie good ſigns of cure, I vvould change my adviſe. Divers conſultations vvere made, vvhere I never changed my vvord, and prognoſtick, ſuch as I had made at the firſt dreſſing, and alvvaies ſaid that the arm vvould fall into a Gangrene, vvhich it did, vvhat diligence ſoever could bee had for the contrarie; and gave up his ſoul to God the eighteenth daie of his hurt. Monſieur the Prince *upon Yon*, having heard of the death of the Said King, ſent his Phyſician and Surgeon toward

mee,

mee, named *Feure* now in ordinarie to the King, and to the Queen-mother, to tell mee, that hee would have the bullet taken out, and that it ſhould bee look't for in what place ſoever it could bee found: then I was verie joyfull, and told them that I was well aſſured to finde it quickly, which I did in their preſences, and divers Gentlemen. It was lodged in the verie midſt of the cavitie of the Adiutorie bone. My Said Prince having it, ſhewed it to the King and the Queen, who all ſaid my prognoſtick was found true. The bodie was laid to reſt in the Caſtle-Galliard, and I returned to *Paris* where I found divers hurt men who were hurt at the breach of *Roüen*, and chiefly *Italians*, who deſired mee verie much to dreſs them, which I did willingly; there were divers that recovered, and others died. I believ (my little maſter) you were called to dreſs ſom of them, for the great number there was of them.

The voiage of the battel of Dreux. 1562. THe daie after the battel given at *Dreux*, the King commanded mee, to go dreſs Monſieur the Count of *Eu*, who had been hurt with a Piſtol-ſhot in the right thigh, neer the joint of the hip; which fractured and broke the *Os femoris* in divers places, from whence divers accidents did ariſe, and then death, which was to my great grief. The daie after my arrival I would go to the field, where the battel was given, to ſee the dead bodies; I ſaw a league about, all the earth covered, where there was by eſtimation five and twentie thouſand men and more. All which were diſpatch'd in the ſpace of two houres. I would (my little maſter) for the love I bear you, that you had been there to recount it to your ſcholars and to your children. Now in the mean time while I was at *Dreux* I viſited and dreſt a great number of gentlemen and poor ſouldiers, and amongſt the reſt manie *Swiſſer*-Captains. I dreſſed fourteen in one chamber onely all hurt with Piſtol-ſhot, and other inſtruments of diabolical fire, and not one of the fourteen died. Monſieur the Count of *Eu* beeing dead, I made no long tarrying at *Dreux*: there came Surgeons from *Paris* who performed well their dutie toward the hurt people, as *Pigray*, *Coinſteret*, *Hubert*, and others; and I returned to *Paris*, where I found divers gentlemen wounded, who had retired themſelvs thither after the battel to bee dreſt of their hurts.

The voiage of the battel of Montcontour. 1569. DVring the battel of *Moncontour* King *Charls* was at *Pleſsis* the Towers, where hee heard they had won it; a great number of hurt gentlemen and Souldiers withdrew themſelvs into the Cittie and ſuburbs of Towers, to bee dreſt and help'd, where the King and Queen-Mother commanded mee to ſhew my dutie with the other Surgeons, who were then in quarter, as *Pigray*, *du Bois*, *Portail*, and one named *Siret*, a Surgeon of *Towers*, a man verie skilful in Surgerie, and at that time Surgeon to the Kings brother, and for the multitude of the wounded wee were but little in repoſe, nor the Phyſicians likewiſe. Count *Mansfield* Governor of the *Duchie* of *Luxembourg*, Knight of the King of *Spains* order, was greatly hurt in the battel, in the left arm, with a Piſtol-ſhot, which broke a great part of the joint of the elbow, and had retired himſelf to *Bourgueil* neer *Towers*; beeing there hee ſent a gentleman to the King, affectionately to beſeech him to ſend one of his Surgeons to help him in his hurt. Councel was held what Surgeon ſhould bee ſent. Monſieur the Marſhal of *Montmorency* told the King and Queen, that it were beſt to ſend him his chief Surgeon, and declared to them that the Said Lord *Mansfield* was one part of the cauſ of winning the battel. The King ſaid flat hee would not that I ſhould go, but would have mee remain cloſe to him. Then the Queen-Mother ſaid, I ſhould but go and com, and that hee muſt conſider it was a ſtrange Lord, who was com from the King of *Spain*'s ſide, to help and ſuccour him. And upon this hee permitted mee to go, provided that I ſhould return quickly. After this reſolution hee ſent for mee, and likewiſe the Queen-Mother, and commanded mee to go finde the Said Lord *Mansfield* in the place, where I was to ſerv him in all I could, for the cure of his hurt; I went and found him, having with mee a letter from their Majeſties: having ſeen it, hee received mee with a good will, and from thenceforth diſcharged three other Surgeons that dreſt him, which was to my great grief, becauſ his hurt ſeemed to mee uncurable. Now at *Bourgueil* there were retired divers Gentlemen, who had been hurt at the ſaid battel, knowing that Monſieur *de Guiſe* was there, who had been alſo verie much hurt with a Piſtol-ſhot through one leg, well aſſured that hee would have good Surgeons to dreſs him, and alſo that hee, beeing kinde and liberal, would aſsiſt them with a great part of their neceſsities. And for my part, I did help and aid them with all my Art, as much as it was poſsible; ſom died, ſom recovered according to their hurts. The Count *Ringreve* died, who had ſuch a ſhot in the ſhoulder, as the king of *Navar* before *Roüen*. Monſieur *de Baſſompiere* Colonel of twelv hundred horſ, was hurt alſo in ſuch a like place as Count *Montfield*, whom I dreſt and God cured. God ſo well bleſſed my vvork that vvithin three vveeks I led him back to *Paris*, vvhere I muſt as yet make ſom inciſions in the arm of the Said Lord *Mansfield*, to dravv out the bones vvhich vvere greatly broken and caries'd: hee vvas cured by the grace of God, and gave mee an honeſt revvard, ſo that I vvas vvell contented vvith him, and hee vvith mee, as hee hath ſince made it appear: hee vvrit a letter to the Duke of *Aſcot* hovv that hee vvas cured of his hurt, and alſo Monſieur *de Baſſompiere* of his, and divers others, vvhich I had dreſt after the battel of *Montcontour*, and counſelled him to beſeech the king of *France* my good maſter to give mee leav to go ſee Monſieur the the Marqueſs of *Auret* his brother.

Voiage of Flanders. MOnſieur the Duke of *Aſcot* did not fail to ſend a Gentleman to the king vvith a letter, humbly to beſeech him to do him ſo much good and honour, as to permit and command his chief Surgeon to com to ſee the Marqueſs of *Auret* his brother, vvho had received a Musket-ſhot near the knee, vvith fracture of the bone, about ſeven months ſince, vvhich the Phyſicians and Surgeons in thoſe parts vvere much troubled to cure. The King ſent for mee and commanded mee to go ſee the Said Lord *Auret*, and to help him in all that I could for the cure of his hurt; I told him I vvould emploie all all that little knovvledge vvhich it hath pleaſed God to give mee. I vvent then conducted by tvvo gentlemen to the Caſtle of *Auret*, vvhich is a league and a half from *Mounts* in *Hainaut*, vvhere the Said Marqueſs vvas: as ſoon as I arrived I viſited him, and told him the King had commanded mee to com to ſee him,

and

and to dreſs him of his hurt; hee told mee hee was glad of my comming, and was much bound to the King to havedon him the honor to have ſent mee to him. I found him in a great fever his eies verie much ſunk, with a countenance gaſtlie and yellow, his tongue drie and rough, and all the bodie emaciated and lean, his ſpeech low like that of a dying man: then I found his thigh much ſwelled, apoſtemated, ulcerated, and caſting out a green ſtinking matter; I ſearch'd it with a ſilver probe, and by the ſame I found a cavitie neer the groin, ending in the middle of the thigh, and others about the knee, ſanious and cuniculous; alſo certain ſcales of bones, ſom ſeparated, others not. The legs were much tumified, and ſoaked with a pituitous humor, cold, moiſt, and flatulent; inſomuch that the natural heat was in the waie to bee ſuffocated, and exſtinguiſhed, and the ſaid leg crooked and retracted toward the buttocks, his rump ulcerated the bredth of the palm of an hand, and hee ſaid hee felt there a great pain and ſmarting, and likewiſe in his reins, inſomuch that hee could not take anie reſt night or daie; neither had hee anie appetite to eat, but to drink enough; it was told mee that hee fell often into faintings and ſwoonings, and ſomtimes as it were by an Epilepſie, and had oftentimes deſire to vomit, with ſuch a trembling that hee could not carrie his hands to his mouth. Seeing and conſidering all theſe great accidents, and the forces much abated; truly I was much grieved to have gon to him, becauſ mee thought there was little appearance that hee could eſcape. Notwithſtanding to give him courage and good hope, I told him, that I would quickly ſet him on foot by the grace of God, and the Phyſician's and Surgeon's help. Having ſeen him, I went a walking into a Garden, where I praied to God that hee would give mee the grace to cure him, and that hee would give a bleſſing to our hands and medicaments, to combate againſt ſo manie complicated maladies. I bethought in my minde the waies I muſt keep to do it. They called mee to dinner, I entred into the kitchin where I ſaw taken out of a great pot, half a Mutton, a quarter of Veal, three great pieces of Beef, and two pullets, and a great piece of Bacon, with great ſtore of good Herbs. Then I ſaid to my ſelf this broth was full of juice, and of good nouriſhment; After dinner all the Phyſicians and Surgeons aſſembled, wee entred into conference in the preſence of Monſieur the Duke of *Aſcot*, and ſom Gentlemen that did accompanie him; I began to tell the Surgeons that I marvelled much they had made no apertions in the Marqueſs's thigh, which was all apoſtumated, and the matter that iſſued out was foul and ſtinking, which ſhewed it had a long time lurked there, and that I had found with my probe a *Caries* in the bone, and ſmall ſcales which were alreadie ſeparated; they made mee anſwer, hee would never give conſent, and likewiſe it mas almoſt two months ſince they could win him to put on clean ſheets on his bed, neither durſt anie one ſcarce touch the coverlet hee felt ſo great pain. Then ſaid I, for to cure him, wee muſt touch other things then the coverlet of the bed. Each one ſaid what hee thought beſt of the Lord's grief, and for concluſion held it altogether deplorable. I told them there was yet ſom hope, becauſ of his youth, and that God and nature do ſomtime ſuch things which ſeem to Phyſicians and Surgeons to bee impoſsible. My conſultation was, that all thoſe accidents were com by reaſon of the bullet hitting near the joint of the knee, which had broken the ligaments, tendons, and *aponeuroſes* of the muſcles which tie the ſaid joint together with the *Os femoris*; alſo nervs, veins, and arteries from whence had followed pain, inflammation, apoſteme and ulcer: and that wee muſt begin the cure by the diſeaſ, which was the cauſ of all the ſaid accidents, that is to ſaie, to make apertions, to give iſſue to the matter reteined in the interſpaces of the muſcles, and in the ſubſtance of them: Likewiſe to the bones which cauſſed a great corruption in the whole thigh, from whence the vapors did ariſe and were carried to the heart, which cauſſed the ſyncope and the fever; and the fever an univerſal heat through the whole bodie; and by conſequent, depravation of the whol *Oeconomie*; Likewiſe that the ſaid vapors were communicated to the brain, which cauſſed the Epilepſie, and trembling, and to the ſtomach diſdain and loathing, and hindred it from doing his functions, which are chiefly to concoct and digeſt the meat, and to convert it into *Chylus*; which not beeing well concocted, they ingender crudities and obſtructions, which make's that the parts are not nouriſhed, and by conſequent the bodie drie's, and grow's lean; and becauſ alſo it did not do anie exerciſe, for everie part which hath not his motion remaineth languid, and *atropiated*, becauſ the heat and ſpirits are not ſent or drawn thither, from whence follow's mortification. And to nouriſh and fatten the bodie, frictions muſt bee made univerſally through the whole bodie, with warm linnen clothes above, below, on the right ſide: and left, and round about: to the end to draw the blood and ſpirits from within outward, and to reſolv anie fuliginous vapors reteined between the skin, and the fleſh; thereby the parts ſhall bee nouriſhed and reſtored, (as I have heretofore ſaid in the tenth book treating of the wounds of Gun-ſhot) and wee muſt then ceaſ when wee ſee heat and redneſs in the skin, for fear of reſolving that wee have alreadie drawn, and by conſequent make it becom more lean. As for the ulcer which hee hath upon his rump, which came through too long lying upon it without beeing removed, which was the cauſ that the ſpirits could not flouriſh or ſhine in it; by the means of which there ſhould bee inflammation, apoſteme and then ulcer, yea with loſs of ſubſtance of the ſubject fleſh, with a verie great pain: becauſ of the nervs which are diſſeminated in this part. That wee muſt likewiſe put him into another ſoft bed, ard give him a clean ſhirt, and ſheets; otherwiſe all that wee could do would ſerv for nothing, becauſ that thoſe excrements and vapors of the matter reteined ſo long in his bed, are drawn in by the Syſtole and Diaſtole of the Arteries which are diſſeminated through the skin, and cauſ the ſpirits to change and acquire an ill qualitie and corruption which is ſeen in ſom that ſhall lie in a bed where one hath ſweat for the Pox, who will get the Pox by the putrid vapors which ſhall remain ſoaked in the ſheets and coverlets. Now the cauſ why hee could in no wiſe ſleep, and was as it were in a conſumption, 'twas becauſ hee ate little, and did not do anie exerciſe, and becauſ hee was grieved with extreme pain. For there is nothing that abateth ſo much the ſtrength as pain. The cauſ why his tongue was drie and fowl, was through the vehemencie of the heat of the fever, by the vapors which aſcended

through

through the whole bodie to the mouth. For as wee ſaie in a common proverb, when the oven is well heat, the throat feel's it. Having diſcourſed of the cauſſes and accidents, I ſaid they muſt bee cured by their contraries, and firſt wee muſt appeaſ the pain, making apertions in the thigh to evacuate the matter reteined, not evacuating all at a time for fear leſt by a ſudden great evacuation there might happen a great decaie of ſpirits which might much weaken the patient and ſhorten his daies. Secondly, to look unto the great ſwelling and cold of his leg, fearing leſt it ſhould fall into a Gangrene; and that actual heat muſt bee applied unto him, becauſ the potential could not reduce the intemperature *de potentia ad actum*; for this cauſ hot bricks muſt bee applied round about, on which ſhould bee caſt a decoction of nerval herbs boiled in wine and vineger, then wrapt up in ſom napkin, and to the feet an earthen bottle filled with the ſaid decoction, ſtopt and wrapt up with ſom linnen clothes; alſo that fomentations muſt bee made upon the thigh, and the whole Leg, of a decoction made of Sage, Roſemarie, Tyme, Lavender, flowers of Camomile, Melilot, and red-Roſes boiled in white-Wine, and a *Lixivium* made with Oke-aſhes, with a little Vineger, and half an handful of ſalt. This decoction hath virtue to attenuate, inciſe, reſolv and drie the groſs viſcous humor. The ſaid fomentations muſt bee uſed a long while, to the end there may bee a greater reſolution; for beeing ſo don a long time together, more is reſolved then attracted, becauſ the humor conteined in the part is liquified, the skin and the fleſh of the muſcles is rarified. Thirdly, that there muſt bee applied upon the rump a great emplaſter made of the red deſiccative and *augentum Canitiſſe* of each equal parts incorporated together, to the end to appeaſ his pain and drie up the ulcer, alſo to make him a little doun-pillow which might bear his rump aloft without leaning upon it. Fourthly, to refreſh the heat of his kidnies one ſhould applie the unguent called *Refrigerans Galeni* freſhly made, and upon that the leavs of water-Lilies. Then a napkin dipt in *Oxycrate*, wrung out and often renewed: and for the corroboration and ſtrengthening of his heart a refreſhing medicine ſhould bee applied made with oil of *nenuphar*, and unguent of Roſes and a little ſaffron diſſolved in Roſe-vineger, and Triacle ſpread upon a piece of Scarlet: For the *Syncope* which proceeded from the debilitation of the natural ſtrength troubling the brain. Alſo hee muſt uſe good nouriſhment full of juice, as rere eggs, Damask-prunes ſtewed in wine and ſugar, alſo *Panada* made of the broth of the great pot (of which I have alreadie ſpoken) with the white fleſhie parts of Capons, and Partridg-wings minced ſmall, and other roſt-meat eaſie of digeſtion, as Veal, Goat, Pigeon, Partridg, and the like. The ſauce ſhould bee Orenges, Verjuice, Sorrel, ſharp Pomgranats; and that hee ſhould likewiſe eat of them boiled with good herbs; as Sorrel, Lettuce, Purſlain, Succorie, Bugloſs, Marigolds, and other the like. At night hee might uſe cleanſed Barlie with juice of *Nenuphar* and Sorrel, of each two ounces, with five or ſix grains of *Opium* and of the four cold ſeeds bruiſed, of each half an ounce, which is a remedie nouriſhing and medicinal, which will provoke him to ſleep: that his bread ſhould bee of Meſlin, neither too new, nor too ſtale; and for the great pain of his head, his hair muſt bee cut, and rub his head with *Oxirrhodinum* luke-warm, and leav a double-cloth wet therein upon it; likewiſe ſhould bee made for him a frontal of oil of Roſes, *Nenuphar*, Poppies, and a little *opium* and Roſe-Vineger, and a little Camphir and to renew it ſometimes. Moreover one ſhould cauſ him to ſmel to the flowers of Henbane and *Nenuphar* bruiſed with Vineger, Roſe-water and a little Camphir wrapped in a handkerchief, which ſhall bee often and a long time held to his noſe, to the end that the ſmell may bee communicated to the brain, and theſe things to bee continued, till that the great inflammation and pain bee paſt, for fear of cooling the brain too much. Beſides one may cauſ it to rain artificially in powring down from ſom high place into a kettle, and that it may make ſuch a noiſ that the patient may hear it, by theſe means ſleep ſhall bee provoked on him. And as for the retraction of his leg that there was hope to redreſs it, when evacuation was made of the matter and other humors conteined in the thigh, which by their retention (made by repletion) have drawn back the leg; which might bee remedied in rubbing the whole joint of the knee with *unguentum Dialthea* and oil of Lillies, and a little *aqua vitæ*, and upon it to bee laid, black-wool with the greaſ thereof. Likewiſe putting in the ham of a feather-pillow folded in double, and by little and little to make his leg to ſtretch out. All which my diſcourſ was well approoved of by the Phyſicians and Surgeons. the conſultation ended wee went to the ſick patient, and I made him three apertions in his thigh, from whence iſſued out great quantitie of matter and *Sanies*; and at the ſame time I drew out ſom ſcales of bones, nor would I let out too much abundance of the ſaid matter for fear of too much decaying his ſtrength: Then two or three hours after I cauſſed a bed to bee made near his own, where there were clean white ſheets, then a ſtrong man lifted him into it, and rejoiced much in that hee was taken out of his foul ſtinking bed. Soon after hee demanded to ſleep, which hee did almoſt four hours, where all the people of the houſ began to rejoice, chiefly Monſieur the Duke of *Aſcot* his brother.

The daies following I made injections into the bottom of the cavities of the ulcer, made with *Egyptiacum*, diſſolved ſometimes in *aqua vitæ*, and ſometimes in wine. I applied to mundifie and drie the ſpongie and looſ fleſh, bolſters; at the bottom of the ſinuoſities, hollow tents of lead, that the *Sanies* might have paſſage out; and upon it a great Emplaſter of *Diacalcitheos* diſſolved in wine: likewiſe I did rowl it with ſuch dexteritie, that hee had no pain, which beeing appeaſed the fever began much to diminiſh. Then I made him drink wine moderately allaied with water, knowing that it reſtore's and quicken's the ſpirits: and all the things which wee reſted on in the conſultation were accompliſht, according to time and order; and his pains and fever ceaſed, hee began to grow better and diſcharged two of his Surgeons, and one of his Phyſicians, ſo that wee were but three with him Now I remained thereabout two months, which was not without ſeeing divers ſick people, as well rich as poor, which came to mee three or four leagues about. They gave meat and drink to the needie, all which hee recommended to mee, and praied

mee alſo for his ſake to help them. I proteſt I did not refuſe anie one, and did to them what I poſſibly could, whereof hee was joyful. Then when I ſaw hee began to mend, I told him hee muſt have a conſort of Violons and a Jeſter to make him merrie, which hee did: in one month wee ſo wrought, that hee could hold himſelf up in a chair, and made himſelf to bee carried and walk in his garden, and at the gate of his Caſtle to ſee the people paſs by. The Countrie people of two or three leagues about, knowing they could ſee him, came the feaſt daie male and female, to ſing and dance pell mell, in joie of his amendment, all beeing verie glad to ſee him, which was not don without good laughing and drinking. Hee caus'd ſtill a barrel of beer to bee given them, and they drank all merrily to his good health. And the Citizens of *Mont Hainaut* and other gentlemen neighbors came to ſee him in admiration, as a man comming from the tomb. And as ſoon as hee began to mend, hee was not without companie, and as one went out another came in to viſit him: his table was alwaies well covered. Hee was greatly loved of the Nobilitie, and of the common people, as well for his liberalitie as by reaſon of his beautie, and honeſtie, having a pleaſant look and a gracious ſpeech, inſomuch that thoſe that beheld his face were conſtrained to love him. The chief of the Cittie of *Monts* came on Saturdaie to beſeech him to permit mee to go to *Mons* where they had a great deſire to feaſt and make mee good chear for his ſake. Hee told them hee would praie mee to go there, which hee did. But I made them anſwer that they ſhould not do mee ſo much honor, as alſo that they could not give mee better chear then I had with him. And hee praied mee again affectionately to go thither, and that I ſhould do that for his ſake, to which I agree'd. The daie after they fetcht mee with two Coaches, and beeing arrived at *Monts* wee found the dinner readie, and the chief of the Cittie with their wives, ſtaied for mee with a good will. Wee went to the Table and they placed mee at the upper end, and drank all to mee, and to the health of Monſieur *D'auret*, ſaying that hee was verie happie, and they likewiſe to have obteined mee to take him in hand, for that they knew that in this companie, hee was greatly honored and loved. After dinner they led mee back to the Caſtle of *Auret*, where Monſieur the Marqueſs ſtaied for mee with great exſpectation to recount unto him, what wee had don in our banquet, I told him that all the companie had drank divers times to his health; in ſix weeks hee began to uphold himſelf a little with crutches, and to grow verie fat and get a livelie natural colour. Now hee had a deſire to go to *Beaumont* which is the dwelling place of Monſieur the Duke of *Aſcot*, and made himſelf bee carried in a great chair with eight men by turns, and the Countrie folks where wee paſſed along, knowing 'twas Monſieur the Marqueſs fought and ſtrove together who ſhould carrie him, and conſtrained us to drink, but it was but Beer, but I believ had it been Wine or Hippocras they would have given it us with a verie good will, ſo much did they ſhew themſelvs joyful to ſee the Said Marqueſs, and praied all to God for him. Beeing arrived at *Beaumont* all the people came before us to do him reverence, and praied God to bleſs him, and keep him in good health. Wee entred into the Caſtle where there was more then fiftie gentlemen which the Duke of *Aſcot* had ſent for to com make good chear with his brother, who kept his table furniſht three daies together. After dinner the gentlemen ran at the Ring, plaied at Foils, and rejoic'd greatly to ſee Monſieur *Auret*, becauſ they had heard hee would never com out of his bed again, or bee cured of his hurt. I was alwaies at the upper end of the table, where everie one drank carouſes to him, and mee, thinking to make mee foxt, which they could not do: For I drank but according to my old cuſtom. A few daies after wee returned back and took leav of Madam the Dutcheſs of *Aſcot*, who took a Diamond-ring from her finger which ſhee gave mee, acknowledging I had verie well dreſt her brother; which Diamond was better worth then fiftie Crowns. Monſieur *Auret* grew ſtill better and better, and walked all alone round about his garden with crutches. I beg'd leav of him divers times to com awaie to *Paris*, declaring that his Phyſician and Surgeon would well do the reſt that remained, for the cure of his grief. And now to begin a little to eſtrange my ſelf from him, I praied him to give mee leav to go ſee the Cittie of *Antwerp*, which hee willingly accorded to: and commanded his Steward to conduct mee thither accompanied with two pages: wee paſſed through *Malignes* and *Bruxelle*, where the chief of the Cittie praied the Said Steward, that at our return they might hear of it; and that they had a great deſire to feaſt mee, as they of *Monts* had don. I thank'd them moſt kindely, and told them that I was not worthie of ſuch honor; I was two daies and a half to ſee the Cittie of *Antwerp*, where ſom Merchants knowing the Steward, praied him to do them the honor, that they might beſtow a dinner or ſupper upon us. There was ſtriving who ſhould have us, and were all verie joiful to hear of the good health of the Marqueſs of *Auret*, doing mee more honor then I exſpected. To conclude, wee came back to the Marqueſs making good cheer, and within five or ſix daies I asked my leav of him, which hee granted with great grief, and gave mee an honeſt Preſent, and of great value, and made mee bee conducted by the ſaid maſter of his houſ and two Pages, even to my houſ at *Paris*.

I have forgot to tell you, that the *Spaniards* have ſince ruined, and demoliſht his Caſtle of *Auret*, ſack't, pillag'd, rifled and burnt all the houſes, and Villages belonging unto him, becauſ hee would not bee of their ſide, in the ſlaughters and ruines of the Low Countries.

The voiage of *Bourges*, 1562

THe King with his Camp remained not long at *Bourges*, but thoſe within yielded it up, and went out with their jewels ſaved. I know nothing worthie of memorie, but that a boie of the Kings privie kitchin, who being neer the walls of the Cittie before the compoſition was made, cried with a loud voice, Hugue not, huguenot, ſhoot here, ſhoot here having his arms lifted up, and his hand ſtretched out; a ſouldier ſhot his hand quite through with a bullet: having received his ſtroak, hee came and found mee out to dreſs him. My Lord high-Conſtable, ſeeing the boie to have his hand all bloodie, and all rent and torn; demanded of him who had hurt him. Then there was a Gentleman who ſaw the ſhot made, ſaid it was well beſtowed becauſ hee cried, *Huguenot*, ſhoot here, ſhoot here.

here. Then the Said Lord Conſtable ſaid this *Huguenot* was a good musketeer, and pare a pittiful minde, for it was veriel likelie if hee would have ſhot at his head, hee might have don it more eaſily then in the hand. I dreſſ'd the ſaid Cook who was verie ſick, but at length was cured, but with lameneſs of his hand, and ever ſince his companions call him *Huguenot*; hee is living.

The battel of S. Denis, 1567. AND as for the battel of Saint *Denis* there were divers ſlain as well on one ſide, as on the other: ours beeing hurt, went back to *Paris* to bee dreſſed together with the priſoners who were taken, whereof I dreſſed a great part. The King commanded mee, by the requeſt of the Ladie high-Conſtable, to go to her houſ to dreſs my Lord, who had received a Piſtol-ſhot in the middle of the ſpondils of his back, whereby hee preſently loſt all ſenſ and motion of thighs and legs, with retention of excrements, not beeing able to caſt out his Urine, nor anie thing by the fundament, becauſ that the ſpinal marrow, (from whence proceed the ſinews to give ſenſ and motion to the inferiour parts,) was beuiſſed, broken, and torn by the vehemence of the bullet. Hee likewiſe loſt his reaſon and underſtanding, and in a few daies hee died. The Surgeons of *Paris* were a long time troubled to dreſs the ſaid wounded people, I believ (my little maſter) that you ſaw ſom of them. I beſeech the great God of victories, that wee may never bee emploied in ſuch evil encounters and diſaſters.

The voiage of Bayonne, 1564. NOw I ſaie moreover, what I did in the voiage with the King to *Bayonne*, where wee have been two years and more to compaſs all this Kingdom, where in divers Cities and Villages I have been called into conſultations for divers diſeaſes, with the deceaſed Monſieur *Chaplain* chief Phyſician to the King and Monſieur *Chaſtellan* chief to the Queen-Mother, a man of great honor and knowledge in Phyſick and Surgerie: making this voiage I was alwaies inquiſitive of the Surgeons if they had marked anie rare thing of remark in their practiſe, to the end to learn ſom new thing. Being at *Bayonne* there happened two things of remark for the young Surgeons. The firſt was, that I dreſſ a Spaniſh Gentleman, who had a grievous great impoſtume in his throat: hee came to have been touched by the deceaſed King *Charls* for the Evil. I made incition in his Apoſteme, where there was found great quantitie of creeping worms as big as the point of a ſpindle, having a black head; and there was great quantitie of rotten fleſh. Moreover there was under his tongue an impoſtume called *Ranula*, which hindred him to utter forth his words, and to eat and ſwallow his meat: hee praied mee with his held up hands to open it for him if it could bee don without peril of his perſon, which I immediately did, and found under my Lancet a ſolid bodie, which was five ſtones, like thoſe which are drawn from the bladder. The greateſt was as big as an Almond and the other like little long Beans, which were five in number; in this apoſteme was conteined a ſlimie humor of a yellow color which was more then four ſpoonfuls; I left him in the hands of a Surgeon of the Cittie to finiſh his cure.

Monſieur *de Fontain* Knight of the Kings Order, had a great continual peſtilent Fever, accompanied with divers Carboncles in divers parts of his bodie, who was two daies without ceaſing to bleed at at noſe, nor could it bee ſtanch'd; and by that means the fever ceaſed with a verie great ſweat, and ſoon after the Carboncles ripened and were by mee dreſſed, and, by the grace of God, cured.

I have publiſh'd this Apologie to the end that each man may know, with what foot I have alwaies marched, and I think there is not anie man ſo tickliſh, which taketh not in good part what I have ſaid, ſeeing my diſcourſ is true, and that the effect ſheweth the thing to the eie, reaſon beeing my warrant againſt all Calumnies.

The end of the Apologie and Voiages.

FINIS.

A General Table of all the chief things treated of in this VVork.

A

Abortions why frequent in a peſtilent ſeaſon, 8 their cauſſes &c. 618
Abductores muſculi, 174, & 187
Abſceſſes how to bee opened, 203
Aconite, the ſymptoms cauſſed thereby, and their cure, 528
Actual cauteries preferred before potential, 485. Their forms and uſe, *ibid.* Their force againſt venemous bites, 511
Action, the definition and diviſion thereof, 17
Voluntarie action, *ibid.*
Adders their bitings, the ſymptoms thereon enſuing, together with the cure, 515
Adipoſa vena, 90
Adductores muſculi, 174
Adjuncts of things natural, 17
Adnata, ſive conjunctiva, one of the coats of the eie, 142
Ægilops what, the differences thereof, 407. The cure, 408
Ægyptiacum, the force thereof againſt putrefaction, 324. a cleanſer and nota ſuppurative, 325 deſcriptions thereof, 338. 318. the praiſe thereof, 566
After-birth, ſee Secundine. 504
After-tongue, 153
After-writt, 17
Age what, the diviſion thereof, 6
Ages compared to the four ſeaſons of the year, 7
Agonie what, 30
Agues, ſee *quotidian, quartain, tertian.*
Baſtard Agues how cured. 224
Agglutinative medicines 255. their nature and uſe, 708
Air an Element, the prime qualities thereof, 61. the neceſſitie thereof for life, 22. which hurtful, *ibid.* What underſtood thereby, *ibid.* How it change's our bodies, 23. Though in Summer colder then the brain, 277. How it becom's hurtful, 314. How to bee corrected, 322. Of what force in breeding diſeaſes, 324. What force the Stars have upon it, 325. How that which is corrupt or venemous may kill a man, 509. How it may bee corrupted, 539. Pent up it is apt to putrifie, 549. change thereof conduce's to the cure of the plague. 551
Ala what, 102
Alantoides tunica, there is no ſuch, ſhewed by 3. ſeveral reaſons, *ibid.*
Albugineus humor, the uſe thereof, 145
Almonds of the throat or ears, their hiſtorie, 230 their tumor with the cauſſes and ſigns thereof, the cure, *ibid.*
Almonds increaſe the pain of the head, 278
Alopecia what; the cauſe, which curable, and how, and which not, 399
Amnios tunica the ſubſtance and compoſure there of, 103
Amphiblaſtroides vel retiformis tunica, 141
Amputation of a member when to bee made, 338 How to bee performed *ibid.* to ſtanch bleeding enſuing thereon, 339. how to dreſs the part, 340. To perform the reſt of the cure, *ibid.* ſometimes made at a joint, 342
Anatomie, the neceſſitie of the knowledg thereof, 68. A threefold method thereof, *ibid.* The definition thereof, *ib.*
Anatomical adminiſtration of the lower Bellie, 66. Of the ſternon, 105. Axioms, 95. 119, 144. 166
Anneuriſma what, 224. how cured, 225. which incurable, *ibid.*
Anger, the effects thereof, 29
Angina, ſee ſquinacie.
Anima how manie waies taken, 4. See Soul.
Animal parts which, 63. Their diviſion, *ibid.*
Anodyne medicines, 709. For the eies, 291. in pains of the teeth, 304
Antidotes muſt bee given in great quantities, 511. No one againſt all poiſons, 529. To bee uſed in cure of the Plague, 555
Antipathie, ſee ſympathie.
Antipathie between ſom Men and a Cat, 526. Of poiſons with poiſon. 540
Ants, 44. their care, *ibid.*
Apes their imitation of men's actions, 52
Aponeuroſis, the poiſonous qualitie thereof, with the cure, 526
Apologie concerning wounds made by Gun-ſhot, 324. That ſuch wounds are not poiſoned, 326. Concerning bindeing of veſſels, &c.
Apophlegmatiſms what, and their uſe, 725
Apophyſes clinoides, 135. 136
Aphoriſms concerning Surgerie ſelected out of *Hippocrates*, 759 of the Autor, 762
Apoſtumes, ſee impoſtumes.
Apothecaries, choiſ of ſuch as ſhall have care of thoſe ſick of the plague, 545
Appendices glandulosæ, 95
Aqua fortis the poiſonous qualitie, and the cure thereof, 531
Aqua theriacalis the deſcription and manner thereof, 490. 540. good againſt the Plague, *ibid.*
Aqua vitæ how diſtilled.
Aqueus humor, 144
Arachnoides, ſive aranea ſa tunica, 144
Arætick medicines. 704
Archagatus a Romane Surgeon, ſlain by the people.
Argentum vivum, ſee *Hydrargyrum.*
Ariſtomachus the philoſopher a great obſerver of Bees, 44
Arm or ſhoulder-bone the fracture thereof,
Arm and the bone and muſcles thereof, 168. The defect thereof how to bee ſupplied, 585, 587
Arſnick, the poiſonous qualitie thereof, and the cure, 530
Arrows, wounds made by them, and their ſeveral forms, 327. How to bee drawn forth, 328
Arterie what, 74. The diviſion of the great deſcendent arterie, 87, 89. Diſtribution of the left ſubclavian arterie, 119. the Axillarie, 165 Of the crural, 176. Not dangerous to bee opened, 402. Rough Arterie, 122. Figure of the Arteries, 120
Arteria venoſa, and the deſtruction thereof, 114 *Carotydes*, 119. *Cervicalis ibid. Intercoſtalis, ibid. Mammaria, ibid. Muſculoſa, ibid. Humeraria duplex, ibid. Thoracica duplex, ibid. Aſpera* 122, *Muſcula*, 177
Arthrodia what, 191
Articulation and the kindes thereof, *ibid.*
Aſcarides have knowne, 497
Aſcites, ſee Dropſie.
Aſpe his bite, and the ſymptoms that happen thereon, with their cure, 519
Aſſ's-milk how to bee uſed in the cure of a Hectick, 300
Aſtragalus. 183
Atheroma what, 212. The cure thereof, *ibid.*
Atrophia how helped,
Attractive medicines what, 703
Auricula cordis, 113
Auripigmentum, the poiſonous qualitie, and the cure thereof, 530
Autumn, the condition thereof, 7
Axioms anatomical, 95. 119. 144. 166 Philoſophical. 144

B

Back-bone and the uſe thereof, 155
Bags, the diverſitie and uſe. 727
Ball-bellows, 313
Balneum Mariæ, 737
Balſams fit to heal ſimple, not contuſed wounds, 326
Balſam of *Veſalius*'s deſcription 745. of *Fallopius* his deſcription, *ibid.* An anodyne, and ſarcotick one, 305
Bandages their differences, 357. What cloth beſt for them, *ibid.* Indications how to fit them *ibid.* Three kindes neceſſarie in fractures. Common precepts for their uſe, 358. Ufwardsmo they ſerv, *ibid.*
Bernard the Hermit. 689
Barrenneſs the cauſe thereof in men 625. In women, 626
Baſilisk, her deſcription, bite, and the cure thereof 517
Battels where the Autor was preſent: See voiage, 14
Baths good in pain of the eies, 466
Baths their faculties and differences, 628. How to know whence they have their efficacie, *ibid.* Their faculties and to whom hurtful, 729. half baths, *ibid.*
Beautrol a beaſt of Florida, 691
Bear-worms, the bites and the cure thereof, 522
Bears their craft, 42
Beaſts inventors of ſom remedies, *ibid.* Their faultie in preſaging, *ibid.* Their love and care of their young, 43. Moſt wilde ones may bee tamed, 48. They know one another's voice, Bees their government, 43. Care and juſtice, *ibid.* Their ſtinging and the cure thereof, 521
Beggars their coſenages and craftie tricks, 670
Bellie, why not bonie, 64. The diviſion of the lower bellie *ibid.*
Bezoar and Bezoartick medicines, 529
Biceps muſculus, 172
Bindeing of the veſſels for bleeding, 266. An Apologie therefore. Autorities therefore, Reaſon, Experience, Hiſtories to confirm it.
Birds their induſtrie in building their neſts, 43. Ravenous birds, counterfeit man's voice, 54. They have taught men to ſing, *ibid.*
Bird of Paradiſe, 686
Birth. See Childe-birth.
Bitings of man and Beaſt venenate, 262, 509
Bitings of a Mad-dog, Adder &c. ſee Dog, Adder, &c.
Bitter things not fit to bee injected into wounds of the Cheſt, 297
Bladder of the Gall, 85
Bladder of urine, 95. The ſubſtance, figure, &c. *ibid.* Signs of the wounds thereof, 302. Ulcers thereof and their cure, 352, 437
Blear-eies their differences and cure, 405
Bleeding in wounds, how helped, 256. How ſtopped by bindeing the veſſels, 266. Why deviſed by our Autor, 341. In amputation of members, 339
Blood the temper thereof, 7. The material and efficient cauſſes thereof, *ibid.* Where perfected, *ibid.* All the four humors comprehended under that general name, *ibid.* computed with new wine, *ibid.* the nature, conſiſtence, color, taſte and uſe, 8
Blood-letting whether neceſſarie at the beginning of peſtilent diſeaſes, 657
Blood-letting, when neceſſarie in a ſynocus, 205. When in an Eryſipelas, 206. When in a Tertian, 208. In what wounds not neceſſarie, 255. The two chief indications thereof, 279. Why neceſſarie in the fracture of the heel, See Phlebotomie.
Bloodie Urine and the cauſſes thereof, &c. 436
Boat-bone, 183
Bodie how divided, 63, 65. The fore part thereof, 66. The back-part, *ibid.* The crookedneſs thereof how helped, 582
Bolſters and other uſe, 278
Bones, how they feel, 61. Their definition, 106. Their differences, *ibid.* How hurt by the trepan, 283. What haſten's their ſcaling, *ibid.* Their corruption, 283. How helped, 287
Bones of the ſcul, 126. of the face, 138. of the noſe *ib.* of the auditorie paſſage, 149. of the arm, 168. of the back, 155. of the breſt, 105. of the cubit, 190. of the wriſt, after wriſt, and fingers, 171. Seed-bones, 173. of the thigh, 179. of the leg, 183. of the foot, 183. of the toes, 185. A brief recital of all the Bones, 188

Bones

Bones more brittle in frostie weather, 362. sooner knit in young bodies, *ibid.* Their general cure being broken or dislocated, 363. How to help the symptoms happening thereon, 364. Why they become rotten in the *Lues venerea*, and how it may bee perceived, 481. How helped, *ibid.*
Bones stricken in the throat or jaw, how to bee got out. 358
Brachiæus Musculus, 171
Brain and the Historie thereof, 128. The Ventricles thereof, 130. The mammillarie processes, *ibid.*
Brain, the mooving or concussion thereof, 272. how cured. 273
Brests, 107. Their magnitude, figure, &c. *ibid.* How they communicate with the womb, *ibid.*
Brest-bone, the Historie thereof. *ibid.*
Brest-bone, the depression or fracture thereof, how helped. 367.
Brevis Musculus, 171
Bronchocele, the differences thereof, and the cure, 233
Bruises, see Contusions.
Bubo's, by what means the humor that causes them flows down, 176
Bubo's, venereal ones returning in again causes the *Lues venerea*, 466. Their efficient and material causes, 481. Their cure *ibid.*
Bubo's in the Plague, whence their original, 535. the description, signs, and cure, 563. prognosticks, *ibid.*
Bubonocele what, 238
Bullets shot out of Guns do not burn, 312. They cannot bee poisoned, 311. remain in the bodie after the healing of wounds, 312
Bupresses their poison and their cure. 522
Burns, how kept from blistering, 310. See Combustions.
Bishop-fish, 677

C.

Cacoëthymia what, 28
Cæcum intestinum, 81
Calagnosis, 183
Calotes arteriæ, 87
Callus what, and whence it proceeds, 253. Better generated by meats of grosse nourishment, 362. Made more handsom by Ligation, *ibid.* The material and efficient causes thereof, 377. Medicines conducing to the generation thereof, *ibid.* How to know it is a breeding, *ibid.* What may hinder the generation thereof, and how to help it being ill formed, 378
Camels their kinds and condition, 51
Cancer, the reason of the name, 219. Causes thereof, *ibid.* differences, 220. Which not to bee cured, *ibid.* The cure if not ulcerated, *ibid.* Cure if ulcerated, *ibid.* Topick medicines to bee thereto applied, 221
Canker or Canker in a childe's mouth how to bee helped, 605
Cannons, see Guns.
Cantharides, their malignitie and the help thereof, 522. Applied to the head they ulcerate the bladder, 523
Capons subject to the Gout, 454
Carbuncles whence their original, 535. why so called, together with their nature, causes, and signs, 566. prognosticks, *ibid.* cure, *ibid.*
Caries ossium, 286
Carpiatores musculi 178
Carpiensores musculi, *ibid.*
Cartilago scutiformis, vel ensiformis, 103
Caruncles, their causes, figures, and cure, 479. Other waies of cure, 480
Cases, their form and use, 361
Caspillio a strange fish, 52
Catagmatick powders, 282
Catalogue of medicines and instruments for their preparation, 747. &c. of Surgical instruments, 748
Cataplasms their matter and use, 720
Cataracta, where bred, 145. Their differences, causes, &c. 409. Their cure at the beginning *ibid.* The touching of them, 411
Catarrh sometimes malign, and killing manie, 538
Cathartick medicines. 709
Cats, their poisonous qualitie, and the Antipathie between them and men, 526
Caustick medicines their nature and use, 708
Cauteries, actual ones preferred before potential. 485. Their several forms, 486. Their use, 487. Their force against venemous bites, 511
potential ones, 722
Cephale what, 191
Cephalica vena. 165
Cephalick powders how composed, 487
Cerats what, their differences, 717
Ceratum ossypi ex Philagrio, 719
Cerus, the poisonous qualitie thereof, and the cure, 531
Certificates in sundrie cases,
Chataracta an effect of the eie-lids, 403
Chamelion his shape and nature, 694
Chance sometimes exceeds art, 37. Some out remedies, 309
Change of native temper, how it happens, 13
Chaps, or Chops occasioned by the *Lues venerea*, and the cure, 489. In divers parts by other means, and their cure, 639
Charcoal causeth suffocation, 756
Chemosis an effect of the eie-lids, 406
Chest and the parts thereof, 106. why partly gristly, partly bonie, *ibid.* The division thereof, *ibid.* The wounds thereof, 279. Their cure, *ibid.* They easily degenerate into a Fistula 298
Childe, whether alive or dead in the womb, 612. If dead, then how to bee extracted, 613
Children why like their fathers, and grandfathers, 592. Born without a passage in the fundament, 600. Their site in the womb, 601. When and how to bee weaned, 621. Their pain in breeding teeth, 646. They may have impostumes in their mother's womb, 380
Childe-birth and the cause thereof, 601. The natural and unnatural time thereof, 602. Women have no certain time, *ibid.* Signs it is at hand, 603. What's to bee don after it, 604
China-root, the preparation and use thereof, 469
Chirurgerie, see Surgerie.
Chirurgion, see Surgeon.
Choler, the temper thereof, 8. The nature consistence, color, taste and use, 10. The effects thereof, 11. Not natural, how bred and the kindes thereof, *ibid.*
Cholerick persons, their habit of bodie, manners and diseases, 12. They cannot long brook fasting, 454
Chorion what, 103
Chylus, what, 8
Cirsocele, a kinde of Rupture, &c. 238. The cure, 245
Cinna mom and the water thereof, 744
Chavicle, see Collar-bone.
Claviculæ, 102
Clyster, when presently to bee given after blood-letting, 205. See Clyster.
Coats, common coat of the muscles, the substance, quantitie, &c. thereof, 70. of the eies, 142 of the womb, 102
Cocatrice, see Basilisk.
Cocks are kinglie and martial birds, 50
Colchicum the poisonous qualitie thereof, and the cure, 530
Colick, and the kindes thereof, &c. 439
Colon, 81
Collar-bones, or Clavicles, their Historie, 107. 108. Their fracture, 366. How to help it, *ibid.* Their dislocation and cure. 384
Collyria what, their differences and use, 724.
Color is the bewraier of the temperament, 20
Columella, see Uvula,
Combustions and their differences, 333. their cure, *ibid.*
Common sense what, 598
Comparison between the bigger and the lesser world, 494
Complexus musculus, 157
Composition of medicines, the necessitie thereof, 739
Compresses, see Bolsters.
Concoction, fault of the first concoction not mended in the after, 413
Concussion of the brain, how helped, 289
Condylomata, what they are, and their cure, 645
Conformation, the faults thereof must bee speedily helped. 504
Congestion, two causes thereof, 196
Contusions what, their causes, 330. general cure, *ibid.* How to bee handled if joined with a wound, 331. How without a wound, *ibid.* how kept from gangrening, *ibid.*
Contusions of the ribs, their cure, 332
Convulsion, the kindes and causes thereof, 257 the cure, 258, 259. why on the contrarie part in wounds of the head, 276
Convulsive twitching in broken members and the cause thereof, 376
Conies have taught the art of undermining, 50
Cornea tunica, 142
Corns, what, 191
Coronalis vena, 86
Corroborating medicines. 712
Coxa what, 191
Coxendices what, 190-194
Courses how to provoke them, 571, 638. how to stop them, 571, 641. The reason of their name, 636. Their causes *ibid.* causes of their suppression, 638. what symptoms follow thereon, 639. symptoms that follow their immoderate flowing, *ibid.*
Crabs, 52
Cramp, the cause and cure thereof. 464
Cranes observe order in flying and keep watch, 51
Cremaster muscles, 93
Cridones what disease, and the cure, 250
Crocodiles may bee tamed, 58
Crookedness how helped, 582
Crural vein, 176. Arterie, 177
Cruræus musculus, 182
Crus how taken. 178
Crystallinus humor. 144
Cubit, the bones and muscles thereof, 170
Cubit-bones, the fracture of them, 369
Cubitalis, 183
Cupping glasses and their use, 443. Their use in the cure of a Bubo. 563
Cures accidental and strange, 37, 38. deceitful, *ibid.*
Custom how forcible, 22
Cuticle, the matter, quantitie, figure, &c. thereof 67
Cuttel-fish his craft, 52
Cysticæ gemellæ, 86

D.

Dactylus, 93
Death, the inevitable cause thereof, 30. How sudden to manie, 506
Definition of Surgerie, 1
Definition how different from a description, 61
Defluxion of humors how diverted, 201
Delirium, the causes thereof, 261. The cure, *ibid.*
Deliverance in childe-birth how furthered, 604. Which difficult, 604. Which easie, *ibid.*
Deltoides musculus, 170
Dentifrices, their differences, matter, and form. 726
Depilatories,
Derma, 67
Detersives, 203. 706. their use, *ibid.*
Devils and their differences, 665. Their titles and names, 666. They are terrified and angred by divers things, 668
Devil of the Sea, 678
Diabetes what, the causes, signs, and cure, 438
Diaphoretick medicines, 709
Diaphragma, see Midriff, why called Phrenes, 110
Diaphysis what, 181
Diatie fever, the causes and signs, 204. the cure, *ibid.*
Diarrhœa, 191
Die-bone, 183
Diet hath power to alter or preserv the temperament, 21
Diet convenient for such as have the Gout, 453. For such as have the stone, 422. In prevention of the Plague, 539. In the cure thereof, 552
553
Differents of muscles, 73
Digitum flexores musculi, 173, 186
Digitum extensores musculi, 173, 186
Diploe what, 127
Disease the definition and division thereof, 30. causes, *ibid.*
Diseases strange and monstrous, 52
Diseases incident to sanguine, cholerick, phlegmatick and melancholick persons, 12. Wherefore som are hereditarie, 590. supernatural, 667. Monstrous accidents in them, 675
Dislocations, their kindes and manner, 361. their differences, 362. Causes, *ibid.* Signs, *ibid.* Prognosticks, 363. The general cure, 382. Symptoms that may befal a dislocated member,

Dislocation of the jaw, 383. The cure, 384. and *ibid.* Of the Collar-bone, *ibid.* Of the spoke, 385. Of the head, *ibid.* Of the neck, 386. Of the Rumps, *ibid.* Of the Ribs, *ibid.* Of the shoulder, *ibid.* Of the elbow, 396. Of the *Styliformis processus*, 397. Of the wrist 398. Of the afterwrist. 399. Of the fingers, *ib.* Of the thigh or hip, *ibid.* Of the whirl-bone, 394. Of the knee forwards, 395 Of the greater and lesser Focile, 396. Of the heel *ibid.* Of the Pastern or ankle-bone, 397. Of the instep and back of the foot, *ibid.* Of the toes, *ibid.*
Dismembring, see Amputation.

Diſtemperature and the diverſitie thereof, 31
Diſtillation and the kindes thereof, 735. Fornaces and the veſſels therefore, 736. What to bee conſidered therein, 737. How to prepare the materials therefore, 738. How to diſtil waters, 739. How aqua vitæ, 740. How to rectifie them, 741. To diſtil in the Sun, *ibid.* By filtring *ibid* Of Oils, 742 Of Spirits, 744. Of Oils out of Gums, *ibid.* Of Oil of Vitriol. 746
Docilitie of beaſts. 52
Dogs their love to their maſters, 46. Their docilitie, 52. Why they becom mad ſooner then other creatures, 512. How their bites may bee known, *ibid.* Prognoſticks, 513. The cure of ſuch as are bitten by them, 514
Dotycnium, the poiſonous qualitie thereof and the cure, 527
Doves free from adulterie, 49
Draco marinus, the ſea-Dragon his poiſonous puncture, the ſymptoms and cure, 524
Dracunculus what, 247. The cure, *ibid.*
Dragons their craft, 51
Dreams of the ſanguine, cholerick, phlegmatick and melancholick perſons, 12. Not to bee neglected, 26
Dropſie what, 234. The differences, Symptoms and cauſſes, 235. Signs and Prognoſticks *ibid.* The cure, *ibid.* Following upon a Tumor of the meſenterie, 624
Dugs, their ſubſtance, magnitude, &c. 107. What to bee don to drie up milk, 616
Duodenum, the magnitude, &c. 81
Dura mater what, 128. The hurts thereof by Trepanning, and how helped, 288. Remedies for the inflammation and Apoſtumation thereof, *ibid.* Why it eaſily endure's acrid medicines, 219

E.

Ears, their parts and compoſure, 148. Their woonds and cure 295. To ſupplie their defects, 581. Their ulcers, 311. Their ſtopping, and things falling into them how helped, 412
Ears of the heart, 113
Ear-wax, for what uſe it ſerv's, 149
Earth a cold and drie element, 4
Earthquakes, their cauſ, 317
Ecchomoſis what, and how cured, 267
Echo, the cauſ thereof, 149
Effects of Phlegm. 10. Of choler and melancholie. *ib.*
Ejaculatorie veſſels in men 93. In women, 99
Elbow, the diſlocation thereof, 395. how to reſtore it diſlocated outwardly, *ibid.* To the inſide, 397 Why moſt ſubject to the anchylois, *ib.*
Elements how underſtood, and their principal qualities, 3. What thoſe of generation are, 4. What theſe of mixt bodies are, *ibid.* The cauſ of their tranſmutation, 313
Elephants, their ſtrength, pietie, &c. 46. Where bred, and their qualities, 689
Embalming the dead, 759. The manner how, 760
Embryon, when it take's that name, 566
Embrocation what, and how performed, 721
Emollient and reſolving medicines, 215, 218
Emplaſters what, their differences, 717. Signs they are perfectly boiled, 718. Their uſe, 720. Cautions in their application, 211
Emplaſtrum de Vigo *cum Mercurio*, 718. *Degrutia Dei*, ibid. *De Betonica ſive de Fumo*, ibid. *Oxycroticum*, 716. *De ceruſa*, ibid. *Trifarmacum ſeu nigrum* ibid. *Diacalmo ſeu Diachalcithos*, ib. *Contra Ruptu.m*, ibid. *De Minio*, ibid. *Diachylon magnum*, ibid.
Empyema what, 234. The cure thereof, *ibid.*
Emptineſs, 28
Emulgens Arteria, 88. *vena*, 90
Enarthroſis, a kinde of articulation, 191
Enterocele a kinde of Rupture, 238
Ephemera febris, 204. The cauſſes and ſigns thereof, *ibid.* The cure. ibid.
Epidermis, 67
Epididimis, 93.
Epigaſtrium what, 66. The conteining parts thereof, *ibid.*
Epigaſtrica vena, 90.
Epiglottis what, 15
Epiploon what. 78
Epiploi vena, 87
Epiplocele, 238
Epithemes to ſtrengthen the principal parts, 845 Their compoſition and uſe, 721
Epanus muſculus, 170
Epulis what, the ſymptoms and cure, 229.
Epulotick, or skinning medicines, their kindes and uſe, 707
Epphines their differences, deſcription and uſe, 724
Erryſipelas what, 206. What tumors referred thereto, 199. the differences thereof, 262. Prognoſticks, 262. Their cure, *ibid.*
Erythrois tunica, 92
Eſchar how to haſten the falling awaie thereof, 565. Medicines cauſſing it, 709
Eſcaroticks, 709. Why uſed to ſpread ulcers, 304
Eſtrich between a bird and a beaſt, 686. The ſcelecton of one, *ibid.*
Evacuation and the kindes thereof, 28. What to bee obſerved therein, 29
Eunuches aſſimilated to women, 81
Excrements of the firſt, ſecond, and third concoction what, 399
Exerciſe, the uſe and beſt time for it, 26. The qualitie thereof, *ibid.*
Exomphalos, or ſtanding forth of the navel, 238
Expoſitio in Lue venerea, 483
Experience without reaſon, of what account, 34
Eie browe, 142
Eie-lids, *ibid.* To ſtaie them beeing too lax, 402 To open them faſtned together, 404. To help their luſhing, *ibid.*
Eies their ſight and quickneſs, 141. Figure, compoſure, &c. *ibid.* Their muſcles, coats, and humors, 142, 143. their wounds, 291. to hide the loſs or defect of them, *ibid.* their ulcers, 349. their cure, 350. their effects, 402. &c. their inflammation, 401

F.

FAce diſlofer of affections and paſſions 29. the woundis thereof, 290. How to help the rodneſs thereof, 733
Facnikies what, 15, their diviſion, 16
Falling down of the Fundament the cauſſes and cure thereof, 246
Fat, the ſubſtance, and cauſ, &c. thereof, 69 Why not generated under the skul, 290. How to bee diſtinguiſhed from the brain, *ibid.* the cure thereof beeing wounded, 303
Fauces what, 151
Faulcon her ſight with the Hern, 54
Faults of conformation muſt bee ſpeedily helped, 504. Of the firſt concoction, not helped in the after, 453
Fauſtus and the effects thereof, 29
Fever ſomtimes a ſymptom, otherwhiles a diſeaſ,
Fevers accompanying Phlegmons and their cure, 204. Happening upon Eryſipelous tumors, 208. Upon Oedematous tumors, 222. Upon Schirrous tumors, 223. The cure of baſtard intermitting Fevers. 224
Feet and their bones, 183. Their twofold uſe, 315
Feirce Clare a fiſh, 315
Females of what ſeed generated, 592
Fetus aurei what, 148
Fibulæ, 181
Figures in Anatomie, and firſt of the forepart of man, 65. Of the backparts, 66. Of the lower bellie, and parts thereof, 76, 77. Of the ſtomach, 80. Of the veſſels of ſeed and urine, 91. Of the bladder and yard, 96. Of the womb, 198. Of ſom parts in women different from thoſe of men, 101. Of the hollow vein, 116. Of the Arteries, 120. Of the rough Arterie or weazon, 122. Firſt and ſecond of the brain, 129. Third of the *Cerebellum*, 130. Fourth and fifth of the brain, 132. The ſixth of the brain, *ibid.* Seventh ſhewing the Nervs of the brain, 134. The eighth of the brain, 135. Of the ſpinal marrow, 137. Of the eie, 143. Of the chief muſcles of the face, 147. Of the lower jaw, *ibid.* Of the eares, 148. Of the backbone, 154. Of the muſcles in ſundrie parts of the bodie, 156, 157, 158, 159, 160, 161. Of the nervs, 163. Of the bones in the hands, 172. Of the thigh-bone, 179. Of the bones in the feet, 184. Of the Skelcton, 188, 189, 190
Figures of Inſtruments uſed in Surgerie, See Inſtruments.
Figures of divers ſorts of javelins and arrow-heads, 327
Figures of monſters, 648, 649. &c. Of divers beaſts, &c. as of the Succurah, 45. Of the Elephant, 47, 690. Of the Rhinoceros, 49. Of the Camel, 31. Of the Crocodile, 38, 693. Of the Crab, 219. Of the Scorpion, &c. 494, 495. Of the Serpent Hemorrhous, 516. Of the Serpent Seps, 517. Of the Baſilisk, 518. Of the Salamander and Torpedo, *ibid.* of the ſting Raie, 525. Of the Sea-hare, 526. Of the monk and biſhop-fiſh, 677. Of the Sea-divel, Of the Sea-Mors, and Bore, 677. Of the fiſh Hoga, 681. Of a monſtrous flying-fiſh, 682. Of *Barnard* the Hermite, 683. Of the ſilling-fiſh, *ibid.* Of the Whale, 685. Of an Eſtrich, 686. Of the birds of Paradiſe, 687. of a Giraffa, 688. Of a beaſt called Thamuth, 691. Of the Beaſt Haiit, and a monſtrous Africanbeaſt, 692. Of a Chamæleon, 694
Figures of Fornaces and other things fit for diſtillation, 737, 738, 739, 742, 743, 744, 746
Figure of a fractured arm with a wound in a corpoſure, 376. Of a Leg fractured with a wound and bound up, 374. Of Ligatures for extention, 382. How to reſtore the diſlocated ſpine, 386. Of putting the ſhoulder-joint, 389, 390, 391, 392, 393, 394. Of the cauſ and the uſe thereof, 394, 396. Of reſtoring the diſlocated Elbow, 396. Of the thigh-bone diſlocated inwards, 393. Outwards, 394. Of reſtoring a knee diſlocated fotwards, 395
Figure of a *Semiopium*, 435. Of a Barrel to bee uſed in the cure of a Carcuncle, 480. Of the Helmet-flour, 528. Of the ſite of the childe in the womb, 601. Of leaden nipples, 611. Of a glaſs to ſuck the breaſts with 616
Figures of Artificial Eies, 576. Of noſes, 578. Of Teeth, 579. Palats, *ibid.* How to ſupplie the defect of the tongue, 580. Of the Ears, 581. Iron breſt-plates, 582. Of an arm and leg, 587, 588. Of a crutch, 589
Filings of lead, their harm taken inwardly, and cure, 530
Filtration the manner and uſe thereof,
Fingers and their parts, &c. 172. their diſlocation, why eaſily reſtored, *ibid.* how to take awaie ſuch as bee ſuperfluous, and help thoſe that ſtick together, 417. How to ſupplie their defects, 583
Fire and the qualities thereof, 3. The force thereof againſt the Plague, 539
Fiſhes their induſtrie, 50. They may bee tamed, 48
Fiſher a fiſh ſo called, 51
Flatulent tumors, their cauſſes, ſigns, and cure, 211
Flatulencies about the joints counterfeiting the Gout, 462
Fiſtula *lacrymalis*, ſee Hygilops
Fiſtula's what, their differences, ſigns, &c. 335 Their cure, *ibid.* In the Fundament, *ibid.* The cure, *ibid.* Upon the wounds of the cheſt, and the cure, 298
Fleſhly Pannicle, the Hiſtorie thereof, 68
Fleſh quickly putrifie's in maritime parts 314
Blattones muſculi, 180. *Superior* 187
Flux of blood in wounds how helped, 256
Flux of the bellie how to bee ſtopped, 572 573
Flying fiſh of a monſtrous ſhape, 682
Focile what, 181. How to cure the ſeparation of the greater and leſſer, 631. The ſeparation from the paſtern-bone, 632,
Fomentations and their uſe, 720. For broken bones, 379. They hurt plethorick bodies, *ibid.* What to bee obſerved in their uſe, *ibid.*
Fornaces, their matter and forme, 735, 737, 738, &c.
Fornix, 131
Foxes and their craftes, 50
Fracture what, and the differences thereof, Their cauſſes, 362. Signs and Prognoſticks, *ibid.* Their general cure, 363. How to help the ſymptoms, 364. Why dead lie in the joint of the ſhoulder, 367. why near a joint more dangerous, 373
Fractures of the ſcul, their differences, 262. Of the cauſſes and ſigns, *ibid.* 264. Signs manifeſt to ſcul, 265. A Fiſſure the firſt kind of fractures, *ibid.* How to finde it being leſs manifeſt, *ibid.* A contuſion the ſecond kinde of fracture, 267. An Infracture the third kinde, 269. A Scat the fourth kinde, 271. Reſonitus the fifth kinde, *ibid.* The Prognoſticks, 274 general cure of them and their ſymptoms, 277. They are hurt by venerie, 279. By noſe, *ibid.* The particular cure 281. Why Trepanned, 282
Fractures more particularly and firſt of the noſe, 365. Of the lower jaw, *ibid.* Of the Collar-bone 666. Of the ſhoulder-blade, *ibid.* Of the breſt-bone, 367. Of the Ribs, *ibid.* Of the vertebræ or Back-bones, 369. Of the Holie bone, *ibid.* Of the Rump, *ibid.* Of the Hip. *ibid.* Of the ſhoulder or arm-bone, *ibid.* Of the cubit

or

or Ill a-Wand, 370. Of the Hand, 371. Of the Thigh, *ibid.* Of the Thigh near the joint, 373. Of the *patella* or whirl-bone, *ibid.* Of the leg, 374. Of the bones of the feet. 399
Postures associated with wounds, how to ben bound up. 359, 375.
Pox, see *Lues venerea*.
Pultices their kindes and use. 25
Pori, how made. 734
Purgations, their differences, matter and forms. 727
Pudendum, the falling down thereof. 246
The causes and cure. 646
Pungus, an excrescence sometimes happening in Fractures of the scull. 286

Q.

Quadrus Effigies and praise. 769
Gall and the bladder thereof, &c. 85
Ganglion, what. 214. properly so called. Ibid.
Gangrene what, 335. The general and particular causes, *ibid.* That which is occasioned by cold, upon what part is most? 336. Signs, *ibid.* Prognosticks. 337. The general cure, *ibid.* The particular cure, *ibid.*
Gangrena. 156
Gargarisms, their matter and form. 725
repelling, ripening and detergent ones, 233
Garlick good against the Plague. 540
Gastrica vena. 88
Gastrocnemii vena, *ibid. Major*. ibid.
Geef, their nature is in flying over mount Taurus. 51
Gemelli musculi. 186
Genioi musculi. 180
Generation, what it is, 17. What necessarie thereto. 593
Generation of the Navil. 594
Giddinesse, see *Vertigo*.
Gingivæ what. 191
Giraffe a strange beast. 688
Glandula what sort of tumor. 213
Glandula lacrymalis. 142
Glandules in general, 80. At the root of the tongue, 151. Their inflammation and cure. 230
Glans penis, 97. Not rightly perforated, how to bee helped. 419
Glysters, their differences, materials, &c. 711. Several descriptions of them, *ibid.* They may nourish. 712
Goat's dung is good to discuss scirrous tumors. 215
Golden ligature, how made. 242
Gomphosis what. 191
Gonorrhœa, how different from a virulent strangurie, 476. the cure. 478
Gout, the names and kindes thereof, 446. the occult causes thereof, *ibid.* the manifest causes thereof, 448. out of what parts it may flow, 449. Signs that it flow's from the Brain, or Liver, *ib.* How to know this or that humor accompanying the Gowtie malignitie, *ibid.* Prognostick, 450. The general method to prevent and cure it, 451 Vomiting sometimes good, 452. Other peculiall remedies, *ibid.* Diet convenient, 453. What wine not good, 454. How to strengthen the joints, *ibid.* The palliative cure thereof, 455. Local medicines in a cold Gout, 446. In a hot or sanguine Gout, 458. In a Cholerick Gout, *ibid.* What is to bee don after the fit is over, 460. Tophi or knots how caused, 461. The hip-gout or sciatica, 462. The cure thereof, 463
Grittles what, 106, of the nose, 145. of the *Larinx*. 152
Groins their wounds, 303. Their tumors, see Bubo's.
Guajacum, the choise faculties and parts, 468. The preparation of the decoction thereof, 469. The use. 470
Gullet and the historie thereof, 123. The wounds thereof. 295
Gums overgrown with flesh, how to bee helped. 1229
Guns, who their inventer. 307. Their force, 308. The cause of their report. 312
Gun-powder not poisonous 310, 311. How made. *ibid.*
Gutta rosacea what, 733. The cure. *ibid.*
Guts, their substance, figure, and number. 81 Their use and connexion, *ibid.* Action, 82. How to bee taken forth, 89. Signs that they are wounded, 89. Their cure, 301, 302. Their illness. 351

H.

Hæmorrhoids what, their differences and cure, 356. In the neck of the womb. 643
Hæmorrhoidalis interna, 89. *Externa*. 90
Hæmorrhoidalis arteria, sive mesenterica inferior. 88
Hæmorrhous a Serpent his bite, the signs and cure. 516
Hæir, a strange beast. 692
Hair, what the original and use, 128. How to make it black, 734. How to take it off. *ibid.*
Hairie-scalp, the contexion and use, 129. The wounds thereof not to bee neglected, *ibid.* The cure thereof beeing consulted. 280
Hand taken generally, what, 164. The fracture thereof with the cure, 370. How to supplie the defect thereof. 384, 386
Harts how they provide for their young. 46
Hare-lips what, 293. Their cure *ibid.*
Harmonia what. 191
Hawks. 54
Head, the general description thereof, 124. The containing and contained parts thereof. *ibid.* The musculous skin thereof, 129. Why affected when anie mischievous part is hurt, *ibid.* The watrie tumor thereof, 226. The wounds thereof, 262. &c. The falling away of the hair and other affects thereof, 390. The dislocation thereof. 385
Hearing, the organ, object, &c. thereof. 18
Heart, and the historie thereof. 122. The ventricles thereof, 123. Signs of the wounds thereof. 296
Heat, one and the same efficient cause of all humors at the same time, 10. three causes thereof. 196.
Hectick feyer with the differences, causes, signs and cure. 209
Hedg hogs, how they provide for their young. 46
Heel, and the parts thereof, 183. Why a fracture thereof so dangerous, *ibid.* The dislocation thereof, Symptomes following upon the contusion thereof, *ibid.* Why subject to inflammation.
Hemitritæus, see Ephgrim.
Hemlock the poisonous qualitie thereof, and the cure. 528
Henbane the poisonous qualitie and the cure. 527
Hermaphrodites, 20. and 673.
Hern, his sight, and the Palsie. 54
Hernia and the kindes thereof, 238. *Humoralis*. 245
Herps and the kindes thereof, 207. The cure. 1
Hip-gout; see *sciatica*.
Hip, the dislocation thereof, 389. Prognostick, 390. Signs that it is dislocated outwardly or inwardly, 390. Dislocated forwards, 391. backwards, *ibid.* how to reduce the inward dislocation, 392. the forward dislocation, 394. the backward dislocation. *ibid.*
Hippocampus his Effigies. 749
Horse, a monstrous fish. 681
Holes of the inner basis of the scull, 136. of the external basis thereof, *ibid.* small ones sometimes remain after the cure of great wounds. 294
Holie-bone, his number of *Vertebræ*, and their use, 155. the fracture thereof. 369
Hordeolum, an affect of the eie-lids. 403
Horns used in stead of Vessels. 443
Horse-leeches, their application and use, *ibid.* their virulencie and cure. *ibid.*
Hot-houses how made. 731
Hufkalis, a monstrous beast. 688
Humoralis morbi, 220. *Pars*, 195
Humors, their temperaments, 7. the knowledg of them necessarie, 8. their definition and division, *ibid.* Serous and fecundarie; as *Ros, Exudatum, Glutten*, 21. an argument of their great putrefaction. 314
Humors of the eie. 142
Aqueus. 144
Crystallinus. *ibid.*
Vitreus. 145
Hydatis. 403
Hydrargyrum, the choise, preparation, and use thereof in the *Lues Venerea*. 470
Hydrophalia, whether curable, 513. What cure must bee used therein. 514
Hydrocephalus what, 282. The causes, differences, signs, &c. *ibid.* the cure. 216
Hydrocele. 238, 244
Hyems. 101
Whether sick or no. 630
A historie thereof. 631
Hyoides os, the reason of the name, compositie, site, &c. thereof. 149
Hypochondria, their site. 64
Hypochyma. 409
Hypogastrica vena. 90
Hypopyon, 409
Hypothenar. 194

I.

Iaundis, a medicine therefore. 237
Ilia, the bones thereof, & their production. 139
The fracture of the lower jaw. 365
How to help it. 366
The dislocation thereof. 383
The cure. 384
Ibis, a bird, the inventer of glysters. 42
Ichneumon, how hee arm's himself to assail the Crocodile. 48
Idleness, the discommodities thereof. 26
Ileum intestinum. 81
Ilium. *ibid.*
Iliaca arteria. 88
Vena. 90
Ilium os, 178
Ill conformation. 31
Imagination, and the force thereof. 598
Impostors, their impudencie and craft. 39, 287
Impostume, what, their causes and differences. 195
Signs of them in general. 296
Prognosticks. 297
What considerable in opening of them. 303
Inanition, *see* Emptiness.
Incus. 137, 149
Indication, whence to bee drawn, 3. of feeding, 25, what, 32. the kindes, *ibid.* table of them, 36. observable in wounds by gun-shot. 320
Infant, what hee must take before hee suck, 606. their crying what it doth. 611. how to bee preserved in the womb when the mother is dead, 619. *See* Childe.
Inflammation of the almonds of the throat, and their cure, 230. of the *Uvula*, *ibid.* of the eies. 405
Inflammation hinder's the reposition or putting dislocated members into joint. 396
Insessus, what, their manner, matter, and use. 728
Instruments used in Surgerie for opening abstersion. 203
A veit for the womb. 222, 643
An iron-plate and actuall cauterie for the cure of the *Rumula*. 229
Constrictorie rings to binde the *Columella*. 232
Speculum oris, *ibid.* 259
A trunk with canterie to canterize the *Uvula*. 233
An incision-knife. 233
An actuall cauterie with the plate, for the cure of the *Empyema*, 234. of a pipe to evacuate the water in the Dropsie, 237. wherewith to make the golden ligature, 242. to stitch up wounds. 256
A razor or incision-knife, 265. a chizzel, 266 *Rudula vel Scalpri*, 267. a three-footed levatorie, 268. other levatories, 269. Saws to divide the scull, 268. a desquamatorie Trepan, 269. *Rostra pterani*, 270. Scrapers, pinters and a leaden mallet, 270. A pierser to enter a Trepan, 282. Trepans, 283. Terebellum, 284. A lentil-like Scraper, *ibid.* cutting-compasses, *ibid.* A conduit pipe, and syringe, 286. to depress the *dura Mater*, 288. *Speculum oculi*, 295 for making a Seton, 296. Pipes used in the wounds of the chest, 298. to draw out bullets, 316, &c. Dilaters and Probes to draw through Barmula's, 318. to draw forth arrow-heads, 318, 328. A fanisicator, 331. A dismembring knife and saw, 339. A dilater to open the mouth, 342. A pyoulcos, or matter-drawer. 351. A *Glossocomium*, 371. A lattin-case. 376. A pullie and hand-vice, 383. the *Glossocomium* called *Ambi*, 393. little hooks, needles, and an incision-knife to take away the Web, 407. files for filing the teeth, 415. for cleansing and drawing the teeth, 416. cutting mullets to take off superfluous fingers, 418. A Catheter, 420. Gimblet to break the stone in the passage of the yard, 425. other instruments to take out the stone, *ibid.* used in cutting for the stone, 426. and 432. A lancet, and Cupping-glasses, 443. Horns to bee used for ventoles, 445. Catheters to wear away caruncles, 481. Trepans for rotten bones, 484. actuall cauteries, 485. Griffin's talons, 614. Hooks to draw forth the childe, 614. *Speculæ matrices*, 646
Instruments, when necessarie in reducing broken bones. 364
Intricata talaginis musculi. 182
Intercostales arteriæ. 87, 119
Intercostales musculi externi, 142. *Interni*. *ibid.*
Interossei musculi. 175, 187
Iunctionis vena. 86
Instrumenti musculi. 180
Joie, and the effects thereof. 29
Joints, their wounds, 305. how to strengthen them, 454. how to mitigate their pains caused only by distemper. 460
Ischiadica vena, 178. *Ischium os*. 178
Issues, or fontanels. 452
Itching of the womb. 645
Iudgment, why difficult. 751
Junks, what, 361. their use. *ibid.*

The Table.

K.

KAll, it's substance, &c. 78. what to bee don when it fall's out in wounds. 302
Kernels of the ears. 148
Kibes, where bred. 186
Kidnies, their substance, &c. 91. signs that they are wounded, 302. Ulcers, and their cure, 352, 437. their heat how tempered. 561
Kings-evil, what, the cause, 215. the cure. *ibid.*
Knee dislocated forward, how to restore it. 395

L.

Lagophthalmia, what, 291. the causes and cure. 402, 403
Lameness how helped. 589
Lamprie, their care of their young. 48
Lampron, their poisonous bite. 524
Larinx, what meant thereby, 152. it's magnitude, figure, composure, &c. *ibid.*
Latissimus musculus. 164
Leeches, *see* Horse-leeches.
Leg, taken in general, what, 175. the bone thereof, 181. the wounds, 303. the fracture and cure, 374. the cure of the Autor's leg beeing broken, 374. 375. their crookedness how helped, 584. defect supplied. 587, 588
Leprosie, and the causes thereof, 500. the signs, 501. &c. why called *Morbus leoninus*, *ibid.* the Prognosticks, diet, cure, 503. it sometimes follow's the *Lues venerea*. 465
Lepus marinus, the poison, the symptoms, and cure. 525
Levator musculus, 163. *Levatores Ani*. 82
Life, what, and it's effects, 407. *See* Soul.
Ligaments, their use, 73. why without sense, 155 their difference, *ibid.* their wounds. 306
Ligatures for wounds are of three sorts, 254. too hard hurtful, 288. they must bee neatly made, 358. for what uses they chiefly serv, 360. in use at this daie for fractures, 372. how in fractures joined with wounds, 375. which for extention. 382. *See* Bandages.
Lightning, the wonderful nature, and the stinking smell thereof, 312. how it may infect the Air. 508
Lime unquencht, the hurtful qualitie and cure. 531
Liniments are not to bee used in wounds of the chest, 298. their matter, form, and use. 751
Lion, his provident care in going.
Lion of the sea. 677
Lirpiunde. 405

Subclavian. See Arterie and Vein.
Subclavius muſculus. 162
Succineth, a beaſt of the Weſt Indies. 45
Suffuſio. See Catar. &.
Suggillations. See Contuſions.
Summer, the temper thereof. 7
Supinator muſculi. 178
Suppuration, the ſigns thereof, 127. cauſed by natural heat. 215
Suppuratives, 202, 211. an effectual one, 704. their differences, &c. 705, how they differ from emollients. ibid.
Superfetation what, 620. the reaſon thereof. ib.
Suppoſitories, their difference, form, and uſe. 729
Suppreſſion of urine. See Urine.
Surgerie, what, 1. the operation thereof. ibid.
Surgeons, what neceſſarie for them, 1. their office, 2 the choiſe of ſuch as ſhall have care of thoſe ſick of the plague, 540. they muſt bee carefull in making Reports, 753. how long in ſome caſes they muſt ſuſpend their Judgments, 753. they muſt have a care leſt they bring Magiſtrates into an error, 758. how to Report, or make Certificates in divers caſes. ibid. &c.
Sutures of the ſcull, their number, &c. 125. wanting in ſom, ibid. why not to bee trepaned, 126, 284. Sutures in wounds, their ſorts and manner how to bee performed. 253, 256
Sweating ſickneſs. 511
Sweet-bread. 83
Sweet-waters. 734
Swine aſſiſt their fellow. 50
Symptoms, their definition and diviſion. 31
Sympathie and Antipathie of living creatures. 55
Symphyſis, a kinde of articulation. 491
Sym neroſis, Synarthroſis, Synchondroſis, Syſſarkoſis. ibid.
Synocus putrida, it's cauſ and cure. 205

T.

TAlparia, what. 213
Tarentula's poiſonous bite, and cure. 37
Tarſus, what. 191
Taſtes, what, their differences, 700. their ſeveral denominations and natures. ibid. 702
Teſticle, what. 18
Teeth, their number, diviſion, and uſe, 139. wherein they differ from other bones. 140. pain of them how helped, 304. their affects, 414. how to draw them. 415. to cleanſe them, 417. how to ſupplie their defect, 378, to help the pain in breeding them. 646
Temporal muſcle, 146. what enſue's the cutting thereof. 285
Temperament, what, the diviſion thereof, 4. ad pondus, ibid. ad juſtitiam, 5. of a bone, ligament, griſtle, tendon, vein, arterie. 6. of ages, ibid. of humors. 7
Temper of the four ſeaſons of the year, ibid. native temper how changed. 13
Temperatures in particular; as of the ſouthern, northern, &c. people. 13, 14
Tendines muſculi. 180
Tentigo. 202
Tertian agues, or fevers, their cauſes, &c. 208. their cure. ibid. &c.
Teſticles, their ſubſtance, 92. in women, 97. their wounds. 303
Teſtudo, what. 188
Tetters, their kindes and cauſſes, 207. their cure, ibid. &c. 733. occaſioned by the lues venerea, 489. their cure. ibid.
Thanatth, a ſtrange beaſt. 492
Thenar muſculus. 174, 187
Thigh, the nerve thereof, 177. it's proper parts, 178. and wounds thereof. 303
Thigh-bone, the appendices and proceſſes thereof, 179, 180. the fracture and cure, 371. nigh to the joint, 373. it's diſlocation, 389, 403. See Hip.
Things natural, 3. not natural, 21. why ſo called, ibid. againſt nature. 30
Thorax, the cheſt and parts thereof. 205
Thoracica arteria. 120
Throat, how to get out bones, and fiſh, like things that ſtick therein. 418
Throttle, and the parts thereof. 102.
Throws, and their cauſ. 604
Thymus what. 132
Tibia. 180
Tibialis anticus muſculus, 186. poſticus. ibid.
Tongs, what. 208
Toad, his bite, and cure. 524
Tongue, it's quantitie, &c. 159. it's wounds, and cure, 294. it's impediments and cure, and the cure, 417. to ſupplie it's defect, 680. Tonſils, 219. their inflammations, and their cure. ibid.

Tooth-

Tooth-ach, the cauſſes, ſigns, &c. 413
Tophi, or knots at the joints in ſom that have the gout, how cauſſed, 461. the *Lues venerea* how helped. 483
Torpedo, his craft, and ſtupefying force. 518
Touching, how performed. 18
Touche, a ſtrange bird. 689
Trapezius muſculus. 163
Transverſalis muſculus. 159
Tranſverſe muſcles of the *Epigaſtrium*. 76
Triacle, how uſeful in the gout, 453. how it dull's the force of ſimple poiſons. 510
Trepan, when to bee applied, 266. their deſcription, 283. where to bee applied. 285
Trepaning why uſed, 282. how performed, *ibid.* a caution in performance thereof. 283
Triangulus muſculus. 163
Triceps. 676
Trochanter. 780
Truſſes, their form and uſe. 240, 244
Tumors, their differences, 195. their general cauſſes, ſigns, 196, general cure, 198. which hardeſt to bee cured, *ibid.* the four principal, 199, flatulent and watriſh, their ſigns and cure, 211. of the gums, 229. of the almonds of the throat, 230. of the navel, 238. of the groin and cods, *ibid.* of the knees. 247
Turtles. 46
Tympanites. *See* Dropſie.

V.

Valves of the heart, their action, ſize, &c. 114
Varicous bodies. 93
Varices, what, their cauſſes, ſigns and cure. 353
Vas breve, ſeu varoſum. 87
Vaſa ejaculatoria. 93
Vaſti muſculi. 182
Vein, what, 74. Gate-vein, and it's diſtribution, 88 deſcendent hollow vein, and it's diſtribution, 89. aſcendent hollow vein, and it's diſtribution, 115. they are more then arteries. 119. thoſe of the eies, 145. which to bee opened in the inflammation of the eies, *ibid.* the cephalick, 165. Median, *ibid.* diſtribution of the ſubclavian vein, *ibid.* of the axillarie, *ibid.* of the crural. 176
Vena porta, 86. *cava*, 89. *arteriſa*, 114. *phrenica, coronalis, azygos, vertebralis, mammaria*, 115 *cervicalis, muſculoſa*, ibid. *axillaris, humeralis, jugularis interna & externa*, 116. *renes piopi*, 118. *cephalica, humeraria, mediana*, 165. *ſalvatella, & pleuriz, ſaphena, vel ſaphena, iſchiadica*, 176. *muſculoſa, poplitea, ſuralis, iſchiadica major*.
Venerie, it's diſcommodities in wounds of the head. 279
Venemous bites and ſtings how to bee cured. 510
Venom of a mad dog, outwardly applied, cauſeth madneſs. 513
Ventoſe's their form and uſe. 433, 444
Ventricle. *See* Stomach.
Ventricles of the brain. 136
Verdegreaſe, it's poiſonous qualitie and cure. 530
Vertebræ and their proceſſes, 153. of the neck *ibid.* of the holie-bone, 155. how different from thoſe of the loins, 161. Tenth of the back, how to the middle of the ſpine, 162. their diſlocation, *See* Spine.
Vertigo, it's cauſſes and ſigns, 401. the cure. *ibid.*
Veſſels for diſtillation. 736, 737. &c.
Veſicatories why better then cauterics in cure of a peſtilent bubo, 563. whereof made 709. their deſcription and uſe. 713
Viper. *See* Adder.
Virginitie the ſigns thereof. 758
Vital parts which, 83. their diviſion. 64
Vitreous humor. 145
Viver, or, as ſom term it, the Weaver, a fiſh, his poiſonous prick and the cure. 524
Ulcers conjoined with tumors how cured, 207. in what bodies not eaſily cured, 314. their nature, cauſſes, &c. 343. ſigns, prognoſticks, 344. their general cure, 345. ſigns of a diſtempered one, and the cure, 346. a painful one and the cure, 347. with proud fleſh in them, *ibid.* putrid and breeding worms, *ibid.* a ſordid one, 358. a malign, virulent, and eating one, *ibid.* advertiſements concerning the time of dreſſing ulcers, 349. how to bind them up, *ibid.* ſuch as run are good in time of the plague, 544. Ulcers in particular, and firſt of the eies, 350 of the noſe *ibid.* of the mouth *ibid.* of the ears, 351. of the windepipe, weazon, ſtomach, and guts, *ib.* of the kidnies and bladder, 352. of the womb. 353. that happen upon the fracture, of the leg, rump, and heel, 376. how to prevent them, 377, they muſt bee ſeldom dreſt when the *callus* is breeding, *ibid.*
Umbilical veſſels, how manie and what. 595
Unction to bee uſed in the *Lues venerea*, 476. their uſe, 471. cautions in their uſe, 472. and the inconveniences following the immoderate uſe. 473
Vugula, or the web on the eie, the cauſſes, prognoſticks, and cure. 405, &c.
Magnetum adſtringens, 715. *nutrimum*, 716. *anticum*. ibid. *baſilicum, ſive tetrapharmacum*, ib. *diapompholigos*, ibid. *deſiccativum, rub.* ibid. *cœruleum*, ib. *Album Rhaſis*, ib. *Althæa*, ib. *populeum*, ib. *apoſtolorum*, ib. *commiſſa*, ib. *pro ſtomacho*, 717. *ad morſus rabioſos*. ibid.
Unicorn, if anie ſuch beaſt, what the name imports, 533. what the ordinarie horns are, 534. not effectual againſt poiſon, *ibid.* effectuall onely to drie, *ibid.* in what caſes good. *ibid.*
Voices, whence ſo various. 152
Vomits, their force, 28. their deſcription. 217
Vomiting, why it happen's in the Colick, 82. the fitteſt time therefore, 452. to make it eaſie. *ibid.*
Voiages and other employments, wherein the Author was preſent; of Thurin, 767. of Marolle and Low Britanie, 761. of Perpignan, 769. of Landreſie, *ibid.* of Bologn, 770. of Germanie, *ibid.* of Danvillers, *ibid.* of Caſtle of Compr, 771. of Mets, 772. of Hedin, 775. Battel of S. Quintin, 781. Voiage of Amiens, of Harbour, of Grace, *ibid.* to Roven, *ibid.* battell of Dreux, 783. of Moncontour, *ibid.* Voiage of Flanders, *ibid.* of Burges, 786. battel of S. Denni, *ibid.* voiage of Balon. 787
Urachus. 104.
Ureters, their ſubſtance, &c. 95
Urine ſtopt by diſlocation of the thigh-bone, 391. ſuppreſſion thereof how deadlie, 431. how it happen's by internal cauſſes, 434. by external, 435. prognoſticks, *ibid.* things unprofitable in the whole bodie, purged thereby, *ibid.* bloodie, the differences and cauſſes thereof. 436. the cure, 437. ſcalding thereof how helped, 478. a receptacle for ſuch as cannot keep it, 581. Urines of ſuch as have the plague ſomtimes like thoſe that are in health. 547
Uteliſ, a ſtrange fiſh. 52
Uvea tunica. 142
Vulnarie potions, their uſe, 488. the names of the ſimples whereof they are compoſed, *ib.* their form, and when chiefly to bee uſed. 489
Uvula, the ſite and uſe thereof, 151. the inflammation and relaxation thereof, 230. the cure. *ibid.*

W.

Walnut tree, and the malignitie thereof. 528
Warts of the neck of the womb, 643. their cure. 644
Waſhes to beautifie the ſkin. 731
Waſps, their ſtinging how helped. 521
Watching, and the diſcommodities thereof. 27
Water, it's qualities, 3. beſt in time of plague, 540
Waters, how to bee diſtilled. 739
Watriſh tumors, their ſigns and cure. 211
Weapons, of the Ancients compared with thoſe of the modern times. 308
Weazon, the ſubſtance, &c. thereof, 122. how to bee opened in extreme diſeaſes, 230. the wounds thereof, 295. the ulcers thereof. 351
Weakneſs, two cauſſes thereof. 196
Web on the eie, which curable, and which not, 407. the cure. *ibid.*
Weig-bone. 115
Weights and meaſures, with their notes. 711
Wens, their cauſſes and cure, 213. &c. how to diſtinguiſh them in the breſt from a Cancer. 214
Whale, why reckoned among monſters, 684. they bring forth young and ſuckle them, *ibid.* how caught. *ibid.*
Whale bone. *ibid.*
Whirl-bone, the fracture thereof and cure. 373. the diſlocation thereof. 394
White ſime. 77
Whites, the reaſon of the name, differences, &c. 611, cauſſes, 642. their cure. *ibid.*
Whitlows 346
Wine, which not good in gout. 454
Windes, their tempers and qualities. 14, 22
Winter, and the temper thereof, 7. how it increaſeth the native heat, *ibid.*
Wiſdom the daughter of memorie and experience. 599
Witches hurt by the Divel's aſſiſtance. 668
Wolvs, their deceits and ambuſhes. 50
Womb, the ſubſtance, magnitude, &c. thereof, 99. the coats thereof, 102. ſigns of the wounds there of, 302. ulcers thereof, and their cure, 353. when it hath received the ſeed it is ſhut up, 574. the falling down thereof how cauſſed, 606. it is not diſtinguiſhed into cells, 620. a ſcirrus thereof, 625. ſigns of the diſtemper thereof, 627. which meet for conception, *ibid.* of the falling down, pervertion, or turning thereof, 628. the cure thereof, *ibid.* it muſt bee cut away when it is putrefied, 629. the ſtrangulation or ſuffocation thereof, 632. *See* Strangulation.
Women, their nature, 20. how to know whether they have conceived, 593. their travel in childebirth, and the cauſe thereof, 601. what muſt bee don to them preſently after their delivrance, 604. bearing manie children at a birth. 654
Wonderful net. 135
Wondrous original of ſom creatures, 676, nature of ſom marine things. *ibid.*
Worms in the teeth, their cauſſes, and how killed, 413. bred in the head, 494. caſt forth by urine, 495. how generated and their differences. 497. of monſtrous length *ibid.* ſigns, 498. the cure. *ib.*
Wounds may bee cured onely with lint and water. 39
Wounds termed great in three reſpects. 252, 753
Wounds poiſoned how cured. 508
Wounds of the head at Paris, and of the legs at Avignon, why hard to bee cured. 32.
Wounds, what, the divers appellation and diviſion of them, 251. their cauſſes and ſigns, 252 prognoſticks, 253 ſmall ones ſomtimes mortal, *ibid.* their cure in general, *ibid.* to ſtaie their bleeding, 256. to help pain, 257. why ſom die of ſmall ones, and others recover of great, 273. whether better to cure in children or in old people. 274
Wounds of the head, *See* Fractures. Of the muſculous ſkin therof, 279. their cure, 280. of the face, 290. of the eie-brows *ibid.* of the eies, 291. of the cheek, 293. of the noſe, 294 of the tongue, *ibid.* of the ears, 295. of the neck and throat, *ibid.* of the weazon and gullet, *ibid.* of the cheſt, *ibid.* of the heart, lungs, and midriff, 296. of the ſpine, *ibid.* what wounds of the lungs curables 299. of the *Epigaſtrium* or lower bellie, 301. their cure, 302. of the Kall, *ibid.* of the fat, 303. of the groins, yard, and teſticles, *ibid.* of the thighs and legs, *ibid.* of the nerys and nervous parts, *ibi.* of the joints, *ibid.* of the ligaments. 305, 306
Wounds contuſed muſt bee brought to ſuppuration. 315
Wounds made by gun-ſhot are not burnt, neither muſt they bee cauterized, 309. they may bee dreſſed with ſuppuratives, 310. why hard to cure, *ibid.* why they look black, 312. they have no Eſchar, *ibid.* why ſo deadlie, 317. in what bodies not eaſily cured, 314. their diviſion, 315 ſigns, *ibid.* how to bee dreſt at the firſt, *ibid.* & 318 how the ſecond time, 319. they all are contuſed. 324
Wounds made by arrows how different from thoſe made by gun ſhot. 327
Wriſt, and the bones thereof, 171. the diſlocation thereof, and the cure.

Y.

Yard, and the parts thereof, 97. the wounds thereof, 304, to help the cord thereof, 419. the malign ulcers thereof, 475. to ſupple the deſ. & thereof for making water. 582

FINIS.

ΑΓΓΕΙΟΛΟΓΙΑ:

Or, A

Description of the Vessells in the body of

MAN,

Of the three kinds, *i.* e.

OF THE

VEINS, ARTERIES, and NERVES,

Especially of those in the Limbs and Habit of the Body:

Whereof there are also given Anatomicall Figures, (the largest and faireſt that ever were publiſhed with any ENGLISH Book.)

In three Tractates.

Translated out of the Anatomie of *Adrianus Spigelius*, by whom these parts are more largely and accurately described then by other Authors; the more ful tractation whereof, being a part of Anatomie so usefull in order to Chirurgicall Operations, hath been judged very worthy to be annexed unto this present work.

LONDON,
Printed by *Richard Cotes*, for *Iohn Clark*, and are to bee sold at the lower end of Cheapside, entring into Mercers-chappell, 1649.

The Preface.

OF how great consequence a more perfect knowledge of Anatomie is to the Art of Physick, and Chirurgery, hath been frequently and abundantly made out by Anatomists, Physitians and Chirurgeons, upon occasion, in their severall writings; though the thing it self speak so plainly in its own behalf, that much need not be said in this kind. The case is plain, that with the like facility and successe may a Mariner, making out some unknown land, steer his course through the main Ocean, where nothing but sea and skie appears, without the help of his Card and Compasse; as a Physician judg of the naturall action, or preternaturall affect of any part of the body; or a Chirurgeon institute any operation about the same, without the Anatomicall knowledge thereof; and therefore no more shall be said to this effect. Anatomie may be very commodiously reduced to four distinct kinds, or distinguished according to so many principall parts. 1. Σπλαγχνολογία, Splanchnologie, that is, the description of the Bowels contained in the three Cavities or Bellies of the body; the lower, middle, and supreme. Οστεολογία, Osteologie, which is the description of all the bones of the body. 3. Μυολογία, Myologie, being the Anatomicall history of all the Muscles. 4. Αγγειολογία, Angeiologie, describing all the Vessells of the body: i. e. the Veins, Arteries, and Nerves; these last, though having no sensible cavities, being reputed vessells in the account of Anatomists. Now though all these parts or kinds of Anatomie, are needfull both to Physick and Chirurgery; yet are they not all of a like necessity to both: but the first of more absolute neeessity to the Art of Physick; the other three, to Chirurgery. And therefore though all four have been treated on by the learned author of this Volume; yet in reason it could not but be advantagious and acceptable to Chirurgeons to have some farther helps in our English tongue, for improvement in the three later kinds before mentioned, or in some of them at least. Now for Osteologie, the parts themselves, or the dry bones are and may be kept at hand, for frequent view and contemplation upon them; whereby their severall Figures, Articulations, and all other particulars observable about them, may be rendred familiar; in order to practice about Fractures and Luxations: and without such Autopsie, much cannot

be acquired by the reading of Deſcriptions, or ſight of Delineations. Toward Myologie, there hath been a peculiar tractate of late publiſhed in Engliſh, which may be uſeful in that reſpect to thoſe who cannot peruſe Latin Authors. So that the greateſt want ſeemed to be in that kind or part of Anatomie, which is the laſt in the Enumeration, i. e. Angeiologie, or the Deſcription of the Veſſells; the more exact or particular knowledge whereof, eſpecially of thoſe in the Habit of the body, will appear, upon a true accompt, more neceſſary to the exerciſe of Chirurgicall operations, at greater certainty, and with more ſecurity, then the knowledg of the Muſcles. Upon theſe conſiderations, being conſulted by the Publiſher of this Work, what peece or Tractate in any kind, of Chirurgery or Anatomy, I thought might to good purpoſe be added thereunto; I reſolved him, that I could think of nothing more advantagious in this kind, then a fuller and more accurate Anatomicall Deſcription of the Veins, Arteries, and Nerves in the body of Man, tranſlated out of the Anatomie of Spigelius; *adding alſo the moſt uſefull Anatomicall Figures, relating to the ſaid Deſcriptions, of the ſame largeneſſe as they are in the Editions of the ſaid Author in* folio; *which were firſt taken out of* Veſalius, *and are the largeſt and faireſt that are extant: the caſe being here, as in Mathematical inſtruments, in which, how much the largeneſſe conduceth to certainty in uſe, is well known. Accordingly he hath not ſpared for care and coſt, in procuring a Scholar every way competent to tranſlate the Deſcriptions of theſe parts, out of the forementioned author; and an able Artificer to cut the Figures. And as the werk is now accompliſhed, I doubt not but good improvement may be made thereof, by ſuch Chirurgeons, as being not able to make uſe of the Originall, ſtand in need of ſuch helps, if they will not be wanting to themſelves for induſtry in the uſe hereof.*

J. G.

THE

The first Treatise, Concerning The VEINES.

CHAP. I.

Reckons up the branches or propagations of the vena portæ or the Gate-vein, and explains an Aphorism of Hippocrates, that makes very much to the purpose.

Note that the Letters, which are enclosed thus [ ] refer to the particular tables at the end of that Treatise, wherein they are set.

LEt us come now to the History of the veins, in which we will begin with the *vena portæ* or gate-vein, as that which spreads not so wide and far as the common hollow one. For it is wont to be distributed only through the lowest belly, and not at all to propagate it self out of it; nor does it branch through all the parts of that, but such only as are appropriated to the nutritive faculty, namely the Liver, the bladder of Gall, the Stomach, the Spleen, the Sweet-bread, Kall, Guts, and Mesentery, for the Hollow vein sends its propagations to the rest, as the Reins, Bladder, and those parts which serve for generation. But that the manner of this distribution may be more easily understood, for our better method in teaching, likening the whole vein to a tree, we will divide it into four parts, one of which we will call the Roots, as that part which is in the Liver; another the Trunk, which continues it self on and is not divided; a third the Branches into which the Trunk is divided; a fourth, Twigs or Sarcles, such small veins as the Trunk shoots out at its sides, before it be divided into its branches. Which terms ought diligently to be observed, because we have endeavoured by the propriety of these words to give light to this obscure Treatise concerning the veins. But that they may more easily be committed to memory, and all that concerns this business be written with more brevity, following some very learned later Authors, we will give every part its name from the place of its insertion.

Through what parts the Gate-vein is dispersed.

The division of the Gate-vein into the roots, trunk, branches and twigs.

From the outside then of the Liver some very little hairy veins are prolonged towards its inner region, and by little and little meet together into greater branches, so that at length they become five, which again gathered together like roots about the middle of the hollow side of the Liver, but somewhat hinderly near to the back, make a notable stock or Trunk, which at length issuing forth near to those eminencies of the liver, which by the Greeks are named πύλαι Gates, is cal'd the Gate-vein, and now deserves the name of a Trunk.

The Roots.

The Trunk.

This Trunk parting now from the Liver descends somewhat obliquely towards the left side, under the Gut cal'd *Duodenum*, where above the Rack-bones it gets a firm seat; but before it be divided into branches, two twigs sprout from it; the first of which being very small, arising out of the uppermost and forepart of the Trunk, as soon as it is come forth from the Liver, is scattered into the neck and body of the bladder of Gall, or into its outer coat, with a numerous succession of very little branches, such as we have said above are called hairy veins. This twig is cald in Greek κυστικὸς, in Latin you may render it *vesicalis*, the vein of the bladder of Gall. *Vesalius* sayes there are two branches, which run through the bladder of Gall, whence they are called by some *Cysticæ gemellæ*, the twin veins of the Gall, but this makes no great matter. The second twig being greater then the former, but lower, arising from the same fore part, and more to the right, is inserted into *Pylorus* or the lower mouth of stomach, into whose hinder part, which looks towards the back, it scatters many small branches, from whence it is commonly called *Gastricus*, the stomach-branch, but perhaps for memories sake it may be better termed *Pylorica*, or branch of

The twigs that grow out before the division of the trunk *Cystica*.

Gastrica.

the lower mouth of the Stomach, becauſe there are others alſo, which are called Stomach-branches.

The two branches.

Theſe two twigs being thus propagated, the Trunk runs downwards, and inclining all the way ſomewhat to the left is divided into two notable branches, a right, and a left one: the left is ſome thing higher then the right, but leſſer; the right lower, but greater: the left ſpreads it ſelf through the ſtomach, the kell, one part of the *colon* or colique gut, and the ſpleen; the right through the Guts and Meſentery that is called *Splenica* or Spleen-vein, or the linear one; this the Meſenterick.

Splenica.

Circles riſing from the upper part of the Spleenick-branch.

Now the Spleen-vein, after it is thus come forth from the Trunk, is carried athwart, being underpropt by the membrane of the Kall, toward the Spleen, into which before it be conſumed, it ſhoots forth certain twigs, both from its upper part, and from its lower; from its upper part one, that aſcending obliquely to the left ſide of the Stomach, that looks toward the back, is divided into three propagations, of which the outermoſt on either ſide are conveyed into the Stomach, and preſently ſcatter into more twigs; but the middle one aſcending through the ſame hinder part ſpreads itſelf through the upper region of the Stomach, and compaſſes the left orifice or mouth, round about like a crown, from whence it is called *Stephanitis* or *Coronaria*, the Crown-vein of the Stomach. This again ſends forth continually ſome ſmall branches upwards to the end of the Gullet, and others downwards through the Stomach. All this branch is called *Gaſtricus*, the Stomach branch, becauſe it is the greateſt, and moſt capacious of all thoſe, which come to the Stomach. From the lower part of the Spleen branch ariſe two twigs; one, which is ſmall, ſending forth other little ſprigs to the right ſide of the lower membrane of the Kell, and the colique Gut annexed thereunto, is commonly called *Epiploïs dextra*, you may Latin it *Omentalis*, the right Kall-vein. Another anſwering to that branch, which ariſes from the higher part of the Spleen-vein, and begets the Crown-vein, is inſerted in the lower membrane of the Kall, and preſently after its riſe is divided into two branches, which parting one from another a great diſtance beget many other twigs, which are ſpent upon the lower membrane of the Kall, which like a Meſentery ties the colique gut to the back, as alſo upon that part of the colique Gut, which is ſo tyed. It is called *Epiploïs*, or *Omentalis ſiniſtra*, the kinder Kall vein. After the Spleen-branch has thus ſcattered many twigs, now drawing near to the Spleen it is cleft into two branches, an upper, and a lower one; which are broken into others in the very *Parenchyma* or fleſh of the Spleen. From the upper, ſometimes before it enters the Spleen, ſometimes when it is already entered, there ſprouts forth a double or threefold twig, very famous among the writers of Phyſick, which they commonly call *vas breve* the ſhort veſſel, but we the venall, to diſtinguiſh it from the Arteriall veſſel that anſwers to it: this is inſerted into the left ſide of the bottom of the Stomach, ſometimes alſo higher, and about the left orifice or mouth. Which is the cauſe why ſome Phyſicians, and commonly Anatomiſts too have fooliſhly thought, that the melancholick humor is returned from the Spleen through this veſſel back into the Stomach, to provoke appetite. But you may often find bodies, in which it is altogether wanting. From the lower branch, which goes to the nether part of the Spleen, one propagation ariſes, which being pretty big, and notable is reflected towards the right hand, like the foregoing, and compaſſes the bottom of the Stomach on the left ſide, and alſo ſends many little branches to the higher membrane of the Kall on the left ſide; it is called *Gaſtro-epiploïs ſiniſtra*, the left Stomach and Kell-vein. There is alſo another notable branch, which is found in moſt to ariſe from the lower Spleen-branch; very ſeldom from the Spleen it ſelf. This is carried downwards, and ſcattering twigs over all the left ſide of the colique Gut, goes on further by the whole length of the ſtrait Gut, and at length determins in the membranous ſubſtance thereof, and in the fundament with many little twigs. Phyſicians make mention of this very often, and call it *Hæmorrhoidalis interna*, the inner Emroid vein, to diſtinguiſh it from the outer, which is derived from the Hollow-vein. It is truly and properly called the Emroid vein; I ſay, properly, and truly, becauſe ſometimes they call by that name the veins of the noſtrills, gums, and mouth, that caſt forth blood, and without pain. In this large ſenſe the Philoſopher took it 3. *de part. animal.* where he makes mentrious purgation alſo a ſpecies of the emroids. But the Emroids properly ſo called by Phyſicians are dilatations of this vein in the fundament, cauſed as well by black and yellow choler, as alſo by a ſalt phlegm, as by the melancholick humor. And theſe are of two ſinds; 1. Some blind piles, which caſt out no blood, but ſwell out like the ſtone of a grape into the fundament or out of it: 2. Others *aperta*, open, which caſt out the blood, which they contain. The learned *Hippocrates* hath left us a peculiar book, a golden one indeed, concerning the cure of theſe. The remaining part of the Spleen-branch is ſpent upon the whole Spleen, and therein is ſcattered into divers and very ſmall propagations, entring the very fleſh of it about the hollow, and middle line. And theſe are the ſprigs which grow out of the Spleen-branch.

1. 2.

The Meſenterick vein, or right branch of the Gate-vein is joined to the Meſentery, as ſoon as it comes from the back, and is divided into two chief branches, which paſſing through

through the Mesentery betwixt its two coats, are each of them cleft into an infinite number of small branches, and they again into less twigs, which going to the guts make up those veins so famous among Physitians, that are called the Mesaraick veins. The first of these branches is called the right Mesenterick vein from the right side, wherein it is placed, and is likewise twofold, whence it came to pass, that *Vesalius*, and almost all others, who follow him, reckon three Mesenterick veins. This branch is inserted into the *Jejunum* or empty gut, the *Ileum*, or circled gut, the *Cecum* or blind gut, and the right side of the Colique gut, where it lies next to the reins, and liver, and although both its branches shoot forth many propagations from themselves, so that it is very hard to expresse any number of them, as well because they vary much by reason of their subjects, as also because they do not observe the very same order and course, yet it hath been observed, that for the most part there are fourteen, which afterwards are scattered into an infinite company of other twigs. These when they are come to the guts, only gape with their little mouths into their coat, and enter not the cavity it self, that being compassed about within with a certain crust. But as we have said above, that in most parts of our body, the divarications or divisions of the vessels are attended with certain glandules, partly that they may make the safer progresse, partly least they should sink down, and withall the flow and ebb of the blood so very necessary be hindered; so here also the divisions of the vessels, which are scattered through the Mesentery, are bolstered up with certain glandules, which with their propagations observe such an exact proportion, that the greater glandules do sustain the greater branches, and the less the lesser. When these glandules swell with a *Scirrhus* the vessels being prest close together, and the distribution of the chylus through the veins, and consequently of the bloud through the body being hindered, there follows a Consumption, and pining of the whole body. The right Mesenterick vein.

The left Mesenterick vein is divided into the middle part of the Mesentery, and also that part of the Colique Gut, which runs from the left region of the Stomach as far as to the strait gut. The *hæmorrhoidalis interna*, or inner Emroid vein, of which we spake a little before, sometimes arises from this vein, as *Vesalius* hath observed, which affording some sprigs to the Colique gut, at last running forward through the whole length of the strait gut, descends in the fundament. The left Mesenterick.

But before the Mesenterick trunk be divided into these two branches, it first sends forth two propagations, one of which is called *Gastro-epiploa dextra*, or the Right Stomach and Kall-vein, which creeps through the right bottom of the Stomach, before, and behind, as also through the upper membrane of the Kall: the other called by others *Intestinalis*, or the Gut vein, by us the *Duodena*, reaches to the middle of the Gut *Duodenum*, and the beginning of the Empty gut or *Jejunum*, and descends all along through them. Propagations that arise before the division of the Mesenterick, *Gastro-epiploa Dextra*. *Intestinalis*.

The chief use of the Gate-vein is to nourish those parts, which are seated in the lowest belly, and need a thicker and more feculent bloud, such as are all those parts, which serve for nutrition. For their blood ought to be thicker, that it might be hoter, when heat is alwayes more powerfull in a thicker body: so then the Roots of the Gate-vein nourish the Liver, the Trunk nourishes the *Pancreas* or Sweet-bread; of the Twigs, the *Cysticus*, or Gall-twig nourishes the bladder of the Gall; the Spleen-branch, all the entrails, which serve for nutrition, except the Mesentery, and the Guts; the Twig *Pyloricus*, or of the lower mouth of the Stomach, the *Gastricus* or Stomach-branch, both the Stomach and Kall-veins, and the short vessell nourish the Stomach. The first use of the Gate vein.

For I do not think that the short vessell was made by nature for the carrying back of melancholick humor to the Stomach, but chiefly for its nourishments sake; when that bloud, which is generated in the Spleen, is not melancholy, and excrementitious humor, but rather the best, although somewhat thicker then other bloud, and that because the parts that are to be nourished by the Spleen branch, needed a thicker bloud, then they which are to be nourished by the Mesenterick. Both the Stomach and Kall-veins nourish the upper membrane of the Kall; the right and the hinder *Epiploa*, or the Kall-veins, the lower. The Spleen is nourished by those two branches, into which the Spleen-vein is cleft, and which enter its *parenchyma*, or flesh through its middle line: the Mesentery, and almost all the Guts by the two Mesenterick branches; the Gut *Duodenum* by the propagations called *Duodena*; but the empty Gut, the *Ileum* or circled Gut the blind Gut, or the right side of the Colique or *Colon* by the right Mesenterick-branch. The left side of the Colique, and all the strait Gut by the hæmorrhoidall vein; but the middle part which lies under the Stomach, by the hinder Kall-vein. The second use is to attract the *Chylus*, and carry it to the Liver; whose veins are most fantous for the making of bloud. But the same veins which nourish the Mesenterick branch, do also attract the *chylus*, as we shall shew you hereafter, when we shall insist upon the History of it. The second use.

The third use is to empty out the excrements from the body through the Guts. Thus we see that the cholerick humor is sometimes poured forth out of the Liver through the Mesenterick-branch in the bloudy flux, and cholerick loosnesse, and the melancholick dregs through the Emroid-vein. The fourth use is, to help the concoction of the Liver. Thus we see that the thicker part of the *chylus*, which is called melancholy, is attracted by the splenick branch, not that the seat of melancholy The third use. The fourth.

is in the Spleen, but that it may be more attenuated, and better concocted by the benefit of the arteries, which are moſt abounding in the Spleen, and ſo not diſturb, or hinder the concoction, which is famed to be in the veins of the Liver, as it uſually happens, that whenſoever the Spleen is troubled with any diſeaſe, the work of making bloud is preſently harmed.

The explanation of a certain *Aphoriſm* of *Hippocrates.*

But becauſe there has been mention made here of the Emroid veins, it ſeemed, that it would not be unſeaſonable if I did refer to this place the explanation of a moſt excellent Aphoriſm, which is the twelfth of the ſixth Section, when it cannot be underſtood without the Hiſtory of Anatomy, and is not ſo faithfully explained by others, as was neceſſary. *Hippocrates* writes in it, αἱμορροΐδας ἰσθίῳ χρονίας ἢν μὴ μία φυλαχθῇ λείπεται ὑδρωπικὸν ἢ φθίσιν, that is, he that is cured of old Emroids, unleſs one of them be preſerved, is in danger of falling into a Dropſie, or Conſumption. In explanation hereof we will firſt doubt of the Aphoriſm, then we will deſpute of the manner whereby a Dropſie, or Conſumption follows upon the cure of old Emroids. But we may not without cauſe doubt of the truth of it, becauſe the ſame *Hippocrates* in a Book concerning the Emroids, which I think to be very much his own, whatever *Mercurialis* ſay though otherwiſe a moſt learned man, bids us to turn the Emroids, and forbids us to leave any unburnt, but to burn them all. And truly *Aetius* in his 14. Book, deſirous to reconcile theſe two places, at thoſe words ἢν μὴ μία φυλαχθῇ, that is, unleſs one be preſerved, being overcome, thinks that a manner of diet is to be underſtood, not an Emroid, as if *Hippocrates* ſhould ſay: Thou ſhalt not cure one that hath long had the Emroids, unleſs the Patient will diligently obſerve a convenient manner of diet preſcribed by thee; for otherwiſe there is danger of his falling into a Dropſie, or Conſumption. But *Galen* in his Comment upon that Aphoriſm writes expreſly, that *Hippocrates* ſayes, that unleſs one Emroid be preſerved, ſuch danger will enſue, and makes no mention at all of diet. And, what is more, dayly experience ſufficiently witneſſes, that ſuch miſchiefs do enſue though never ſo exact a diet be kept, and the reaſon taken from the manner, wherein they happen, and which we ſhall preſently explain, does abundantly manifeſt it. Whence it is evident, that theſe two places of *Hippocrates* are left to him controverſie, and contradicting one another from this anſwer of *Aetius*. But the right anſwer will be, if we ſay, that *Hippocrates* when he writes in his Book of the Emroids, that for a perfect cure they muſt all be burnt, ſpeaks not of old Emroids, but of ſuch only as are lately come, or when nature has already endeavoured to expell the humor, which was otherwiſe purged out of the Emroids ſome other way, whether it be by iſſues, or by a Fiſtula, or ſome ulcer in the leg. For ſuch may be very well and without danger of Conſumption, or Dropſie, the rather, if the entrails be yet whole and ſound, and eſpecially if a good rule of diet follow. Nor does the cure of all old Emroids neceſſarily bring on a Dropſie or Conſumption, but only for the moſt part they threaten a danger of theſe diſeaſes to enſue, for ſometimes the melancholick matter being hurried up into the brains, there follows madneſs, as it happened to *Alcippus*, in *Hippocrates* 4. *Epidem.* For, ſayes he, this *Alcippus* having the Emroids was forbidden to be cured, for after the cure he fell madd, but an acute Feaver following it, he was recovered. For explanation of the ſecond doubt, firſt let us hear *Galen* for he in his Commentary upon the Aphoriſm, ſayes "That the Emroids come by reaſon of faeculent and me-"lancholick bloud, which the Liver drives down to the mouths of certain veins, and ſo "this way being ſtopt, and abundance of groſs humor burdens the Liver, and diſſes the "naturall heat, which being extinguiſhe, no more bloud is generated, but only water, "which nature afterwards driving it into the *abdomen*, or paunch, makes a Dropſie. But if "the Liver ſend that abundance of melancholick humor to the Lungs, ſome veſſell being "broken, there follows a Conſumption. This interpretation of *Galen*, beſides that it ſeems very obſcure to us, is not altogether agreeable to truth. For firſt, it is falſe in my judgment, which *Galen* ſets down in his Comment, that it is impoſſible, that the Emroids ſhould be cauſed without an abundance of faeculent and thick bloud; when it may be proved both by reaſons, and authority, that they come alſo from choler and phlegm. By
1. the authority of *Hippocrates*, who in the beginning of his Book concerning the Emroids, witneſſes that this diſeaſe is cauſed in this manner; to wit, when choler, or phlegm falling down into the veins of the Straight-Gut, heats the bloud, which is in the veins. For theſe veins being heated attract the bloud out of the little veins, that are near, and when they are filled, the inward part of the Seat ſwels, and the heads of the veins appear out of it.
2. But by reaſon it is proved thus; when madneſſes are cauſed by phlegm, or choler, as *Hippocrates* witneſſes in his Book *De Morbo Sacro*, the ſame Author in the 6. Aphoriſm, 21. profeſſes that that madneſs is taken away, if there follow ſwellings of the veins, or Emroids in thoſe that are ſo mad. Now the madneſs would not be taken away, if melancholick humor did only come forth by the Emroids; for then the cauſe of the diſeaſe would not be purged out. But I my ſelf alſo have ſeen formerly in *Germany* ſome Noblemen, that were troubled with ſalt catarrhs, afterwards recovered by a great flux of the Emroids, that I am of opinion, that not only melancholy, but alſo ſalt phlegm and choler are wont to purged out by the Emroids. Wherefore if it happen, that one, who has been long-trou-

bled

bled with the Emroids, be cured afterwards, that choler and phlegm, either breed, obstructions in the Liver, or Spleen, or being gathered together in some plenty by stretching the vessels contained in the *abdomen*, or paunch, breaks through them, or by their quality corrodes and eats their way out, and makes a Dropsie in the *Abdomen*; or else by raising obstructions in the Liver, and extinguishing the naturall heat, generates much water, and serous humor in stead of bloud, which passing through the veins, make a *species* of the Dropsie called *Leucophlegmatia*. But if this humor go back to the Breast, or Lungs, it breaks through, or eats out there a way, and hence follows a spitting first of bloud, then of corrupt matter, and from thence at last a Consumption, as *Hippocrates* teaches in his Aphorisms. But in this place it is first of all to be observed, that there are two sorts of propagations of veins, which make the Emroids: for there are some propagations of the Gate-vein, of which we have already treated; but there are others of the Hollow-vein, which arise from the Iliacall branches, of which we are to speak hereafter. Now if the forementioned humors, whether melancholick, or choleriek, or phlegmatick, and late, flow through the propagations of the Gate-vein, the internall Emroids are caused, which being cured, the matter flows back into the branches of the Gate-vein, that are scattered through the lower Belly into which the veins being loaden with these humors unburden themselves, and make a *species* of the Dropsie called *Ascites*. But if they flow through the branches of the Hollow-vein, they cause the external Emroids, and these being cured against the Precept of *Hippocrates*, there is danger of a Consumption to ensue, because from hence there is an easie passage of the peccant matter through the Hollow-vein to the Lungs, and so to the Heart. And this is that which we have of a good while observed, that many, who have been long troubled with Fistula's of the Fundament, and afterwards cured, through the ignorance of Physitians, have fain into a spitting of bloud, and then into a Consumption. Nay we remember, that a maid was once cured by us in *Germany*, which had a Fistula in the middle of her Hip, and for three years had sought help from many in vain, but being cured shee fell at length after three or four months into a spitting of much bloud. Although shee was scarse ten years old, I let her bloud presently in the foot of that side on which shee had been troubled with the Fistula, and purging her body, and laying on a cautery near the place, in which the Fistula had been, I easily freed her in this manner from imminent danger of a Consumption. This spitting of bloud happened from no other cause, but that sharp and choleriek matter, which when it could no longer find a way out by the Fistula, got up afterwards to the Lungs through the branches of the Hollow-vein. But *Hippocrates* sayes expressly, that there is danger of a Dropsie, or Consumption to follow, because it sometimes falls out, that neither of these happen, but rather some other disease insues, as it happened to *Asclepius*, who fell into a madnesse, and from that into an acute Feaver: sometimes also the bloudy flux follows, and other mischiefs. Sometimes also it happens, that they who are so cured, are preserved still in health, by abundance of urine, sweatings, remedies, and a good rule of diet.

CHAP. II.

Treats of the superior, or ascendent Trunk of the Vena Cava, *or Hollow-vein, and the branches which it scatters through the Head.*

WE are now to consider the other vein, which as we told you is called *Cava*, the Hollow one [a], which spreads it self much wider, then the Gate-vein, as being distributed throughout the whole body. For its office is to nourish all those parts of our body, which conduce not to the concoction of the food, and those parts being spread far and wide, it is necessary, that the Hollow-vein also be very large, and extended to a great length: and because they ought to be nourisht with a thinner, and more elaborate bloud, and not so thick and faculent, as that wherewith the Stomach, Spleen, and Kall are nourisht; therefore the bloud which the Hollow-vein makes, and carries, is also more pure, thin and sincere. The use of the Hollow-vein.

In delivering the History of this vein, although we are not of their opinion, who derive its beginning either from the Liver, or heart, yet because we must begin our Treatise of it somewhere, we thought fit to follow the receiv'd custome of Anatomists, and so for perspicuities sake we shall alwayes speak of it, as if it took its birth from the Liver. It may be added, that it spreads certain roots as it were in the Liver, just like the Gate-vein, in the History of which, when for that reason we took our rise from those roots, we may not without cause begin thence also with the Hollow one. But this vein although it run directly through the whole Trunk of the body, and make one very notable stock [D] that is drawn out through the middle, and lowest belly, like one straight line continued, or rather in manner of a channell, or conduit pipe, is notwithstanding wont to be divided into two by reason of the Liver, and so one to be called the Ascendent Trunk, the other the Descendent. For indeed that is not true, to which many perswade themselves, that The method to be observed in the History of this Vein.

that the Hollow-vein in its going forth from the Liver, like the great Artery, when it comes out of the heart, is cleft into two Trunks; but if hereafter they be called Trunks by me, you muſt beleeve, that I do it only for orders ſake in teaching. The Aſcendent therefore or upper Trunk [A.D.] is that which ſtands about the Liver, and is terminated about the *Jugulum*, or Hollow of the Neck; but that is called the Deſcendent one [T.V.] which is beneath the Liver, and reaches down as far as the Legs. For both of them are afterwards divided into branches; of which they of the Aſcendent [m and q] are carried upwards to the Head, as the Jugular or Neck-branches; or to the Arms, as the *Brachiales* [G and I] or Arm-veins; theſe of the Deſcendent Trunk to the Legs, and are called the Crurall branches. [T]. We will ſpeak therefore of all theſe in order, ſo that we firſt deliver the Hiſtory of the Aſcendent Trunk, then of its branches, that grow up partly to the Head, partly to the Arms, after that we will come to the Deſcendent Trunk, and its branches, that are digeſted into the Legs.

The Aſcendent Trunk.

As therefore we have ſaid, that many little Veins like roots grow out of the Hollow ſide of the Liver, which alwayes by degrees inſerted into the greater veins, and all of them at length meeting together about the middle of it did make a Trunk; ſo in the ſame manner out of a circuit of the Convex ſide of the Liver a numerous propagation of veins iſſues forth, which afterwards meet together in one Trunk. This Trunk makes its way through the nervous part of its Midriffe on its right ſide, and paſſing through it goes undivided to the *Jugulum*, or Hollow of the Neck, and becauſe it climbs upwards, it is commonly called the Aſcendent Trunk by them, who conceive that the Hollow-vein riſes out of the Liver. It is much greater then the Deſcendent, becauſe the upper parts are nouriſhed by it alone; but almoſt all the inferior parts, that are contained in the loweſt Belly, by the Gate-vein. But although it be not parted into any branches, untill it come to the *Jugulum*; yet before that it ſpreads ſome propagations at its ſides, and of thoſe, three notable ones. The firſt [e e] is that which is called *Phrenica*, or the vein of the Midriffe, on either ſide one, and is diſtributed throughout the whole Midriffe, which is called *epiris*, with a numerous iſſue, ſending little branches to the neighbouring *Pericardium*, or purſe of the Heart, and the *mediaſtinum*, or partition of the Cheſt; which when it has now got above, and entred the Cheſt, it inclines a little to the left hand, and enters the *pericardium*, and being hidden very cloſe over againſt the eight rack-bone of the Cheſt, is very ſtrongly infixt into the Right ventricle [C] of the heart; that *Ariſtotle* did not without cauſe gueſſe, that it ſprung from hence. But before it be ſo infixed, it ſends out another propagation [b b] which is a notable one, and extends itſelf by the hinder part of the Heart, and the left ſide of it, towards the forepart, compaſſing the *baſis* of the Heart like a Crown, from whence it is called *Coronaria*, or the Crown-vein of the Heart. This ſcatters many branches through all the outer ſurface of the Heart, but eſpecially through the left ſide, as that which needed a more copious aliment then the right ſide, becauſe of the continuall, and greater motion there. But becauſe the fleſh of the Heart is hard, and ſolid, it ought therefore to be nouriſht with a thicker bloud, from whence it is, that this branch grows out of the vein, before it enters the Heart, to wit, when the bloud is ſomewhat thicker, and not yet attenuated in the cavities of the Heart. Near to the originall of this there is a little valve, or floud-gate, which hinders the bloud from flowing back to the Hollow-vein, as it might eaſily do by reaſon of the continuall motion of the Heart. When the Hollow-vein has now gotten above the Heart, it becomes leſſer, and perforates again the *Pericardium*, and forſakes the Rack-bones of the Back, and being got above the Gullet, the rough Artery, and the *aorta*, or Great Artery, (which lean ſo upon one another, that the Gullet takes hold of the bodies of the Rack-bones, the rough Artery lies upon that, and the *aorta* again upon this) it climbs upwards through the midſt of the diviſion of the Lungs, where the right part is ſeparated from the left. But becauſe by this means it could not get to the Back, and the little branches, if it ſhould have ſent forth any ſuch, had been very liable to danger of breaking, being ſo hanged up; therefore it ſends forth a third propagation [c c] as ſoon as it is got out of the *Pericardium* or purſe of the Heart. The Greeks call this vein ἄζυγον, the Latins *ſine pari*, or *carens conjuge*, without a companion, or wanting a mate, becauſe in a man there is but one, and it has no companion, or mate on the left ſide, as other veins have; though in creatures that chew the cud, it is double, and plainly to be perceived of both ſides. But it iſſues forth about the fifth Rack-bone of the Cheſt out of the hinder part of the Hollow-vein, and the right ſide, and goes downwards, not directly, but inclining a little toward the right hand as it were reflected backwards to the Back-bone: but as ſoon as it reaches the eighth, or ninth rib, it is cleft above the Spine of the Back into two branches, which running downwards paſſe through the diviſion of the Midriffe, which is betwixt its two productions, and ſo are ſpread abroad into the loweſt Belly: Of theſe the left, which is ſometimes the greater, hiding itſelf about the tranſverſe Proceſſes of the Rack-bones, and under the left production of the midriffe and the originall of the firſt bending muſcle of the thigh, is inſerted into the left Emulgent, either near to its beginning, or (as it oft happens) into the middle of it. But the right, running on likewiſe under the mem-

Propagations of the *Aſcendent* Trunk *Phrenica.*

Coronaria.

Ἄζυγος.

branes

branes about the transverse processes of the right side, and the right production of the *Septum* or Midriffe, and the beginning of the same fifth bender of the thigh, which keeps the right side, is implanted sometimes into the very Trunk of the Hollow-vein, sometimes into the first vein of the Loins. And we are indebted for this observation to the learned *Fallopius*, who would have the matter that is gathered together in the Chest, whether it be watery, or purulent and corrupt, or sanguinous, to be evacuated by the benefit of the left branch of this vein; of which notwithstanding we will say something briefly in the following Book. But this vein in its journey downwards shoots forth twigs of both sides, as well right, as left, of which the right are more notable, and larger, of which there are numbred almost always ten; which run out to as many distances of the lower ribs, and make the inferiour Intercostall veins. But I say they are almost always ten, because it happens very seldom, that all the distances of the ribs receive branches from this vein, the two uppermost, to wit, the first and second distance getting their furcles or twigs from the fourth branch, that is prefently to be mentioned. But these twigs run straighe forwards near to the lower side of the ribs, where there are cavities cut out for them, as we have taught in the second Book. And truly this place is diligently to be taken notice of by Students in Chirurgery, because of the opening of the Chest in the disease called *Empyema*, that they may know that incision is to be made in the uppermost place of the rib, because in the lower the veins would be harmed to the great indangering of life. But these veins do not run through the whole length of the true ribs, but are terminated together with the bony part. But the propagations of the Mammary vein nourish the six distances between the gristles of the seven true ribs, as we shall tell you by and by. Yet in the falsard ribs they run even beyond the Gristles towards the *Abdomen* or Paunch, into whose Muscles they insinuate themselves. But there are certain other little branches propagated from the same vein, by which nourishment is derived to the marrow of the Back-bone, and the Muscles, to wit, those about which they are carried: some also are implanted into the *Mediastinum* near to the back. This vein *the vein without a* companion, being thus constituted, the Hollow-vein ascends to the *Jugulum*, or Hollow of the Neck [D] being supported by the *Mediastinum*, and a certain soft and membranous body, which the Greeks call [illegible], and is placed in the highest part of the Chest, to defend the divarications of the veins there hanging up from all danger of breaking.

The division of the Hollow-vein into the two Subclavian branches.

And here the Hollow-vein is first divided into two [illegible] branches [E E] from which all those veins arise, that run as well to the [illegible] as to the [illegible], or to certain Muscles of the *Abdomen*. Of these one goes to the right [illegible], the other to the left, which as long as they yet are in the Chest, are called *Subclavian*, [illegible] because they go under about the *clavicule*, or Collar-bones; but as soon as they have got out of the Chest, and attain to the Arm-hole, they are named *Axillares*, the Axillary-veins [F]. From both of them very many propagations issue forth, some of which arise from their upper part, and some from their lower. In our recitall of them we will observe this order, that they which are nearest to the Trunk, shall be first mentioned by us; and they last, which are farthest from it.

Propagations from the lowest part of the Subclavian branches. *Intercostalis superior.*

The first propagation then issues out near the very root of the divarication or division of the Trunk, and is called *Intercostalis superior*, the upper Intercostall vein; [G] there is of either side one, which being very little, and descending along by the roots of the ribs, as far as to the third rib, sends two twigs [I I] overthwart, like the vein *sine pari*, to the two distances of the upper ribs. But if the vein *sine pari* sends its propagations to all the distances (as it sometimes happens) then it is wanting not without cause. Sometimes the same vein arises from the Trunk of the Hollow-vein, before its division into the Subclavian branches.

Another vein [H] sometimes arises from the fore-part of the bifurcation; sometimes from the root of the Subclavian branch, and is double, of either side one; sometimes also only one grows out of the middle of the Trunk, before it be divided; which at length, when it has attained unto the Breast-Bone, is parted into a right, and a left branch. For Nature is wont to sport, as sometimes in its other works, so especially in the rise of veins, so that they are not spread in all bodies after the same manner. But this is called *Mammaria*, the Mammary vein, which, which soever is arise, going toward the fore-part, drives to get up to the higher part of the Breast-Bone, and descends by the sides of it, and when it is come to the Breast-blade, about its sides goes out of the Chest, and runs obreddy under the right Muscles of the *Abdomen*, even to the Navill, near to which it is joyned by an Anastomosis, or inoculation [K] with an Epigastrick-vein [L] that ascends and thereto it, by the benefit whereof arises that notable sympathy betwixt the womb and Breasts of women, of which we shall speak more hereafter in the eight Chapter, when we shall intreat on their history of the Epigastrick-veins. But before it leave the Chest, in its descent, it distributes one branch a piece to the six distances betwixt the Gristles of the seven upper true ribs, of either side, which are terminated with the Gristles near to the end of the bony part of the ribs, in which place we told you that the branches of the vein *sine pari* (whose extremities or ends are joyned) were ended. From these veins,

Mammary.

veins, which are diſtributed in this manner to the diſtances of the Griſtles, ſome others very worthy of our notice do ariſe, which are diſſeminated both into the Muſcles, that lye upon the Breaſt, and into the Paps. Near to theſe a third [h] ariſes, and ſometimes alſo grows out of the Trunk, which is called *Mediaſtina*, becauſe it ſpreads itſelf into the *Mediaſtinum*, or membrane that cloſes up the cavity of the Cheſt, being extended all along by it, with the left Nerve of the Midriffe. The fourth [i] commonly called *Cervicalis*, or the Neck-vein, is a large vein of both ſides which running obliquely, upward, and backward, to the Tranſverſe proceſſes of the Rack-bones of the Neck, and climbing up through their holes, (from whence perhaps it might be better named *Vertebralis*) affords ſprigs to the Muſcles, that lye next upon the Rack-bones. When this vein has got above the Tranſverſe Proceſſe of the ſeventh Rack-bone, it derives a notable branch of the *Sinus* or *Canale*; in the Neck, through the hole that is made for the outlet of the Nerves; and then another, when it comes above the Proceſſe of the fixt Spondyll, or Rack-bone, and again another, when it has left the fifth Spondyll, untill at laſt it comes to the Proceſſe of the firſt Rack-bone, which notwithſtanding it does not touch, much leſſe does it paſſe into the Skull, (as *Veſalius* would have it) near which it goes partly to the ſame *ſinus* or canale, partly it is diſtributed into the hinder parts of the Neck. For there are two long *ſinus* filled with bloud, which are made out of the hard membrane of the Brain, one of each ſide, being placed at the ſides of the marrow of the Neck. From theſe little branches are diſtributed, which nouriſh the marrow of the Back-bone, and the neighbouring parts; they begin about the Junćture of the Head with the firſt Rack-bone, and end near to the ſeventh Rack-bone of the Neck. Theſe two *ſinus*, of which one is of the Right, the other on the Left ſide, have ſome communion betwixt themſelves by a little pipe, and that a ſhort one, which is derived overthwart from the one to the other, for the moſt part about that region of the Neck, which is betwixt the ſecond, and third Rack-bones. At laſt there is a fift vein [l] which ariſes from the hinder part, called *Muſcula inferior*, or the lower Muſcle-vein, which is diſtributed in many branches to the Muſcles in the lower part of the Neck, (and ſo extending the Head and Neck, from whence the vein might be rightlyer called *Cervicalis*, or the Neck-vein) and alſo to thoſe in the higher part of the Cheſt near to the Rack-bones.

Mediaſtina.

Cervicalis.

Propagations that ariſe from the upper part of the Subclavian branches.

From the upper part of the Subclavian branches, whileſt the Hollow-vein is yet in the Cheſt, three propagations iſſue forth, two of which do very well deſerve to be noted, which take their way upward, under the Muſcles that bend the Head. The former of the two looks more inwards, and is called *Jugularis interna*, the inner Jugular vein: the other inclines to the outer parts, and is commonly called *Jugularis externa*, the outer Jugular vein. For both of them ariſe near to the *Jugulum*, or Hollow of the Neck, and aſcend by that to the Head. The inner is greater, and the outer leſſe in a man; but in Brutes 'tis contrary. But when almoſt all Appellations are derived, and that beſt, not from the place, through which the veins paſſe, but from their inſertion; perhaps they might be rightlier named *Cephalicæ* or *Capitales*, Head-veins. The inner Jugular vein [m] takes its originall near to the joint, by which the Clavicles or Patel-bones are tyed to the Cheſt, and as ſoon as it ariſes, is joined with the *arteria carotis*, or ſleepy Artery, and a Nerve of the fixt pair, as companions in its journey, at the ſide of the rough Artery, and climbing to the Chops, about the middle of the way is parted into two branches, of which one is called the outer, the other the inner branch. The outer is ſo called, becauſe it comes not into the inner parts of the Head, but being divided into two at the corner of the lower Cheek, diſtributes one branch to the Chops, and the other near to the Ears, and Face. The inner branch, all the way, is joyned to the *Arteria Carotis*, or ſleepy Artery, even to the baſis of the Skull, whither when it is arrived on the backſide, it is likewiſe cleft into two branches, but of unequall bigneſſe. For the firſt [n] is greater and more hinderly, being carried backward obliquely, which having propagated ſome twigs to the Muſcles under the Gullet, and in the forepart of the Rack-bones of the Neck, through the ſecond hole of the *occipitium* or Nowl-bone enters the Skull with the leſſer branch of the *Arteria Carotis*, through which ſaid hole the fixt pair of the Nerves deſcends: and thus this branch enters the firſt [1] and ſecond [2] *ſinus* of the thick membrane. The ſecond branch [p] being ſmaller, and more to the forepart, quite forſaking the *Arteria Carotis*, or ſleepy Artery, goes to the forepart of the Head, and after that by the way it has beſtowed a Circle not very notable upon the Organ of hearing, it enters the Skull through the ſeventh hole of the Wedg-bone, or *Os cuneiforme*. This is diſperſed through the *baſis*, and ſides of the thick membrane, with a numerous iſſue of branches, the prints whereof are obſerved in the inner ſurface of the bones of the forepart of the Head, as we have ſaid above in the ſecond Book. Wee will call theſe two branches, becauſe they go to the brain, *Encephalici*, as if you ſhould ſay *Cerebrales*, of the brain, and that ſhall be the greater *Encephalicus*, this the leſſer. The externall Jugular vein [q] aſcending under the skin, and the *muſculus quadratus*, or Square-Muſcle, that draws down the Cheeks, by the ſides of the Neck, when it comes to the Ear, is cleft into two branches [r] one of which I call *Profundus*, the deep one, becauſe it enters the Muſcles, and retires

Jugularis Interna.

Jugularis Externa.

Profundus.

into

into the more inward parts, the other *Cutanes* the Skin-branch. The deep or inner one [s] in its first divarications meets with Glandules about the Chops, and sends forth propagations worthy of our notice to the *Larinx* or Throttle; and the Glandules, that grow to it, as also to the Muscles of the Chops, and of the bone called *hyodes*, among which that which creeps all along under the tongue, is a notable one, and is scattered into many little branches, which are seen, if the Tongue be lift up, even before dissection. From this deep branch three others arise, which enter into the inner parts of the Head, and the Skull. The first, after it has spread little branches into the Chops, and Mouth, enters the Skull, through the first hole of the Temple-bone. The next [e] passes out of the forepart of the eye through the second hole of the Wedg-bone, at which the second pair of Nerves gets out, and runs with some circles through the thicker Membrane upwards. The third is scattered out of the breadth of the Nostrils through the hole of the *Os cribrosum*, or sive-bone into the same Membrane. These two nourish this forepart, to which the third *sinus* reaches not, but ends near to the partition of the Mamillary Processes. But the outer or Skin-branch [u] creeping by the skin of the Head, and stayed up with the Glandules under the Ears, which they call *Parotides*, is divided into two branches; of which the Anteriour [x] is carried upward obliquely through the Cheeks to the inner corner of the Eye, distributing little branches by the way to the Nose; and going on to the Eye-brow, is joyned with the remainder of the branch of the other side, and makes the Strait-vein, which they call *vena frontis*, the Forehead vein, [y] and which in madnesse is opened to very great advantage. To this the *Satyrist* alludes, when speaking of a certain foolish fellow, hee sayes,----*Medianı pertundite venam.*

Three branches entring the skull.

Cutaneus.

The other or Posteriour branch is carried behind, and sends branches to the Temples [z] and skin of the Back-part [a] of the Head. A third vein, which arises out of the upper part of the Subclavian branches, is commonly called *Muscula superior*, the upper Muscle-vein, in relation to another of the same name arising out of the lower part. It issues out near to the externall Jugular vein, and is dispersed into the Muscles, and skin of the back-side of the Neck, in regard whereof we shal not do amisse to cal it *Cervicalis superior* or the higher Neck-vein [β]. But now let us return to the distribution of the Subclavian-vein, from which we have digrest. This vein, as soon as it gets out of the cavity of the Chest, is called *Axillaris* [F], and when it comes to the Arm-pit, is divided into two notable branches, called *Cephalica* or Head-vein [G] and *Basilica* [I], which are afterward dissеminated throughout the whole Arm. But before the Axillary-vein be thus divided, it sends forth two twigs: the first [γ] is called *Scapularis interna* the inner Blade-vein, and is distributed through the Muscles on the inside of the Shoulder-blade: the other [δ] is named *Scapularis externa*, or the outer blade-vein, it is a pretty big one, and is implanted into the Muscles of the outer, and gibbous part of the same Shoulder-blade. But the vein *Basilica* also, before it enters the Arm, shoots out two propagations; one called *Thoracica superior*, or the upper Chest-vein [ε] because it arises out of a higher part then the following, it is a very notable one, and runs through the inside of the pectorall Muscle that brings the Arm forward to the Brest; it distributes branches also to the other Muscles of the Brest, as also to the Skin of the Dugs in women. The other is called *Thoracica inferior*, the lower Chest-vein [ζ], a great and notable one likewise, which descending along the side of the Chest is distributed especially through the third bread Muscle or *Latissimus* that moves the Arm backward, scattering many little branches from itself, which afterwards are joyned by *Anastomosis* or inoculation, with the branches of the vein *sine pari*, that fall out of the Chest. And this vein sometimes grows out of the former, or the upper Chest-vein. These branches being thus distributed, the Axillary-vein reaches into the Arm.

CHAP. III.

Shews how the Axillary-vein is distributed through the Arm.

THe Axillary-vein [F] therefore is cleft into two branches, as soon as it comes near to the Arm, but those branches are of different bigness. For the upper [G] which they call *Cephalicus*, the Head-branch, is smaller; but the lower vein [I] called *Basilica*, is almost thrice greater. The Cephalick also is as it were wholly just under the skin, & sinks not with above one branch into the deeper retreats of the Muscles; wherefore it has neither Artery, nor Nerves for its companions, they being addicted to the more inward rooms of the body. But the Basilick-vein partly creeps on under the skin, partly hides itself under the Muscles, and therefore it ought with good reason to exceed the other in bigness, as being destined for the nourishment of more parts. It hath both Nerves, and Arteries as companions in its journey, which is the cause, why upon the cutting of this vein the bloud spins out with a force; but of the

The division of the Axillary vein.

contrary, the Cephalick being cut, it comes forth ſoftly: which we ſee ſome Phyſitians unskilfull in diſſections, ſtanding by whileſt the vein is opened, fooliſhly refer to the ſtrength, or weakneſſe of the mind, or body. We are now to ſpeak briefly of the manner of the diſtribution of both theſe veins through the Arm, beginning from the upper, as the leſſer branch.

The Cephalick vein.

The *Cephalica* [G] therefore is called by *Veſalius Humeraria*, or the vein of the Arm, becauſe by the Arm it deſcends into the Hand; by others *Cubiti exterior*, the outer vein of the cubit, from its ſituation, becauſe it runs on the outſide of the Cubit, as the *Baſilica* contrariwiſe does on the inſide. By ſome later writers it is commonly called *Cephalica*, the Head-vein, becauſe it is wont to be opened in diſeaſes of the Head, through the error of the Ancients, who thought ignorantly, that it ariſes from the external Jugular vein, and therefore empties the bloud immediately out of the Head. But it ariſes from the upper part of the Axillary vein, & climbing over the Tendon of the *Serratus minor*, or leſſer Saw-Muſcle, that bends the Shoulder-blade forward to the Breaſt, it runs betwixt the Muſcle called *Deltoides*, which lifts up the Arm, and the beginning of the Pectorall Muſcle, which brings it forward to the Breaſt, where it ariſes from the Clavicle or Coller-bone, and ſo it runs down by the Arm to the outſide of the firſt Muſcle that bends the Cubit, which they call *Biceps*, or the double-headed Muſcle; by reaſon whereof the more learned Chirurgeons have wiſely uſed to make iſſues betwixt the Muſcles *Biceps*, and *Deltoides*; for iſſues ought alwayes to be made at the ſeat of ſome notable vein, that the matter may more eaſily be voided out. But although this vein be not divided into branches, whileſt it is thus carried down by the upward part of the Arm, yet it ſcatters ſome twigs [u and e] of both ſides into the aforeſaid Muſcles, and the skin. At length when it is come to the Cubit, it runs under the fleſhy Membrane, as a vein under the skin ſhould, and ſo preſents itſelf to the ſight without diſſection. But about the very joint of the Cubit at the externall protuberation of the Arm, it is wont to be divided [H] for the moſt part into three branches, an outer, an inner, and a middle one. The two former run under the skin, the third deeper.

Three branches of the Cephalick-vein.

The firſt or middle one, [i] which is often wanting, is very little, and deeper, and penetrates into the ſubſtance of the Muſcles, eſpecially of thoſe two, that bend the ſecond, and third joint of the fingers, as alſo of the long *ſupinator* of the *Radius*, or wand of the Arm. The ſecond [x] and inner, and chief of the three branches is carried down obliquely under the skin, and joins with the inner branch of the *Baſilica*, three fingers below the joint of the Cubit, with which it makes up the vein, that Phyſitians call *Mediana*, the middle vein [λ]. This running down obliquely by the middle Region of the Cubit, diſtributes many Circles to the *Radius* or wand, and at length itſelf is divided into two leſſer branches; of which the outer [ρ] goes to the inſide of the wriſt, toward the thumb; the other and inner [σ] runs to the fore, and middle fingers. The outer of theſe is called by ſome *Cephalica manus*, and is opened to very good purpoſe in diſeaſes of the Head, or Teeth. Now the third branch [π] or outer Cephalick-vein climbs up to the Muſcle called the long *ſupinator* of the *Radius*, or wand, diſperſing divers little veins into the skin, and ſo is carried obliquely [ρ] through the *Radius*, or wand, and having attained to the middle of its length enters the outſide of the Cubit, and in that ſame place is joyned with a little branch [τ] of the Baſilick-vein; being united thereto it goes on to the outſide of the wriſt; and diſtributes veins to that part of the Hand, which lies before the little, and Ring-fingers, as alſo to the fingers themſelves. This vein, eſpecially that, which reſpects the little Finger, is commonly called *Salvatella*, and the Section of it is much commended by Practitioners in Phyſick in melancholy diſeaſes. Which being ſometimes called in queſtion, and I having obſerved, that experience does favour thoſe Practitioners, endeavoured to find out the cauſe, and found that there are many inoculations here of this vein with the Arteries, as the inoculations are uſually more frequent about the extream parts, as being more removed from the fountain of heat, and therefore wanting a hotter, and more ſpirited bloud. This vein therefore being cut, becauſe the Inoculations are ſo near, it cannot be, but that the bloud of the Arteries ſhould be alſo let out, which cannot be ſo well done by opening the veins of the Cubit, becauſe the *Anaſtomoſes* or Inoculations are ſomewhat more diſtant from the place, in which the vein is opened. And hence it is, that the bloud, which is emptied out of the Hand, is much faier and redder, then that out of the Arm, becauſe the Arterious bloud there alwayes runs out together with that of the veins. But there being ſix times more Arteries, then there are veins in the Spleen, it is neceſſary, that its diſeaſes be much helped, when the peccant bloud is drawn out of thoſe veſſels, wherein it was.

Salvatella.

The baſilick vein.

The other branch of the Axillary-vein, that is the inner, and greater, is the *Baſilica* [I] which according to its ſituation in different arms hath found different names among writers practiſed in Phyſick. For in the right arm it is called *Hepatica* or the liver-vein; but in the left *Splenica*, or the ſpleen-vein. They chooſe that to be opened in diſeaſes of the liver, this in diſeaſes of the ſpleen. But it iſſues forth under the armpit, and diſperſing many propagations to the Glandules, that are frequent thereabout, it is carried down by the upper part of the Arm to the ſide of the double headed-Muſcle, or *Biceps*, between the Muſcles

that

that bend and ſtretch out the Cubit, and not far from its egreſſe out of the Cheſt, is divided [K] into two notable branches, of which one is called *Profundus* or deep, the other *Subcutaneus*, or branch under the skin, from their ſite, and progreſſe. The deep one or *Profundus* [L], which for the moſt part is the thicker, all the way it goes, penetrates into the more inward parts of the Arm; having the Axillary Artery, that runs into the Arm, every where for its companion, as alſo the fourth branch of the third Nerve of the Arm. But it is carried betwixt the two Muſcles, which bend the Cubit, and, having paſt its joint, is cleft [M] into two branches; of which the outer [N] near to the *radius* or wand, (from whence it might be called *Raditus*) goes down to the Hand, and ſcatters little branches toward the Thumb and Fore-finger, as alſo the middle one; but the inner branch [O] paſſing near to the bone of the Cubit, (from whence it deſerves the name of *Cubitus*) diſtributes ſmall branches to the middle, and little fingers; but as the outer ſends its propagations to the Muſcles on the outſide of the Hand; ſo the inner to thoſe on the inſide. The other is the branch *Subcutaneus*, or under the skin [P] which is carried down by the inſide of the Arm, ſcattering divers little branches to the skin, and parts adjacent, but when it is come to the inner protuberation of the Arm, it is divided [Q] into an outer, and inner branch, like as the Cephalick is. The inner [R] is carried down obliquely, beneath the bought of the Arm, and being united with the inner branch [x] of the Cephalick, makes the vein called *Mediana*, [λ] of which we ſpake before. But the outer [S] near to the inner protuberation of the Arm being divided into two branches, is carried by the greater along the Region of the *ulna* or ell downward to the wriſt, and ſcatters itſelf into the little Finger, but by the other it is derived to the inſide of the Hand.

The branches of the baſilick vein.
Profundus.
Subcutaneus.
Its diviſion into an outer and an inner branch.

But in this place it is worth our pains to advertiſe with other the moſt learned Anatomiſts; that it ought not to be believed, that the ſame order, and courſe of veins is to be found in all men; when the diſſection of bodies does demonſtrate, that ſcarſe two in a thouſand do accurately obſerve the ſame diſtribution of the veins. Wherefore we ought not to be ſo ſcrupulous in chooſing out places for the openings of veins, as ſome that are unexperienced, are wont; but to chooſe that vein eſpecially, which may be moſt ſafely opened, becauſe it is beſt ſeen. For ſometimes the Cephalick or Head-vein is ſo ſmall, that it can hardly be diſcerned; and ſometimes on the contrary the Baſilick is ſo. Wherefore he ſhall do beſt, who will rather follow wiſe counſell, then the ſcrupulous opinion of unskillfull men.

CHAP. IV.

Explains the lower, or deſcendent Trunk of the Hollow-vein.

WE have done with the upper Trunk, and branches of the Hollow-vein, it remains now, that we treat alſo of the lower. Nevertheleſſe (as we have above alſo admoniſht) they are not indeed two Trunks, as *Galen* would have them, but one only which reaches in one continued line from its diviſion about the fifth Rack-bone of the Loins [V] as far as to the *Jugulum*, or Hollow of the Neck [D]: but, for methods ſake in teaching, we thus divide it by reaſon of the Liver, which ſtanding as it were in the middle of it, ſeems to part it into an upper, and a lower Trunk. As therefore that is the upper one [AD] which runs up from the Liver to the Hollow of the Neck; ſo that is the lower [TV] which beginning at the ſame Liver is terminated at the *Os ſacrum*, or Holy-bone. And as the upper did run on undivided through the Cheſt, ſcattering only ſome propagations at its ſides; ſo the lower alſo ſlides down intire through the whole *Abdomen*, or paunch, only ſome twigs ſprouting from it. But when it has attained to the fifth Rack-bone of the Loins, it is cleft into thoſe two notable branches called *Iliaci* [XX] as the upper is into the Subclavian, which Iliacall branches afterward reaching into the Legs make the Crurall-veins; as the ſubclavian carried into the Arms make the *Brachiales*, or Arm-veins. Let us ſpeak therefore in this Chapter of the Trunk, and its propagations, as long as it yet is in the lower belly. Then let us come to the crurall branches.

The inferiour Trunk of the Hollow-vein.

From the deſcendent Trunk then [TV] before it part into branches, ariſe four veins. For as ſoon as it is come forth from the hinder part of the Liver, it declines to the right ſide of the Back, and ſends forth a propagation from its own left ſide which they call *Adipoſa ſiniſtra*, the left fatty vein [υ on the left ſide] becauſe it paſſes to the fat and outer membrane of the Kidneys, which ariſes from the *Peritonæum* or Rim of the Belly, as alſo to the Glandule, that grows above the Kidneys. There is another [υ on the right ſide] anſwering to this on the right ſide, but which does very ſeldom grow out of the Trunk, but rather from the upper ſide of the middle part of the Emulgent vein; and becauſe it is diſtributed in the ſame manner as the left is, it is called *Adipſa dextra*, the right Fatty vein. Yet ſometimes you may ſee the contrary alſo to happen, and this right vein to

Four propagations ariſing from the Trunk before its diviſion.
Adipoſæ.

come forth of the Trunk, and the left out of the Emulgent. For there are divers ſportings of nature to be ſeen in the veins; and you cannot eaſily meet with a dead body, in which you may not find ſomething new, and differing from others. After this the Hollow-vein paſſing on, when it comes beyond the middle of the back, about the firſt Rackbone of the Loyns, it brings forth a ſecond pair of veins [♎] very notable, which haſtens directly to the Kidneys, upon whoſe ſubſtance it is wholly ſpent. And hence it is called *Renale*, the pair of Kidney-veins from its inſertion; but from its uſe *Emulgens*, becauſe the Kidneys ſeem by this pair to milk out the wheyie or ſerous moiſture in the bloud, and to draw it to themſelves. It is therefore very thick, but yet ſhort, and not of equall length, nor riſing directly oppoſite each to his fellow. It is ſhort, becauſe it did not need length, which for the moſt part is given by nature to veſſels for ſome previous preparation. It is unequall, becauſe it was fitting the left ſhould be longer then the right, by reaſon that it was neceſſary to bring the ſpermaticall vein out of it. But the beginning of both anſwers not directly one to another, leſt one ſhould be hindered by the action of the other. And the left is higher then the right, becauſe the left Kidney is alſo ſeated higher, then the right. But the Emulgent branches, as ſoon as they ariſe out of the Trunk, do not preſently go to the cavity of the Kidneys, but are firſt divided into two greater branches, and ſo, accompanied with Arteries, enter the concavous ſide of the Kidneys, and afterward being broken into leſſer branches are ſcattered quite through the whole ſubſtance of the Kidneys, and at laſt determin with their ſmall hairy ends in certain fleſhy proceſſes, which they cal *Mammillares*. Theſe veins do ſerve not only for the bringing of nouriſhment to the Kidneys, but alſo for the carrying down of the ſerous moiſture to thoſe fleſhy Proceſſes called *Mammillares*, through which it is ſtrained into the pipes of the Ureters, and then gathered together into that cavity of theirs called the *Pelvis*, and ſo drops down by little and little into the bladder, as we ſhall ſhew, when we open the Hiſtory of the Kidneys. And here the place is to be noted, in which the ſtones of the Kidneys are wont to be generated, which is not in the Emulgent veſſels, I mean veins, or Artery; but rather in the very cavity of the Kidneys, or in the *Pelvis*, and pipes of the Ureters. For in theſe if a viſcous matter be at any time received, either it is hardened there by reaſon of a notable heat, or elſe through cold is congealed into gravell or ſtone. For this matter is not only a crude, and uncocted kind of bloud, which like ſnivell ſometimes is wont to abound in the maſſe of bloud, but oftentimes alſo that excrementitious phlegm which falls down from the Head, through the veins and Arteries, both into the Hollow-vein, and the great Artery, and ſometimes into the Stomach, and Guts. Of which this ſeems to be a manifeſt ſign, that they who are ſubject to diſeaſes of the Stone, are very often troubled with rheumes, and pains of the Colique; of which whilſt ſome perſwade themſelves that it is cauſed by wind, dayly experience hath taught me, that it comes from phlegm; becauſe I have obſerved, that they, who are troubled with the Stone in the Kidneys, had their *Colon* or Colique-gut alwayes ſtuft with plenty of this phlegm, and that this being taken away, the Stone has been no longer bred. And therefore oft-times I give ſcouring Clyſters, and ſuch as gently purge phlegm, not only to ſuch as have the Stone already, but alſo to ſuch as are threatned with the breeding of it, with a great deal of benefit to the Patients. But all thoſe things are perpetually to be avoided, which drive out the Stones, as well becauſe moſt of that nature are hot, as alſo becauſe they are able to drive down the crude matter plentifully to the Kidneys. We thought fit therefore to inſiſt upon this, that we may accommodate the ſtudy of Anatomy to the very practiſe of Phyſick; eſpecially ſeeing that the place, wherein the Stone is bred, is not commonly known, becauſe the moſt famed *Fernelius*, whom the greateſt number of Phyſitians does for the moſt part follow, *Lib. 6. Patholog. c.* 12. thinks that ſmall gravell is bred in the proper ſubſtance of the Kidneys, and waſhed from thence by the flowing of the Urine, and carryed into the cavity, and ſo the Urine full of gravell ſlides down through the Ureters into the Bladder. But if any one enquire alſo the cauſe, why the left Kidney is more ſubject to the Stone, then the right; we muſt conclude, that this happens, becauſe the Colique-gut lies more upon the left Kidney, in whoſe cells this phlegm, of which we ſpake, abounding, either it ſweats through the pores, and is ſuckt into the Kidneys, or elſe by reaſon of its nearneſſe, the Kidneys are exceedingly cooled; experience having often taught us, that this kind of phlegmatick matter is indeed actually exceeding cold in the body, as they have ſufficiently perceived, who have voided it in great plenty by Stool. After this there follows a third pair [♐ and ♑] called *ſpermatica*, or *ſeminales*, the ſpermaticall, or ſeeds veins, becauſe they carry down matter for making of the ſeed. Theſe differ in their originall. For the left [♑] ariſes from the inſide, and middle part of the Emulgent, and communicating ſome ſurcles to that part of the *Peritoneum*, or rim of the belly, which covers the Muſcles, that lie in the Loins, it goes faſt by the ſaid *Peritoneum*, and deſcends obliquely; but, when it has attained to the *Os pubis*, or the Share-bone, riding over it, it paſſes through the *Peritoneum*, and holes of the oblique and tranſverſe Muſcles of the *Abdomen*, with whoſe proceſſes being ſuſtained it is concocted into certain varicous

Emulgentes.

The place in which the ſtones of the Kidneys are bred.

VVhy the left Kidney is more ſubject to the ſtone, then the right.

Spermatica.

varicous circlings, which are joined with the ſpermaticall Artery by *Anaſtomoſes* or Inoculations, and at length it ends in the Teſticle of its own ſide. But the right ſpermaticall vein [χ] ariſes not out of the Emulgent, but the Trunk itſelf, and the forepart of it, a little beneath the Emulgent-vein, and afterwards obſerves a like courſe with the former. And thus they are in males, though we may obſerve nature oftentimes varying in them: but in women, although they ariſe in the ſame manner, and obſerve the ſame courſe with thoſe in men, as far as the Holy-bone; yet they fall not out of the *Peritoneum*, nor reach unto the ſhare-bones, but before they come to the Teſticles, are cleft into two unequall branches; the leſſer of which is ſcattered into the ſides of the Womb, toward the bottom of it; the greater being joined to the ſpermaticall Artery, and inoculated with it, enters into the Teſticle of its own ſide. Laſt of all the fourth pair is called [X] *Lumbares*, the Loin-veins [4 4 4] two, or three, which the Hollow-vein ſends forth from its backſide, which looks towards the bodies of the Rack-bones of the Loins; and therefore they are not to be ſeen, unleſſe the Trunk of the Hollow-vein be lifted up. Theſe veins go in through the holes of the Rack-bones, through which the Nerves go out, and ſo carry nouriſhment to the Spinall marrow. From them two other veins, tyed on both ſides to the ſide of the Marrow, aſcend toward the brain, with which afterward two veins deſcending from the internall Jugular, are joined by an *Anaſtomoſis* or Inoculation. *Lumbares.*

Theſe propagations being thus ſent out, when the Hollow-vein has almoſt attained to the *Sacrum*, or Holy-bone, about the fifth Rack-bone of the Loins, it inclines under the great Artery, and is cut into two notable branches called *Iliaci* [XX] which having gone a little way are again cleft into two others [Y and Z] of unequall bigneſſe, of which one is called the inner, the other the outer. The inner is leſſe, the outer larger and greater. But before they be ſo divided, they ſcatter two other propagations, the firſt of which [5] is commonly called *Muſcula ſuperior*, the upper Muſcle-vein, which is diſſeminated overthwart, through the Muſcles of the Loins, and *Abdomen*, or paunch, from whence I would call it *Muſcula lumbalis*, the Muſcle-vein of the Loins: the other [6] is named *Sacra*, or the Holy-vein, becauſe it reaches ſome little twigs to the upper holes of the Holy-bone, for the nouriſhing of the ſaid bone and the Spinall-Marrow. The diviſion of the Trunk into the two Iliacall branches. *Muſcula ſuperior.* *Sacra.*

But from both the Iliacall branches many veins iſſue, before they go out of the *Peritoneum* or Rim of the Belly toward the Legs; and from the inner branch two. The firſt [7] ariſes from the outſide called *Muſcula media*, the middle Muſcle-vein; becauſe it is ſcattered into all the Muſcles of the Buttocks, and into their skin: For it carries aliment to all thoſe Muſcles, which are of the outſide, or Back of the bone *Ilion* or Hanch-bone, as alſo to the very joint of the Hip, that for this cauſe it ought to be eſpecially taken notice of by them, who would ſomewhat curiouſly conſider the cauſe of the ach in the Hip, or the *Sciatica*. I ſhould think that this vein may not be amiſſe called *Glutea* from its inſertion, becauſe it is implanted into the Muſcles called *Glutæi*, or Muſcles of the Buttocks. The other [8] grows out of the inſide, and is a notable vein, called *Hypogaſtrica*, or the vein of the water-courſe, from its diſtribution into almoſt all the parts of the *Hypogaſtrium*, or water-courſe. From this iſſues a branch named *Hæmorrhoidalis externa*, the outer Emroid-vein, becauſe if at any time it ſwels with a more faculent bloud, or hot, or ſalt, it makes the outward Emroids of the Fundament. This affords twigs to the holes of the *Os ſacrum*, or Holy-bone, but beſtows greater branches upon the Muſcles of the *Rectum Inteſtinum*, or the Strait-Gut, as far as to the outer skin of the Fundament. There is alſo another branch ariſing from the ſame Hypogaſtrick-vein, which we call *Cyſticus*, the Bladder-branch, and is worthy of obſervation both in men, and women; in men, becauſe it is ſpent upon the Bladder; but in women, becauſe in them being ſuſtained with a fat membrane, it goes with ſome twigs to the Bladder; but with more to the bottom of the Womb; and with more manifeſt ones to the Neck of it, by which veins alone ſome think that the monthly courſes flow in Virgins, and ſome alſo think the ſame in women. But the monthly courſes do not only flow out by theſe branches, but by thoſe alſo, which we told you were ſent from the ſpermaticall branch, and which go to the bottom of the Womb, not to the Neck. For the menſtruous bloud is uſually purged out, whether in virgins, or women, every month; not only through the Neck, but eſpecially through thoſe paſſages of the Womb, called *Cotyledones*. Which we have ſhown here at *Padua*, publiquely in the Theater, the firſt year of our being Profeſſor, in the carkaſſe of a certain woman having her monthly courſes. For we ſaw that the Hypogaſtrick branches, and the ſpermatick veſſels, with the Teſticles were filled with bloud, and that the Womb itſelf did pour out a thicker bloud, the little mouths of the veins in the inner part of the Womb lying open, and manifeſtly gaping. Yet I ſaw twice in others, that the menſtruous bloud came out of the veins of the Neck only, not alſo out of the Womb, and in another on the contrary that it flowed out of the Womb only. But the ordinary way is for women to be purged at them both, and not at one only, except when beſides the intent of nature obſtructions do ſeem to hinder their flowing. Propagations of the inner Iliacall branch. *Glutæa.* *Hypogaſtrica.* *Hæmorrhoidalis externa.* *Cyſticus.*

But

But we have obſerved, and ſeen divers times, whileſt we were about the cure of Ulcers in the privie Members, and Neck of the Womb, that at what time the monthly courſes do flow, the mouth of the Womb gapes. I ſaw alſo then, that thoſe parts were dilated with a certain ſtinking moiſture, and that the Neck of the Womb appeared much larger, then it was wont to be at other times. And therefore no man need to wonder at that, which hath been obſerved by ſome Writers of our age, that in the time of their courſes theſe parts have been ſo widened in ſome, that being new married, although they were true Virgins, they have for this reaſon been accuſed, and thought to have been deflowred. Wherefore if it happen, that any, who are new married, doubt of their Wifes virginity, becauſe they find the privy paſſage very wide, it will behove them to conſider, whether their flowres were not at that time upon them. Now at length the remainder of the inner Iliacall Trunk makes to the Share bone, and taking to it a propagation of the outer Iliacall, together with which it makes one vein, and ſo paſſing through the *Peritoneum*, and hole of the Share-bone, it ſpreads itſelf into the Leg, and is extended almoſt beyond the middle of the Thigh on the inſide.

Propagations of the outer Iliacall branch.

Epigaſtrica.

From the outer branch in like manner ſome veins iſſue: and firſt of all, that which is called *Epigaſtrica*, or vein of the lower Belly [9] which ariſes from the higher part of the branch, and is ſo named, becauſe it goes to the Muſcles of the *Epigaſtrium*, to wit, the right Muſcles of the *Abdomen*. For paſſing with its chief branch out of the *Peritoneum* or Rim of the Belly, it climbs ſtraight up of both ſides under the right Muſcle, till it come near to the Navill, where it is joined by *Anaſtomoſis* with the deſcending Mammary-veins. But this *Anaſtomoſis* or Inoculation is ſeldom found in men, but in women it is very conſpicuous, from whence alſo *Galen Lib. de Diſſect. ven. & Arter. Cap.* 8. witneſſes, that that great ſympathy betwixt the Womb and the Breaſts or Dugs is cauſed by theſe two veſſels. But the moſt learned *Hippocrates* has explained this ſympathy in many Aphoriſms of the fifth Section. For in the fiftieth Aphoriſm he ſayes, If you would ſtop the courſes in a woman, apply a very great Cupping-glaſſe to her Breaſts. And in the thirty ſeventh. If the Breaſts of a great bellied woman, do of a ſodain become ſmall, the child proves Abortive. And in the thirty eight; If one of the Breaſts of a great bellyed woman become ſmall, one of the Twins, that ſhe goes with, proves Abortive; and that a Male, if the right Breaſt be ſmall; a Female, if the left: ſo the Womb being diſeaſed, the Nipples become pale; and upon a Dropſie in the Womb they ſwell up. But there is a ſympathy alſo not only by reaſon of the veins, but alſo of the Nerves, that come from the ſixth Conjugation. Whence we ſee, that if the Breaſts of a Woman, or Virgin be handled, they are provoked to luſt; ſo that for this reaſon alſo thoſe women, that have great Breaſts may be accounted more luſtfull, as *Afra* is in *Martiall*. But it is convenient to note concerning the originall of this vein, that very often it ariſes out of the Crurall branch, which we ſhall by and by deſcribe, but oftner out of the Iliacall. Another vein is the *Pudenda* [11] which ariſes from the inſide of the outer Iliacall branch, after it is come out of the *Peritoneum*, or Rim of the Belly, and it is called *Pudenda*, becauſe it is ſpent upon the privities of both Sexes. For in men it is diſtributed into the *Scrotum* or Cod, and into the skin of the Yard; but in women it is propagated to the Lips and skin of the privy paſſage, to the *Nympha* or wings, and other parts of it; but in both men and women to the Glandules, that lye about the leskes, whence ariſes that confluxe of matter into theſe Glandules, in a peſtilent or venereous *Bubo*. Laſtly, the *Muſcula inferior*, or lower Muſcle-vein [12] is that, which goes to the joint of the Hip, and is diſſeminated into the skin, and Muſcles thereabout, by reaſon whereof in my judgment by a ſtricter Appellation it might be better called *Coxendica*, or *Coxalis*, the Hip-vein.

Pudenda.

Muſcula inferior.

CHAP. V.

Reckons up the propagations, and branches of the outer Iliacall branch diſſeminated through the crus, or great Foot, that reaches from the lower part of the Buttocks to the ends of the Toes.

THe outer branch then of the Iliacall veins [Z] when it hath ſent forth the ſaid propagations, falls out of the Rim of the belly, and is carried to the *Inguina* or leskes, through the upper and inner region of the Hip-bone, through which the firſt and ſecond bending Muſcles of the Thigh do deſcend, and makes the Crurall vein [Y]. The Hiſtory whereof that we may deliver in an eaſie method, we will divide it into Trunk, and Branches. But before the Trunk be cleft into its branches, it ſhoots out four propagations; the firſt of which is that they call *Saphena*, [13] and vein of the inner Ankle, becauſe it runs near thereunto; it is alſo commonly called by Phyſitians *vena tali*, but improperly, as we have ſaid above in our firſt Book. But it ariſes from the inner ſide of the Trunk, preſently after its departure out of the *Peritoneum*, or rim of the Belly, and having no Artery for its companion, runs ſtraight downwards under the skin

The diviſion of the Crural vein into a Trunk and branches.

Four propagations of the Trunk before its diviſion.

Saphena.

ſkin, through the inſides of the Thigh, & Leg; and when it is now come to the inner Ankle, it ſpreads itſelf into the upper part of the Foot, and ſcatters a branch overthwart, from which afterward many others ariſe, that are diſtributed in their order to every one of the Toes. This vein ſcatters other propagations by the way, but which are ſeldom found anſwerable one to another, either in number, or bigneſſe; as we have already more then once intimated, that nature is ſound to ſport in the veins, but eſpecially in thoſe of the joints. The firſt [17] of theſe propagations, not far from the originall of the vein itſelf, is delt into the upper skin of the inner Region of the Thigh, in two branches; of which the outer, which is the thicker, creeps through the fore, and outſide of the Thigh, under the skin; but the inner goes more inwardly, and ſpreads itſelf into the rim of the Belly. The ſecond [18] is propagated, when the vein has now attained to the middle of the Thigh. The third propagation [19] ariſes about the Knee, and brings forth two off-ſprings, one, which is diſſeminated into the skin of the forepart of the Knee, by the *Patella* or Whirl-bone, but the other into the skin of the Backſide, where the bending, or Ham is, about which it is rowled orbicularly. The fourth [20] is carried to the middle of the *Tibia* or Leg, with ſurcles forward, and backward. Over againſt the *Saphena*, another vein [14] is brought forth from the outſide of the Trunk, but ſhorter then the vein *Saphena* is, and reaches outward, and overthwart into the skin, that covers the forepart of the Hip-bone, as alſo into the Muſcles of the ſame place, which the later Anatomiſts call *Iſchia*. Theſe propagations being brought forth, the Trunk afterwards is drencht into the Muſcles, that compaſſe the bone of the Thigh, and ſets out a third propagation [15] which they call *Muſcula* the Muſcle-vein; and there uſe to be two of them. For the outer, which is the leſſe, ſends ſhoots to the ſecond, and fourth, extending Muſcles of the *Tibia* or Leg, together with the skin; the inner, and greater, affords twigs to the third extender of the Leg, and to almoſt all the Muſcles about the Thigh. After this the Trunk turning to the Backſide, and deſcending by degrees, ſcatters ſome other twigs into the membranes of the Muſcles, and by and by ſends out a fourth vein, which runs into the backſide of the Thigh, and is called *Poplitea*, the Ham-vein [16] much ſpoken of by writers of Phyſick, but eſpecially by *Hippocrates* the chief of them, who 6. *Epidem.* 1. 5. commends much the opening of it in diſeaſes in the Kidneys. But it is oftentimes ſeated too deep to be cut without very great difficulty. I have learnt by frequent experience, that iſſues made in the *Sura* or calf of the Leg, to which this vein ſpreads itſelf, have done a great deal of good in many diſeaſes. This vein, when it is propagated, ſometimes receives the addition of a Sprig from the inner branch of the Muſcle-vein; oftentimes alſo two propagations iſſue from the Trunk, one higher, and another lower, which afterward are united in their journey. But preſently after its riſe it ſcatters ſome branches into the skin of the Thigh, about the higher and hinder part of it; then it runs down directly through the middle of the Ham, or bending of the Leg, into the Calf, to which it diſtributes many Surcles, that run on with an uncertain courſe, ſome directly, ſome overthwart, and ſome obliquely. Theſe little branches being thus diſſeminated, the vein paſſes on as far as to the *Talus*, or Cockall-bone, and there at length determins.

Four propagations of the vein Saphena.

Iſchiea.

Muſculæ.

Poplitea.

And this is the progreſſe of the Crurall-Trunk, and theſe the propagations which it ſcatters, before it be divided. For lying upon the bone of the Thigh, it ſo deſcends, and runs ſide-long near to it, that, when it has attained to the Knee, it is carried betwixt the two loweſt, and hindmoſt heads of the Thigh, in which place [Δ] it is cleft aſunder into two branches, an outer, and an inner one. But they are of unequall bigneſſe, the outer being the ſmaller, and the inner the greater, but both of them [⊖ Δ] are ſcattered through the Leg, and loweſt part of the Foot. The inner [⊖] in its deſcent ſends ſome propagations to the Muſcles, that are placed on the backſide of the Leg, and eſpecially thoſe which make the Calf, but moſt of all to the inner part [21] of the *Gaſteronemius externus*, or outward Calf-Muſcle, and ſo afterward continuing its courſe downward, when it is come to the lower *Appendix* of the *Tibia* or Leg, and has beſtowed ſome ſhoots upon the skin, it is reflected under the inner Ankle [22] and runs out as far as to the great Toe. The outer [Δ] is preſently cleft into two leſſer branches, that are likewiſe unequall, of which the inner [⧖] that is the greater, and lies deep, is wholly ſpent upon the Muſcles of the Calf, running all along directly betwixt the two heads of the *Gaſteronemius externus*, or firſt moving Muſcle of the Foot, as alſo betwixt the *Gaſteronemius internus*, or inward Calf-Muſcle, and the *Tibiens anticus* or forward Leg-Muſcle, and at laſt betwixt the Muſcles, that bend the Toes, diſtributing ſome ſurcles every where by the way to the Muſcles, through which it paſſes. When it comes to the mid length of the Leg, it is again ſubdivided into an inner, and an outer branch. The inner of theſe diſtributes a twig near to the joint of the *Tibia* or greater Leg-bone, and the bone called the Cockall, deſcends with the Tendons of the Muſcles, and is divided into the great, the fore, and the middle Toes. The outer paſſes on near to the *Fibula*, or leſſer bone of the Leg, and when it comes to the Ligament, which tyes together the greater and leſſer bones of the Leg, it ſhoots forth a branch, which perforating the Ligament runs into the Foot, and is ſcattered into the Muſcles; which bend the Toes of the Foot outward.

The diviſion of the Trunk into two branches.

But

But the outer and leſſe branch [π] of the Crurall-vein goes from that diviſion of the outer branch, which is made near the Ham, to the upper *Appendix* of the *Fibula*, as alſo to the outer, and hinder part of the *Tibia*, where ſcattering many little branches, it goes to the outer Ankle, and at laſt ends in the Foot.

And this is the univerſall Hiſtory of the Hollow and Gate-veins, wherein we have perfected the whole courſe of their diſtributions. It ſeems yet to remain, that we ſpeak of the Umbilicall, and Arterious veins. But becauſe the Umbilicall vein is nothing elſe but a more notable propagation iſſuing out of the Gate-vein; and in a man grown performs the office of a Ligament, rather then a vein; becauſe it keeps the Liver in its place; as the ſtories of them do witneſſe, who upon the cutting off, or wounding of the Navill, have ſodainly dyed, their reſpiration being hindred by the weight of the Liver falling out of its place, and putting down the *Diaphragma* or Midriffe with it; we thought it not worth our pains to make any more mention of it in this place. But if any one will obſtinately contend that it is a peculiar vein with arguments fetcht out of his own Brain, we know no better counſell, that we can give him, then to conſult better with his own ſenſe, or if he will contend further, to purge his Head with Hellebore, that that dimneſſe of his Eye-ſight may be a little taken away. But we ſhall with more convenience make mention of the *Vena Arterioſa*, or Arteriall-vein, in the following Book, when we ſhall explain the Hiſtory of the *Arteria venoſa*, or venall Artery, becauſe they are very like one another, and therefore the ſame pains may ſerve them both.

Rem.

An Explanation of the Table of the Veins.

This Table delineates the Hollow-vein, entire, and free from all parts. Wherein we have marked the Trunks, and larger branches, with pretty great letters: but the propagations with little ones; and when they are at an end, with figures.

AD. He Ascendent Trunk *of the Hollow vein, the beginning whereof is about* A, *which notes the place, wherein the Liver should stand in the proportion of this figure, the end about* D. *For*

aaa. *it passes on undivided from the convex part of the Liver, about which it scatters little branches,* a a a. *as far as to the Hollow of the Neck; but it scatters*

xx. *some propagations, three in number. The first of these,* x x, *is called* vena Phrenica *the vein of the Midriffe, which is distributed of both sides into the midriffe and*

bb. Pericardium, *or purse of the Heart growing thereto, as also into the* Mediastinum *or partition of the Chest.*

Another *is* Vena Coronaria *the Crown-vein,* bb, *which embraces the basis of the heart in manner of a Crown, dispersing many Sircles to the point of it.*

cc. The third *is the vein* Azygos, *or without a mate,* c c, *which issuing out from the right side of the Hollow-vein, about the heart, about the fifth Rack-bone of the Chest, goes down near to the right side of the Rack-bones, as far as to the second almost of the loines.*

ddd. *There are ten propagations* d d d *from this, sent to as many bony distances of the ribs, which are called* Intercostales inferiores, *the lower veins between the ribs.*

B. *Shews how the Trunk* A D *is bowed toward the right side, because of the situation of the heart.*

C. *The orifice of the Hollow-vein reaching into the right ventricle of the heart.*

D. *The division of the ascendent Trunk about the Hollow of the Neck, into two branches* E E. *which they*

EE. *call* Subclavia, *or the veins under the Collar-bones. From these arise many propagations, some issuing from the lower, others from the upper part of them.*

Out of th[illegible] *part issue five. The first is*

e. *called* Intercostalis superior *the upper vein between the ribs,* e, *and*

ff. [illegible] *two Sircles* f f, *to the distances of the three upper ribs. The second is* mammaria *the vein of the breast,* g, *which, descending under*

g. *the breast-bone, as far as to the strait Muscles of the Abdomen, is inoculated* 10, *with the Epigastrick-vein climbing upward,* 9, *giving sircles to the Gristly distances of the true ribs, as also to the* Mediastinum, *and Muscles, that lie upon the breast. The third called*

h. Mediastina, h, *is disseminated into the* Mediastinum, *or partition of the Chest. The fourth, ver-*

i. tebralis, *or the vein of the Rack-bones,* i. *climbs up through the holes, that are bored in the transverse processes of the Rack-bones of the Neck, distributing sprigs to the Muscles, that lie upon the Rack-bones.*

I. *The fifth is called* Cervicalis *or the vein of the hinder part of the Neck,* l, *distributed into the Muscles, seated on the lower part of the back side of the neck, and on the upper part of the Chest. Out of the upper part issue three. The first is* [illegible]

m. *vein of the Hollow of the Neck,* m, *which having sent over small sprigs from its outer branch to the Chest,*

and region of the Ear, is joined by the inner all the way to the Arteria carotis, *or sleepy Artery, and is divided near to the skull into two branches called* Encephalici *or of the Brain, by* Spigelius; *of which the*

n. *hindmost and greater,* n, *having entred into the skull through the second hole of the Nowl bone, is in-*

oo. *serted* o o, *into the first* 1, *and second* 2 *sinus of the thick*

p. *membrane. But the foremost and lesser,* p, *having entred through the seventh hole of the wedg-bone, is scattered through the sides of the thick membrane. The se-*

q. *cond is the outer Jugular vein,* q, *which getting up by*

r. *the sides of the Neck, is divided near to the Ears,* r, *into two branches; of which the one called* Profundus, *is variously disseminated into the Muscles of*

t. *the Larinx or Throttle, and the bone called hyoides, as also into the Tongue, the Palat, and hollowness of the Nostrils, and lastly into the skull with three propagati-*

s. *ons, of which that which passes* s *out of the forepart of the eye, through the second hole of the wedg-bone, is very well delineated here. The other called* Subcutanea,

u. u, *first of all spreads its fore-branch* x, *into the Mus-*

x. *cles and skin of the Face, which joins with its fellow a-*

y. *bout the top of the nose, and makes the Forehead vein* y; *then it issues out another hinder branch, which partly,*

z. *creeps upward along the temples,* z, *and partly is carryed behind the ears to the skin of the back part of the head.*

α. α. The third, Cervicalis Superior, *the upper vein*

β. *of the Neck,* β *is propagated into the Muscles behind on the back side of the neck. There are three* sinus *or small channels of the thick membrane of the brain, the*

1. *first or right one is marked with* 1, *the second or left*

2. *one with* 2, *the third with* 3. *The hinder part of this,*

3. *which is nearer to the Nowl of the Head, is shadowed; but the forepart, which is near the Forehead, is seen manifestly. From this sinus many little veins, which they call* Duftus, *are resolved forth to both sides.*

F. *Here the subclavian vein takes on it the name of* Axillaris *or the vein of the Armpit, and is divided into two branches, the* Cephalick G, *and the* Basilick I. *But before this division it scatters two twigs;*

χ. *the first called* Scapularis interna, *or the inner*

δ. *vein of the shoulder blade,* χ, *the other* Scapularis externa, *the outer blade vein* δ. *The Basilick vein also,* I, *before it enters the Arm, propagates two;*

ε. *one called* Thoracica superior, *the upper Chest-vein,* ε, *which is distributed through the inside of the*

ζ. *Pectoral Muscle, and in women, through the Dugs: the other called* Thoracica inferior, *the lower Chest-vein,* ζ, *which descending along the side of the Chest, goes to the Muscle called* Anisalptor.

G. The Cephalick vein, *which, before its division,*

η. *sends away a sprig,* η, *into the Muscle* deltoides, *and another* θ *into the Muscles of the Cubit.*

When the Cephalick vein comes to the joint of the Cubit, at the outer bunching forth of the Arm it is cut

H. *into three branches,* H. *The first,* ι, *or deep and middle*

ι. *one goes to the Muscles arising from the said protube-*

κ. *ration. The second* κ, *or inner goes to the making*

λ. *of the vein called* Mediana λ. *The third* μ, *or outer*

μ. *is carried obliquely,* ν, *by the radius or lesser bone of the*

ν. *Cubit, to the out side of the Arm, and so creeping on obliquely all the way, when it is come to the root of the wrist, it is joined with a little branch of the Ba-*

ſilick-vein, τ, and makes the vein called Salvatella.

The Baſilick-vein, which on the right hand is called Hepatica, or of the Liver, on the left Lienaris, of the Spleen. This before its diviſion ſends out a Surcle, ο, to the heads of the Muſcles of the Cubit; and then another notable one π, which being carried down obliquely, beſtows its Surcles upon the Muſcles, that ariſe from the outer protuberation of the Arm.

K. The diviſion of the Baſilick-vein K into two branches, the one called Profundus or the deep one, the other Subcutaneus, or branch under the skin. The deep one

L. L, when it comes to the bending of the cubit, is divided into two, M, one of which called Radius N, at the Radi-

M. us, or leſſer bone of the Cubit; the other called cubiteus,

N. O, at the greater bone of the Cubit, goes to the hand.

O. Subcutaneus, or the branch next under the skin P,

P. near to the inner protuberation of the Arm is divided, Q,

Q. into two other, of which the inner R together with

R. the inner branch of the Cephalick ϰ, makes up the vein mediana λ, which is likewiſe divided into two branches, the outer of which, ϱ, is called by ſome Cephalica

ϱ. manus, and goes to the Thumb; the inner σ to the

σ. fore and middle fingers: The outer S going to the

S. wriſt, is joined toward the little finger with the outer

τ. branch of the Cephalick-vein about τ.

†. The little valves, which are found in the veins of the joints, are handſomely cut out here, as it were to be ſeen through.

The Deſcendent Trunk of the Hollow-vein which

T. begins about the region of the Liver T, and ends

V. about the fifth Rack-bone of the loins V. There are

υ. four Twigs growing from this. The firſt υ called Adipoſa or Fattie-vein, diſtributed to the Membrane of

φ. the Kidneys. The ſecond φ the Emulgent going to the Kidney. The third, præparans vas, the preparing

χ. veſſell; the right one χ ariſing out of the Trunk T.V.

ψ. the left ψ out of the left Emulgent, both afterward going

ω. into the Teſticles ω. The fourth is the three Lum-

444. bares or loin-veins 444.

The diviſion of the Deſcendent Trunk V, into the

XX. two Iliacall branches XX, both which are again divided into two other, an inner one Y, and an outer Z. But

Y. before this diviſion two propagations are iſſued forth,

Z. Muſcula lumbalis, or the Muſcle-vein of the loins 5,

5. and Sacra or the holy-vein 6.

Y. The inner Iliacall vein, before it goes out of the Peritoneum, or rim of the belly, ſhoots out two propa-

7. gations, the firſt called Glutæa 7, and the ſecond Hy-

8. pogaſtrica 8. The remainder of it paſſing through the Peritoneum, is ſpent upon the inſide of the Thigh.

Z. The outer Iliacall vein likewiſe before its going forth of the Peritoneum ſcatters three propagations;

9. the firſt called Epigaſtrica 9, going into the Muſcles of the Epigaſtrium, and the ſtrait ones of the Abdo-

10. men, where they are joined by Anaſtomoſis, or inocu-

11. lation 10. The ſecond called Pudenda, 11, ſpent

12. upon the privy parts. The third Coxalis, 12, upon the Muſcles of the Hip.

Here the outer Iliacall vein having paſt through the Peritoneum or rim of the Belly enters the Crus, and

Γ. begins to be called the Crurall Trunk Γ, that is undivided as far as to the two lower heads of the Thigh. But it reaches forth four propagations before its diviſion.

13. The firſt; 13, is called Saphena, which creeps through the inſide of the Leg, under the skin as far as to the ends

14. of the Toes. Another 14 called Iſchia is ſpread out

15. into the skin upon the Hip-bone. The third 15 named Muſcula is ſent to the Muſcles, which extend the

16. Leg. The fourth 16 named Poplitea is diſtributed into the Calf of the Leg.

13. The vein Saphena alſo ſcatters from itſelf four

17. ſurcles, the firſt 17 into the upper part of the skin of

18. the inſide of the Thigh: the ſecond 18 about the

19. middle of the Thigh: the third 19 into the Knee:

20. the fourth 20 is carried forward and backward to the middle of the Leg.

Δ. The diviſion of the Crurall Trunk near to the two

Θ. lower heads of the Thigh into an inner branch Θ and an

Λ. outer one Λ.

Θ. The inner diſtributes little branches to the Muſcles

21. of the Calf 21, and then runs down under the inner ankle

22. to the great Toe 22.

Λ. The outer preſently is cleft into two branches, an in-

Ξ. ner one Ξ, and an outer Π. That is ſpent wholly upon the

Π. Muſcles of the Calf: this paſſes on near to the Fibula or leſſer bone of the Leg, through the outer and back-ſide of the Leg.

THE

The second Treatise,
Concerning
The ARTERIES.

CHAP. 1.

Shews the upper or ascendent Trunk of the great Artery, with its propagations that are distributed through the Head.

THere is no controversie among writers of Anatomy concerning the number and originall of the Arteries, but an unanimous consent, that all the propagations, which are scattered throughout the body, take their rise from one, which they call *Aorta*, and that this is derived out of the Heart. But the Heart consisting of two *sinus* or cavities, a right, and a left one; this great Artery grows out of the left *sinus* or ventricle [A], where it is largest, and more hard, and gristly, then elsewhere. But as soon as it is grown out, and before it fall out of the *Pericardium* or purse of the Heart, it presently propagates two small sprigs [a a] one of each side, which they call *Arteriæ Coronariæ*, the Crown-Arteries, because together with the *vena Coronalis*, or Crown-vein, they compasse the *basis* of the Heart in manner of a Crown, and from these many propagations are scattered downward all along the Heart. But they are more, and greater about the left, then the right ventricle, as we have also formerly said concerning the vein, because the Heart needs a greater plenty of bloud on that side, at which beats with a perpetuall, and more violent motion, wherein more bloud is digested, then the right *sinus* or ventricle does: yet that propagation is bigger, and longer, which arises out of the right side of the Artery: sometimes also there is only one, at whose orifice a little valve is found. These propagations being thus disseminated, the Artery ascends somewhat, under the Trunk of the *vena Arteriosa*, or Arteriall-vein, and pierces through the *Pericardium*, and, having got above it, is cleft [B] into two branches, which because of their notable greatnesse we will call Trunks, and because one ascendes [C] and the other runs downward [Q], that shall be the Ascendent Trunk, this the Descendent. Yet the Descendent, and lower Trunk is bigger by much then the upper, because that serves more parts, then this. For the Ascendent one goes only to some parts of the Chest, to the Head, and Arms; but the lower to very many parts of the Chest, to all the lowest Belly, and the Legs. That therefore we may treat of the great Artery with more perspicuity, we will first shew the Ascendent Trunk, and its progresse through the Chest, and Head, and after that its branches distributed through the Arms. Then we will fall upon the Descendent one, and explain the manner of its distribution through the Chest, and lowest belly, and lastly through the Legs.

The originall of the great Artery.

Arteriæ Coronariæ the Crown-Arteries.

The division of the great Artery into two Trunks.

What parts both the Trunks nourish.

The order of that which is to be said.

The Ascendent therefore or upper Trunk of the *Aorta* [C], being fastened to the *Oesophagus*, or Gullet, climbs upward betwixt the rough Artery, and Hollow-vein, and the *mediastinum*, or partition of the Chest. Which situation of it they ought diligently to observe, who desire to know the reason of that Aphorism, which is the four and twentieth of the fifth Section in *Hippocrates*: For, saies he, cold things, as snow, and ice, are enemies to the Breast, provoke coughs, and cause eruptions of bloud, and distillations. Truly they are enemies to the Breast, because, whilest they are swallowed down through the Gullet, they cool the rough Artery, that lies next to it, together with the Gullet, which part being of it self cold does easily take harm from so violent a cold: hence the cough, and other diseases of the Breast follow one another in a long row. But issues of bloud happen in like manner, the great Artery being cooled, whereby the vitall Spirits, and the bloud are driven back to the Heart, and from thence are sent up forcibly to the Head, which being stuft, eruptions of bloud are caused by its dropping forth at the Nostrils, as also

alſo catarrhs and diſtillations, it being driven down undigeſted to the inferiour parts. And hence alſo a reaſon may be rendred, why ſome, upon drinking of cold water after vehement motions and exerciſe of the body, have preſently been ſuffocated, the paſſion of the heart, and grievous ſwoundings following thereupon. For the Artery being vehemently [illegible], the blood is congealed, as well that which was in the *Aorta*, or Great artery, as that which abides in the heart; from whence happen at firſt fearfull ſymptoms, and then ſuddain death. But we have ſeen in theſe men, that a vein being opened, the bloud hath come out thick, and cold, and with very great difficulty, whence alſo we have not found a more preſent remedy for them, then ſuch things, as by reaſon of the thinneſs of their parts have a power of diſſolving the clots of blood. Hence alſo a reaſon may be given, why in burning fevers the tongue becomes black, and the diſeaſed can hardly ſwallow. For although it be true, (which is the cauſe commonly aſſign'd) that many vapors are ſent up from the whole [illegible] to the head; yet we may aſcribe a main cauſe of this blackneſſe to the nearneſſe of [illegible], which being ſet on fire, and inflamed, procures much miſchief to the gullet, and conſequently to the tongue it ſelf.

The diviſion of the Aſcendent trunk into two branches.

The ſubclavian arteries.

But the Aſcendent Trunk, whilſt it paſſes thus upwards, is divided into the two ſubclavian arteries, [DD] of which one runs to the right ſide, and the other to the left. They are called *ſubclaviæ*, as long as they are in the cheſt, for the ſame reaſon as the ſubclavian veins are ſo called, becauſe they run under the *clavicule* or collar-bones: but as ſoon as ever they are faln out of the cheſt, they change their name, and are called *Axillares* [E]. From both the ſubclavian arteries, when they have attained to the firſt rib (for before that they ſend forth no propagations) many ſprigs iſſue out, as well from their upper, as lower part. From the lower iſſues the upper Intercoſtall artery, or *Intercoſtalis ſuperior* [b], which being faſtned to the roots of the ribs, beſtowes particular branches upon the diſtances of the four uppermoſt which run under the ribs, together with the veins, as far as to the griſtles, from which propagations are diſperſed into the marrow of the back, and the neighbouring muſcles.

Intercoſtalis ſuperior, the upper artery between the ribs.

From the upper part iſſues firſt that which is commonly called *Cervicalis*, or the artery of the neck [c], but better *vertebralis*, of the rack-bones, which ariſes more backward, and toward the bodies of the rack-bones, and aſcending obliquely, near to the ſeventh rack-bone of the neck, like the neck-vein, paſſes through the holes of the tranſverſe proceſſes, and upper rack-bones of the neck, where it ſhoots out many propagations, which enter the ſpinall marrow through the common holes, at which the nerves go out. It ſends alſo a pretty company to the muſcles that are ſeated on the back ſide of the neck, and aſcends to the nowle-bone together with the vein, through whoſe firſt notable hole, by which the ſpinall marrow deſcends out of the head, it enters the skull. After this it is joined with its fellow of the other ſide under the ſpinall marrow, which remains yet in the skull, and ſo runs ſtraight forwards, under the middle of the *baſis* of the brain; but when it hath now attain'd to the *ſella*, or ſaddle of the wedg-bone, upon which the phlegmatick glandule lies, it is divided into two branches, a right, and a left one, both which at the ſide of the ſaddle creep to the ſecond pair of the nerves, where being broken on both ſides into an infinite number of furcles, they are diſperſed betwixt the firſt and ſecond pair of the nerves, and folded together with the thin membrane make that complication of veſſels call'd *plexus Choroides*.

Vertebralis, the artery of the rack-bones.

Mammaria, the artery of the paps.

The next is *arteria mammaria* or artery of the paps [d] which being reflected under the breſt-bone (accompanied with the mammary vein) deſcends along its ſides, and when it comes to the griſtle called *Enſi-formis*, or the breaſt-blade, about the ſides thereof goes out of the cheſt, and running under the right muſcles of the *abdomen*, deſcends directly through the lower ſide of them, and at length neer the navell, is joined by *anaſtomoſis* or inoculation [x] with the Epigaſtrick artery plying upward [i]. But before it leaves the cheſt, it ſcatters particular branches to the ſix diſtances betwixt the griſtles of the ſeven true ribs, which branches determin together with the griſtles. A third [e] is otherwiſe called *Fiſtula* the muſcle artery, but might bee better, and more ſtrictly named *Cervicalis*, being it is diſſeminated into the muſcles, that are placed in the region of the neck, as far as to the *occipitium* or nowl of the head.

Cervicalis, the artery of the neck.

Arteria axillaris.

Its branches before it enters into the arm.

From its lower part.

Theſe branches being ſent out, the ſubclavian artery goes out of the cavity of the cheſt, and getting above the firſt ribs tends obliquely to the arm-pit, and ſo makes the axillary artery [E] which afterward is ſpread into the arm. But before that it ſcatters ſome propagations, and *from its lower part* three, of which the firſt is *ſcapularis interna*, the inner-blade artery [f] which goes to the muſcles on the hollow ſide of the ſhoulder-blade. Another is *Thoracica ſuperior* the upper cheſt artery [g], which goes to the pectorall muſcle, that leads the ſhoulder forward to the breaſt, and the other muſcles that lie upon the breaſt, and is a pretty big one. The third is *Thoracica inferior* the lower artery of the cheſt, [h] which is alſo a large one, and running down all along the ſide of the cheſt, is the greateſt part of it ſcattered into the broad muſcle called *Latiſſimus*, which moves the ſhoulder backward from the breaſt.

From its upper part one.

From the upper part of the axillary artery ariſes one called *ſcapularis externa* the outer blade-artery [i], which climbing up to the top of the ſhoulder is diſſeminated into the muſcles that cover the gibbous ſide of the ſhoulder-blade,

blade. The remaining part of the axillary artery passes on in company of the Basilick vein to the arm, upon all which it is afterward spent, of whose distribution we will speak in the following Chapter.

That which remains yet of the Ascendent Trunk [L] being sustained [illegible] the *Thymus* neer to the upper part of the breast-bone, is divided into two branches [MM] which they call *Carotides*, or *soporales* the sleepy arteries, because they being [illegible], if any way stopt, we presently fall asleep, of which *Valuerda* witnesses in [illegible] 6. c. 11. that *Realdus Columbus* made tryall in a young man, among a great company [illegible]. They are unequall in bigness, the right one being much thicker then the left [illegible] they tend directly upward, being carried along by the sides of the neck, and fastned to the rough artery, and to the internall jugular veins, by the benefit of a membrane, and when they are come to the cups, are divided into two branches [N] of which [illegible] is the outer, the other the inner one: that is the less, this is the [illegible]. The [illegible] O] sends propagations [+] to the cheeks and muscles of the face [illegible] to the ear, it is divided in twain; for *one branch* [r] of it [illegible] ear, from which two branches under the ear enter the neather [illegible] of it, that is seated at its processes, and throughout the length thereof [illegible] into the roots of all the lower teeth; that which remains, going out at [illegible] hole; which is placed at the chin, is scattered into the lip. The *other branch* [q] creeps through the Temples and fore-head, and is spent upon the muscles of the face. The *inner branch* [P] of the sleepy artery, or *arteria Encephalica* the brain-artery, is carried into the chops; and having scattered some propagations to the tongue and throttle, is divided about the *basis* of the skull, into two unequall branches, to wit, a greater, and a lesser one. The *lesser and hindmost* [s] is carried together with the greater Encephalick branch of the internall jugular vein to the back-side of the skull, enters through the second hole of the *occipitium* or nowl-bone, and goes into the *sinus* or canale of the thick membrane. The *greater and more forward* [t] having entred the cavity of the skull through a hole made on purpose for it in the temple-bone, and attain'd to the saddle of the wedg-bone, going every where under the hard membrane, first of all propagates a branch on both sides into the side of the thick membrane, then in beasts scattering an infinite number of surcles makes the *Rete mirabile* or wonderfull net, which indeed may be found in a man too, but it is very little, and seems but a shadow in respect of that in beasts. These surcles being thus placed it pierces through the thick membrane of the brain, and having got out of it, sends another propagation out of the skull, through the second hole of the wedg-bone to the eye, and its muscles, as also to the temple muscle, that lifts up the lower jaw; and then going straight up to the side of the phlegmatick glandule, it is divided into two branches, an outer, and an inner. The inner is joined with its fellow of the other side, and being joined they are wasted into many little arteries, which are dispersed through the thin membrane, and the very substance of the brain, to the originall of the optick nerves. The outer being reflected and sustained with the thin membrane, goes into the forward ventricle of the brain, being [illegible] into many surcles, which are united with those little arteries, which arise from the *vertebralis*, or artery of the rack-bones; some with those which the vertebrall artery scatters through the *basis* of the head under the brain, but others with those which it dispenses through the thin membrane and substance of the brain, together with which they make the *plexus choroides*.

The sleepy arteries.

The division of them.

The outer, or branch of the face.

The inner, or branch of the brain.

The division thereof into a lesser and greater branch.

A subdivision of the greater.

CHAP. II.

Declares the History of the Axillary artery being dispersed through the Arm.

THE Axillary [illegible] therefore when it is come to the arm, taking the name of the Arm-trunk [illegible] carried in one undivided stock, beyond the bent of the cubit, [illegible] inside of the arm, dispersing some small propagations on both sides to the muscles that lie on the inside of the upper part of the arm. But it goes fast by the inner or deep branch of the Basilick vein, as an unseparable companion of it, whose conduct and steps it every where follows. But presently falling down by the back-side of the upper part of the arme, where the muscles which extend the cubit stick to it, it sends forth two propagations [l & m] the lower of which is a very notable one, and so it is writhed back toward the bent of the cubit, and having attained thereunto it reaches out two surcles [n n] one of each side, so manifest, that the pulse is there oftentimes evidently enough perceived. Then going under the bent of the cubit, through the inside of it, and sinking down betwixt the two muscles that bend the second and third bones of the four fingers, it is cut [G] into two notable branches, one of which is an outer, the other an inner one. The outer [H] is carried along

Brachialis trunci, the trunk of the arm.

The division thereof into two branches.

The outer branch.

along the *Radius*, or leſſer bone of the cubit (whence I call it *Radicem*) and goes directly to the wriſt, in which place Phyſitians feel the pulſe, it being very manifeſt, by reaſon that the artery lies next under the skin. But not far from the root of the wriſt it ſhoots out a little branch [o] which runs under the tendons of the muſcles, which extend the thumb, into the outſide of the hand, and is ſpent upon the muſcles, which are placed betwixt the firſt bone of the thumb, and that of the after-wriſt, which ſupports the fore-finger. This branch being propagated, going under the inner annular ligament of the wriſt, and the broad tendon of the palm-muſcle, it is divided into three branches [ppp] like the vein, and nerve, that are its companions. The firſt of theſe goes to the inſide of the thumb, the ſecond to the inſide of the fore-finger, and the third to that of the middle. The firſt, and ſecond are each of them parted into two branches; the third is undivided. *The inner branch* of the trunk of the arm [I] runs ſtraight along the *ulna* or greater bone of the cubit (and for that reaſon I call it *Cubitem*) and is diſperſed into the palm of the hand. But it is ſo hidden among the muſcles, that it is hardly perceived to beat, unleſſe in lean folkes; and therefore Phyſitians always lay their hands upon the outer branch, when they feel the pulſe in the wriſt. But it paſſes on under the tranſverſe ligament of the wriſt, and the tendon of the palm-muſcle, in company of a vein, and nerve, and ſcatters two branches into the little finger, as many into the ring-finger, and one into the outſide of the middle.

The inner branch.

CHAP. III.

Shewes the Inferiour or Deſcendent Trunk of the great artery, and the propagation thereof through the middle and loweſt bellies.

WEE have ſaid above, that the great artery [A] as ſoon as it has gotten above the *Pericardium* or purſe of the heart, is divided [B] into two branches; of which one goes upward, the other deſcends to the parts below. We have already handled the upper branch, it remains that wee explain the other alſo.

The Deſcendent trunk.

The Deſcendent trunk therefore [Q] anſwering in proportion to the ſtock of a tree, is carried down to the fifth rack-bone of the cheſt, and declining ſomewhat to the left, cleaves to that ſide of the body of the rack-bones, and ſo deſcends leiſurely.

Its progreſſe.

When it has now paſt the midriffe through that diviſion reſembling a ſemi-circle, which is betwixt the productions of the *ſeptum tranſverſum* or midriffe, preſently it runs out by the rack-bones of the loins, leaning upon the middle of their body, till it come to the laſt of them, where near to the *os ſacrum* it is divided [R] into two notable branches [SS] which with other Anatomiſts we will cal *Iliaci* the Iliacal arteries from their ſituation. In this journey it ſcatters many propagations from it ſelf, which are very worthy to be diligently obſerved, becauſe from thence we may eaſily give a reaſon of many accidents in diſeaſes. But they are in number eight, the Intercoſtal arteries, the two *Phrenicæ* or arteries of the midriffe, the Cœliacall, [illegible] the upper Meſenterick, the two Emulgents, as many ſpermaticall ones, at laſt the lower Meſenterick, and the *Lumbares*, or arteries of the loins. Of theſe the Intercoſtalls are ſcattered, whilſt the trunk is yet in the cheſt; the reſt, whilſt it paſſes on through the loweſt belly: ſome of them accompany the branches of the gate-vein, as the Cœliacall, and both the Meſenterickall arteries: others thoſe of the hollow vein, as the reſt. Now we will treat of them in order, beginning from the Intercoſtalls, or arteries between the ribs, which are placed uppermoſt. Preſently therefore after the Deſcendent trunk [Q] is iſſued forth, from its back-ſide it ſends over little branches on both ſides to the diſtances of the eight lower ribs, which they call *Intercoſtales inferiores*, the lower arteries between the ribs [nnn] in reſpect of the upper Intercoſtall, of which we have ſpoke above. Theſe aſſociating themſelves with the veins and nerves of the ſame name, go ſtraight on by the lower ſide of the ribs, whoſe gristles [illegible] or channells are cut out for them. But as the Intercoſtall veins reach in their ribs only to the griſtles, but in the baſtard ones ſomewhat farther, to wit, to the ends of the ribs: ſo alſo the arteries end in them together with the bony part of the ribs, but in theſe run out a little farther. And theſe arteries ſend over ſome propagations through the holes of the nerves to the ſpinall marrow, and to the muſcles that lie upon the rack-bones of the back, juſt as we have ſaid the Intercoſtall veins were propagated. But the uſe of them is to diffuſe the vitall ſpirit, and the blood to the muſcles betwixt the ribs, beſides which they have alſo another notable office, to wit, of carrying down the water, and purulent matter, that is gathered together in the cheſt, into the great artery, and from thence by the Emulgent branches to the bladder. Although I am not ignorant that the moſt learned *Fallopius*, and others who have read before me in this moſt famous Univerſity of *Padua*, have ſhewn another way to their Auditors, by which either purulent matter, or water might be conveighed forth by help of the kidneys, to wit, the vein *ſine pari*, or without a companion, a little branch whereof in the left

Its propagations.

Intercoſtales inferiores, the arteries between the lower ribs.

Their uſe.

eſt ſide goes into the Emulgent of the left kidney. But this way which we ſhew through the Intercoſtall arteries, is by much the ſhorter; that I paſs by this, that any matter heaped together may be more eaſily diſpatcht away through the arteries then the veins. Nor needs any one here to be afraid, leſt the vital ſpirits ſhould be infected from theſe excrementitious and ill humors, whereby the heart may incurre fearfull ſymptomes; when we willingly grant (which experience alſo hath often taught us) that whilſt the corrupt matter is emptied out by the urine, the ſick parties have often faln into fits of ſwounding, and other diſeaſes; ſometimes alſo have died ſuddenly, when the peccant humor has been of too great a quantity, or too bad a quality, and has offered ſo much violence to nature, that the heat, and ſpirits have been overcome therewith. But here a certain place in *Hippocrates* calls upon me to explain it, which has long and often troubled my mind. The place is in *Coacis prænotionibus*, where he ſays; They, who together with the heart have their whole lungs inflamed, ſo that it falls to the ſide, are deprived of motion all over; and the parties ſo diſeaſed lie cold, ſenſeleſſe, and die the ſecond or third day. But if this happen to the lungs without the heart, they live not ſo long. Yet ſome alſo are preſerved. I have often thought with my ſelf, what ſhould be that ſympathy of the heart and lungs with the brain and nerves, that from the inflammation of thoſe parts, the Patient ſhould be ſo deprived of ſenſe and motion all over, when the ſame *Hippocrates* teacheth in the ſame place, that the diſeaſed ſuffer ſuch deprivation in that part, if livid ſpots appear on the outſide about the rib, where-about the *Aorta* (ſo he ſeems to call the lobes or diviſions of the lungs) being inflamed fall to the ſide. But if they be not much inflamed, ſo that they fall not down to the ſide; he ſayes that there is a pain indeed all over, but no deprivation of ſenſe or motion, nor any ſpots appear. Having deliberated often with my ſelf, at length I came to be of this opinion; that there was no other cauſe, but the ſympathy betwixt theſe Intercoſtal arteries and the marrow in the backbone. This ſympathy ariſes from thoſe propagations, which we told you paſt through the holes of the rack-bones of the cheſt into the backbone. Wherefore if the lungs, and heart be ſo mightily inflamed, that great plenty of blood rush into the great artery, whereupon it ſwells, as alſo theſe veſſels betwixt the ribs, and conſequendy thoſe ſureles which go to the marrow of the back-bone, truly it cannot be, but that both the marrow, and the nerves, which iſſue out of it, be compreſt, from whence what elſe can follow, but the reſolutions of thoſe parts, into which thoſe nerves are implanted, and to which they impart the faculty of motion? This opinion ſeems to me to bee wonderfully confirmed by a certain pretty obſervation, which the learned *Cornelius Gemma* has in his book, *de hominis ore peſtilenti*. A certain ſtudious young man, ſayes he, through the whole courſe of his diſeaſe, had his left eye leſſe then the other. He was pain'd in the left ſide, eſpecially all the time the fit raged; but about the *criſis* or change thereof, the artery of his left leg being ſwoln up was moved according to its length, that being to be ſeen by us it ſeemed to be turned upward and downward like a rope pull'd back. Who will not here willingly confeſſe, that this matter was in the arteries, when the *criſis* was made by them? But from this that hath been ſaid a reaſon may be alſo given of another obſervation of *Galen*, which is 4. *de locis affect.* c. 4. where he ſayes thus: In a certain man, who was troubled with a vehement inflammation of the lungs, as well the outer, as the inner parts of his arme, from the cubit to the very ends of his fingers labour'd with difficulty of ſenſe, and their motion alſo was ſomewhat empair'd. In the ſame man alſo the nerves, which are in the firſt, and ſecond diſtances betwixt the ribs, ſuſtained harm. *And* this man was quickly reſtor'd to his health, to wit, a medicine being applyed to the place, from whence the nerves iſſue forth, near to the firſt, and ſecond ſpaces betwixt the ribs. By reaſon of the ſame branches betwixt the ribs *John Valeriola*, the ſon of that Phyſician, whoſe obſervations we have, being yet a boy ſuffered Convulſion-fits in a grievous Pleuriſie.

The explanation of a place in *Hippocrates*.

2. *Phrenicæ* the arteries of the midriffe.

The arteries called *Phrenicæ* of the midriffe, [x x] are two, one of each ſide, which ariſing out of the trunk, preſently after it is come forth of the hollow of the cheſt, being divided into more branches, are ſcattered into the midriffe, but eſpecially into the lower ſide of it, near to the rack-bones of the back. They ſprinkle ſome ſmall twigs alſo into the upper part, which afterwards go to the *Pericardium* or purſe of the heart, there where it growes to the midriffe.

3. *Cœliaca.*

The *Cœliaca* or Stomach Artery is but one, ſo called, becauſe it ſends over branches to the *Cœlia*, that is, the Stomach. This, being moſt like to the ſpleenick branch of the Gate-vein, affords many branches to the Stomach, Liver, Bladder of Gall, Kell, the gut *Duodenum*, the beginning of the *Jejunum* or empty Gut, a part of the *Colon* or Colique-Gut, the Sweet-bread, and Spleen. But it ariſes out of the forepart of the body of the Trunk, and being ſtayed up all the way by the upper part of the lower membrane of the Kall, is divided into two notable branches, but of unequall bigneſſe, one of which goes to the right, the other to the left: that is the leſſe, this the greater. *The right branch* therefore is joined with the deſcendent Gate-vein in the *Pancreas* or Sweet-bread, that is placed under the hinder part of the Stomach, and leaning there upon the membranes of the Kall goes to the Liver; and its ſmalneſſe is worth the taking notice of, if you look upon the largeneſs of the Liver, which the Ancients long ſince, and many at this day have made the work-

The two branches thereof. The right branch.

house of the bloud. But it is inserted in the hollow part, near to the Trunk of the Gate-vein, and is so small, because that part of the Liver, which entertains the roots of the Gate-vein, needed not a greater Artery; but the other part which hath the propagations of the Hollow-vein, receives great plenty of vitall spirit sent over from the Heart through the Hollow-vein. Yet before it enters into the Liver, it disseminates in the way many surcles, and those partly from its upper side, partly from its lower: *from the upper side* two, first, that which I call *Pyloricus*, which arises in the mid-way, and being divided into many little branches is scattered into the back-side of the right orifice of the Stomach. The other is called *Cysticæ gemellæ*, the Twin-Arteries of the bladder of Gall, which are two little branches, and go into the bladder of Gall, and presently are divided into many propagations. *From the lower side* likewise two arise. The first is *Epiploïs dextra* or the right Kall-Artery, which is implanted into the right side of the lower membrane of the Kall, and part of the Colique-Gut annexed thereunto. The other is cleft into two branches, of which one called *Intestinalis*, the Gut-Artery passes on to the *Duodenum*, and beginning of the *Jejunum* or empty Gut: the other, named *Gastro-epiploïs dextra* the right Stomach and Kall-Artery, somewhat larger then the former, turns down to right side of the bottome of the Stomach, and being supported by the upper membrane of the Kall, issues out some shoots from the upper part to the fore and back-sides of the Stomach; but from the lower to that membrane of the Kall, upon which it leans. *The left and greater* branch is called *Arteria Splenica* the Spleen Artery, which sticking to the lower membrane of the Kall, and the Glandules placed therein, passes on together with the Spleen-vein, to which it is fastened, and in like manner distributes its propagations to the Spleen. But in the way likewise it distributes branches from both parts of it: *from the upper* issues *Gastrica* the Stomach-Artery, which reaches into the middle of the hinder part of the Stomach, or that, wherewith it leanes upon the back, and ascending from thence it compasses the left orifice of the Stomach round about like a crown, and disperses little twigs, partly upward to the end of the Gullet, partly downward, and those greater, and more numerous, into the Stomach, and so it makes the *Arteria Coronaria* or Crown-Artery, like to the Crown-vein, which arises from the Gate-vein, as we have said in the fore-going Treatise. But *from its lower side* the Spleen-Artery sends out the *Epiploïs sinistra*, or left Kall-Artery, about that part, wherewith it now attains to the Spleen, which runs out into the left side of the membrane of the lower part of the Kall. This Artery presently after its rise is cleft into two branches, which part very far asunder from each other, from which many other Arteries arise, that are all consumed upon the said membrane of the Kall, and the Colique gut, that is tyed thereto. These branches being issued, the Spleen-Artery draws nearer to the Spleen, and just like the vein of the same name, which accompanies it all the way, is cleft into two branches like the Letter Y, one of which may be called the upper, the other the lower, which afterward entring by the hollow part of the Spleen are splintered into an infinite number of little sprigs, so that there are five times more Arteries there, then veins. Whence it comes to passe, that in inflammations of the Spleen, if you lay your hand to the left *Hypochondrium*, or place under the Griftles of the Bastard-ribs, it seems to pant. But before this entry of the Artery of the lower branch makes a notable *anastomosis* or inoculation with the lower branch of the vein, and propagates a twig to the lower membrane of the Kall. But from the upper branch is one called *Gastro-epiploïs sinistra*, the left Stomach and Kall-Artery, which being [illegible] to the upper membrane of the Kal is derived into the left side of the bottom of the Stomach, bestowing little branches upon the fore and back-sides of it, or also upon the upper part of the Kall. Another issuing from the upper branch makes the *vas breve Arteriosum*, or short arteriall vessell, carried, like the vein its name-sake, to the left side, and orifice of the Stomach. The use of the right branch, which goes to the liver, besides the common one, which it hath, is this, as often as the bladder of Gall is obstructed, to carry down choler to the Guts, and especially to the *Colon*, into which some of its branches are implanted. Which is the reason, that in bloudy Flixes the Ulcers are almost alwayes found in the great Guts, and especially in the *Colon*, very seldome in the small ones. For this artery, when either the Liver being over hot breeds abundance of choler, or the bladder of Gall is obstructed, receiving into itself store of choler carries it directly over to the *Colon*, or Colique Gut. In like manner the use of the left branch, or Spleen Artery, besides the common one, is to throw down choler, melancholy and wheyy humors, if at any time the Spleen abound with them, to the Guts. Moreover by the same way the waterish humors in such as have the Dropsie, are sometimes committed either to the Guts, or to the Kidneys and Bladder. This same branch is that by which the drink passes so sodainly through the whole body, and by which ill humors are cast out by vomit. This same is the cause, that upon a full Stomach we make little water; but more when the concoction therein is finished. For the Stomach being much distended presses it; but that once empty, it can perform its office. This same branch teaches us that a slender diet is to be prescribed to them, who are to take purges, that the way may be open for the medicins, as well that, by which the

the excrements are sent over to the Stomach, as that, by which they are conveyed to the Guts. This same branch also, if you adde the two Mesentericks, is the seat of the hypochondriacall Melancholy. For this disease arising from the obstruction of the entrails, which are contained in the lowest belly, it is necessary that the arteries here should suffer very much, which the very Symptomes, that happen in this disease, may sufficiently inform us.

4. *Mesenterica superior.*

Mesenterica superior, the upper Artery of the Mesentery [y] arises a little below the Coeliacall, being distributed like the Meseraick vein (which is its companion) with numerous propagations into the Guts called *Ilium* and *Jejunum*, as also that region of the *Colon*, which reaches from the Hollow of the liver as far as the right Kidney, and so for the most part into the upper part of the Mesentery. In which place it is to be observed, that the Artery sometimes lies upon the vein, sometimes on the contrary the vein upon the Artery, and so is carried betwixt both the membranes of the Mesentery. But these Arteries in many places in the Mesentery have Glandules, which were made for the free perspiration of the vessels, and especially of the Arteries, whereby it comes to passe, that these Glandules labouring with a hard tumor, or *Scirrhus*, the vessels are compresst, and a pining away of the whole body follows thereupon.

An observation.

5. *Emulgentes.*

The Emulgent Arteries [z] are two, one the right, another the left one. Both issue out under the forementioned Artery, where the first, and second Rack-bones of the loins are coupled together by a Ligament. But they arise out of either side of the Trunk, although not directly over against one another, as also it is in the Emulgent veins, the right one being lower then the left. These Arteries, when they come to the Kidney, are cleft into two branches, with which they are inserted into the *sinus* or channels of the cavity of the Kidneys, and like the veins are consumed in an infinite number of little sprigs upon their substance. Their use, besides the common one, is to purge out the whey, which is found in great plenty in the Arteries.

Their use.

6. *Spermaticæ.*

The spermaticall, or seed-arteries [a] are likewise two, which arise out of the forepart of the Trunk of the great Artery, their originals touching each other; for the left Artery issues not from the Emulgent, as the left spermaticall vein does. Afterward in their descent they are made fast to the veins of their own side, and in men are carried through the proceſſes of the *Peritonæum* or Rim of the Belly to the Testicles: but in women, when they come somewhat near to the Testicles, they are divided into two parts, one of which is carried to the Testicles, the other to the bottom of the womb. But the arteries do so passe to the womb, that they only water it at the sides, and pierce not at all into the inner part. Which truly ought to passe by the great providence of wisest nature, since it had not been safe to have sent the them down to the inner surface of the womb, by reason that in the coming forth of the child very great effusings of bloud would be caused to the no small danger of the woman in Child-bed, if the Arteries had been annexed to the Womb on the inside. Hence also it is, that in the time of delivery they flow by little and little, not rushing down with violence.

7. *Mesenterica inferior.*

Mesenterica inferior, the lower Artery of the Mesentery [b] arises near to the *Os sacrum*, or rump bone, a little above the division of the Trunk into the Iliacall branches, and goes to the left side of the *Colon*, and into the streit gut, descending with the hæmorrhoidall veins to the very end of the fundament, and making the hæmorrhoidall Arteries. It is questioned concerning the use of both the Mesentericks, whether besides the common, they have any peculiar one. For Galen in his 4. of the use of the parts, seems to make mention of some other, when he would have some part of the chylus to be attracted by them. And in the book, whether bloud be contained in the Arteries, in the fifth Chapter, he sayes: If we divide the lowest belly, and the inner membrane, we shall plainly see the Arteries in the Mesentery filled with milk in Kids newly yeaned, but in living creatures that are grown, full of something else. In which words Anatomicall experience teaches us, that not onely the Meseraick veins, but Arteries also do manifestly draw the chylus to them. Which being so granted, it is also to be believed, that the chylus is either afterward transported by them into the veins, or changed into bloud by the Arteries themselves. Nor will this seem wonderful to any one, if he consider also that the mothers bloud is conveyed through the Umbilicall [c] vessels to the child, while it is yet shut up in the Womb. But if the bloud which is received by the veins ought yet to be better worked, as any diligent inquirer into nature will conclude of it, truly that which is received by the Arteries will require to be so much the more laboured, by how much the better it is, then that of the veins. But it is also perfected in the Arteries themselves, and in the Spleen, being haled into the Coeliacall Arteries, and carried to the Spleen. And this is an excellent use of the Mesenterick Arteries, whereby man enjoyes perfect health, besides which we will adde another also, by which he leaves to be in health. For these Arteries take to them the excrements of the whole body, that they may carry them down to the Guts, in like manner as the veins do, by which nature doth both attract the chylus, and likewise expell the noisome humors out of the body, as choler, phlegm, and melancholy. Choler is thus expelled oftentimes in continuall and intermitting cholerick fevers, a solutions whereof follows by a loosenesse. Phlegm is so

Its use.

expell'd, as often as bloudy fluxes happen to ſuch as have the gout in the feet, which eaſe them of their pain, if the intent of nature be advanced by the help of a wiſe Phyſician. Laſtly melancholy is conveyed out by both the Meſentericks, but eſpecially by the hæmorrhoidall branch; whence *Hippocrates* ſayes, 6. *Epidem.* He which has the Emroids naturally, ſhall neither be troubled with the pain of the ſide, or inflammation of the lungs, nor with felons or black puſtles, called *Terminthi*, nor with the Leproſy, canker, or other diſeaſes. For

An obſervation.

there is a very great ſympathy betwixt the breaſt and the hæmorrhoidall artery, becauſe the trunk, out of which it ariſes deſcending from the heart, preſently after it firſt iſſues from thence, propagates the Intercoſtall branches. Moreover all black cholerick humours are purg'd by this means out of the whole body, that cankers and leproſies cannot be cauſed by them. From theſe voluntary purgings which nature it ſelf has found out, wee may now judg of ſuch as are cauſed by the help of a Phyſician, and may be termed Artificiall. For an opinion of ſome men hath prevailed much in our age, that the body cannot be purged by clyſters, but only by thoſe medicins, which are taken at the mouth. But I will not only believe, but alſo being taught it by experience can witneſſe, that, if the clyſters contain in them purging medicins, the whole body is very commodiouſly cleanſed. For the whole colick gut receiving the matter of the clyſter, the vertue itſelf of the medicin draws down the noiſome humors by the arteries out of the *Aorta* or great artery. Which being granted, we may give a reaſon (what we have ſeen very often) why Suppoſitories made of white hellebore produce the ſame ſymptomes, as are wont to be cauſed to them, who have taken in white hellebore at the mouth. In like manner from hence we may fetch the reaſon, why the belly is ſtrongly purged, the region about the navell, being anointed with purging medicins. For the vertue of the medicin is attracted by the arteries, and by them afterward it purges. Theſe arteries are they, by which the diſeaſe of the colick is changed into the gout, and on the contrary the gout into the colick, as we have it in *Hippocrates*, 6. *Epidem. Sect.* 4. where he ſayes: One, that was vexed with the pain of the colick on the right ſide, had ſome eaſe, whileſt the gout held him; but this diſeaſe being cured, he was pained more. The reaſon hereof was this, becauſe that humor, which cauſed the gout, was carried out of the joints to the colick gut, whereby the colick diſeaſe was increaſed. *Hippocrates*, inquiring into the cauſe of this, refers us to hidden and unknown paſſages, to which, it ſeems to me, that we need not fly, if we ſay, that the humors are brought out of the cruſall arteries into the trunk, and out of this into the Meſenterick branches, and laſtly out of theſe into the guts; for this is the ſhorteſt, and moſt convenient way. Nor is there any reaſon, that we ſhould be afraid of that pollution of the vitall ſpirits, which they will object to us if the excrementitious humors paſſe through the arteries, for this betrayes their great ignorance as well in Anatomy, as in ſolid phyſicks. And it would be very eaſie, if I would digreſſe, to prove in this place, that a great part of the humors in our body flow down through the arteries. For in them the ſtrength of nature exceeds, and is more vigorous, that whenſoever it is provoked, it is moſt apt to expell; and the bloud being ſtirred by their continuall beating, as alſo by its own nature, makes all that is therein more fit to flow. And who will not believe that excrements are carried through the arteries, who conſiders the fluxes down from the ſpleen, in which there being five times more arteries, then there are veins, truly it is neceſſary that that ballaſt of the ſpleen be carried out through the arteries?

VVhy anointing of the navell with ſuch things as purge, looſen the belly.

How the colick is changed into the gout; and on the contrary.

8. *Lumbares.*

The four *Lumbares* or loin-arteries [ ] ariſe out of the hinder ſide of the trunk of the great artery, all along as it paſſes through the region of the loins. They run through the muſcles in holes into the rack-bones of the loins, and to their marrow, and alſo into the neighbouring muſcles. And at the ſide of the marrow, after they have entred the rackbones, they climb upon both ſides to the brain together with the veins of the loins. But they are alle equally big, if you except thoſe two, which iſſue out next to the *os ſacrum* or holy-bone, which are not only derived into the rack-bones to the marrow, and to the muſcles thereabout, but are alſo ſent overthwart through the [illegible] and muſcles of the [illegible]. The two laſt are by ſome called *Muſculæ ſuperiores* the [illegible] muſcle-arteries, and are diſtinguiſht from the *Lumbares*. And theſe are the arteries, which if we obſerve, we ſhall eaſily give the reaſons of many things, of which Phyſitians do [illegible] very badly; but eſpecially of that moſt difficult queſtion, which is controverted among Phyſitians, by what wayes, and in what manner the colick ends in a palſie or in the falling ſickneſſe. For we have the obſervation in *Paulus Ægineta lib.* 3. *c.* 43. Where he ſayes: the colick, as it were by a certain peſtilent contagion, ended with many in the falling ſickneſſe, with others in a reſolution of the joints or palſie, their ſenſe remaining; and they who fell into the falling ſickneſſe, for the moſt part dyed, but they who fell into the palſie, were moſt of them preſerved; the cauſe of the diſeaſe being carried to another place in the ſolution. For the humor, that cauſed the diſeaſe, came back out of the colick gut through the meſentericall arteries, from whence being afterward tranſported into the trunk of the great artery, it came alſo to the *lumbares* or arteries of the loins, which ſwelling with bloud preſt together the neighbouring nerves, from which came the palſie in the feet. And this we have often obſerved, as well in our ſelves, as in others, eſpecially in former years, when theſe diſ-

How the colick diſeaſe ends in a palſie or Epilepſie.

eaſes

cases at *Padua* were Eoldemiall. Yet the Palsie is not always a perfect one, but often (as I am wont to call it) imperfect, because the power to walk is not wholly taken away, but the diseased stand upon their feet with a great deal of difficulty. Many at that time being deceived in the knowledge of the disease, mistaking this for a great weakness of body contracted by their sickness, endeavoured to take it away by eating and drinking largely, but in vain. This also is the cause, why the Falling-sickness, and Lethargies too, (as we have often-times seen) follow after the Colick, because the matter being sent over from the Mesenterick arteries to those of the loins, may easily go from them into the brain, to which those very vessels are carried.

But the trunk of the great artery, when it is come to the last rack-bone of the loins, having taken its journey all the [illegible] shewed, under the hollow vein, at the left side, here gets above the [illegible] more away in that continuall motion by the hardness of the holy-bone. [illegible] it is divided, no other wise then the hollow vein is, into two notable branches [S. S.] which are called by Anatomists the Iliacall arteries from their situation, and being carried down ward obliquely to the thigh, resemble the γ of the Greeks turned upside down. But they also just like the Iliacall veins, to which they are exactly answering, before they be implanted into the thighs, shoot out a pretty number of branches. But from the lower side of the artery before the Iliacall branches be divided, flue forth *four* Laeriæ. the holy arteries [ ] which are notable ones, and carried downward, leaning upon the holy-bone, pass through the [ ] thereof, and run to the marrow and substance of the bone. And through these also there is a way for the matter, that makes the Colick, to cause the Palsie of the legs.

Above this a little below the division of the trunk, the Iliacall arteries are subdivided into two branches, one of which is the inner and less, the other outer and greater. *The less and inner* [T] sends out two propagations, one from its outside, the other from its inside. *The outer* [ ] is commonly called *Adiposa*, by us more strictly *Glutea*, the muscle of the buttocks, because it runs down with its name-fake vein, betwixt the hollow and hip bones, where they part into many branches, and scatters many twigs into the muscles, which lye upon the *Os Ilium*, as has been said, called *Glutæi*, or the muscles of the buttocks, because they are the cushions of [illegible]

The division of the Iliacall arteries into an inner and outer branch.

Propagations of the inner or lesse branch.

1. *Glutæa.*

2. *Hypogastrica.*

The inner is called *Hypogastrica* [ ] which is very notable, and large, and, being carried directly down to [illegible] of the holy-bone, affords certain propagations in men to the [illegible], as also to the strait gut, which also may be called the Haemorrhoidal [illegible] in women, to whom this branch is somewhat larger, it distributes a great [illegible] propagations, besides those to the foresaid parts, into the lower region [illegible] of the womb, and likewise into its neck. Hence we may gather the reason, why [illegible] through reach to the middle of the hip, Convulsions are caused, as *Hippocrates* witnesseth. [illegible] As also if the womb fall down to the hip, why the monthly flowers are stopped, and a pain is caused in the forefront of the share, and in the lowest belly. For the [illegible] which nerves drive to the wombe, cannot be laid in their [illegible] the ureters being [illegible] by the falling down of it, so that necessarily flowing back, [illegible] arteries, which swelling, cause these pains. For we [illegible] those veins so swoln, that they have been seven fold bigger [illegible] Neither also a reason may be given of the thirty second Aphorism of the [illegible] in the fourth *Epidemicks*, where he witnesseth, that a woman vomiting blood is [illegible] upon shedding [illegible] other wombs. Which happening by the consent of all by reason of the attraction of the humours to a contrary part, and that not by the benefit of the veins, because the veins of the stomach arise out of the gate-vein, but they of the womb from the Hollow vein, there is no other sympathy to be sought for, then that which [illegible] by the arteries, especially when the Hypogastrick or artery of the lower part of the lowest belly [illegible] from the Gastrick, or artery of the stomach. Hence likewise a reason will be given of the Aphorism that follows this, wherein he judgeth the *Haemorrhagie* or [illegible] of blood as the noftrills to be profitable when the monthly courses do fail. The [illegible] part of the lesser Iliacall artery descends, and brings forth the [illegible] or navell artery [ ], which is carried down near to the length of the great artery, and is tyed with strong [illegible] to the sides of the bladder of urine. But it loses its hollowness in those that are once out of the womb. After this [ ] like the Iliacall vein which is joined to it, it goes through the hole of the share bone, or *os pubis*, which before it be past, it takes to it a propagation [illegible] from the outer Iliacall branch, and so goes out of the hole, and being departed from it spends it self, in like manner as the inner Iliacall vein does, upon the muscles; partly those with which the hole is stopt; and partly those which arise from the share bone. At length being terminated at the middle almost of the length of the thigh, the end of it meets [ ], and is united with the ends of the branches [ ] of the inner muscle-artery of the leg, of which we shall speak in the next Chapter.

Arteria umbilicalis.

Propagations of the outer or greater Iliacall branch.

1. *Epigastrica*, or the artery of the upper part of the lower belly.

The greater or outer Iliacall artery [V] produces likewise two propagations, the *first* of which [ ] is called *Epigastrica*, which arising from the outside of it, a little before it passe through the *peritonæum* or rim of the belly is reflected upward, and ascends by the inside of the strait muscle

muſcle til about the navel it be inoculated with the deſcendent Mammary artery. The other [ʌ] is called *Pudenda*, which is a little inner propagation, being not divided into ſo many branches, as the vein of that name is. But it ariſes preſently after the artery is gone out of the *peritonæum*, and being carried overthwart along the commiſſure or joyning together of the ſhare-bones, is ſpent at the privy parts upon the skin of the yard. That which remains of this trunk goes into the *crus* [X], whereof we ſhall now ſpeak.

Pudenda or the artery of the privy parts.

CHAP. IV.

The propagations of the outer Iliacall branch which are diſtributed through the Crus *or great foot, containing the thigh, leg, and foot.*

AFter that the outer branch [V] has propagated the fore-mentioned branches, it departs out of the *peritonæum* or rim of the belly, and at the groin is carried into the *crus*, by the ſame way which the crurall vein takes, under which it goes, and is joined in company therewith every where, and ſo it makes the trunk of the Crurall arterie [X], (as we will alwaies call it). But preſently after it hath got beyond the *peritonæum*, it iſſues forth a propagation from the outſide, which is called *Muſcula cruralis exterior*, the outer muſcle-artery of the *Crus*, which being carried downward is propagated into the muſcles that cover the foreſide of the bone of the thigh. Sometimes over againſt this, but oftner a little below, yet of the inſide another is brought forth, called *Muſcula cruralis interna*, the inner muſcle-artery of the *Crus*, [ʏ] which is diſtributed in many branches through the third bending muſcle of the thigh, called *Triceps*, and thoſe on the inſide of the thigh, as far as the knee; the ends of which branches are joined with the end of the inner Iliacall artery, which we told you deſcends through the hole of the ſhare-bones to the *Crus*. These propagations being diſpatcht away, the crurall trunk deſcends from the groin together with the crural vein; and is ſo bent backward near to the bone of the thigh, that when it is come to the ham, it ſtands betwixt the two hindmoſt heads of the thigh. [illegible] prudent nature does alwaies obſerve this, to carry down the veſſells about the joint where the bending is, leſt if they ſhould go on that ſide whereon [illegible] extended, they ſhould be compreſt. But in the very mid-way as it were, [illegible] through the thigh, it ſends out a propagation [ɛ] which breaking into [illegible] out through the muſcles that are ſeated on the backſide of the thigh, [illegible] at length deſcending through the ham (whence it is called [illegible] artery) is diſtributed with many ſprigs into the calf of the leg. But while it lyes in the ham, it ſends out a propagation [ζ ζ] on each ſide, to the ſides of the joint of the knee, which then ſinking deeper, are conſumed partly in the joint it ſelf, partly upon the muſcles called *gaſtrœmenii* that make the calf; from whence they are called *Surales*, the arteries of the calf.

The trunk of the crurall artery and its propagations ere it bee divided.

1.

2.

3.

4.

After that the Crurall trunk lyes in the ham [Y], it ſends forth a propagation from its outſide [σ] which runs down near to the *Fibula* or leſſer bone of the leg, [illegible] betwixt the muſcle, that moves the foot outward, and the ſecond bending [illegible] inſtep, and diſtributes it ſelf into the reſt, that lye on the forepart of the [illegible] are fleſhy, and till they begin to be contorted by the outer ankle. A little [illegible] another artery [τ] is brought forth out of the backſide of the trunk, which [illegible] as far as to the mixing together of the tendons of the calf-muſcles. Then another [υ] iſſues out of the ſame backſide of the trunk, but under the ſecond, which deſcending [illegible] through the tranſverſe ligament, runs down by the top of the foot, and is [illegible] into the muſcles that move the toes outward. The remainder [φ] of the trunk [illegible] downward by the backſide of the leg, and about the inner ankle offers a furcle [χ] to the foot, which goes to the muſcle of the great toe, and creeps through the top of the foot. But the trunk it ſelf lying hid among the tendons of the muſcles of the toes is cut [ψ] into two branches; of which the Inner [ω] beſtowes two furcles upon the great toe; two upon the fore toe, and one upon the middle; the outer [ϖ] two upon the little toe, and two upon the toes next to it, on the lower ſide. But although the progreſs of the Arteries be for the moſt part ſuch, as we have deſcribed, yet what we have ſaid formerly of the veins, that their diſtribution varies much, not only according to the diverſity of bodies, but alſo of ſides in the body of the ſame man, is true alſo of the arteries, which in divers men are diverſly diſtributed.

AN

An Explanation of the Table of the Arteries.

This Table comprises the delineation of the great Artery, entire and free from all the parts.

A The large beginning of the great artery, where it issues out of the left ventricle of the heart, but presently after its rise, and before it yet fully goes out of the pericardium or purse of the heart, it shoots forth the two Coronary arteries, a, a, which encompasse the basis of the heart in manner of a crown.

B But presently having past the pericardium it is divided B into two trunks, one of which is the Ascendent C, the other the Descendent one Q.

C The Ascendent trunk C, is by and by divided into the two subclavian arteries D D, both which when they have attained to the first rib, scatter many propagations; partly from the higher, partly from their lower side.

DD From the lower side issues intercostalis inferior the upper artery between the [illegible] of the greater two [illegible] of the first upper [illegible]

b From the [illegible] issue three. The [illegible] artery of the [illegible] by the [illegible] bones of the arm, as far as the skull. The second nourisheth the artery of the [illegible]

c [illegible] d, which ascending inside the breast-bone runs out as far as to the first [illegible] and distributes sprigs into [illegible] the griskles of the true [illegible] the muscles that lye [illegible] the breast, at length about the [illegible] by anastomosis or inosculation with the ascending Epigastric artery, i. The third cervicalis or the artery of the back side of the [illegible] and to the muscles on the back side of the neck, as far as the nowl of the head.

e These branches being issued out, the subclavian artery goes to the arm-pit, and there [illegible] axillaris, about [illegible] and is dispersed into the arm. Yet before it enters thereunto, it shoots out some twigs from both parts of it: from the lower three; of which the first, f, is called scapularis interna the inner blade artery, because it is spent upon the muscles that cover the hollow side of the shoulder-blade. The second is Thoracica superior the upper chest artery, g, dispersed into the muscles on the foreside of the chest. The third

f

g

h h, Thoracica inferior the lower artery of the chest, which descending along the sides of the chest, is inserted into a muscle called Aniscalptor, that moves the upper part of the arm backward. Betwixt g and h a little branch is placed, one of them which here are disseminated into the glandules of the arm-pit. From the upper part issues one, i, called scapularis externa the outer blade artery, being disposed of into the muscles, on the outside of the shoulder-blade.

h

i

FF In this place the axillary artery changes its name, and is called Brachialis the trunk of the arm, so it is undivided as far as G, scattering two twigs l and m into the muscles that cover the bone of the upper part of the arm on the back side, and two other n n, one of each side about the bending of the cubit.

lm

nn The portion or trunk of the Brachiall artery under the bending of the cubit into [illegible] H, and lesser branch I.

G

H The outer branch of this division, or Radicus, running straight along the radius or lesser bone of the cubit to the wrist, and there [illegible] branch o into the muscles seated betwixt the first bone of the thumb, and that of the metacarpium or wrist-wrist, which sustains the fore-finger, and then three other, P P P, which are dispersed into the first outer fingers, the thumb, and with the two fingers next thereunto.

o

PPP The inner branch, or Cubitcus passing along the greater bone of the cubit, is at length consumed in a double branch upon the two inner fingers; to ring-finger and little one.

I The remaining part of the Ascendent trunk, which near to the upper part of the breast-bone is cleft into two branches M M called Carotides, or the sleepy arteries. These tend directly upward by the sides of the neck, and being come to the chaps are divided into two branches about N, one of which is the outer O, the other the inner P.

L

MM

N

O The outer Carotis propagates twigs q, to the Bucca or cheek puffes; and to the muscles of the face; but about the ear it is cut into two branches, a foremost one, r, which is carried through the temples; and a hinder one, s, that is disseminated along the back side of the ear under the skull.

q

r

P The inner Carotis, going to the skull is divided near to the basis thereof into two branches; of which the one and lesser, t, which goes into the sinus on the side of the thick membrane, is cut off here, whereabout it sinks into

t

the

t the skull: the other and greater, t, enters the skull, through a peculiar hole bored for it in the temple-bone.

Q The Descendent trunk of the great artery, reaching downward to the rack-bones of the back.

From this before its division at R, many propagations are scattered, which we will now rehearse in order.

First then are Intercostales inferiores, the lower arteries between the ribs, u u u, distributed to the distances of the eight lower ribs, from which propagations are brought to the marrow of the back-bone, and to the muscles that grow to the back and chest. After to is the trunk passing on distributes two more, called Phrenicæ the arteries of the midriffe x x, because they are disposed of into the midriffe. Then follows Cœliaca or the stomach. After that Mesenterica superior, the upper artery of the Mesentery, y, reaching out into the guts Jejunum, and Ileum, as also into that part of the Colon, which reaches from the hollow of the liver as far as the right kidney. After this the Emulgent arteries, z, propagated to the kidneys. Then Spermaticæ, the seed arteries, going to the testicles, under which is Mesenterica inferior the lower artery of the Mesenterie, β, departing into the left side of the colick, and into the strait gut, and making the hæmorroidall arteries. Lastly Lumbares the arteries of the loins, γ γ γ, which going to the rack-bones o, the loins joint by joint, are distributed, into the peritonæum or rim of the belly, and the muscles growing to the rack-bones.

R These branches being issued forth, the trunk about the fift rack-bone of the loins, is divided into two branches S S called the Iliacall, both which are again broken into two other, an inner branch T, and an outer one V. But before this division in the very parting in twain of the Trunk, arises Sacra the holy artery δ, distributed into the holes of the os sacrum or holy bone, to the marrow thereof.

T The inner Iliacall artery, before it falls out of the peritonæum, issues forth two propagations: from its outer side, that called glutæa, ε, distributed into the muscles of the buttocks; from its inner side, that called Hypogastrica, ζ, going into the bladder and yard, and in women also to the bottome of the womb. After this it runs down, and sends forth the umbilicall arteries η η, that tend upward near to the length of the great artery.

θ The remainder under θ, taking to it a propagation from the outer Iliacal artery, slips down through the hole of the share-bone into the Crus, the end of it joining about ι with the inner muscle artery of the Crus.

V The outer Iliacall artery likewise before its going forth of the peritonæum produces two. The first is called Epigastrica, κ, digested into the muscles of the Epigastrium, and the straight ones of the abdomen, λ, where it is joined by inoculation μ with the descending mammary artery ξ. The other called Pudenda ν goes to the privy parts.

X In this place the outer Iliacall artery having past the Peritonæum, enters the Crus, and begins to be called the Crurall trunk, which issues out more propagations. The first is Musçula cruralis exterior, the outer muscle artery of the Crus, μ, that is propagated into the muscles, that cover the fore-side of the Thigh-bone. The second is the inner muscle-artery of the Crus, ρ, digested through the third bending muscle of the thigh; and these muscles that are on the inside of the thigh; the ends of it are joined with the ends of the inner Iliacal artery about σ. The third is Poplitea, the ham-artery, τ. running out into the muscles on the back-side of the thigh. The fourth is suralis the calf-artery υ, which is double, issuing out there, where the crurall trunk is hid betwixt the two lower heads of the thigh, and spreading out on both sides into the joint of the knee, and the two heads of the first extending muscle of the foot.

Y Here the great artery lyes in the ham, where it is divided into branches of unequall bigness.

σ A sprig issuing from its outside, and reacht out to the fibula or lesser bone of the leg, betwixt the muscle that moves the foot outward, and the second bending one of the instep.

Z The trunk descending by the back-side of the leg.

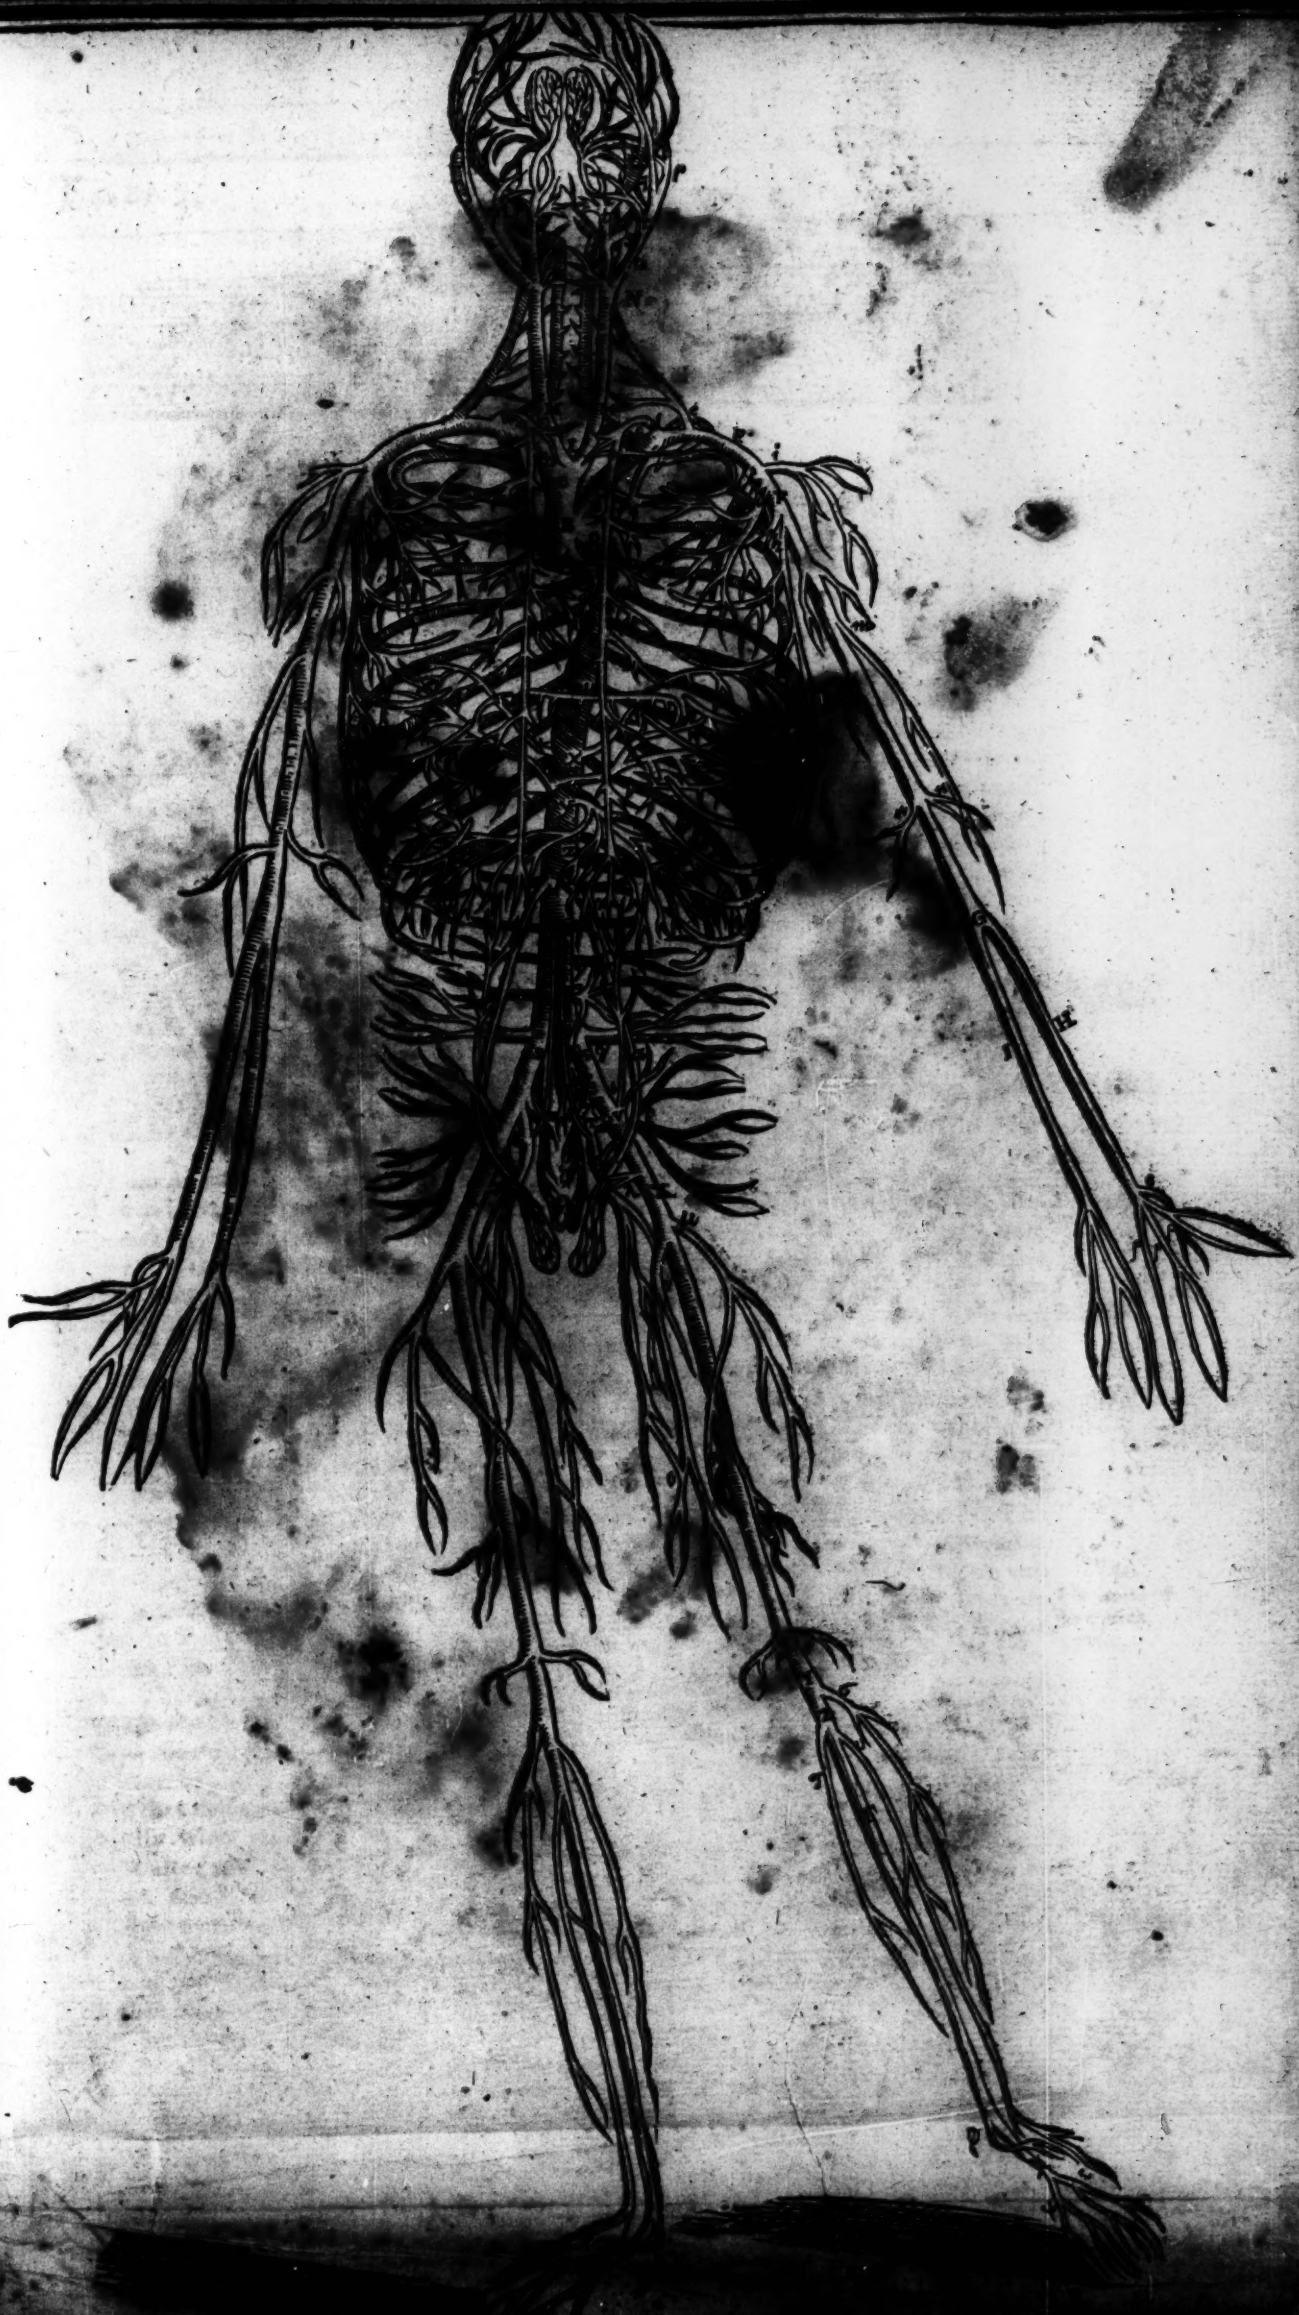
τ A higher branch issuing out of the back-side of the trunk.

υ A lower branch issuing out of the back-side of the trunk.

Γ The remainder of the trunk descending by the leg, which offers a little branch φ to the inner ankle.

φ The division of the trunk χ into an inner branch ψ that is propagated to the great toe, and the two next; and an outer, ω propagated to the little toe, and the two next to that.

THE



The third Treatiſe,

Concerning

The NERVES.

CHAP. I.

Of the nerves of the brain.

AMong thoſe eight Conjugations, which ariſe from the marrow of the brain drawn out in length, whileſt it is yet contained within the limits of the skull, *that* offers itſelf in the first place, *which makes the Optick nerves*, that are ſo famous among all the Maſters of Anatomy. The first pair of the brain. For theſe are not only the biggeſt, if you look upon their thickneſſe; but alſo without doubt the ſofteſt of all the nerves of the body. Its originall. But they ariſe out of the middle of the *baſis* of the brain, on the forepart, according to the opinion of the Ancients, but indeed, if the head be turned upſide down in the diſſection (which is the proper way) out of the beginning of the former trunks of the ſpinall marrow, that their originall is as it were in the back part of the head, and preſently each of them by little and little making towards its mate, they are united (not only joyned, as ſome would have it) over the ſaddle of the wedg-bone, and make one common ſquare body, the marrow within them being mixt together. Progreſſe. After that preſently ſeparating again, each of them is carried obliquely into the eye of its own ſide, entring the orb thereof through the firſt hole of the wedg-bone, and ending at the very centre of the eye. Inſertion. In this pair we may eaſily ſhew thoſe two membranes, which are derived to the nerves from the two *meninges* of the brain, as alſo the very inner marrowy ſubſtance, which comes from the body of the brain. Yet the nerve it ſelf is not cleft into more branches, (as the other are) but lying hid makes the coats of the eye; and out of the thick membrane it forms that coat, which is called *Cornea*, the horny one, out of the thin membrane that is called *Uvea*, the grapey one; but out of the ſubſtance of the marrow the *Retina* or coat like a net. For as ſoon as it is arrived at the centre of the eye, theſe membranes are diſplayed, and making a ſphere contain the humors in them. Theſe nerves convey the faculty of ſeeing to the eyes; wherefore, they being obſtructed, or compreſt, a blindneſſe inſues. *Uſe.* *Galen* hath aſcribed holes to them, and *Herophilus* for the ſame reaſon called them *πόροις*, the paſſages of the ſight, teaching that there is a ſenſible hollowneſſe plainly to be ſeen in them, whom for all that all Anatomiſts do contradict. The holes of the optick nerves. But I have heretofore ſhewen in the Univerſitie of Padua, and in a great aſſembly of men, that there are certain paſſages continuing from the beginning of theſe nerves, as far as to the place, where they meet together, and preſently after that vaniſhing away toward the eye. And therefore I ſhewed that the Ancients may not only be excuſed, but alſo that they write the truth, eſpecially when none of them have ſaid, that theſe paſſages were great, but only ſuch, as did not altogether eſcape the ſight, if one would make tryall thereof in a great living creature, and by a clear light, and preſently after it is killed. For *Galen* himſelf requires theſe three conditions, 7. *placit.* 4. and *lib. de oculis*, that one may ſee them. But before we depart hence, I will bring in ſome problemes, that, beſides the hiſtory itſelf, I may alſo ſhew the uſe of that, which I ſay, eſpecially when in our time they only for the moſt part follow the ſtudy of Anatomy, who imploy their induſtry in the behalf of Phyſick. Problemes. The firſt therefore ſhall be, what is the cauſe, that many upon ſneezing often (eſpecially when they have provoked it for the nonce) have of a ſodain faln blind. I. This happens, either becauſe the branches of the ſleepy arteries, which are ſo near to the optick nerves, that they touch, are filled, and being ſo, preſſe together thoſe nerves; or elſe becauſe

cauſea copious, and that a phlegmatick humor has faln out of the brain into the optick nerves, and obſtructed them. I have ſeen thoſe, that have been blind through the firſt cauſe, ſometimes cured by a Seton; but I never remember, that any, in whom this aroſe from phlegmatick humors, have recovered, except one having the French pox, who being anointed with quick-ſilver, all the humors melting away, was reſtored to health. But it is not the part of a good and pious Phyſitian, to make uſe of thoſe things, which, being full of danger, may do more harm, if they prove hurtfull, then they can procure good, if they be profitable. And truly it is better not to cure blindneſſe, then to cauſe death; although oftentimes raſhneſſe helps them, whom reaſon helps not, as the moſt elegant of Phyſitians *Celſus* ſayes elegantly. In the mean time in diſeaſes of the eyes, they who practiſe Phyſick, may learn rather to adminiſter thoſe things, which bring the phlegm out by the palat, then to draw the noxious humors to the noſtrils. That I may conceal beſides the danger which they avoid, that more profit ariſes from the medicins, that void the phlegm out of the head through the mouth; which both long experience hath hitherto taught, and Anatomy perſwades, when the optick nerves in their originall are not far diſtant from the palat; but farther from the ſpongy bone, and it is a preternaturall way, by which the humors are carried, as hath been already demonſtrated by
2. the learned *Veſalius*. Then it is diſputed, by what means the eye can fall out of its orb. the optick nerve not being broke, whereof we have very many hiſtories. But it is not hard to give an anſwer, to wit, that the nerves may be ſo much extended in length. Whileſt therefore this nerve receives much moiſture in the inflammations of the eyes, it eaſily comes to paſſe, that it is ſlackned; but the muſcles themſelves ſwelling very much, when they can no longer be contained in the orb, leap forth out of it. For this falling forth of the eyes moſt commonly proceeds from inflammations; ſuch as are the ſtories of
3. the moſt learned *Vega*, who cured a woman in this caſe by procuring the flux of her terms, and a young man by digeſting ointments. But the queſtion is very worthy to be made mention of, and that gives me an occaſion to explain it, which I have read in ſome Authors, that ſuch as were before blind, upon receiving of a wound overthwart the forehead, and ſome, upon a great looſneſſe of the belly ariſing on a ſodain, have received their ſight, and that preſently. The cauſe of their blindneſſe was no other, then the compreſſion of theſe nerves proceeding from the neighbour-veſſels, to wit, the veins, and arteries being ſwoln with bloud, which ſuch a wound preſently emptyed. Wherefore I alſo ſometimes, and not without ſucceſſe, in that *ſpecies* of blindneſſe, which the Barbarians call *Gutta ſerena*, open the middle vein of the fore-head, out of which I draw bloud ſo long, till it ceaſes to run of its one accord.

The ſecond pair. Its originall. *The ſecond pair* ariſes, as the ancient Anatomiſts ſay, from the ſides of the *baſis* of the forepart of the brain, near to the originall of the firſt pair. But the new diſſection ſhews, that it iſſues out at the inſide of the beginning of the ſpinall marrow, and that they are ſo united in their originall, that they make one common angle, which is the cauſe why both the eyes are moved together to the ſame ſides. It is much ſmaller, if you compare it with the firſt pair, and harder, and goes out of the ſkull through the ſecond hole of the wedg-bone, which is ſomewhat long, and ſo it enters the orb of the eye. By and

Branches. by it is divided into many ſprigs, which goe to the muſcles of the eye; and *the firſt* climb-
1. ing up above the firſt pair, or the optick nerves, is diſpoſed of into the two muſcles, as well
2. that, which lifts up the eye-lip, as that which lifts up the eye. *Another* very conſpicuous
3. one is diſſeminated in many ſurcles into the muſcle, which moves the eye inward. *The third, no* contemptible one neither, being divided firſt into two fibres, and by and by into more,
4. is ſent into the muſcle, that draws down the eye: *the fourth*, into the lower or leſſer of the oblique muſcles, that rowls the eye about toward the other angle. At length it iſſues out ſome thin fibres, which being joined with the firſt pair are diſtributed to the outer membranes of the eye, ſo that this ſecond pair is propagated only to four muſcles of the eye, and
Uſe. to that, which lifts up the eye-lid. The uſe of this pair is, to impart the faculty of motion to the muſcles of the eyes.

The third pair. Its originall. Banches. 1. *The third pair* ariſes with a very ſmall nerve out of the lower, and hinder part of the marrow of the brain, and runs directly forwards under the *baſis* of the brain, being tyed to the ſecond conjugation, together with which it enters into the orb of the eye through the ſaid ſecond hole of the wedg-bone. By and by it is divided into four branches, of which *the firſt* offers a little branch to the upper, and greater of the oblique muſcles of the eye, or that called the muſcle of the pulley, and then falling out through the hole of the fore-head-bone above the orb of the eye, in the ſkin, and muſcle of the fore-head,

An obſervation. which ought rather to be called the muſcle of the ey-brows. This branch is diligently to be taken notice of, becauſe I have long ſince obſerved, that, it being hurt with a ſlight wound the eye-lid fell down, whileſt the muſcle of the eye-brow by reaſon thereof fell into a Palſie. I have ſeen alſo the ſame palſie cauſed by cold, and narcotick medicins, ſomewhat unreaſonably applyed for the procuring of ſleep. But hence alſo a reaſon may be rendred, why *Hippocrates* 1. Prognoſtic. reckons it among the ſigns of death in acute diſeaſes to ſleep with the eyes half open. For this is an ill ſign for that reaſon, becauſe it ſignifies,

that

that the nerves are very much dryed, and ſo the brain itſelf, whence it comes to paſſe, that they, who are ſo diſeaſed, for the moſt part ſuffering convulſions afterward dye. In ſome alſo a fore-runner of the Falling-ſickneſſe is wont to ariſe from the ſame cauſe in the eye-lids, the eyes, and the whole face, when this third pair is pluckt by the humors begetting the falling-ſickneſſe, and ſo a convulſion of the eyes, and face is cauſed. *The ſecond* branch is carried downward, and falls out through the hole of the fourth bone of the upper jaw, which is under the orb of the eye, and preſently ſcattering into more propagations, on the forepart of the face, is ſpent upon the muſcles, that move the upper lip, and wing of the noſe outward, as alſo upon the lip itſelf, and the gums of the teeth, called *Inciſorii*, or ſhredders. *The third is* ſent through the hole of the ſecond bone of the upper jaw, behind the caruncle, that is placed in the inner angle of the eye, to the wide cavity of the noſtrills, being ſpread throughout its coat, whereby it comes to paſſe, that it is indued with a very ſharpe ſenſe, and being but lightly touch't cauſes ſneezing. *The fourth* goes out through that creviſe, which is betwixt the firſt bone of the upper jaw, and the wedg-bone, in the outer angle of the eye, or through the fourth hole of the wedg-bone, and departs to the inner ſide of the temporall muſcle. The uſe of this pair is to convey the faculty of moving to the ſaid muſcles.

2.

Uſe.

The fourth pair ariſes out of the marrow of the brain on the backſide, goes out of the skull through the ſixt hole of the wedge-bone, and running ſtraight down, propagates three branches from itſelf. *The firſt* is preſently after its going out of the skull, which being writhed ſometimes about in manner of the tendrells of a vine, or gourd, and united to two ſprigs of the Auditory nerve (of which we are to ſpeak next) afterward diſtributes ſurcles to the temporall muſcle, that lifts up the lower jaw, and that which moves it forward from the head, as alſo to the muſcles of the cheeks. After this the pair running farther down, iſſues forth a *ſecond* branch, which propagates ſurcles in order to the gums of the upper cheek-teeth called the grinders, and alſo to the teeth themſelves. *The third* branch iſſuing forth from the backſide of the nerve, and entring the hole of the lower jaw-bone that is bored in the inner ſurface of it, at the originall of the proceſſes, beſtows little branches in order to the roots of the teeth, and at length going forth through the foremoſt hole in the outer ſurface is terminated in the lower lip, and skin of it. The remainder of this nerve is ſpent upon the coat of the tongue near to the roote, and ſo gives it the power of diſtinguiſhing ſapors or taſting.

The fourth pair.

Its originall branches.

1.

But note in this place, that theſe two pairs which we have now recounted, I ſay, the third and fourth, are commonly reckoned for one by Anatomiſts, and that the third; but with this diſtinction, that they ſay this very pair ariſes with a double root; the one ſmaller, and the other thicker. They call that the ſmaller root, which wee ſet down for the third pair; that the thicker, which we make the fourth. But we diſtinguiſh them, becauſe indeed they are not joined together, neither in their originall, nor in their progreſſe. But that which they account for the fourth pair, ſeems not to bee diſtinguiſhed, from the third; as *Valverda* himſelf grants, *lib. 7. Anatomic. cap. 4.*

A note.

The fifth pair iſſues out of the marrow of the brain drawn out in length, on that ſide whereon a part of the *cerebellum* or after-brain is joined to it, ariſing out of two nerves, of which one is ſofter, the other harder. Theſe go out of the membrane together, and enter the organs of hearing, through the hole of the temple-bone, that is bored in the ſtony proceſſe thereof, being a large one and winding. After this that *harder* part goes forthwith to the foreſide, being carried through a peculiar channell, and returns backward again obliquely through the ſame bone, and departs into the firſt cavity of the inner ear. From thence being more reflected, it ſends forth two propagations, one higher, the other lower; but both paſs through their peculiar holes. *The upper* is carried through the tranſverſe hole of the ſame bone, through which alſo a little vein paſſes into the organ of hearing, and a little after it is come forth of it, is joined with that branch of the fourth pair (as we have delivered; but as other commonly count the pairs of the third) which we told you was writhed about, like the tendrell of a Vine. *The lower* goes out through the third hole of the ſame bone, which is very narrow and winding; and being carried overthwart above the muſcle of the lower jaw, that moves it ſidewards, deſcends into the chops, having diſſeminated a pretty many propagations into the noſtrills. But forthwith it is joined with the propagation of the fourth pair, that reſembles the tendrell of a Vine, or that ſprig which goes to the tongue, from which it paſſes to the roots of the teeth, and muſcles of the cheeks, as alſo to the skin that goes about the roos of the outer, or little ear. Anatomiſts do beleeve, that by means of this branch it comes to paſſe, that they who are born deaf, are for the moſt part dumb alſo. But that *ſofter* part of this pair is carried together with the hard part; and when it is come to that firſt cavity of the inner ear, it is ſpread throughout it in manner of a membrane, and ſo it deſerves to bee called the Auditory nerve, as miniſtring all the ſpirits, that ſerve for hearing.

The fifth pair.

Its originall.

Its two parts.

The harder.

The ſoft part.

Its uſe.

The ſixth pair ariſes ſomewhat more toward the lower and hinder part, then the fifth,

The ſixth pair and its originall.

and not with one, but with many little nerves ſevered from each other, which for all that are preſently joined together, although they do not cloſe ſo, as to make one only, but two diſtinct ones alwaies, yet are they contained in one membrane, ariſing from the *Dura meninx* of the brain, which hath deceived many, ſo that they have accounted them for one. Being thus joined, they deſcend both together out of the skull, through the ſecond and third hole of the nowl bone; through which ſame the leſſer branch of the ſleepy artery, and the greater of the Jugular vein enter into the skull. There being then two nerves, the *one* in its egreſſe inclines more to the forepart of the ſaid hole, and is the leſſer of the two; the *other* to the hinder part, and is the *greater*. *That* preſently after its going forth of the skull, tends ſtraight downward to the muſcles of the tongue and chops, and to the parts placed in the mouth, upon which it is wholly conſumed.

The leſſer nerve.

The greater nerve, and its propagation.

This on the contrary ſends its firſt propagation to the muſcles ſeated on the backſide of the neck, eſpecially to the firſt muſcle of the ſhoulder-blade, called *Cucullaris* or the cowl-muſcle, and then adhering to the ſeventh pair, and the aforeſaid artery and vein, by the benefit of certain membranes, it runs down to the ſides of the throtle, to whoſe muſcles, eſpecially thoſe ſeated in the inner cavity, it diſtributes ſurcles overthwart. Here many propagations of nerves meeting together, and parting aſunder again, a certain texture is made, wherein knots are found not unlike to the glandules, that are tyed to the divarications of the veſſels; which was firſt obſerved by the moſt learned Anatomiſt *Fallopius*, who would have it reſemble the body of an olive. But the greater nerve it ſelf going in the middle betwixt thoſe ſame veſſells which I ſpake of, is carried leiſurely from the throtle to the rough artery, and running down at the ſide thereof, tends to the cheſt.

The branches of the greater nerve.

But before it enters thereinto, it is divided over the hollow of the neck into two branches, of which one is the outer and leſſe: the other the inner and greater. We ſhall now ſpeak briefly of the diſtribution and propagations of them, but ſo that being the right trunk is diſſeminated in another manner then the left, we ſet down the hiſtory of each by it ſelf; and firſt of the right, then of the left.

The propagations of the outer branch of the right nerve.

The outer branch then of the *right* nerve ſends out propagations preſently after the diviſion to the muſcle that bends the head, called *Maſtoideus*, as alſo to that of the bone *hyoides*, called *ſternohyoideus*, and that of the *Larinx* or throtle, called *ſternothyroideus*; after this it enters the cavity of the cheſt, and when it comes to the axillary artery, iſſues forth

1. from its inſide ſometimes three, ſometimes two ſurcles one under another which are returned about the ſaid axillary artery, as it were an axel-tree, or (to ſay trulyer) a kind of pulley, and cloſing together make one nerve; which being

2. faſtned to the right ſide of the rough artery, by the benefit of a membrane, runs back from the lower part thereof to the higheſt, and haſts to the right ſide of the throtle, leaning upon a glandule, which is placed at the root of the right ſide. Having paſt this, it is forthwith divided into many ſurcles, which are ſpent upon the muſcles of their own ſide, which are placed in the throtle, and have their heads downward, giving motion to them. And this nerve is called *Recurrens*, the returning one from its progreſſe, and is very famous among all, being ſo made by skilfull nature with great wiſdome, that it might be inſerted into the muſcles of the throtle, whoſe heads look downward, when all the nerves that give motion, ought to be inſerted into the heads; and to look towards the end, not on the contrary. And becauſe the throtle is an organ of the voice, but the voice cannot be uttered without motion of the muſcles, that either open the cartilages of the throtle, or ſhut them; therefore theſe nerves, which impart to the muſcles the power of moving and contracting themſelves, being either bound faſt or cut off, it happens for that cauſe, that the voice is taken away. This may be very handſomely ſhewn in dogs, or in a hog, becauſe the one continually makes a noiſe with barking, the other with grunting. For one of theſe nerves being cut off, halfe the voice is taken away; but both being cut, it is wholly loſt. The recurrent propagation being thus conſtituted, the outer branch running down obliquely under the hollow of the neck, after that by the way it hath

The right recurrent nerve.

3. diſtributed ſurcles of an indifferent bigneſſe into the *Pleura*, or membrane of the ribs, and

4. into the coat of the lungs, and given others to the *pericardium* or purſe of the heart, and to

5. the heart it ſelf; it deſcends farther within the duplication of the *mediaſtinum*, and near to the rack-bones is divided into two branches, which make *the right nerve of the left orifice of the ſtomach*, are carried obliquely, and then piercing through the midriff, together with the gullet, to which for all that they afford never a branch, are conſumed upon the left orifice of the ſtomach, with many branches like a little net, and ſo encompaſſe it together with the left nerve, that it ſeems wholly to conſiſt of nerves. Hence there is ſo great a ſympathy of the ſtomach, not only with the brain, but with the heart alſo; that ſuch diſeaſes, as pain the upper orifice, ſeem to be of the heart, and indeed ſo they are, the ſame heart ſuffering pain, becauſe of this nerve being pained. And this is the true cauſe, to wit, the communion of this nerve, not the nearneſſe of both the entrails, as others ſay. The *inner branch* goes to the inner ſide of the root of the firſt rib of the cheſt, and cleaving to

VVhence the ſympathy is betwixt the ſtomach and heart.

Propagations of the inner branch.

the

the rack-bones under the *Pleura*, runs down through the roots of the rest of the ribs, taking to it a little branch from every one of the Intercostall nerves, that issue out of the back-bone, then passing through the midriffe with the Descendent trunk of the great artery it is carried as far as to the *os sacrum* or great bone, at the region whereof it issues out three propagations, which are distributed into the naturall inner parts. *The first* goes to the lower membrane of the Kall, and descending through it is parted into three little branches, of which *one* is distributed to the right side of the same membrane, and to that part of the collick gut, that is joined unto it: *another* the least of them, and a very small one, to the guts *duodenum*, and the *jejunum* about its beginning; *the third* to the bottom of the stomach on the right side, and to the upper membrane of the Kall, which is something the larger. That which remains of this propagation is spent upon the hollow part of the Liver, and the bladder of gall. *The second* goes into the right kidney, and 2.
the membrane thereof. *The third*, which is greater then either of the former, descending to the first rack-bone of the loins, reaches into the right side of the mesentery and into the guts, that are tyed thereto, entring the center of the mesentery in company of an artery, and a vein. The remainder goes into the bladder, and in women into 3.
the right side of the bottom of the womb. But *the outer* branch of *the left* nerve, saving The outer branch of the left nerve.
that in its descent it has offered sprigs both to the *Pleura*, or membrane investing the ribs, and to the coat of the lungs, and that outwardly, as also to the purse of the heart, and heare itself inwardly, at that part of the Descendent trunk of the great artery, where it first issues out of the heart, and is bowed to the back-bone, it sends forth three furcles, Its propagations.
which returning to the said artery close together into one nerve, which is called *sinister recurrens nervus*, the left returning nerve, and in like manner as the right one, takes its The left recurrent nerve.
progresse upward, and is propagated into the muscles of the *Larinx*, or throttle. After this it issues out a small sprig, which is distributed through the *basis* of the heart, and coat of it in manner of hairs. Afterward the remainder descends inclining itself obliquely to the right, and goes to the upper orifice of the stomach, into the right side whereof it is diffused, as the right branch was before into the left side, being divided into many little branches in manner of a net. From this a furcle is stretched down along the upper part of the stomach to the *pylorus*, or lower orifice, which when it hath as it were interwoven with some sprigs, it goes into the hollow of the liver. *The inner* branch first of Propagations of the inner branch of the left nerve.
all takes to it propagations from the intercostall nerves, and then passing through the midriffe is divided into three. *The first* of them goes overthwart to the Spleen, and in 1.
the way shoots out two sprigs, *one*, which is likewise sent into the lower membrane of the Kall, and part of the colick-gut, which is tyed thereto; *another* into the left side of the bottom of the stomach, and into the upper membrane of the Kall. *The second* propagation goes into the left side of the Mesentery, and the guts of that place; sometimes 2.
also it issues sprigs, which run out with the seminary vessels through the processes of the *Peritoneum*, or rim of the belly to the testicles. *The third* goes to the left Kidney, 3.
and the fat membrane thereof. The remainder of the branch passes to the left side of the bladder, and of the bottom of the womb. The use of this pair is manifest enough, as *Use.*
being very notorious, when the outer branch bestows little boughs upon the middle bowels, but the inner upon all those of the lowest belly, and the right branch upon those of the right side, the left on those of the left. Besides this use it conduces by the returning branches also to the framing of the voice, by imparting the faculty of motion to the muscles of the throttle.

The seventh pair arises in [illegible] part of the hough-bone, where the marrow of the The seventh pair.
brain is ready to goe out [illegible], and so is counted the hardest of all the nerves, that Its originall.
have their originall within the [illegible]. But it arises in some roots separated from each other; which joining together on both sides into one, it goes out of the skull through the fourth and fifth holes of the [illegible] (which are placed betwixt that greatest one, which opens a way for the descent of the [illegible] marrow, and that, at which the sixth pair goes out) and [illegible] involved in one common membrane with the fifth [illegible] since some have so diligently observing it, have believed that they were mixed with another, and thus they descend together. When it comes to the root of the tongue, it distributes furcles into all the muscles thereof, sending over some also to the [illegible] muscles of the bone *hyoides*, and of the throttle, as also to those, Its use.
which take [illegible] from the *apophysis* called *styloides*. The use of this conjugation is to carry down the [illegible] motion from the brain, to the muscles of the tongue.

To these seven [illegible] are commonly so numbred, we adde *an Eighth* which makes The eighth pair.
the nerves of smelling, by which a faculty is derived from the brain of apprehending the odours of things without. These are commonly affirmed to arise out of the marrowy substance of the brain, in the *basis* thereof, near to the first pair; but the new dissection Its originall.
of the brain, and which is performed by turning it upside down, hath taught us, that they arise at the utmost sides of the brain, in that part, which is above the holes of the ears, whereby it is manifest, that hitherto only one half of them hath been shewn. They are very sharp at their originall, and distant one from the other, but going forward by de-

grees

grees, betwixt the uppermoſt and middle prominence of the brain, they grow thicker, and draw nearer one to another, and ſo at length they lye down above the *ſinus* or cavities of the ſpongy bone within the skull. Theſe are thruſt into the mammillary proceſſes of the brain: but *Galen* and *Marinus*, (whom almoſt all Anatomiſts have followed) would not call them by the name of Nerves, although they altogether agree therewith in their colour, courſe, and uſe, becauſe they neither have productions like the reſt of the nerves, nor go out of the cavity of the skull: but truly they ſeem to me to commit no other a ſophiſm, then they, who have expelled the teeth out of the number of the bones becauſe they are not inveſted on the outſide with a membrane, as others are, although neither this makes any thing to the eſſence of the bones, nor that to the eſſence of the nerves.

CHAP. II.

Concerning the nerves of the Spinall marrow properly ſo called, and firſt of thoſe of the Rack-bones of the Neck.

NAture, the wiſe parent of all things, as ſhee hath framed the nerves, that they might ſerve for the carrying of the faculties, and ſpirits, that are generated in the brain, becauſe the brain itſelf could not be diffuſed through the whole body: ſo when the ſame could not conveniently beſtow nerves upon all the parts, by reaſon of their too great diſtance, ſhee made the ſpinall marrow, which is nothing elſe, but the marrow of the after-brain and brain, extended through the long conduit pipe of the rack-bones of the back. And therefore we having already viewed thoſe nerves, which take their originall from the marrow of the brain, whileſt it is yet contained in the skull; is remains now, that we take a view of them alſo, which come from the ſpondyls of the back-bone. But it is called marrow, not that it hath any affinity by reaſon of its ſubſtance with the marrow of the bones; but becauſe like marrow it is contained within the rack-bones; but the ſubſtance thereof is like that of the brain, which itſelf alſo *Plato* called marrow; and it is named the *ſpinall* marrow, or *of the back*, to diſtinguiſh it from both thoſe, that are not contained in the back-bone, but either in the skull, as the brain, or in the hollowneſſe of the bones, as that which is properly called marrow. This ſubſtance is covered with two membranes, no otherwiſe then the brain itſelf is, from whence it takes its originall, the one thick, the other thinner, which are inveſted with a certain third, ſtrong, and membranous covering, that *Galen* thought to be the ligament of the rack-bones. But it was made to that end, that it might diſtribute ſenſe, and motion to the muſcles, and membranes, to which thoſe pairs of the brain do not reach. Therefore, when there is a good number of nerves ariſing there from, yet we ſhall eaſily reduce them to ſome certain *claſſes*, or companies, if we ſay that they all make up thirty pairs, of which ſeven belong to the marrow whileſt it is carried through the rack-bones of the neck; twelve, whileſt it is carried through thoſe of the cheſt; five, through thoſe of the loins; and laſtly ſix to that which is contained in the holes of the *os ſacrum*, or great bone. But theſe nerves go out through the holes of the rack-bones, and either *with a double originall* on the fore and hinder part, as it happens in the two firſt conjugations of the neck, and five of the great bone, which ariſe not from the ſides, that is, from the right, or left part, but iſſue forth two by two before and behind; or elſe *with a ſingle one*, through one hole bored in both ſides of the rack-bones, as happens in all the reſt of the pairs, in which one nerve iſſues from the right ſide, the other from the left. But the firſt, and ſecond pair have a double beginning, leſt if they ſhould ariſe with a ſingle one, that being ſomewhat thicker might be hurt by the joints of the rack-bones; or if the hole ſhould be made larger, the rack-bone (which was ſmall enough of itſelf) ſhould be liable to breaking. Therefore that both theſe evils might be avoided, the wiſe Opificer made a double beginning, one on the fore part, another on the hinder. But the right branches go every where to the right ſide, the left to the left, and they are diſtributed on both ſides after the ſame manner.

The ſpinall marrow.

VVhy it is called marrow.

It is wrapt up in two membranes.

The conjugations or pairs of the ſpinall marrow.

The firſt pair of the neck.

The firſt pair therefore [*tab.* 1. *fig.* 2.] ariſes *with its firſt, and fore-ward propagation* [*tab.* 1. B] from the forepart of the ſpinall marrow, and paſſes out betwixt the nowl-bone, and the firſt rack bone of the neck, near to the ſides of that round ligament, wherewith the tooth-like proceſſe of the ſecond rack-bone is tyed to the foreſide of the nowl-bone, and ſo it is diſtributed into the muſcles over the neck, and under the gullet, that bend the neck. *With the other, and hinder propagation,* [*tab.* 2. *Fig.* 1. *C.*] it likewiſe falls out through the hole, that is common to the nowl-bone, and firſt rack-bone of the neck, toward the hinder part, but with a double ſprig, one of which being ſmall is ſpent upon the leſſer ſtrait muſcles, and the upper oblique ones, that extend the head; the other reaches out into the beginning of the muſcle, which lifts up the ſhoulder-blade.

The

The ſecond pair [*tab.* 1. 2.] *with its fore-branch* [*tab.* 1. D,] (which is ſlender, then the hinder one, though both of them ſeem ſmall enough) ariſing from the fore-part of the marrow goes forth betwixt the firſt, and ſecond rack-bones at the ſide of the tooth-like proceſſe, which branch is diſtributed into the muſcles, that lie upon the neck, as well as the fore-branch of the firſt pair, which is wrapped together with it; and is almoſt wholly ſpent upon the skin of the face. *With its hinder branch* [*tab.* 2. *Fig.* 1. E.] it ſlips out through the ſides of the backward proceſſe of the ſecond rack-bone, but preſently is cleft into two branches of unequall bigneſſe, of which *that which is the thicker* [*tab.* 2. *f.* 1. F.] tends from the forepart to the hinder, where the muſcles ſeated on both ſides of the hinder part of the neck do meet together, & there being mixt [*t.* 2. *f.* 1. G] with the third propagation of the third pair of the nerves, it runs out through the middle of the ſaid muſcles, returning from the hinder to the foreparts, and ſo is diſtributed into all the skin of the head, as far as to the top of the crown, [*t.* 2. *f.* 1. H] as alſo to the ears. *The other branch, which is the ſlenderer*, is inſerted into the greater ſtraight muſcles, and the lower oblique ones, that extend the head. *Galen* makes mention of theſe branches *lib.* 4. *de locis affect.* which place we ſhall not think much to tranſcribe hither, it making very much to the illuſtration of the uſe of this kind of learning. Not long ſince, ſayes he, thou ulcerated the head of a certain man, by laying on medicins vehemently heating, thinking by this means his ſenſe, that was greatly impaired, might be recovered. But we cured this very man, having found out the ſeat of the diſeaſe as well from other accidents, as from the primitive, or procatarctick cauſe. For we diligently examined him about every one of them, and found that this was once, when he had walked in much rain cauſed by a violent wind, his cloak was wet about his neck, ſo that he felt himſelf affected with a vehement cold in that part; ſo then if, you know, that four nerves aſcend from the firſt racks of the back-bone to the head, from which the skin about it receives its ſenſe, you will eaſily find out the ſeat of the diſeaſe, that therefore being healed, the skin of the head was healed alſo, as having no primary diſeaſe.

The ſecond pair.

The hinder branch.

The ſeventh pair.

The fore-branch.

The hinder.

The third pair [*tab.* 1. 3.] iſſues out of the common hole in the ſides, which is betwixt the ſecond and third rack-bones, and preſently after it gets out, is cleft into two branches, of which the *more forward* one [*tab.* 1. I.] is ſubdivided into four propagations. *The firſt* [*t.* 2. K] goes to the firſt bending muſcle of the neck, or the long one: *the ſecond* [*t.* 1. L.] runs down, and being united with a ſprig of the fourth pair [*tab.* 1. Q.] ends in the muſcles, that lye under the gullet. *The third* [*tab.* 1. M.] climbs up, and joining with the thicker branch of the ſecond pair but now mentioned [*tab.* 2. *f.* 1. F.] is ſpent upon the skin of the hinder part of the head. *The fourth* [*tab.* 1. N] is imparted to the tranſverſe muſcles, or to the firſt pair of the extenders of the neck, and to that, which lifts up the ſhoulder-blade, of which two muſcles that ends in the tranſverſe proceſſes of the neck; this begins [illegible] and at length it is digeſted into the ſquare muſcle, that draws down the cheeks, which is called by *Galen* πλατυσμα μικρον. *The hinder branch* [*tab.* 2. *f.* 1. O] is imparted into the [illegible] pair of muſcles, that extend the cheſt.

The third pair.

Its fore-branch

Its hinder branch.

The fourth pair [*tab.* 1. *numb.* 4.] iſſues out of the common hole of the third, and fourth rack-bones, and like the third pair is divided into two unequall branches. *The more forward and greater* [*tab.* 1. P] is cleft into three other twigs, of which *the firſt* [*tab.* 1. O] is joined with another branch of the third pair [*tab.* 1. L] and goes to the firſt long pair of muſcles, that bend the neck. *Another* [*tab.* 1. R] goes to the [illegible] muſcle, or firſt of thoſe, which extend the neck, and to the firſt of the ſhoulder-blade, called *Cucullaris*, the cowl-muſcle. *The third* [*tab.* 1. S] being ſmaller then the other, and joyned with a ſurcle of the fifth pair, and another branch of the ſixth pair, near to the [illegible] or membrane that parts the cheſt in the middle, [illegible] above the *Pericardium*, paſſes downward, that out of theſe three principles the nerve of the midriffe may be made up. *The hinder branch* [*tab.* 2. *f.* 1. T] goes toward the ſpine or ridge, under the muſcles, which are placed thereabout, to which alſo it affords a good number [illegible] from thence being led downward between the muſcles on both ſides of the [illegible] to the ſquare muſcle, that draws down the cheeks. In this [illegible] is worth [illegible] to inquire what may be the reaſon, that they who are troubled [illegible] of motion in their whole body, have nevertheleſſe the [illegible] their midriffe [illegible] anſwer, that this happens, becauſe [illegible] Spirits are [illegible] that they may be diffuſed out of the marrow [illegible] back. But theſe [illegible] the queſtion, we ſuppoſe, that no ſpirits come from thence, becauſe we ſee that all the muſcles of the whole body, to which nerves are ſent from the marrow of the back, are reſolved or deprived of motion. Therefore I thought fit to ſeek out for another anſwer, and to ſay that the midriffe has two motions, one, that is voluntary, which we uſe, whilſt we breath ſtrongly; another naturall one, when the fibres are extended, and contracted of themſelves. A man therefore is preſerved by this naturall motion, when we ſee that breathing is little, and weak, and as much as ſuffices, that the lungs may be moved a little.

The fourth pair.

The fore-branch.

Its propagations.

I.

2.

3.

The hinder branch.

A queſtion.

The hinder branch.

The fifth part [*tab.* 1. *numb.* 5.] goes out betwixt the fourth and fifth rack-bones, and like the two laſt fore-going, is cleft into two branches. *The forwarder* of them [*tab.* 2. U] iſſues forth

The fifth nerve.

Its fore-branch.

forth some propagations. *The first* [*tab.*1 betwixt U and 6] goes to the muscles, that bend the neck. *Another* [*tab.*1 X] together with propagations of the fourth, and sixth pairs, sometimes also of the seventh, to wit, then when the branch of the fourth is wanting, descends near to the side of the gullet through the forepart of the rack-bones of the neck, and is implanted into the midriffe, & so makes the midriffe nerve. *The third* [*t.*1 Y] is carried through the upper part, and outside of the arm, to the second muscle of the arm, to wit, that which lifts it up, called *Deltoides*, from whence little branches are sent over to the first, and second, that is to the cowl-muscle, & the lifter up of the shoulder-blade. *The fourth* propagation [*tab.* 1 b] at the neck of the shoulder-blade is cleft into two, of which *the former* [*tab.*1 c] goes into the muscle *Deltoides*, at that part where it arises from the clavicles or canal-bone: *the latter* and thicker [*tab.*1 d] is inserted into the fourth pair of muscles of the bone *hyoides*, called *coracohyoideum*, and from thence imparts a small branch to the upper muscle over the shoulder-blade called *superscapularis*, and to the muscle *Deltoides*, where it arises from the spine of the shoulder-blade. *The hinder branch* [*tab.*2 *f.*1 e] is writhen toward the back-bone, and distributed in the same manner, as the hinder branch of the fourth pair is.

The hinder branch.

The sixth pair. Its fore-branch.

The sixth pair [*tab.*1 *numb.*6] goes out under the fifth rack-bone, and in like manner as the other pairs are, is divided into two branches. *The forwarder and greater* [*tab.*1 f] after it has propagated that sprig [*tab.*1 g] which we said is joined with the fourth, and fifth pair, [*tab.*1 S and X] to the making up of the nerve of the midriffe [*tab.*1 h] passing on farther is united with the two next following pairs, the seventh of the neck, and the first of the chest, and is again separated from them, and then again being joined with them it so weaves a certain net-like texture, from which nerves are issued forth, that go to the arm. *The hinder* [*tab.*2 *fig.*1 l] is carried to the hind muscles, which extend the head, and neck.

Its hinder branch.

The seventh pair. The fore-branch. The hinder.

The seventh pair [*tab.*1 *n.* 7] is derived from the marrow of the neck, and issues forth through the common hole of the sixth, and seventh rack-bones. *The forwarder, and greater* branch thereof [*tab.*1 m] is joined presently after its egresse with the sixth nerve of the neck, and the first of the chest, and for the greater part is carried with the rest to the arm. *The hinder and lesser branch* [*tab.*2 *fig.*1 n] goes to the muscles, that lye upon the neck, and to the square one, that draws down the cheeks.

CHAP. III.

Concerning the Nerves of the marrow of the rack-bones of the Chest.

TWelve conjugations of nerves issue forth from the foreall marrow, whilst it runs through the rack-bones of the back, as the most learned *Vesalius* hath rightly opinioned, however there are but eleven holes bored in the twelve rack-bones thereof, as *Columbus* objected; because the first pair passes out between the last rack-bone of the neck, and the first of the back, wherefore it ought to be numbred rather among the pairs of the chest, then those of the neck. All these conjugations after their egresse are divided in two; and the one branch which is the greater, always bends forward; the other which is the lesse is bent to the hinder parts, and to the muscles, that lye upon the back.

The first Pair.

The first pair then [*tab.*1, *numb.*8] of the nerves, which issue forth from the marrow of the chest, goes out of the common hole of the seventh rack bone of the neck, and the first of the chest, in the same manner, as the five pairs last mentioned do, and in like sort also is forthwith divided into two branches. *The forwarder*, and greater [*tab.*1, o] is united, [*tab.*2, p] partly with the seventh pair of the neck, partly with the second of the chest, in that manner, which we have before explained, and so afterward is wholly consumed upon the arm, excepting one propagation [*tab.*1, q] which arising at the beginning of it is joined with the said nerves, and runs into the foreparts, near the length of the first rib of the chest, to the breast bone, bestowing a sprig upon the subclavian muscle, and that being [illegible] upward it is spent upon the muscles, which take their original from the top of the breast bone: such are the muscle that bends the head called *Mastoideus*, that which draws down the bone *hyoides*, or *sternohyoideus*, and the first of them which extend the buckler-like gristle of the throttle, called *thyroides*, or the muscle *sternothyroideus*. But to the two last forenamed branches are sent over from the first conjugation of the brain, and the third of the chest. The same branch also when it has past the arm-pit, being ready to go to the arm, issues forth a certain other propagation from its hinder part, which goes to the muscles seated in the hollowesse of the shoulder-blade. *The hinder and lesse* branch [*tab.*2 *fig.*1 r] lies hid under the muscles, which grow to the rack-bones, and imparts some propagations to the second bending muscle of the neck, and to them which extend the head and neck; but when it has attained to the spine of the seventh rack-bone, it goes overthwart to the lower side, and distributes sprigs into the first muscle of the shoulder-blade, or that like a Monk's cowl, and into the third of the same, called *Rhomboides*, as also into the upper of the hindmost saw-muscles.

Its sc. -branch

Its hinder branch.

The

The ſecond pair [*ta.* 1. *num.* 9.] breaks out betwixt the firſt and ſecond rack-bones of the cheſt, and is cleft likewiſe into two branches. *The forwarder* [*t.* 1. *s.*] is united with the firſt pair of the cheſt; and thus the firſt and ſecond pairs of the cheſt are united by turns, with the fifth, ſixth, and ſeventh of the neck, that the one are not diſcerned from the other; but make a net not unlike to thoſe ſtrings which hang at Cardinals hats; from which afterward all the nerves that go to the arms, iſſue forth, and take their originall. This ſpreads out a branch [*t.* 1. *t*] which goes forward through the firſt diſtance betwixt the ribs, according to the courſe of the firſt rib, as far as to the breaſt-bone, making the firſt Intercoſtall nerve, from which ſurcles [*t* 1. *u*] are diſtributed into the muſcles that lie upon the cheſt. *The hinder* branch [*t.* 2. *f.* 1. *x*] has the ſame diſſemination with that of the foregoing pair. The ſecond pair. The fore-branch. The hinder one.

The other ten pairs [*tab.* 1. *numb.* 10, 11, 12. and ſo on to 19 incluſively] of the nerves of the cheſt, obſerve the ſame manner both of their riſe, and diſtribution. For they all iſſue out of the common holes of the rack-bones at the ſides, and preſently after their egreſſe are cleft into two branches of unequal bigneſſe, one of which is the forwarder and greater; the other, the inner and leſſe. *The forward* branches [*ta.* 1. *y.*] (which make the nerves between the ribs) are carried into the fore-ſide, and each of them affords a little branch in order according to its length, to the inner branch of the ſixth pair, which deſcends under the *pleura* to the roots of the ribs. Theſe branches are joined with the Intercoſtall veins and arteries; together with which they paſſe along the rib to the forepart through the *ſinus* or chanel, which is cut out on the lower and inſide of the ribs. But they which belong to the true ribs, go on as far as to the breaſt-bone; but they which belong to the baſtard ones, are carried into the forepart of the *abdomen* above the *peritonæum* or rim of the belly. From theſe nerves many branches are diſſeminated into the muſcles between the ribs, not only in the inner, but the outer ones alſo, as wel as into the other [*ta.* 1. *z*] which lye upon the cheſt; ſuch as are the fourth, and fifth muſcles of the ſhoulder-blade or the two formoſt ſaw-muſcles, as alſo the broad one, called *Latiſſimus* [*tab.* 1. *β*] that moves the arm backward from the breaſt. In like manner a propagation goes from the fifth Intercoſtall nerve, about the middle of the rib, paſſing through the Intercoſtall muſcle, into the firſt pair of the muſcles of the *abdomen*, [*ta.* 1. *a*] as alſo into the skin of the cheſt; and being divided in four parts is diſtributed into the pectorall muſcle that moves the arm forward to the breaſt, and alſo into the skin, from which ſome ſprigs doe afterward goe to the nipples of the breaſt [*ta.* 1. *γ*] and impart to them a very ſharp ſenſe. *The hinder branches* [*ta.* 2. *fi.* 1. *δ*] goe backward to the ſpine, or ridge, betwen the muſcles going to the rack-bones, which have the charge of extending the cheſt. Yet are they not wholly ſpent upon theſe muſcles, but when they have now attained to the tops of the ſpines, they fall out between the muſcles of both ſides, where that they are joined to one another, and ſo afterward they give nerves to all the muſcles, which ariſe out of the tops of the ſpines of the rack-bones. Such are the firſt extending muſcle of the head, called *Triangularis*, or *Splenius*; the third muſcle of the ſhoulder-blade, or *Rhomboides*; the firſt of the ſhoulder-blade, or *Cucullaris*; the third broad muſcle that leads the arm away from the breaſt, called *Aniſcalptor*, and the hinder ſaw-muſcle. A good number alſo of ſurcles are diſtributed into the skin of the back. Their hinder branches.

CHAP. IV.

Concerning the nerves of the marrow of the rack-bones of the loins.

FRom the ſpinall marrow, whilſt it is carried through the loins, although there be only four holes, yet five pairs iſſue forth, the firſt being between the laſt rack-bone of the cheſt, and the firſt loins. But they go forth through the common holes, and being gone forth, are diſtributed in like manner as we have ſaid of the nerves of the cheſt; when from every one of them, preſently after its going out, one branch, and that the greater, ſpreads it ſelfe forward; the other, and leſſe backward. *The formoſt* branches run to the muſcles of the *abdomen*, or outer, and forepart of the loweſt belly; the *hindmoſt* to them, which lie upon the ſpines of the rack-bones, and the bones without a name, from whence they impart ſome little branches alſo to the skin that covers the loyns. But the fore-branches are knit together, the firſt with the ſecond, the ſecond with the third, the third with the fourth, and the fourth with the fifth in the ſame faſhion, as we ſaid the nerves of the arm were; whilſt they make the net-like complication.

The firſt pair then, [*ta.num.* 1. 20.] as the reſt do alſo; going out under the *peritonæum*, or rim of the belly, through the common hole of the rack-bones, which is betwixt the laſt rack-bone of the cheſt, and the firſt of the loins; preſently after its egreſſe is cleft into two branches. *The fore-branch*, which is greater, goes into the fleſhy parts of the midriffe, and into the beginning of the firſt bending muſcle of the thigh, called *Ileus*. The firſt pair. Its fore-branch

The hinder one.

From this nerve a certain ſurcle [*ta.* 1. 39.] takes its beginning, reaching out for the moſt part with the preparing artery to the teſticle. *The hinder branch* [*ta.* 2. *fig.* 1. *nu.* 42.] ſends propagations into the muſcles that lie upon the backſide of the rack-bones of the loins, ſuch as are the firſt and third of them which extend the cheſt, that being called *Dorſi longiſſimus*, this *ſacrolumbus*; as alſo the muſcle which extend the loins: but when they iſſue out from the tops of the ſpines, whereabout the ſaid muſcles are joined one to another, they run to the ſides, and are implanted into the broad muſcle, that leads the arm outward from the breaſt, called *Latiſſimus*.

The ſecond.

The ſecond pair [*t.* 1. *n.* 21.] goes out under the firſt bending muſcle of the thigh, called *Pſoas*, betwixt the firſt and ſecond rack-bones of the loins. *The fore-branch* thereof is diſtributed to the ſecond bending muſcle of the thigh, that fills up the cavity of *os Ilium*, or the hanch-bone, and the firſt bending one of the leg, called *Faſcialis*, as alſo to the skin of the thigh. *The hinder branch* going out of the *abdomen* is diſtributed to the three muſcles that extend the thigh, or the *Glutæi*; and to that which extends the leg, called *Membranoſus*, the membranous muſcle.

The third.

The third pair [*t.* 1. *n.* 22.] iſſues forth likewiſe under the firſt bending muſcle of the thigh, betwixt the ſecond and third rack-bones. *The fore-branch* thereof paſſes over near to the hanch bones, diſtributing two propagations; *one* which goes to the knee, and its skin; *another* [*t.* 1. 51.] which accompanies the vein of the inner ancle, called *ſaphena*. *The hinder branch* is reflected and diſſeminated into the muſcles which lie upon the loins.

The fourth.

The fourth pair [*t.* 1. *n.* 23.] is the greateſt of all the nerves of the loins, and being carried under the ſaid muſcle that bends the thigh, as alſo under the *os pubis*, or ſhare-bone, accompanies the Crurall vein and artery.

The fifth.

The fifth and laſt pair [*t.* 1. *n.* 24.] iſſues out betwixt the fourth and fifth rack-bones; *the fore-branch* whereof paſſes through the hole which is betwixt the hip-bone, the *os pubis*, or ſhare-bone, and the *os Ilium* or hanch-bone, and diſtributes ſome propagations to the two muſcles that turn the thigh about, called *Obturatores*, others to the ſecond and third bending ones of the thigh, and others to the muſcles of the yard. *The hinder branch* goes into the muſcles, and skin upon the rack-bones.

CHAP. V.

Concerning the nerves of the marrow of os ſacrum *or the great bone.*

LAſt of all from the marrow which is contained in the rack-bones of the *os ſacrum*, the ſix laſt pairs of the nerves of the ſpinall marrow do iſſue forth. *The firſt* of theſe [*t.* 1. *n.* 25.] goes out betwixt the laſt rack-bone of the loins, and the firſt of the great or holy bone, in the very ſame manner as the reſt, that ariſe out of the rack-bones of the loins, and likewiſe after the ſame ſort is divided into two branches. *The fore-branch* although it be mixed with the crurall nerves, ſends yet a ſurcle [*t.* 1. 43.] over near to the inner region of *os Ilium*, and is diſperſed into the muſcles of the *abdomen*, and into the ſecond bending one of the thigh. *The hinder* [*t.* 2. *f.* 1. *n.* 44.] is diſſeminated into the muſcles that ariſe from the *os Ilium* or hanch-bone, and eſpecially into the firſt of them, that extend the thigh, or the greater *Glutæus*, as alſo into the skin of the buttocks.

The firſt paire.

The other five pairs.

The other five pairs have ſomething proper to themſelves; ſo that before they go out of the bone, they are every of them double on each ſide, and ſo from every one of them a double branch is carried on each ſide, one to the forepart, another to the hinder. The three uppermoſt of the fore-branches, as that of the firſt pair alſo, go to the *Crus*, or parts of the body below the buttocks: the two lowermoſt go into the muſcles of the fundament and bladder, and in women to the neck of the womb, in men to the yard; but in both ſexes to the outer privy parts. The hinder branches are diſtributed to the muſcles ſeated on the backſide of the bones *Ilium*, and *ſacrum*. Of this ſort are the firſt and third extending muſcles of the cheſt, or *Dorſi longiſſimus*, the long muſcle of the back, and *ſacrolumbus*, that which bends the loins, called *ſerr*, and the broad muſcle that leads the arm away from the breaſt; as alſo the three which extend the thigh, being the authors of the buttocks, and therefore called *glutæi* the buttock-muſcles. And this is the utmoſt end of the ſpinall marrow, which reaching into the rump-bone, called *os coccygis* is in this manner terminated: And this is the hiſtory of the thirty pairs of the nerves which go out of the ſpinall marrow, which is diligently and accurately to be committed to the memory, that we may know to what place remedies ought to be applyed, if at any time from ſome externall cauſe, as by a fall from aloft, or a bruiſe, or ſome notable compreſſion, any part ſhall have loſt either motion, or ſenſe, or both. For the remedies muſt be applyed alwaies to the beginning of that nerve, not to the place, in which the ſymptome is perceived.

CHAP.

CHAP. VI.

Concerning the Nerves which are diſtributed through the Arms.

THoſe nerves being now enumerated, which are diſperſed through the muſcles of the three bellyes, and the parts contained in them; it remains that we deſcribe thoſe alſo, which are propagated through the *artus*, or extream parts of the body. Here we meet with them firſt, which are diſtributed through the arms, whereof there are ſix pairs commonly ſet down by Anatomiſts ariſing from the fifth, ſixth, and ſeventh pair of the nerves, that come out of the marrow of the neck, and from the firſt, and ſecond of thoſe, which iſſue out of the cheſt. Theſe nerves go out through the common holes of the rack-bones, on both ſides, and preſently after their going out are united one among another with their forwarder, and greater branches, by and by are ſeparated one from another again, and joined again, and finally ſeparated, ſo that they ſeem to make out a certain net-like texture, which cannot be better likened then to thoſe ſtrings of Cardinals hats. This implication of nerves goes forth under the clavicle, or coller-bone, about that place, where the axillary veins and arteries go out of the hollow of the cheſt, and from this all the nerves of the arm take their originall. But their riſe is very uncertain by reaſon of their being ſo knit together, wherefore wee in our relation of them will rather follow the footſteps of other men, then our own obſervations, leſt wee ſhould ſeem to affect new opinions raſhly, and without neceſſity.

The firſt nerve then [*tab.* 1. e] which is carried to the arm, is a double propagation, namely the third, and fourth of the fore branch of the fifth pair of the neck. For *the one* branch [*tab.* 1. Y] is carried to the ſecond muſcle of the upper part of the arm called *Deltoides*, and to the skin that lies upon it: *the other* [*tab.* 1. b] goes toward the neck of the ſhoulder-blade, where it is cleft into two branches; *the former* of which [*tab.* 1. c] goes into the muſcle *Deltoides*, where it ariſes from the collar-bone; *the latter* [*tab.* 1. d] is inſerted into the fourth pair of the muſcles of the bone *hyoides* called *coracohyoideum*, and from thence affords a little branch to the upper ſuperſcapular muſcle, and the *Deltoides*, at what place it ariſes from the ſpine of the ſhoulder-blade. *This* nerve runs out through the higher ſide of the arm; but *the other five* are carried through the arm-pit into the arm, and in the ſame are ſcattered into more branches. The firſt nerve of the arm.

The ſecond nerve [*tab.* 1. ζ] is thicker, and takes it originall from that net-like compli- The ſecond. cation, of which we ſpake, yet, from what nerve cannot be evident enough. This is Its progreſſe. carried down through the middle, and fore-part of the arm; into which it enters under the firſt bender of the cubit, or the double-headed muſcle, at that part, where its two heads are united one with the other, and where the tendons are inſerted both of the pectorall muſcle, that leads the arm forward to the breaſt, and of the *Deltoides*, that lifts it up. Being hid then under this muſcle it ſends forth two propagations [*tab.* 1. ϑ] one Its propagati- of each ſide, which enters into the two heads of the muſcle *biceps*; and after that about ons. the middle of the length of the upper part of the arm, going under the ſame double-headed muſcle, it ſhoots forth another ſprig [*tab.* 1. ϯ] by means whereof it is joined with the third nerve; and from thence deſcending it diſtributes in its progreſſe a ſurcle [*tab.* 1. θ] from its outſide to the head of the longer of the two muſcles of the *radius* or wand, that turns the palm of the hand downward. When it is now come to the bending of the cubit, being led to the fleſhy membrane, near to the outſide of the tendon of the ſaid double-headed muſcle, it is diſtributed into the skin, being divided into two branches, of which one is the outer, the other the inner; that is the ſlenderer, this the thicker. *The outer* then [*tab.* 1. ι] being carried down a good way with a branch of the Cepha- Its branches. lick vein through the inſide of the cubit, is diſtributed [*tab.* 1. ϰ] to the ſecond bone of The outer. the thumb. *The inner* branch [*tab.* 1. λ] is ſubdivided under the common vein of the The inner. arm, or the middle one, called *Mediana*, into two branches, *the outer* whereof [*tab.* 1.] going on obliquely under the skin leaving the vein goes away toward the *radius* as far as to the wreſt: but *the inner* [*tab.* 1. ν] being faſtened to the inner branch of the Cephalick-vein, when it goes more obliquely, in the region of the cubit is cleft into two ſpeciall branches, of which *one* [*tab.* 1. ξ] is diſtributed through the region of the leſſer bone of the cubit, *the other* [*tab.* 1. ο] through the region of the greater bone to the wriſt, and from thence, that being paſt, into the skin of the inſide of the hand.

The third nerve of the arm [*tab.* 1. μ] or the third, which is carried to the arm, lies next The third. under the ſecond, and in like manner with it ariſes from that net-like texture. This nerve, whilſt it paſſes through the arm-pit, before it has yet attained to the arm, brings forth

forth a propagation, [*tab.* 1, σ] which is diſperſed under the skin betwixt the Pectorall muſcle, that leads the arm to the breaſt, and the muſcle *Deltoides*, that lifts up the ſame. But when it hath firſt attained to the arm, it hides itſelf under the muſcle *Biceps*, or firſt bender of the cubit, and paſſing on downward together with the ſecond nerve, it ſends out a little branch [*tab.* 1. τ] into the head of the ſecond bending muſcle of the cubit. After this deſcending it receives a branch [*tab.* 1. υ] from the ſecond nerve, by means whereof they are joined one with the other, and then it goes farther through the forepart of the arm unto the bending of the cubit, being alwayes equally diſtant from the ſecond nerve, and is carried into the protuberation of the inſide of the arm, and the fore-part thereof. When it hath paſt this, it iſſues forth many propagations, [*tab.* 1. φ] which together with the branches, that are derived from the fifth nerve, which is carried through the hinder region of the ſame protuberation, are diſtributed into the muſcles, that are ſeated on the inſide of the cubit, and ariſe from the inner protuberation of the arm: ſuch are the two, that bend the uttermoſt bones of the fore-fingers, and that, which bends the third joint of the thumb. After this it ſends out another propagation, which is carried down between the ſaid muſcles through the *radius* together with a vein, and artery, to the wriſt, and paſſing through under the the tranſverſe ligament, ſcatters ſome ſmall ſprigs into the muſcle, that moves the thumb outward from the fingers, and the two, that bend the firſt joint of the ſame. After this when it is come to the palm of the hand, it is divided [*tab.* 1. χ] into three branches; the firſt of which ſcatters two twigs into the thumb, the ſecond as many into the fore-finger, the third ſends one to the middle finger on the inſide.

The fourth. *The fourth nerve* [*tab.* 2. *fig.* 1. ϕ] is the biggeſt of all them, which are carried to the arm, as being almoſt thrice thicker then the reſt. This ariſes, as well as the other, from the net-like complication, and from thence is carried down through the arm, in like manner as the third is, lying deep every where among the muſcles, having the baſilick-vein, and axillary artery for its companions. But preſently after it hath entred the arm, it derives many, but ſmall ſprigs [*tab.* 2. *fig.* υ] into the heads of the muſcles, that extend the cubit; and before it is come to half the length of the upper part of the arm, it is contorted obliquely downward to the bone thereof, and paſſes on betwixt that, and the muſcles, which extend the cubit. But before it be wholly reflected, it ſends forth a ſurcle [*tab.* 2. *fig.* 1. Γ] from its inſide, which goes betwixt the ſaid muſcles, as alſo the ſecond of them, that bend the cubit, and is ſpent upon the skin, that clothes the inſide of the arm, ſome fibres being propagated upward, and downward. Having diſſeminated this propagation it goes by degrees through the hinder part to the outſide of the arm, being carried through the cavity of the outer protuberation of the upper bone of the arm, that is cut out in the back-ſide thereof, where likewiſe it ſends out a ſurcle, [*tab.* 2. *fig.* 1. Δ] going to the skin, that covers the lower part of the outſide of the arm; and then another [*tab.* 2. *fig.* 1 Θ] which is diſtributed into the skin, as far as to the wriſt. After that near to the joint of the cubit it is divided into two branches, an outer, and an inner one, which being hid deep, and among the muſcles, as the whole trunk alſo, deſcend to the wriſt.

Its propagations.

Its two branches.

The outer. *The outer branch* [*tab.* 2. *fig.* 1. Λ] goes along the *radius*, or wand, and when it is come to the wriſt, paſſes through the tranſverſe ligament, on the outer part, and by and by is ſubdivided [*tab.* 2. *fig.* 1. Ξ] into two branches, of which *one* goes with a double ſprig into the outſide of the thumb, the *other* is ſpent partly upon the fore-finger, partly on the middle one.

The inner. But *the inner branch* [*tab.* 2. *fi.* 1. Π] reaching along the cubit ſcatters more propagations, the *firſt* [*tab.* 2. *fig.* 1. Σ] into the firſt muſcle that extends the fingers, the *ſecond* [*tab.* 2. *fig.* 1. Φ] into the ſecond, that extends the fingers; the *third* [*tab.* 2. *fi.* 1. Ψ] into the inner muſcle, that extends the wriſt. But in its progreſſe [*tab.* 2. *fi.* 1. Ω] it affords propagations to the three beginnings of the muſcles, that take their original from the *ulna*, or greater bone of the cubit. The remainder of it ends in the wriſt, [*tab.* 2. *fig.* 1. 31].

The fifth nerve *The fifth nerve* [*tab.* 1. *numb.* 32] ariſing lower then any of the fore-mentioned, out of ſame net-like complication, and being joined to the fourth, deſcends through the inſide of the arm, between the muſcles, that bend, and extend the cubit. This ſcatters no propagation from itſelf, but remains intire, till it be come to the inner protuberation of the arm, at whoſe hinder cavity it is reflected, and is diſtributed afterward in the ſame manner with the third nerve, which paſſes through the foreſide of the ſame protuberation. For both of them beſtow propagations [*tab.* 1. 33] upon the muſcles, which grow out of the inner protuberation of the arm, and keep the inſide of the cubit. It iſſues forth a propagation alſo [*tab.* 1. 34.] which being carried through the *radius*, or wand; goes between the muſcles, which bend the ſecond, and third joints of the fingers, and ſo to the palm of the hand, & ſends out *the firſt branch*, which being parted in two is implanted into the inſide of the little finger; then *another*, which being alſo cut in two goes into the ring-finger, and at laſt *another* that goes to the outer part of the inſide of the middle finger. But from this ſame fifth nerve, and from the outſide near to the middle of the length of the *radius*, or wand, there grows out a certain other ſurcle, [*tab.* 1. 35.] which being divided into three branches is diſſeminated into the outer part of the middle, the ring-finger, and the little one.

The

The ſixth nerve [*tab.* 1. *numb.* 36.] iſſues out of the loweſt part of the net-like complication, and going through the arm-pit, and inſide of the upper part of the arm, & of the cubit, under the skin it makes haſt to the inner protuberation of the upper-bone of the arm, diſperſing many ſurcles in its way to the neighbouring skin. [*t.* 1. 37. 37.] But as ſoon as it has attained to this protuberation, it is cleft into many propagations, ſome of which lie under the branches of the baſilick vein, ſome lie over, and ſo being carried under the skin, when they are come down to the wriſt, they end [*ta.* 1. 38.] The ſixth.

CHAP. VIII.

Of the nerves that are diſtributed through the Crura, *or thighs, legs, and feet.*

THere are four pairs of nerves, which are propagated through the *Crura*. They ariſe from the three lower conjugations of the loins, and the four upper ones of the *Os ſacrum*, or great bone, which after they are gone through forth the common holes of the rack-bones, as wel as the nerves, which are diſtributed through the arm, make a certain complication like the meſhing of a net, but far greater then that other. Nor are theſe nerves of equall bigneſs, but the firſt [*ta.* 1 *n.* 46.] and the third [*ta.* 1. 56.] are ſmall, wherefore alſo they reach but to the thigh; the ſecond [*t.* 1. 50.] is ſomewhat thicker, and reaches to the leg; but the fourth [*t.* 1. 61.] alone is thicker then the three other put together; and is carried down as far as to the utmoſt ends of the toes.

The firſt nerve then [*ta.* 1. 46.] growes out of the higher part of the net-like complication, where the third nerve of the loins is joined with the fourth [*ta.* 1. 47. But it is preſently carried downward under the rim of the belly, to the thigh; lying upon the outſide of the tendon of the firſt bending muſcle of the thigh, to which when it is come, it ſends out a propagation [*ta.* 1. 48.] which runs out through the skin on the forepart of the thigh, as far as to the joint of the knee, and there ends, and offers ſurcles [*ta.* 1. 49.] to the firſt bending muſcle of the leg, as alſo to the ſecond and third, that extend the ſame. The firſt nerve.

The ſecond nerve [*t.* 1. 50.] ariſes out of the ſame complication, and below the firſt, over againſt the connexion of the third and fourth rack-bones of the loins. This together with the crurall vein, and artery, (which are the outer Iliacall branches) deſcends through the groin into the thigh, which when it has attained to, preſently it iſſues forth a notable propagation [*ta.* 1. 51.] from its inſide, lying upon the *ſaphena* or vein of the inner ankle, on the forepart, all the way it goes under the skin through the inner parts of the *crus* to the great toe. But as the vein *ſaphena* it ſelf diſtributes ſome ſprigs in the way to the skin next to it, ſo alſo this nerve ſends out many propagations, of which that is the chief [*t.* 1. 53.] which it gives to the foreſide of the knee. But the trunk it ſelf [*t.* 1. 54.] when it has ſent out this propagation, paſſes together with the trunk of the crurall vein and artery into the thigh, and is ſcattered into the muſcles ſeated on the inſide of the thigh, eſpecially [*t.* 1. 55.] into the third bending one of the thigh, and the fourth extending one of the leg, and ſo afterward it is terminated above the knee. The ſecond. The progreſs of the trunk.

The third [*t.* 1. *n.* 56.] grows out of the complication, under the ſecond, over againſt the conjunction of the fourth and fifth rack-bones of the loins. This nerve being carried down upon the ſecond bending muſcle of the thigh, called *Iliacus internus*, paſſes through the hole of the ſhare-bone, and affords propagations [*t.* 1. 57.] to the two muſcles, that turn the thigh about, which they cal *Obturatores*, the ſtoppers, to wit, of that ſaid hole, as alſo to the two muſcles that erect the yard, which ariſe out of the bone of the hip. From thence like the two foregoing nerves, it deſcends, and diſtributes little nerves into the skin, that clothes the inner part of the thigh [*t.* 1. 58.] The remaining part [*t.* 1. 57.] lies deep, the chief propagation whereof [*t.* 1. 60.] is ſpent partly on the ſecond, partly on the third muſcle that bend the leg. The third.

The fourth nerve [*t.* 1. *n.* 61.] is made up out of the fore-branches of the four upper pairs of the great bone being united together. By reaſon whereof it paſſes the reſt, yea and all the nerves of the whole body, not only in thickneſſe, but in hardneſſe alſo, as being made of the laſt, that iſſue out of the ſpine, or ridge. This enters into the hinder part of the thigh through the cavity, that is in the hinder part of the hip-bone. But preſently it ſends forth a notable propagation [*t.* 1. 62.] from its back-ſide, which ſtayes a pretty while under the firſt extending muſcle of the thigh, or *Glutæus magnus*, the great buttock-muſcle, and from thence is diſperſed into the skin that covers the buttocks, and the back-ſide of the thigh to the middle of its length. Then it ſends other propagations [*ta.* 1. 63.] on both ſides, three for the moſt part to the heads of the third, fourth, and fifth muſcles that extend the leg, and to the third bending one of the thigh. After this the trunk of the nerve deſcends among the muſcles ſeated on the hinder part of the thigh, near to the bone, as far as half the length thereof, and diſtributes another branch [*t.* 1. 64.] to that fleſhy lump of the fifth bending muſcle of the leg, called *Biceps*, which growes to it on the inſide, The fourth. The progreſs of the trunk.

inſide, after it has gone beyond the middle of the thigh. From hence alſo other ſurcles proceed, which are diſtributed into the skin on the backſide of the thigh. But the trunk it ſelf proceeding farther on, at length attains to the knee betwixt the two heads of the bone of the thigh, and imparts a ſmall branch [*t.* 1. 65.] on each ſide into the firſt extending muſcle of the foot, and the ſole muſcle, called *plantaris*, and by and by is divided, [*t.* 1. 66.] into the inner cavity of the knee, or in the ham into two unequall branches, which are diſtributed alone through the leg and foot. For there is not any nerve which runs out through the leg, beſides theſe two branches of the fourth; if you except only that notable propagation, which being derived from the ſecond nerve, as we have ſaid, deſcends in company of the vein *ſaphena*, through the inner part of the *crus*. *The outer* branch [*t.* 1.67.] is the ſmaller, and goes toward that part where the upper *appendix* of the *fibula*, or leſſer bone of the leg is joined with the *tibia*, or greater bone thereof, ſcattering a propagation [*t.* 1.68.] in the way, which goes to the outer ancle under the skin, diſtributing in the mean time, many ſprigs to the skin. But the branch it ſelf [*ta.* 1. 69.] paſſes betweeen the muſcles ſeated on the foreſide of the leg, and going through the long ligament of the *tibia* and *fibula*, or two bones of the leg, paſſes together with the tendons of the muſcles that extend the toes, under the tranſverſe ligament, and diſperſes little branches to the ſides of the upper part of the toes. *The inner* branch [*t.* 1. 72.] is carried down through the backſide of the *crus*, lurking betwixt the muſcle of the ſole of the foot, and the firſt of them, that move the foot obliquely, as alſo the long bending muſcles of the toes; and being joined afterward with the branch of the outer, which paſſes through the ligament, it goes to the ſole of the foot, and diſtributes propagations in both the ſides of the lower part of the toes.

Its diviſion.

FINIS.

AN

An Explanation of the two Tables of the Nerves.

THe thirty pairs of the nerves of the marrow of the brain, whilſt it is carried through the ſpine or ridge, are expreſt in theſe two Tables the preſent & the following one. Wee have inſcribed common characters on both of them; though many alſo bee peculiar to one; after which we have preſently ſet the number of the Table. But the firſt ſhews the rack-bones of the ſpine and the nerves that iſſue from thence on the foreſide; the ſecond on the backſide.

nu. 1. 1. &c. *as far as to* 7. *The ſeven rack-bones of the neck.*
8 *as far as to* 19. *The twelve rack-bones of the cheſt.*
20 *as far as to* 24. *The five rack-bones of the loins.*
25 *as far as to* 30. *The ſix bones of the* os ſacrum. *Theſe ſame figures do ſtand for the pairs of the ſpinall marrow.*

A *ta.* 1. & 2. *The ſeat of the ſpinall marrow, where it firſt enters into the rack-bones.*

1. 1. B 1. C 2. The firſt pair *of the neck, whoſe* forwarder *propagations is* B; *the* hinder C.

2. 1. D. E 2. E 2. F 2. The ſecond pair, *whoſe* fore-propagation *is* D, *its hinder* E, *from this two branches grow out; the* ſlender *one marked with the letter* E, *the other* thick *one with* F, *which is mixed with a branch of the third pair* M, *about* G. *But the courſe thereof to the ſkin of the crown, and backſide of the head, is marked with the letter* H.

3. 1. I. 1. K. 1. M. 1. The third pair *of the neck, whoſe* fore-branch I *is divided into four propagations.* The firſt K *is implanted into the muſcles, that bend the neck.* The ſecond L *is mixt with a twig of the fourth pair* Q. The third M *is mixt with the thicker propagation of the hinder branch of the ſecond pair* F. The fourth N *is inſerted into the muſcles that are joined to the tranſverſe proceſſes of the rack-bones.*

N.

O 2. *The* hinder branch O.

4. 1. P. Q 1. R 1. S 1. T 2. The fourth pair *of the neck, whoſe* fore-branch P *is cleft into three propagations.* The firſt Q *joins with the ſecond propagation of the third pair* L. The ſecond R *goes into the tranſverſe muſcle of the neck.* The third S. *The* hinder branch T.

5. 1. V 1. The fifth pair *of the neck, whoſe fore-branch* V *iſſues out ſome ſurcles.* The firſt *goes to the muſcles that bend the neck, being to be ſeen in the firſt table between* V, *and the number* 6.

X 1. Y. The ſecond X *making the greateſt part of the nerve of the midriffe.* The third Y *goes to the muſcle* Deltoides, *of which there is a propagation,* a, *which goes to the ſkin, that covers the muſcles* Deltoides, *and* Biceps.

a 1. b 1. c 1. The fourth b, *at the neck of the ſhoulder-blade is cleft into two branches;* one *of which,* c, *enters into the muſcle* Deltoides, *at what part it growes out of the Collar-bone:* the other,

d 1. d, *is implanted into the ſame, in the place where it grows out of the ſpine of the ſhoulder-blade.*

e 2. The hinder branch, e.

6. 1. f 1. g 1. The ſixth pair *of the neck, whoſe* fore-branch f, *when it has propagated that circle* g, *which with the fourth and fifth pair,* S *and* X, *makes the nerve of the midriffe, is joined with the two following,* h, *and thus it makes up the nerve of the midriffe* i, *ſo that this ariſes out of three ſurcles* S, X, *and* g. *The* hinder branch l.

h 1. i. 1. l 2. 7. 1. m 1. 2. The ſeventh pair *of the neck, whoſe* fore-branch *is* m, *its* hinder one n.

8. 1. o 1. p 1. The firſt pair *of the cheſt, whoſe* fore-branch o, *is united,* p, *with the ſeventh pair of the neck, and ſecond of the cheſt, ſpreading a propagation* q, *through the upper ſide of the firſt rib. The* hinder branch r.

q 1. r 2. 9 1. t 1. The ſecond pair *of the cheſt, whoſe* fore-branch *ſends forth a ſurcle* t, *running out through the firſt ſpace betwixt the ribs, and ſending ſurcles* u *to the muſcles of the cheſt.*

u 1. x 2. *The* hinder branch x.

10, 11, 12 &c. to 19 inclu-ſively 1. The paires of nerves from the ninth to the twentieth, *which have the ſame ſeries of propagations, and eſpecially to the diſtances of the ribs. The* fore-branches *of theſe (fig.* 1.) *are ſcattered into the muſcles ſeated on the forepart of the cheſt, and partly into their upper region, as* y, *partly into their lower* z, *which in women go alſo to the breaſts; and then they ſend other ſurcles into the heads of the oblique deſcending muſcles of the* abdomen *α, and into that which leads the arm from the breaſt* β, *another goes to the nipple of the breaſt* γ. The hinder branch δ.

y 1. z 1. α 1. β 1. γ 1. δ 1. ε 1. The firſt nerve that goes to the arm, *which is ſcattered into the skin of the outſide of the arm.*

ζ 1. η 1. The ſecond nerve that goes to the arm, *whoſe two firſt propagations* η η *goe to the two heads of the muſcle* Biceps: *then it joins with the third nerve by a ſurcle* †. *Thirdly, it carries a propagation to the longer muſcle that turns the palm of the hand downward* θ. *But about the bending of the cubit it is divided into two branches, an* outer ι, *and an* inner *one* κ. That ι *deſcending along the* radius *or wand, is inſerted at the outſide of the ſecond joint of the thumb* λ. This κ *is by and by ſubdivided into an* outer μ, *and an* inner *branch* ν. This ν *is again cleft in the region of the cubit into an* outer *branch* ο, *and an* inner *one* π.

† θ 1. ι 1. κ 1. λ 1. μ 1. ν 1. ο 1. π 1. The third nerve entring the arm ρ, *before it attains to the arm, ſcatters a ſprig betwixt the Pectoral muſcle, and* Deltoides σ. *By and by having entred the arm, it diſtributes another,* τ, *into the ſecond muſcle that bends the cubit. After that deſcending it receives a branch from the ſecond nerve* υ; *when it is paſt the bought of the arm, it is diſtributed into many*

ρ 1. σ 1. τ 1. υ 1. φ 1. *ſurcles*

ρ.1. χ 1. ψ 2. ω. Γ. Δ. Θ. Λ. Ξ. Π. Σ Φ. Ψ. Ω. 31. 32.1. 33. 34. 35. 36.1. 37. 38. 20.21. 22,23, 24. 1. 39.1. 40.1. 41.1. 42.2. 25, 26, 27, 28, 29, 30.1. 43.1. 44.2. 45.1 46.1. 47. 48.1. 49.1.

ſurcles ρ, at length about the palm of the hand it is divided into three branches χ.

The fourth nerve entring the arm, which is the greateſt of all them that goe to the arm, is not marked with any letters in the ſecond table, but in the third only, leſt the ſecond ſhould be too much blurred with Letters. This ſodainly after it has entred the arm, reaches out ſmall ſprigs ω into the muſcles, that extend the cubit, then another into the inner skin, upwards and downward Γ, and another into the lower part Δ, and another Θ, which goes as far as to the wriſt. After this near to the bought of the arm it is divided into two branches, an outer one Λ, and an inner Π. That Λ about the tranſverſe ligament is again divided in two Ξ. This Π reaching all along the cubit ſends forth more propagations, the firſt Σ, the ſecond Φ, the third Ψ. Then another in its progreſſe Ω. The remainder ends in the wriſt 31.

The fifth that enters the arm, which about the inner protuberation of the arm, is diſſeminated like to the third. Its firſt ſurcle 33, its ſecond 34, its third 35.

The ſixth nerve of the arm, which goes under the skin imparting many ſprigs to it 37, 37, 37. The end of it is 38.

The five pairs of the nerves of the loins: the firſt 20, the ſecond 21, the third 22, the fourth 23, the fifth 24. A certain branch ariſing from the firſt pair of the loins 20, and deſcending for the moſt part with the preparing artery to the teſticle.

The courſe of the nerves through the muſcles of the Abdomen; from which branches 41 goes to the muſcle that leads the arm outward from the breaſt.

The hinder branches of the nerves of the loins.

The ſix pairs of the nerves of the great bone. Of theſe the firſt is 25, the ſecond 26, the third 27, the fourth 28, the fifth 29, the ſixth 30.

A Surcle reacht out from the fore-branch of the firſt nerve of the great bone to the inſide of the hanch bone, and ſo to the muſcles of the abdomen, that ariſe from that bone. Then another ſpreading out from the hinder-branch to the muſcles ſeated on the back of os Ilium, or the hanch-bone.

The termination of the ſpinall marrow paſſing on without a mate, and undivided.

The firſt nerve entring the crus. This ariſes where the third nerve of the loins meets with the fourth 47. A branch of this 48 goes to the skin; but 49 it is entangled among the muſcles, that are ſeated on the outſide of the thigh.

50.1. 51.1. 52.1. 53.1. 54.1. 55.1. 56.1. 57.1. 58.1. 59.1. 60.1. 61.1. 62.1. 63.1. 94.1. 65.1. 66.1. 67.1. 68.1. 69.1. 70.1. 71.1. 72.1. 73.1. 74.1. 75.75.1. 76.1. 77.1.

The ſecond crurall nerve, a notable propagation whereof 51 runs out in the ſame courſe with the vein Saphena to the end of the foot, and there ends about 52. In the mean time it proffers another notable ſurcle 53 to the foreſide of the knee. But the remainder of the trunk 54 enters deep into the thigh, and gives out a ſmall branch 55, but without queſtion the chief.

The third crurall nerve, whoſe propagation 57 goes to the muſcles called Obturatores, and another 58 to the skin. The remainder 59 lies deep intangled in the muſcles whoſe chief propagation is 60, which is implanted into the ſecond and third muſcles, that bend the Leg.

The fourth, and that the thickeſt of all the nerves of the crus, whoſe firſt branch is 62, which is inſerted into the skin of the buttocks; another 63 is diſtributed into the heads of the muſcles that ariſe from the appendix of the Hip: a third 64 is given to the fifth muſcle, that bends the leg; and others 65 go into the outer calf-muſcle, and that of the ſole of the foot. But about the lower heads of the thigh it is divided 66 into two branches, to wit, an outer one, 67, and an inner 72.

The outer branch, a propagation whereof 68 is ſent under the skin that covers the outer part of the leg, and the outſide of the foot. But the branch itſelf 69 goes to the connexion of the leſſer bone of the leg with the greater; ſending forth another ſurcle 70 to the forepart of the leg under the skin: the remainder of it 71 reaches along the fibula or leſſer bone of leg.

The inner branch a propagation whereof, 73, goes through the inſide of the leg toward the calf, and inſide of the foot under the skin: and then another 74 is ſcattered into the skin, eſpecially that which covers the calf. Another alſo 75, 75 goes into the fore-part of the leg through the ligament that joins the leſſer bone of the leg to the greater, and afterward is ſpent on the upper ſide of the foot. The laſt propagation 76 runs out betwixt the inner and outer calf-muſcles. The remainder of the trunk goes by the inner ankle to the lower part of the foot, diſtributing two ſurcles a peice to the lower part of all the toes.

The ſecond and third figures of the ſecond Table. Theſe two figures do exhibit the nerves of the arm and leg in a larger form, then the firſt table does, ſo that all, which concerns thoſe nerves, may be ſhew'n more accurately herein. But they have common characters, and the ſame explanation of the ſame ſerves for both.

THE WORKES of that famous Chirurgion Ambrose Parey

Translated out of Latine and compared with the French.

by Tho: Johnson.

Whereunto are added three Tractates out of Adrianus Spigelius of the Veines, Arteries, & Nerves, with large Figures.

Also a Table of the Bookes and Chapters.

London.
Printed by Richard Cotes, and Willi: Du-gard, and are to be sold by John Clarke, entring into Mercers Chappell. 164

ΑΓΓΕΙΟΛΟΓΙΑ:

Or, A

Description of the Vessells in the body of

MAN,

Of the three kinds, *i. e.*

OF THE

VEINS, ARTERIES, and NERVES,

Especially of those in the Limbs and Habit of the Body:

Whereof there are also given Anatomicall Figures,
(the largest and faireſt that ever were publiſhed with any ENGLISH Book.)

In three Tractates.

Translated out of the Anatomie of *Adrianus Spigelius*, by whom these parts are more largely and accurately described then by other Authors; the more ful tractation whereof, being a part of Anatomie so usefull in order to Chirurgicall Operations, hath been judged very worthy to be annexed unto this present work.

LONDON,
Printed by *Richard Cotes*, for *John Clark*, and are to bee sold at the lower end of Cheapside, entring into Mercers-chappell, *1649*.

The Preface.

OF how great consequence a more perfect knowledge of Anatomie is to the Art of Physick, and Chirurgery, hath been frequently and abundantly made out by Anatomists, Physitians and Chirurgeons, upon occasion, in their severall writings; though the thing it self speak so plainly in its own behalf, that much need not be said in this kind. The ease is plain, that with the like facility and successe may a Mariner, making out some unknown land, steer his course through the main Ocean, where nothing but sea and skie appears, without the help of his Card and Compasse, as a Physician judg of the naturall action, or preternaturall affect of any part of the body; or a Chirurgeon institute any operation about the same, without the Anatomicall knowledge thereof; and therefore no more shall be said to this effect. Anatomie may be very commodiously reduced to four distinct kinds, or distinguished according to so many principall parts. 1. Σπλαγχνολογία, Splanchnologie; that is, the description of the Bowels contained in the three Cavities or Bellies of the body; the lower, middle, and supreme. Οστεολογία, Osteologie, which is the description of all the bones of the body. 3. Μυολογία, Myologie, being the Anatomicall history of all the Muscles. 4. Αγγειολογία, Angeiologie, describing all the Vessells of the body: i. e. the Veins, Arteries, and Nerves; these last, though having no sensible cavities, being reputed vessells in the account of Anatomists. Now though all these parts or kinds of Anatomie, are needfull both to Physick and Chirurgery; yet are they not all of a like necessity to both: but the first of more absolute necessity to the Art of Physick; the other three, to Chirurgery. And therefore though all four have been treated on by the learned author of this Volume; yet in reason it could not but be advantagious and acceptable to Chirurgeons to have some farther helps in our English tongue, for improvement in the three later kinds before mentioned, or in some of them at least. Now for Osteologie, the parts themselves, or the dry bones are and may be kept at hand, for frequent view and contemplation upon them; whereby their severall Figures, Articulations, and all other particulars observable about them, may be rendred familiar; in order to practice about Fractures and Luxations: and without such Autopsie, much cannot

be acquired by the reading of Deſcriptions, or ſight of Delineations. Toward Myologie, there hath been a peculiar tractate of late publiſhed in Engliſh, which may be uſeful in that reſpect to thoſe who cannot peruſe Latin Authors. So that the greateſt want ſeemed to be in that kind or part of Anatomie, which is the laſt in the Enumeration, i. e. Angeiologie, or the Deſcription of the Veſſells; the more exact or particular knowledge whereof, eſpecially of thoſe in the Habit of the body, will appear, upon a true accompt, more neceſſary to the exerciſe of Chirurgicall operations, at greater certainty, and with more ſecurity, then the knowledg of the Muſcles. Upon theſe conſiderations, being conſulted by the Publiſher of this Work, what peece or Tractate in any kind, of Chirurgery or Anatomy, I thought might to good purpoſe be added thereunto; I reſolved him, that I could think of nothing more advantagious in this kind, then a fuller and more accurate Anatomicall Deſcription of the Veins, Arteries, and Nerves in the body of Man, tranſlated out of the Anatomie of Spigelius; *adding alſo the moſt uſefull Anatomicall Figures, relating to the ſaid Deſcriptions, of the ſame largeneſſe as they are in the Editions of the ſaid Author in* folio; *which were firſt taken out of* Veſalius, *and are the largeſt and faireſt that are extant: the caſe being here, as in Mathematical inſtruments, in which, how much the largeneſſe conduceth to certainty in uſe, is well known. Accordingly he hath not ſpared for care and coſt, in procuring a Scholar every way competent to tranſlate the Deſcriptions of theſe parts, out of the forementioned author; and an able Artificer to cut the Figures. And as the werk is now accompliſhed, I doubt not but good improvement may be made thereof, by ſuch Chirurgeons, as being not able to make uſe of the Originall, ſtand in need of ſuch helps, if they will not be wanting to themſelves for induſtry in the uſe hereof.*

J. G.

THE

The first Treatise, Concerning The VEINES.

CHAP. I.

Reckons up the branches or propagations of the vena portæ or the Gate-vein, and explains an Aphorism of Hippocrates, that makes very much to the purpose.

Note that the Letters, which are enclosed thus [ ] refer to the particular tables at the end of that Treatise, wherein they are set.

LEt us come now to the History of the veins, in which we will begin with the *vena portæ* or gate-vein, as that which spreads not so wide and far as the common hollow one. For it is wont to be distributed only through the lowest belly, and not at all to propagate it self out of it; nor does it branch through all the parts of that, but such only as are appropriated to the nutritive faculty, namely the Liver, the bladder of Gall, the Stomach, the Spleen, the Sweet-bread, Kall, Guts, and Mesentery, for the Hollow vein sends its propagations to the rest, as the Reins, Bladder, and those parts which serve for generation. But that the manner of this distribution may be more easily understood, for our better method in teaching, likening the whole vein to a tree, we will divide it into four parts, one of which we will call the Roots, as that part which is in the Liver; another the Trunk, which continues it self on and is not divided; a third the Branches into which the Trunk is divided; a fourth, Twigs or Surcles, such small veins as the Trunk shoots out at its sides; before it be divided into its branches. Which terms ought diligently to be observed, because we have endeavoured by the propriety of these words to give light to this obscure Treatise concerning the veins. But that they may more easily be committed to memory, and all that concerns this business be written with more brevity, following some very learned later Authors, we will give every part its name from the place of its insertion.

Through what parts the Gate-vein is dispersed.

The division of the Gate-vein into the roots, trunk, branches and twigs.

From the outside then of the Liver some very little hairy veins are prolonged towards its inner region, and by little and little meet together into greater branches, so that at length they become five, which again gathered together like roots about the middle of the hollow side of the Liver, but somewhat hinderly near to the back, make a notable stock or Trunk, which at length issuing forth near to those eminencies of the liver, which by the Greeks are termed πύλαι Gates, is cal'd the Gate-vein, and now deserves the name of a Trunk.

The Roots.

This Trunk parting now from the Liver descends somewhat obliquely towards the left side, under the Gut cal'd *Duodenum*, where above the Rack-bones it gets a firm seat; but before it be divided into branches, two twigs sprout from it; the first of which being very small, arising out of the uppermost and forepart of the Trunk, as soon as it is come forth from the Liver, is scattered into the neck, and body of the bladder of Gall, or into its outer coat, with a numerous succession of very little branches, such as we have said above are called hairy veins. This twig is cald in Greek κυστικὸς, in Latin you may render it *vesicalis*, the vein of the bladder of Gall. *Vesalius* sayes there are two branches, which run through the bladder of Gall, whence they are called by some *Cystica gemella*, the twin veins of the Gall, but this makes no great matter. The second twig being greater then the former, but lower, arising from the same fore part, and more to the right, is inserted into *Pylorus* or the lower mouth of stomach, into whose hinder part, which looks towards the back, it scatters many small branches, from whence it is commonly called *Gastricus*, the Stomach-branch, but perhaps for memories sake it may be better termed *Pylaricus*, or branch of the

The Trunk.

The twigs that grow out before the division of the trunk.

Cystica.

Gastrica.

the lower mouth of the Stomach, becauſe there are others alſo, which are called Stomach-branches.

The two branches.

Theſe two twigs being thus propagated, the Trunk runs downwards, and inclining all the way ſomewhat to the left is divided into two notable branches, a right, and a left one; the left is ſome thing higher then the right, but leſſer; the right lower, but greater: the left ſpreads it ſelf through the ſtomach, the kell, one part of the *colon* or colique gut, and the ſpleen; the right through the Guts and Meſentery that is called *Splenica* or Spleen-vein, or the linear one; this the Meſenterick.

Splenica.

Circles riſing from the upper part of the Spleenick-branch.

Now the Spleen-vein, after it is thus come forth from the Trunk, is carried athwart, being underpropt by the membrane of the Kall, toward the Spleen, into which before it be conſumed, it ſhoots forth certain twigs, both from its upper part, and from its lower; from its upper part one, that aſcending obliquely to the left ſide of the Stomach, that looks toward the back, is divided into three propagations, of which the outermoſt on either ſide are conveyed into the Stomach, and preſently ſcatter into more twigs; but the middle one aſcending through the ſame hinder part ſpreads itſelf through the upper region of the Stomach, and compaſſes the left orifice or mouth, round about like a crown, from whence it is called *κορωνάρια* or *Coronaria*, the Crown-vein of the Stomach. This again ſends forth continually ſome ſmall branches upwards to the end of the Gullet, and others downwards through the Stomach. All this branch is called *Gaſtricus*, the Stomach branch, becauſe it is the greateſt, and moſt capacious of all thoſe, which come to the Stomach. From the lower part of the Spleen branch ariſe two twigs; one, which is ſmall, ſending forth other little ſprigs to the right ſide of the lower membrane of the Kell, and the colique Gut annexed thereunto, is commonly called *Epiploïs dextra*, you may Latin it *Omentalis*, the right Kall-vein. Another anſwering to that branch, which ariſes from the higher part of the Spleen-vein, and begets the Crown-vein, is inſerted in the lower membrane of the Kall, and preſently after its riſe is divided into two branches, which parting one from another a great diſtance beget many other twigs, which are ſpent upon the lower membrane of the Kall, which like a Meſentery ties the colique gut to the back, as alſo upon that part of the colique Gut, which is ſo tyed. It is called *Epiploïs*, or *Omentalis poſtica*, the hinder Kall vein. After the Spleen-branch has thus ſcattered many twigs, now drawing near to the Spleen it is cleft into two branches, an upper, and a lower one; which are broken into others in the very *Parenchyma* or fleſh of the Spleen. From the upper, ſometimes before it enters the Spleen, ſometimes when it is already entered, there ſprouts forth a double or threefold twig, very famous among the writers of Phyſick, which they commonly call *vas breve* the ſhort veſſell, but we the venall, to diſtinguiſh it from the Arteriall veſſel that anſwers to it: this is inſerted into the left ſide of the bottom of the Stomach, ſometimes alſo higher, and about the left orifice or mouth. Which is the cauſe why ſome Phyſitians, and commonly Anatomiſts too have fooliſhly thought, that the melancholick humor is returned from the Spleen through this veſſell back into the Stomach, to provoke appetite. But you may often find bodies, in which it is altogether wanting. From the lower branch, which goes to the nether part of the Spleen, one propagation ariſes, which being pretty big, and notable is reflected towards the right hand, like the foregoing, and compaſſes the bottom of the Stomach on the left ſide, and alſo ſends many little branches to the higher membrane of the Kall on the left ſide; it is called *Gaſtro-epiploïs ſiniſtra*, the left Stomach and Kell-vein. There is alſo another notable branch, which is found in moſt to ariſe from the lower Spleen-branch; very ſeldom from the Spleen it ſelf. This is carried downwards, and ſcattering twigs over all the left ſide of the colique Gut, goes on further by the whole length of the ſtrait Gut, and at length determins in the membranous ſubſtance thereof, and in the fundament with many little twigs. Phyſicians make mention of this very often, and call it *Hæmorrhoidalis interna*, the inner emroid vein, to diſtinguiſh it from the outer, which is derived from the Hollow-vein. It is truly and properly called the Emroid vein; I ſay, properly, and truly, becauſe ſometimes they call by that name the veins of the noſtrills, gums, and mouth, that caſt forth blood, and without pain. In this large ſenſe the Philoſopher took it 3. *de part. animal.* where he makes menſtruous purgation alſo a ſpecies of the emroids. But the Emroids properly ſo called by Phyſitians are dilatations of this vein in the fundament, cauſed as well by black and yellow choler, as alſo by a ſalt phlegm, as by the melancholick humor. And theſe are of two kinds; *Cæcæ*, blind piles, which caſt out no blood, but ſwell out like the ſtone of a grape into the fundament or out of it: Others *apertæ*, open, which caſt out the blood, which they contain. The learned *Hippocrates* hath left us a peculiar book, a golden one indeed, concerning the cure of theſe. The remaining part of the Spleen-branch is ſpent upon the whole Spleen, and therein is ſcattered into divers and very ſmall propagations, entring the very fleſh of it about the hollow, and middle line. And theſe are the ſprigs which grow out of the Spleen-branch.

1.

2.

The Meſenterick vein, or right branch of the Gate-vein is joined to the Meſentery, as ſoon as it comes from the back, and is divided into two chief branches, which paſſing through

through the Mesentery betwixt its two coats, are each of them cleft into an infinite number of small branches, and they again into less twigs, which going to the guts make up those veins so famous among Physitians, that are called the Mesaraick-veins. The first of these branches is called the right Mesenterick vein from the right side, wherein it is placed, and is likewise twofold, whence it came to pass, that *Vesalius*, and almost all others, who follow him, reckon three Mesenterick veins. This branch is inserted into the *Jejunum* or empty gut, the *Ileum*, or circled gut, the *Cecum* or blind gut, and the right side of the Colique gut, where it lies next to the reins, and liver; and although both its branches shoot forth many propagations from themselves, so that it is very hard to expresse any number of them, as well because they vary much by reason of their subjects, as also because they do not observe the very same order and course, yet it hath been observed, that for the most part there are fourteen, which afterwards are scattered into an infinite company of other twigs. These when they are come to the guts, only gape with their little mouths into their coat, and enter not the cavity it self, that being compassed about within with a certain crust. But as we have said above, that in most parts of our body, the divarications or divisions of the vessels are attended with certain glandules, partly that they may make the safer progresse, partly least they should sink down, and withall the flow and ebb of the blood so very necessary be hindered; so here also the divisions of the vessels, which are scattered through the Mesentery, are bolstered up with certain glandules, which with their propagations observe such an exact proportion, that the greater glandules do sustain the greater branches, and the less the lesser. When these glandules swell with a *Scirrhus* the vessels being prest close together, and the distribution of the chylus through the veins, and consequently of the bloud through the body being hindered; there follows a Consumption, and pining of the whole body. The left Mesenterick vein is divided into the middle part of the Mesentery, and also that part of the Colique Gut, which runs from the left region of the Stomach as far as to the strait gut. The *hæmorrhoidalis interna*, or inner Emroid vein, of which we spake a little before, sometimes arises from this vein, as *Vesalius* hath observed, which affording some sprigs to the Colique gut, at last running forward through the whole length of the strait gut, determins in the fundament. But before the Mesenterick trunk be divided into these two branches, it first sends forth two propagations, one of which is called *Gastro-epiploïs dextra*, or the Right Stomach and Kall-vein, which creeps through the right bottom of the Stomach, before, and behind, as also through the upper membrane of the Kall: the other called by others *Intestinalis*, or the Gut vein, by us the *Duodena*, reaches to the middle of the Gut *Duodenum*; and the beginning of the Empty gut or *Jejunum*, and descends all along through them.

The right Mesenterick branch.

The left Mesenterick.

Propagations that arise before the division of the Mesenterick.

Gastro-epiploïs Dextra.

Intestinalis.

The chief use of the Gate-vein is to nourish those parts, which are seated in the lowest belly, and need a thicker and more fæculent bloud, such as are all those parts, which serve for nutrition. For their blood ought to be thicker, that it might be hotter, when heat is alwayes more powerfull in a thicker body: so then the Roots of the Gate-vein nourish the Liver, the Trunk nourishes the *Pancreas* or Sweet-bread; of the Twigs, the *Cysticus*, or Gall-twig nourishes the bladder of the Gall; the Spleen-branch, all the entrails, which serve for nutrition, except the Mesentery, and the Guts; the Twig *Pyloricus*, or of the lower mouth of the Stomach, the *Gastricus* or Stomach-branch, both the Stomach and Kall-veins, and the short vessell nourish the Stomach. For I do not think that the short vessell was made by nature for the carrying back of melancholick humor to the Stomach, but chiefly for its nourishments sake; when that blood, which is generated in the Spleen, is not melancholy, and excrementitious humor, but rather the best, although somewhat thicker then other bloud, and that because the parts that are to be nourished by the Spleen branch, needed a thicker bloud, then they which are to be nourished by the Mesenterick. Both the Stomach and Kall-veins nourish the upper membrane of the Kall; the right and the hinder *Epiploïs*, or the Kall-veins, the lower. The Spleen is nourished by those two branches, into which the Spleen-vein is cleft, and which enter its *parenchyma*, or flesh through its middle line: the Mesentery, and almost all the Guts by the two Mesenterick branches; the Gut *Duodenum* by the propagations called *Duodena*; but the empty Gut, the *Ileum* or circled Gut the blind Gut, or the right side of the Collique or *Colon* by the right Mesenterick-branch. The left side of the Colique, and all the strait-Gut by the hæmorrhoidall vein; but the middle part which lies under the Stomach, by the hinder Kall-vein. The second use is to attract the *Chylus*, and carry it to the Liver; whose veins are most famous for the making of bloud. But the same veins which nourish the Mesenterick branch, do also attract the *chylus*, as we shall shew you hereafter, when we shall insist upon the History of it. The third use is to empty out the excrements from the body through the Guts. Thus we see that the cholerick humor is sometimes poured forth out of the Liver through the Mesenterick-branch in the bloudy flux, and cholerick loosnes, and the melancholick dregs through the Emroid-vein. The fourth use is to help the concoction of the Liver. Thus we see that the thicker part of the *chylus*, which is called melancholy, is attracted by the splennick branch, not that the seat of melancholy

The first use of the Gate-vein:

The second use.

The third use.

The fourth

is in the Spleen, but that it may be more attenuated, and better concocted by the benefit of the arteries, which are moſt abounding in the Spleen, and ſo not diſturb, or hinder the concoction, which is famed to be in the veins of the Liver, as it uſually happens; that whenſoever the Spleen is troubled with any diſeaſe, the work of making bloud is preſently harmed.

The explanation of a certain Aphoriſm of *Hippocrates*.

But becauſe there has been mention made here of the Emroid-veins, it ſeemed, that it would not be unſeaſonable if I did refer to this place the explanation of a moſt excellent Aphoriſm, which is the twelfth of the ſixth Section, when it cannot be underſtood without the Hiſtory of Anatomy, and is not ſo faithfully explained by others, as was neceſſary. *Hippocrates* writes in it, ἀιμορροΐδας ἐνθὸν χρονίας ἢν μὴ μία φυλαχθῇ κινδυνῶδες ὑδρωπα ἐπιγενέσθαι ἢ φθίσιν, that is, he that is cured of old Emroids, unleſs one of them be preſerved, is in danger of falling into a Dropſie, or Conſumption. In explanation hereof we will firſt doubt of the Aphoriſm, then we will diſpute of the manner whereby a Dropſie, or Conſumption follows upon the cure of old Emroids. But we may not without cauſe doubt of the truth of it, becauſe the ſame *Hippocrates* in a Book concerning the Emroids, which I think to be very much his own, whatever *Mercurialis* ſay though otherwiſe a moſt learned man, bids us to turn the Emroids, and forbids us to leave any unburnt, but to burn them all. And truly *Aetius* in his 14. Book, deſirous to reconcile theſe two places, at thoſe words ἢν μὴ μία φυλαχθῇ, that is, unleſs one be preſerved, being overcome, thinks that a manner of diet is to be underſtood, not an Emroid, as if *Hippocrates* ſhould ſay: Thou ſhalt not cure one that hath long had the Emroids, unleſs the Patient will diligently obſerve a convenient manner of diet preſcribed by thee; for otherwiſe there is danger of his falling into a Dropſie, or Conſumption. But *Galen* in his Comment upon that Aphoriſm writes expreſly, that *Hippocrates* ſayes, that unleſs one Emroid be preſerved, ſuch danger will enſue, and makes no mention at all of diet. And, what is more, dayly experience ſufficiently witneſſes, that ſuch miſchiefs do enſue though never ſo exact a diet be kept, and the reaſon taken from the manner, wherein they happen, and which we ſhall preſently explain, does abundantly manifeſt it. Whence it is evident, that theſe two places of *Hippocrates* are left ſtill in controverſie, and contradicting one another from this anſwer of *Aetius*. But the right anſwer will be, if we ſay, that *Hippocrates* when he writes in his Book of the Emroids, that for a perfect cure they muſt all be burnt, ſpeaks not of old Emroids, but of ſuch only as are lately come, or when nature has already endeavoured to expell the humor, which was otherwiſe purged out of the Emroids ſome other way, whether it be by iſſues, or by a Fiſtula, or ſome ulcer in the Leg. For ſuch may be very well and without danger of Conſumption, or Dropſie, the rather, if the entrails be yet whole and ſound, and eſpecially if a good rule of diet follow. Nor does the cure of all old Emroids neceſſarily bring on a Dropſie or Conſumption, but only for the moſt part they threaten a danger of theſe diſeaſes to enſue, for ſometimes the melancholick matter being hurried up into the brains, there follows madneſs, as it happened to *Alcippus*, in *Hippocrates* 4. *Epidem.* For, ſayes he, this *Alcippus* having the Emroids was forbidden to be cured, for after the cure he fell madd, but an accute Feaver following it, he was recovered. For explanation of the ſecond doubt, firſt let us hear *Galen* for he in his Commentary upon the Aphoriſm, ſayes "That the Emroids come by reaſon of fæculent and melancholick bloud, which the Liver drives down to the mouths of certain veins, and ſo this way being ſtopt, and abundance of groſs humor burdens the Liver, and ſtifles the naturall heat, which being extinguiſht, no more bloud is generated, but only water, which nature afterwards driving it into the *abdomen*, or paunch, makes a Dopſie. But if the Liver ſend that abundance of melancholick humor to the Lungs, ſome veſſell being broken, there follows a Conſumption. This interpretation of *Galen*, beſides that it ſeems very obſcure to us, is not altogether agreeable to truth. For firſt, it is falſe in my judgment, which *Galen* ſets down in his Comment, that it is impoſſible, that the Emroids ſhould be cauſed without an abundance of fæculent and thick bloud; when it may be proved both by reaſons, and authority, that they come alſo from choler and phlegm. By

1. the authority of *Hippocrates*, who in the beginning of his Book concerning the Emroids, witneſſes that this diſeaſe is cauſed in this manner; to wit, when choler, or phlegm falling down into the veins of the Straight-Gut, heats the bloud, which is in the veins. For theſe veins being heated attract the bloud out of the little veins, that are near, and when they are filled, the inward part of the Seat ſwels, and the heads of the veins appear out of it.

2. But by reaſon it is proved thus; when madneſſes are cauſed by phlegm, or choler, as *Hippocrates* witneſſes in his Book *De Morbo Sacro*, the ſame Author in the 6. Aphoriſm, 21. profeſſes that that madneſs is taken away, if there follow ſwellings of the veins, or Emroids in thoſe that are ſo mad. Now the madneſs would not be taken away, if melancholick humor did only come forth by the Emroids; for then the cauſe of the diſeaſe would not be purged out. But I my ſelf alſo have ſeen formerly in *Germany* ſome Noblemen, that were troubled with ſalt catarrhs, afterwards recovered by a great flux of the Emroids; that I am of opinion, that not only melancholy, but alſo ſalt phlegm and choler are wont to purged out by the Emroids. Wherefore if it happen, that one, who has been long troubled

bled with the Emroids, be cured afterwards, that choler and phlegm, either breed, obſtructions in the Liver, or Spleen, or being gathered together in ſome plenty by ſtretching the veſſels contained in the *abdomen*, or paunch, breaks through them, or by their quality corrodes and eats their way out, and makes a Dropſie in the *Abdomen*; or elſe by raiſing obſtructions in the Liver, and extinguiſhing the naturall heat, generates much water, and ſerous humor in ſtead of bloud, which paſſing through the veins, make a *ſpecies* of the Dropſie called *Leucophlegmatia*; but if this humor go back to the Breaſt, or Lungs, it breaks through, or eats out their veſſels, and hence follows a ſpitting firſt of bloud, then of corrupt matter, and from thence at laſt a Conſumption, as *Hippocrates* teaches in his Aphoriſm. But in this place it is firſt of all to be obſerved, that there are two ſorts of propagations of veins, which make the Emroids: for there are ſome propagations of the Gate-vein, of which we have already treated; but there are others of the hollow-vein, which ariſe from the Iliacall branches, of which we are to ſpeak hereafter. Now if the forementioned humors, whether melancholick, or cholerick, or phlegmatick, and ſalt, flow through the propagations of the Gate-vein, the internall Emroids are cauſed, which being cured, the matter flows back into the branches of the Gate-vein, that are ſcattered through the lower Belly into which the veins being loaden with theſe humors unburden themſelves, and make a *ſpecies* of the Dropſie called *Aſcites*. But if they flow through the branches of the Hollow-vein, they cauſe the external Emroids, and theſe being cured againſt the Precept of *Hippocrates*, there is danger of a Conſumption to enſue, becauſe from hence there is an eaſie paſſage of the peccant matter through the Hollow-vein to the Lungs, nigh to the Heart. And this is that which we have of a good while obſerved, that many, who have been long troubled with Fiſtula's of the Fundament; and afterwards cured, through the ignorance of Phyſitians, have faln into a ſpitting of bloud, and then into a Conſumption. Nay we remember, that a maid was once cured by us in *Germany*, which had a Fiſtula in the middle of her Hip, and for three years had ſought help from many in vain, but being cured ſhee fell at length after three or four months into a ſpitting of much bloud. Although ſhee was ſcarſe ten years old, I let her bloud preſently in the foot of that ſide on which ſhee had been troubled with the Fiſtula, and purging her body, and laying on a cautery near the place, in which the Fiſtula had been, I eaſily freed her in this manner from imminent danger of a Conſumption. This ſpitting of bloud happened from no other cauſe, but that ſharp and cholerick matter, which when it could no longer find a way out by the Fiſtula, got up afterwards to the Lungs through the branches of the Hollow-vein. But *Hippocrates* ſayes expreſly, that there is danger of a Dropſie, or Conſumption to follow, becauſe it ſometimes falls out, that neither of theſe happen, but rather ſome other diſeaſe inſues, as it happened to *Alcippus*, who fell into a madneſſe, and from that into an acute Feaver: ſometimes alſo the bloudy flux follows, and other miſchiefs. Sometimes alſo it happens, that they who are ſo cured, are preſerved ſtill in health, by abundance of urine, ſweatings, remedies, and a good rule of diet.

CHAP. II.

Treats of the ſuperior, or aſcendent Trunk of the Vena Cava, *or Hollow-vein, and the branches which it ſcatters through the Head.*

WE E are now to conſider the other vein, which as we told you is called *Cava*, the Hollow one [a], which ſpreads it ſelf much wider, then the Gate-vein, as being diſtributed throughout the whole body. For its office is to nouriſh all thoſe parts of our body, which conduce not to the concoction of the food, and thoſe parts being ſpread far and wide, it is neceſſary, that the Hollow-vein alſo be very large, and extended to a great length: and becauſe they ought to be nouriſht with a thinner, and more elaborate bloud, and not ſo thick and faeculent, as that wherewith the Stomach, Spleen, and Kall are nouriſht; therefore the bloud which the Hollow-vein makes, and carries, is alſo more pure, thin and ſincere. The uſe of the Hollow-vein.

In delivering the Hiſtory of this vein, although we are not of their opinion, who derive its beginning either from the Liver, or heart, yet becauſe we muſt begin our Treatiſe of it ſomewhere, we thought fit to follow the received cuſtome of Anatomiſts, and ſo for perſpicuities ſake we ſhall alwayes ſpeak of it, as if it took its birth from the Liver. It may be added, that it ſpreads certain roots as it were in the Liver, juſt like the Gate-vein, in the Hiſtory of which when for that reaſon we took our riſe from thoſe roots, we may not without cauſe begin thence alſo with the Hollow one. But this vein although it run directly through the whole Trunk of the body, and make one very notable ſtock [D] that is drawn out through the middle, and loweſt belly, like one ſtraight line continued, or rather in manner of a channell, or conduit pipe, is notwithſtanding wont to be divided into two by reaſon of the Liver, and ſo one to be called the Aſcendent Trunk, the other the Deſcendent. For indeed that is not true, to which many perſwade themſelves, that The method to be obſerved in the Hiſtory of this Vein.

that the Hollow-vein in its going forth from the Liver, like the great Artery, when it comes out of the heart, is cleft into two Trunks; but if hereafter they be called Trunks by me, you muſt beleeve, that I do it only for orders ſake in teaching. The Aſcendent therefore or upper Trunk [A.D.] is that which ſtands about the Liver, and is terminated about the *Jugulum*, or Hollow of the Neck; but that is called the Deſcendent one [T.V.] which is beneath the Liver, and reaches down as far as the Legs. For both of them are afterwards divided into branches, of which they of the Aſcendent [m and q] are carried upwards to the Head, as the Jugular or Neck-branches; or to the Arms, as the *Brachiales* [G and I] or Arm-veins; theſe of the Deſcendent Trunk to the Legs, and are called the Crurall branches. [T]. We will ſpeak therefore of all theſe in order, ſo that we firſt deliver the Hiſtory of the Aſcendent Trunk, then of its branches, that grow up partly to the Head, partly to the Arms, after that we will come to the Deſcendent Trunk, and its branches, that are digeſted into the Legs.

The Aſcendent Trunk.

As therefore we have ſaid, that many little Veins like roots grew out of the Hollow ſide of the Liver, which alwayes by degrees inſerted into the greater veins, and all of them at length meeting together about the middle of it did make a Trunk; ſo in the ſame manner out of a circuit of the Convex ſide of the Liver a numerous propagation of veins iſſues forth, which afterwards meet together in one Trunk. This Trunk makes its way through the nervous part of its midriffe on its right ſide, and paſſing through it goes undivided to the *Jugulum*, or Hollow of the Neck, and becauſe it climbs upwards, it is commonly called the Aſcendent Trunk by them, who conceive that the Hollow-vein riſes out of the Liver. It is much greater then the Deſcendent, becauſe the upper parts are nouriſhed by it alone; but almoſt all the inferior parts, that are contained in the loweſt Belly, by the Gate-vein. But although it be not parted into any branches, untill it come to the *Jugulum*; yet before that it ſpreads ſome propagations at its ſides, and of thoſe, three notable ones. The firſt [e e] is that which is called *Phrenica*, or the vein of the Midriffe, on either ſide one, and is diſtributed throughout the whole Midriffe, which is called *ὑπόζωμα*, with a numerous iſſue, ſending little branches to the neighbouring *Pericardium*, or purſe of the Heart, and the *mediaſtinum*, or partition of the Cheſt; which when it has now got above, and entred the Cheſt, it inclines a little to the left hand, and enters the *pericardium*, and being hidden very cloſe over againſt the eight rack-bone of the Cheſt, is very ſtrongly infixt into the Right ventricle [C] of the heart; that *Ariſtotle* did not without cauſe gueſſe, that it ſprung from hence. But before it be ſo infixed, it ſends out another propagation [b b] which is a notable one, and extends itſelf by the hinder part of the Heart, and the left ſide of it, towards the forepart, compaſſing the *baſis* of the Heart like a Crown, from whence it is called *Coronaria*, or the Crown-vein of the Heart. This ſcatters many branches through all the outer ſurface of the Heart, but eſpecially through the left ſide, as that which needed a more copious aliment then the right ſide, becauſe of the continuall, and greater motion there. But becauſe the fleſh of the Heart is hard, and ſolid, it ought therefore to be nouriſht with a thicker bloud, from whence it is, that this branch grows out of the vein, before it enters the Heart, to wit, when the bloud is ſomewhat thicker, and not yet attenuated in the cavities of the Heart. Near to the originall of this there is a little valve, or floud-gate, which hinders the bloud from flowing back to the Hollow-vein, as it might eaſily do by reaſon of the continuall motion of the Heart. When the Hollow-vein has now gotten above the Heart, it becomes leſſer, and perforates again the *Pericardium*, and forſakes the Rack-bones of the Back, and being got above the Gullet, the rough Artery, and the *aorta*, or Great Artery, (which lean ſo upon one another, that the Gullet takes hold of the bodies of the Rack-bones, the rough Artery lies upon that, and the *aorta* again upon this) it climbs upwards through the midſt of the diviſion of the Lungs, where the right part is ſeparated from the left. But becauſe by this means it could not get to the Back, and the little branches, if it ſhould have ſent forth any ſuch, had been very liable to danger of breaking, being ſo hanged up; therefore it ſends forth a third propagation [c c] as ſoon as it is got out of the *Pericardium* or purſe of the Heart. The Greeks call this vein ἄζυγον, the Latins *ſine pari*, or *carens conjuge*, without a companion, or wanting a mate, becauſe in a man there is but one, and it has no companion, or mate on the left ſide, as other veins have; though in creatures that chew the cud, it is double, and plainly to be perceived of both ſides. But it iſſues forth about the fifth Rack-bone of the Cheſt out of the hinder part of the Hollow-vein, and the right ſide, and goes downwards, not directly, but inclining a little toward the right hand is as it were reflected backwards to the Back-bone: but as ſoon as it reaches the eighth, or ninth rib, it is cleft above the Spine of the Back into two branches, which running downwards paſſe through the diviſion of the Midriffe, which is betwixt its two productions, and ſo are ſpread abroad into the loweſt Belly: Of theſe the left, which is ſometimes the greater, hiding itſelf about the tranſverſe Proceſſes of the Rack-bones, and under the left production of the midriffe and the originall of the firſt bending muſcle of the thigh, is inſerted into the left Emulgent, either near to its beginning, or (as it oft happens) into the middle of it. But the right, running on likewiſe under the membranes

Propagations of the *Aſcendent* Trunk. *Phrenica.*

Coronaria.

Ἄζυγον.

branes about the transverse processes of the right side, and the right production of the *Septum* or Midriffe, and the beginning of the same first bender of the thigh, which keeps the right side, is implanted sometimes into the very Trunk of the Hollow-vein, sometimes into the first vein of the Loins. And we are indebted for this observation to the learned *Fallopius*, who would have the matter that is gathered together in the Chest, whether it be watery, or purulent and corrupt, or sanguinous, to be evacuated by the benefit of the left branch of this vein; of which notwithstanding we will say something briefly in the following Book. But this vein in its journey downwards shoots forth twigs of both sides, as well right, as left, of which the right are more notable, and larger, of which there are numbred almost alwayes ten; which run out to as many distances of the lower ribs, and make the inferiour Intercostall veins. But I say they are almost alwayes ten, because it happens very seldom, that all the distances of the ribs receive branches from this vein, the two uppermost, to wit, the first and second distance getting their surcles or twigs from the fourth branch, that is presently to be mentioned. But these twigs run straight forwards near to the lower side of the ribs, where there are cavities cut out for them, as we have taught in the second Book. And truly this place is diligently to be taken notice of by Students in Chirurgery, because of the opening of the Chest in the disease called *Empyema*, that they may know that incision is to be made in the uppermost place of the rib, because in the lower the vessels would be harmed to the great indangering of life. But these veins do not run through the whole length of the true ribs, but are terminated together with the bony part. But the propagations of the Mammary vein nourish the six distances between the gristles of the seven true ribs, as we shall tell you by and by. Yet in the Bastard ribs they run even beyond the Gristles towards the *Abdomen* or Paunch, into whose Muscles they insinuate themselves. But there are certain other little branches propagated from the same vein, by which nourishment is derived to the marrow of the Rack-bones, and the Muscles, to wit, those about which they are carried: some also are implanted into the *Mediastinum* near to the back. This vein *sine pari* without a companion, being thus constituted, the Hollow-vein ascends to the *Jugulum*, or Hollow of the Neck [D] being supported by the *Mediastinum*, and a certain soft and glandulous body, which the Greeks call θυμὸς, and is placed in the highest part of the Chest, to defend the divarications of the veins there hanging up from all danger of breaking.

And here the Hollow-vein is first divided into two notable branches [E E] from which all those veins arise, that run as well to the Head, as to the Arms, or to certain Muscles of the *Abdomen*. Of these one goes to the right side, and the other to the left, which as long as they yet are in the Chest, are called *Subclavii*, subclavian branches, because they go under the *clavicule*, or Coller-bones; but as soon as they have gotten out of the Chest, and attain to the Arm-hole, they are named *Axillares*, the Axillary-veins [F]. From both of them very many propagations issue forth, some of which arise from their upper part, and some from their lower. In our recitall of them we will observe this order, that they which are neerest to the Trunk, shall be first mentioned by us; and they last, which are farthest from it. *The division of the Hollow-vein into the two Subclavian branches.*

The first propagation then issues out near the very root of the divarication or division of the Trunk, and is called *Intercostalis superior*, the upper Intercostall vein; [c] there is of either side one, which being very little, and descending along by the roots of the ribs, as far as to the third rib, sends two twigs [f f] overthwart, like the vena *sine pari*, to the two distances of the upper ribs. But if the vena *sine pari* sends its propagations to all the distances (as it sometimes happens) then it is wanting not without cause. Sometimes the same vein arises from the Trunk of the Hollow-vein, before its division into the subclavian branches. *Propagations from the lowest part of the Subclavian-branches. Intercostalis superior.*

Another vein [g] sometimes arises from the fore-part of the bifurcation; sometimes from the root of the Subclavian branch, and is double, of either side one: sometimes also only one grows out of the middle of the Trunk, before it be divided; which at length, when it has attained unto the Breast-bone, is parted into a right, and a left branch. For Nature is wont to sport, as sometimes in its other works, so especially in the rise of veins, so that they are not spread in all bodies after the same manner. But this is called *Mammaria*, the Mammary vein, which, when soever it arises, going toward the fore-part, strives to get up to the higher part of the Breast-bone, and descends by the sides of it, and when it is come to the Breast-blade, about its sides goes out of the Chest, and runs on directly under the right Muscles of the *Abdomen*, even to the Navill, near to which it is joyned by an Anastomosis, or inoculation [10] with an Epigastrick-vein [9] that ascends and meets it; by the benefit whereof arises that notable sympathy betwixt the womb, and Breasts of women, of which we shall speak more hereafter in the eight Chapter, when we shall insist on that History of the Epigastrick-vein. But before it leave the Chest, in its descent, it distributes one branch a piece to the six distances betwixt the Gristles of the seven upper true ribs, of either side, which are terminated with the Gristles near to the end of the bony part of the ribs, in which place we told you that the branches of the vein *sine pari*, (with the extremities of which these are joyned) were ended. From these *Mammary*.

veins,

veins, which are diſtributed in this manner to the diſtances of the Griſtles, ſome others very worthy of our notice do ariſe, which are diſſeminated both into the Muſcles, that lye upon the Breaſt, and into the Paps. Near to theſe a third [h] ariſes, and ſometimes alſo grows out of the Trunk, which is called *Mediaſtina*, becauſe it ſpreads itſelf into the *Mediaſtinum*, or membrane that cloſes up the cavity of the Cheſt, being extended all along by it, with the left Nerve of the Midriffe. The fourth [i] commonly called *Cervicalis*, or the Neck-vein, is a large vein of both ſides which running obliquely, upward, and backward, to the Tranſverſe proceſſes of the Rack-bones of the Neck, and climbing up through their holes, (from whence perhaps it might be better named *Vertebralis*) affords ſprigs to the Muſcles, that lye next upon the Rack-bones. When this vein has got above the Tranſverſe Proceſſe of the ſeventh Rack-bone, it derives a notable branch of the *Sinus* or *Canale*; in the Neck, through the hole that is made for the outlet of the Nerves; and then another, when it comes above the Proceſſe of the ſixt Spondyll, or Rack-bone, and again another, when it has left the fifth Spondyll, untill at laſt it comes to the Proceſſe of the firſt Rack-bone, which notwithſtanding it does not touch, much leſſe does it paſſe into the Skull, (as *Veſalius* would have it) near which it goes partly to the ſame *ſinus* or canale, partly it is diſtributed into the hinder parts of the Neck. For there are two long *ſinus* filled with bloud, which are made out of the hard membrane of the Brain, one of each ſide, being placed at the ſides of the marrow of the Neck. From theſe little branches are diſtributed, which nouriſh the marrow of the Back-bone, and the neighbouring parts; they begin about the Juncture of the Head with the firſt Rack-bone, and end near to the ſeventh Rack-bone of the Neck. Theſe two *ſinus*, of which one is of the Right, the other on the Left ſide, have ſome communion betwixt themſelves by a little pipe, and that a ſhort one, which is derived overthwart from the one to the other, for the moſt part about that region of the Neck, which is betwixt the ſecond, and third Rack-bones. At laſt there is a fift vein [l] which ariſes from the hinder part, called *Muſcula inferior*, or the lower Muſcle-vein, which is diſtributed in many branches to the Muſcles in the lower part of the Neck, (and ſo extending the Head and Neck, from whence the vein might be rightlyer called *Cervicalis*, or the Neck-vein) and alſo to thoſe in the higher part of the Cheſt near to the Rack-bones.

Mediaſtina.

Cervicalis.

Propagations that ariſe from the upper part of the Subclavian branches.

From the upper part of the Subclavian branches, whileſt the Hollow-vein is yet in the Cheſt, three propagations iſſue forth, two of which do very well deſerve to be noted, which take their way upward, under the Muſcles that bend the Head. The formes of the two looks more inwards, and is called *Jugularis interna*, the inner Jugular vein: the other inclines to the outer parts, and is commonly called *Jugularis externa*, the outer Jugular vein. For both of them ariſe near to the *Jugulum*, or Hollow of the Neck, and aſcend by that to the Head. The inner is greater, and the outer leſſe in a man; but in Brutes 'tis contrary. But when almoſt all Appellations are derived, and that beſt, not from the place, through which the veins paſſe, but from their inſertion; perhaps they might be rightlier named *Cephalicæ* or *Capitales*, Head-veins. The inner Jugular vein [m] takes its originall near to the joint, by which the Clavicles or Patel-bones are tyed to the Cheſt, and as ſoon as it ariſes, is joined with the *arteria carotis*, or ſleepy Artery, and a Nerve of the fixt pair, as companions in its journey, at the ſide of the rough Artery, and climbing to the Chops, about the middle of the way is parted into two branches, of which one is called the outer, the other the inner branch. The outer is ſo called, becauſe it comes not into the inner parts of the Head, but being divided into two at the corner of the lower Cheek, diſtributes one branch to the Chops, and the other near to the Ears, and Face. The inner branch, all the way, is joyned to the *Arteria Carotis*, or ſleepy Artery, even to the baſis of the Skull, whither when it is arrived on the backſide, it is likewiſe cleft into two branches, but of unequall bigneſſe. For the firſt [n] is greater and more hinderly, being carried backward obliquely, which having propagated ſome twigs to the Muſcles under the Gullet, and in the forepart of the Rack-bones of the Neck, through the ſecond hole of the *occipitium* or Nowl-bone enters the Skull with the leſſer branch of the *Arteria Carotis*, through which ſaid hole the ſixt pair of the Nerves deſcends: and thus this branch enters the firſt [1] and ſecond [2] *ſinus* of the thick membrane. The ſecond branch [p] being ſmaller, and more to the forepart, quite forſaking the *Arteria Carotis*, or ſleepy Artery, goes to the forepart of the Head, and after that by the way it has beſtowed a Circle not very notable upon the Organ of hearing, it enters the Skull through the ſeventh hole of the Wedg-bone, or *Os cuneiforme*. This is diſperſed through the *baſis*, and ſides of the thick membrane, with a numerous iſſue of branches, the prints whereof are obſerved in the inner ſurface of the bones of the forepart of the Head, as we have ſaid above in the ſecond Book. Wee will call theſe two branches, becauſe they go to the brain, *Encephalici*, as if you ſhould ſay *Cerebrales*, of the Brain, and that ſhall be the greater *Encephalicus*, this the leſſer. The externall Jugular vein [q] aſcending under the skin, and the *muſculus quadratus*, or Square-Muſcle, that draws down the Cheeks, by the ſides of the Neck, when it comes to the Ear, is cleft into two branches [r] one of which I call *Profundus*, the deep one, becauſe it enters the Muſcles, and retires into

Jugularis Interna.

Jugularis Externa.

Profundus.

into the more inward parts, the other *Cutanes* the Skin-branch. The deep or inner one [s] in its firſt divarications meets with Glandules about the Chops, and ſends forth propagations worthy of our notice to the *Larinx* or Throttle, and the Glandules, that grow to it, as alſo to the Muſcles of the Chops, and of the bone called *hyodes*, among which that which creeps all along under the tongue, is a notable one, and is ſcattered into many little branches, which are ſeen, if the Tongue be lift up, even before diſſection. From this deep branch three others ariſe, which enter into the inner parts of the Head, and the Skull. The firſt, after it has ſpread little branches into the Chops, and Mouth, enters the Skull, through the firſt hole of the Temple-bone. The next [e] paſſes out of the forepart of the eye through the ſecond hole of the Wedg-bone, at which the ſecond pair of Nerves gets out, and runs with ſome circles through the thicker Membrane upwards. The third is ſcattered out of the breadth of the Noſtrils through the hole of the *Os cribroſum*, or five-bone into the ſame Membrane. Theſe two nouriſh this forepart, to which the third *ſinus* reaches not, but ends near to the partition of the Mamillary Proceſſes. But the outer or Skin-branch [u] creeping by the skin of the Head, and ſtayed up with the Glandules under the Ear, which they call *Parotides*, is divided into two branches; of which the Anteriour [x] is carried upward obliquely through the Cheeks to the inner corner of the Eye, diſtributing little branches by the way to the Noſe; and going on to the Eye-brow, is joyned with the remainder of the branch of the other ſide, and makes the Strait-vein, which they call *vena frontis*, the Forehead vein, [y] and which in madneſſe is opened to very great advantage. To this the *Satyriſt* alludes, when ſpeaking of a certain fooliſh fellow, hee ſayes,----*Mediam pertundite venam.*

Three branches entring the skull.

Cutanei.

The other or Poſteriour branch is carried behind, and ſends branches to the Temples [z] and skin of the Back-part [α] of the Head. A third vein, which ariſes out of the upper part of the Subclavian branches, is commonly called *Muſcula ſuperior*, the upper Muſcle-vein, in relation to another of the ſame name ariſing out of the lower part. It iſſues out near to the externall Jugular vein, and is diſperſed into the Muſcles, and skin of the back-ſide of the Neck, in regard whereof we ſhal not do amiſſe to cal it *Cervicalis ſuperior* or the higher Neck-vein [β]. But now let us return to the diſtribution of the Subclavian-vein, from which we have digreſt. This vein, as ſoon as it gets out of the cavity of the Cheſt, is called *Axillaris* [F], and when it comes to the Arm-pit, is divided into two notable branches, called *Cephalica* or Head-vein [G] and *Baſilica* [I], which are afterward diſſeminated throughout the whole Arm. But before the Axillary-vein be thus divided, it ſends forth two twigs: the firſt [γ] is called *Scapularis interna* the inner Blade-vein, and is diſtributed through the Muſcles on the inſide of the Shoulder-blade: the other [δ] is named *Scapularis externa*, or the outer blade-vein, it is a pretty big one, and is implanted into the Muſcles of the outer, and gibbous part of the ſame Shoulder-blade. But the vein *Baſilica* alſo, before it enters the Arm, ſhoots out two propagations; one called *Thoracica ſuperior*, or the upper Cheſt-vein [ε] becauſe it ariſes out of a higher part then the following, it is a very notable one, and runs through the inſide of the pectorall Muſcle that brings the Arm forward to the Breſt; it diſtributes branches alſo to the other Muſcles of the Breſt, as alſo to the Skin of the Dugs in women. The other is called *Thoracica inferior*, the lower Cheſt-vein [ζ], a great and notable one likewiſe, which deſcending along the ſide of the Cheſt is diſtributed eſpecially through the third broad Muſcle or *Latiſſimus* that moves the Arm backward, ſcattering many little branches from itſelf, which afterwards are joyned by *Anaſtomoſis* or inoculation, with the branches of the vein *ſine pari*, that fall out of the Cheſt. And this vein ſometimes grows out of the former, or the upper Cheſt-vein. Theſe branches being thus diſtributed, the Axillary-vein reaches into the Arm.

CHAP. III.

Shews how the Axillary-vein is diſtributed through the Arm.

THE Axillary-vein [F] therefore is cleft into two branches, as ſoon as it comes near to the Arm, but thoſe branches are of different bigneſſe. For the upper [G] which they call *Cephalicus*, the Head-branch, is ſmaller; but the lower vein [I] called *Baſilica*, is almoſt thrice greater. The Cephalick alſo is as it were wholly juſt under the skin, & ſinks not with above one branch into the deeper retreats of the Muſcles; wherefore it has neither Artery, nor Nerves for its companions, they being addicted to the more inward rooms of the body. But the Baſilick-vein partly creeps on under the skin, partly hides itſelf under the Muſcles, and therefore it ought with good reaſon to exceed the other in bigneſſe, as being deſtined for the nouriſhment of more parts. It hath both Nerves, and Arteries as companions in its journey, which is the cauſe, why upon the cutting of this vein the bloud ſpins out with a force; but of the

The diviſion of the Axillary vein.

contrary, the Cephalick being cut, it comes forth ſoftly: which we ſee ſome Phyſitians unskilfull in diſſections, ſtanding by whileſt the vein is opened, fooliſhly refer to the ſtrength, or weakneſſe of the mind, or body. We are now to ſpeak briefly of the manner of the diſtribution of both theſe veins through the Arm, beginning from the upper, as the leſſer branch.

The Cephalick vein.

The *Cephalica* [G] therefore is called by *Veſalius Humeraria*, or the vein of the Arm, becauſe by the Arm it deſcends into the Hand; by others *Cubiti exterior*, the outer vein of the cubit, from its ſituation, becauſe it runs on the outſide of the Cubit, as the *Baſilica* contrariwiſe does on the inſide. By ſome later writers it is commonly called *Cephalica*, the Head-vein, becauſe it is wont to be opened in diſeaſes of the Head, through the error of the Ancients, who thought ignorantly, that it ariſes from the external Jugular vein, and therefore empties the bloud immediately out of the Head. But it ariſes from the upper part of the Axillary vein, & climbing over the Tendon of the *Serratus minor*, or leſſer Saw-Muſcle, that bends the Shoulder-blade forward to the Breaſt, it runs betwixt the Muſcle called *Deltoides*, which lifts up the Arm, and the beginning of the Pectorall Muſcle, which brings it forward to the Breaſt, where it ariſes from the Clavicle or Coller-bone, and ſo it runs down by the Arm to the outſide of the firſt Muſcle that bends the Cubit, which they call *Biceps*, or the double-headed Muſcle; by reaſon whereof the more learned Chirurgeons have wiſely uſed to make iſſues betwixt the Muſcles *Biceps*, and *Deltoides*; for iſſues ought alwayes to be made at the ſeat of ſome notable vein, that the matter may more eaſily be voided out. But although this vein be not divided into branches, whileſt it is thus carried down by the upward part of the Arm, yet it ſcatters ſome twigs [u and e] of both ſides into the aforeſaid Muſcles, and the skin. At length when it is come to the Cubit, it runs under the fleſhy Membrane, as a vein under the skin ſhould, and ſo preſents itſelf to the ſight without diſſection. But about the very joint of the Cubit at the externall protuberation of the Arm, it is wont to be divided [H] for the moſt part into three branches, an outer, an inner, and a middle one. The two former run under the skin, the third deeper. The firſt or middle one, [i] which is often wanting, is very little, and deeper, and penetrates into the ſubſtance of the Muſcles, eſpecially of thoſe two, that bend the ſecond, and third joint of the fingers, as alſo of the long *ſupinator* of the *Radius*, or wand of the Arm. The ſecond [x] and inner, and chief of the three branches is carried down obliquely under the skin, and joins with the inner branch of the *Baſilica*, three fingers below the joint of the Cubit, with which it makes up the vein, that Phyſitians call *Mediana*, the middle vein [λ]. This running down obliquely by the middle Region of the Cubit, diſtributes many Circles to the *Radius* or wand, and at length itſelf is divided into two leſſer branches; of which the outer [ρ] goes to the inſide of the wriſt, toward the thumb; the other and inner [σ] runs to the fore, and middle fingers. The outer of theſe is called by ſome *Cephalica manus*, and is opened to very good purpoſe in diſeaſes of the Head, or Teeth. Now the third branch [υ] or outer Cephalick-vein climbs up to the Muſcle called the long *ſupinator* of the *Radius*, or wand, diſperſing divers little veins into the skin, and ſo is carried obliquely [τ] through the *Radius*, or wand, and having attained to the middle of its length enters the outſide of the Cubit, and in that ſame place is joyned with a little branch [τ] of the Baſilick-vein; being united thereto it goes on to the outſide of the wriſt; and diſtributes veins to that part of the Hand, which lies before the little, and Ring-fingers, as alſo to the fingers themſelves. This vein, eſpecially that, which reſpects the little Finger, is commonly called *Salvatella*, and the Section of it is much commended by Practitioners in Phyſick in melancholy diſeaſes. Which being ſometimes called in queſtion, and I having obſerved, that experience does favour thoſe Practitioners, endeavoured to find out the cauſe, and found that there are many inoculations here of this vein with the Arteries, as the inoculations are uſually more frequent about the extream parts, as being more removed from the fountain of heat, and therefore wanting a hotter, and more ſpirited bloud. This vein therefore being cut, becauſe the Inoculations are ſo near, it cannot be, but that the bloud of the Arteries ſhould be alſo let out, which cannot be ſo well done by opening the veins of the Cubit, becauſe the *Anaſtomoſes* or Inoculations are ſomewhat more diſtant from the place, in which the vein is opened. And hence it is, that the bloud, which is emptied out of the Hand, is much fairer and redder, then that out of the Arm, becauſe the Arterious bloud there alwayes runs out together with that of the veins. But there being ſix times more Arteries, then there are veins in the Spleen, it is neceſſary, that its diſeaſes be much helped, when the peccant bloud is drawn out of thoſe veſſels, wherein it was.

Three branches of the Cephalick-vein.

Salvatella.

The baſilick vein.

The other branch of the Axillary-vein, that is the inner, and greater, is the *Baſilica* [I] which according to its ſituation in different arms hath found different names among writers practiſed in Phyſick. For in the right arm it is called *Hepatica* or the liver-vein; but in the left *Splenica*, or the ſpleen-vein. They chooſe that to be opened in diſeaſes of the liver, this in diſeaſes of the ſpleen. But it iſſues forth under the armpit, and diſperſing many propagations to the Glandules, that are frequent thereabout, it is carried down by the upper part of the Arm to the ſide of the double headed-Muſcle, or *Biceps*, between the Muſcles

that

that bend and ſtretch out the Cubit, and not far from its egreſſe out of the Cheſt, is divided [K] into two notable branches, of which one is called *Profundus* or deep, the other *Subcutaneus*, or branch under the skin, from their ſite, and progreſſe. The deep one or *Profundus* [L], which for the moſt part is the thicker, all the way it goes, penetrates into the more inward parts of the Arm; having the Axillary Artery, that runs into the Arm, every where for its companion, as alſo the fourth branch of the third Nerve of the Arm. But it is carried betwixt the two Muſcles, which bend the Cubit, and, having paſt its joint, is cleft [M] into two branches; of which the outer [N] near to the *radius* or wand, (from whence it might be called *Raditus*) goes down to the Hand, and ſcatters little branches toward the Thumb and Fore-finger, as alſo the middle one; but the inner branch [O] paſſing near to the bone of the Cubit, (from whence it deſerves the name of *Cubitæus*) diſtributes ſmall branches to the middle, and little fingers; but as the outer ſends its propagations to the Muſcles on the outſide of the Hand; ſo the inner to thoſe on the inſide. The other is the branch *Subcutaneus*, or under the skin [P] which is carried down by the inſide of the Arm, ſcattering divers little branches to the skin, and parts adjacent, but when it is come to the inner protuberation of the Arm, it is divided [Q] into an outer, and inner branch, like as the Cephalick is. The inner [R] is carried down obliquely, beneath the bought of the Arm, and being united with the inner branch [χ] of the Cephalick, makes the vein called *Mediana*, [λ] of which we ſpake before. But the outer [S] near to the inner protuberation of the Arm being divided into two branches, is carried by the greater along the Region of the *ulna* or ell downward to the wriſt, and ſcatters itſelf into the little Finger, but by the other it is derived to the inſide of the Hand.

The branches of the baſilick vein. *Profundus.*

Subcutaneus. Its diviſion into an outer and an inner branch.

But in this place it is worth our pains to advertiſe with other the moſt learned Anatomiſts; that it ought not to be believed, that the ſame order, and courſe of veins is to be found in all men; when the diſſection of bodies does demonſtrate, that ſcarſe two in a thouſand do accurately obſerve the ſame diſtribution of the veins. Wherefore we ought not to be ſo ſcrupulous in chooſing out places for the openings of veins, as ſome that are unexperienced, are wont; but to chooſe that vein eſpecially, which may be moſt ſafely opened, becauſe it is beſt ſeen. For ſometimes the Cephalick or Head-vein is ſo ſmall, that it can hardly be diſcerned; and ſometimes on the contrary the Baſilick is ſo. Wherefore he ſhall do beſt, who will rather follow wiſe counſell, then the ſcrupulous opinion of unskillfull men.

CHAP. IV.

Explains the lower, or deſcendent Trunk of the Hollow-vein.

WE have done with the upper Trunk, and branches of the Hollow-vein, it remains now, that we treat alſo of the lower. Nevertheleſſe (as we have above alſo admoniſht) they are not indeed two Trunks, as *Galen* would have them, but one only which reaches in one continued line from its diviſion about the fifth Rack-bone of the Loins [V] as far as to the *Jugulum*, or Hollow of the Neck [D]: but, for methods ſake in teaching, we thus divide it by reaſon of the Liver, which ſtanding as it were in the middle of it, ſeems to part it into an upper, and a lower Trunk. As therefore that is the upper one [AD] which runs up from the Liver to the Hollow of the Neck; ſo that is the lower [TV] which beginning at the ſame Liver is terminated at the *Os ſacrum*, or Holy-bone. And as the upper did run on undivided through the Cheſt, ſcattering only ſome propagations at its ſides; ſo the lower alſo ſlides down intire through the whole *Abdomen*, or paunch, only ſome twigs ſprouting from it. But when it has attained to the fifth Rack-bone of the Loins, it is cleſt into thoſe two notable branches called *Iliaci* [XX] as the upper is into the Subclavian, which Iliacall branches afterward reaching into the Legs make the Crurall-veins; as the ſubclavian carried into the Arms make the *Brachiales*, or Arm-veins. Let us ſpeak therefore in this Chapter of the Trunk, and its propagations, as long as it yet is in the lower belly. Then let us come to the crurall branches.

The inferiour Trunk of the Hollow-vein.

From the deſcendent Trunk then [TV] before it part into branches, ariſe four veins. For as ſoon as it is come forth from the hinder part of the Liver, it declines to the right ſide of the Back, and ſends forth a propagation from its own left ſide which they call *Adipoſa ſiniſtra*, the left fatty vein [υ on the left ſide] becauſe it paſſes to the fat and outer membrane of the Kidneys, which ariſes from the *Peritoneum* or Rim of the Belly, as alſo to the Glandule, that grows above the Kidneys. There is another [υ on the right ſide] anſwering to this on the right ſide, but which does very ſeldom grow out of the Trunk, but rather from the upper ſide of the middle part of the Emulgent vein; and becauſe it is diſtributed in the ſame manner as the left is, it is called *Adipſa dextra*, the right Fatty vein. Yet ſometimes you may ſee the contrary alſo to happen, and this right vein to

Four propagations ariſing from the Trunk before its diviſion. *Adipoſæ.*

come forth of the Trunk, and the left out of the Emulgent. For there are divers ſportings of nature to be ſeen in the veins; and you cannot eaſily meet with a dead body, in which you may not find ſomething new, and differing from others. After this the Hollow-vein paſſing on, when it comes beyond the middle of the back, about the firſt Rack-bone of the Loyns, it brings forth a ſecond pair of veins [♌] very notable, which haſtens directly to the Kidneys, upon whoſe ſubſtance it is wholly ſpent. And hence it is called *Renale*, the pair of Kidney-veins from its inſertion; but from its uſe *Emulgens*, becauſe the Kidneys ſeem by this pair to milk out the wheyie or ſerous moiſture in the bloud, and to draw it to themſelves. It is therefore very thick, but yet ſhort, and not of equall length, nor riſing directly oppoſite each to his fellow. It is ſhort, becauſe it did not need length, which for the moſt part is given by nature to veſſels for ſome previous preparation. It is unequall, becauſe it was fitting the left ſhould be longer then the right, by reaſon that it was neceſſary to bring the ſpermaticall vein out of it. But the beginning of both anſwers not directly one to another, leſt one ſhould be hindered by the action of the other. And the left is higher then the right, becauſe the left Kidney is alſo ſeated higher, then the right. But the Emulgent branches, as ſoon as they ariſe out of the Trunk, do not preſently go to the cavity of the Kidneys, but are firſt divided into two greater branches, and ſo, accompanied with Arteries, enter the concavous ſide of the Kidneys, and afterward being broken into leſſer branches are ſcattered quite through the whole ſubſtance of the Kidneys, and at laſt determin with their ſmall hairy ends in certain fleſhy proceſſes, which they cal *Mammillares*. Theſe veins do ſerve not only for the bringing of nouriſhment to the Kidneys, but alſo for the carrying down of the ſerous moiſture to thoſe fleſhy Proceſſes called *Mammillares*, through which it is ſtrained into the pipes of the Ureters, and then gathered together into that cavity of theirs called the *Pelvis*, and ſo drops down by little and little into the bladder, as we ſhall ſhew, when we open the Hiſtory of the Kidneys. And here the place is to be noted, in which the ſtones of the Kidneys are wont to be generated, which is not in the Emulgent veſſels, I mean veins, or Artery; but rather in the very cavity of the Kidneys, or in the *Pelvis*, and pipes of the Ureters. For in theſe if a viſcous matter be at any time received, either it is hardened there by reaſon of a notable heat, or elſe through cold is congealed into gravell or ſtone. For this matter is not only a crude, and uncocted kind of bloud, which like ſnivell ſometimes is wont to abound in the maſſe of bloud, but oftentimes alſo that excrementitious phlegm which falls down from the Head, through the veins and Arteries, both into the Hollow-vein, and the great Artery, and ſometimes into the Stomach, and Guts. Of which this ſeems to be a manifeſt ſign, that they who are ſubject to diſeaſes of the Stone, are very often troubled with rheumes, and pains of the Colique; of which whilſt ſome perſwade themſelves that it is cauſed by wind, dayly experience hath taught me, that it comes from phlegm; becauſe I have obſerved, that they, who are troubled with the Stone in the Kidneys, had their *Colon* or Colique-gut alwayes ſtuft with plenty of this phlegm, and that this being taken away, the Stone has been no longer bred. And therefore oft-times I give ſcouring Clyſters, and ſuch as gently purge phlegm, not only to ſuch as have the Stone already, but alſo to ſuch as are threatned with the breeding of it, with a great deal of benefit to the Patients. But all thoſe things are perpetually to be avoided, which drive out the Stones, as well becauſe moſt of that nature are hot, as alſo becauſe they are able to drive down the crude matter plentifully to the Kidneys. We thought fit therefore to inſiſt upon this, that we may accommodate the ſtudy of Anatomy to the very practiſe of Phyſick; eſpecially ſeeing that the place, wherein the Stone is bred, is not commonly known, becauſe the moſt famed *Fernelius*, whom the greateſt number of Phyſitians does for the moſt part follow, *Lib. 6. Patholog. c.* 12. thinks that ſmall gravell is bred in the proper ſubſtance of the Kidneys, and waſhed from thence by the flowing of the Urine, and carryed into the cavity, and ſo the Urine full of gravell ſlides down through the Ureters into the Bladder. But if any one enquire alſo the cauſe, why the left Kidney is more ſubject to the Stone, then the right; we muſt conclude, that this happens, becauſe the Colique-gut lies more upon the left Kidney, in whoſe cells this phlegm, of which we ſpake, abounding, either it ſweats through the pores, and is ſuckt into the Kidneys, or elſe by reaſon of its nearneſſe, the Kidneys are exceedingly cooled; experience having often taught us, that this kind of phlegmatick matter is indeed actually exceeding cold in the body, as they have ſufficiently perceived, who have voided it in great plenty by Stool. After this there follows a third pair [♐ and ♑] called *ſpermatica*, or *ſeminales*, the ſpermaticall, or ſeeds veins, becauſe they carry down matter for making of the ſeed. Theſe differ in their originall. For the left [♑] ariſes from the inſide, and middle part of the Emulgent, and communicating ſome ſurcles to that part of the *Peritoneum*, or rim of the belly, which covers the Muſcles, that lie in the Loins, it goes faſt by the ſaid *Peritoneum*, and deſcends obliquely; but, when it has attained to the *Oſſa pubis*, or the Share-bone, riding over it, it paſſes through the *Peritoneum*, and holes of the oblique and tranſverſe Muſcles of the *Abdomen*, with whoſe proceſſes being ſuſtained it is concocted into certain varicous

Emulgentes.

The place in which the ſtones of the Kidneys are bred.

VVhy the left Kidney is more ſubject to the ſtone, then the right.

Spermatica.

varicous circlings, which are joined with the ſpermaticall Artery by *Anaſtomoſes* or Inoculations, and at length it ends in the Teſticle of its own ſide. But the right ſpermaticall vein [χ] ariſes not out of the Emulgent, but the Trunk itſelf, and the forepart of it, a little beneath the Emulgent-vein; and afterwards obſerves a like courſe with the former. And thus they are in males, though we may obſerve nature oftentimes varying in them: but in women, although they ariſe in the ſame manner, and obſerve the ſame courſe with thoſe in men, as far as the Holy-bone; yet they fall not out of the *Peritoneum*, nor reach unto the ſhare-bones, but before they come to the Teſticles, are cleft into two unequall branches; the leſſer of which is ſcattered into the ſides of the Womb, toward the bottom of it; the greater being joined to the ſpermaticall Artery, and inoculated with it, enters into the Teſticle of its own ſide. Laſt of all the fourth pair is called [X] *Lumbares*, the Loin-veins [4 4 4] two, or three, which the Hollow-vein ſends forth from its backſide, which looks towards the bodies of the Rack-bones of the Loins; and therefore they are not to be ſeen, unleſſe the Trunk of the Hollow-vein be lifted up. Theſe veins go in through the holes of the Rack-bones, through which the Nerves go out, and ſo carry nouriſhment to the Spinall marrow. From them two other veins, tyed on both ſides to the ſide of the Marrow, aſcend toward the brain, with which afterward two veins deſcending from the internall Jugular, are joined by *Anaſtomoſis* or Inoculation. *Lumbares.*

Theſe propagations being thus ſent out, when the Hollow-vein has almoſt attained to the *Sacrum*, or Holy-bone, about the fifth Rack-bone of the Loins, it inclines under the great Artery, and is cut into two notable branches called *Iliaci* [XX] which having gone a little way are again cleft into two others [Y and Z] of unequall bigneſſe, of which one is called the inner, the other the outer. The inner is leſſe, the outer larger and greater. But before they be ſo divided, they ſcatter two other propagations, the firſt of which [5] is commonly called *Muſcula ſuperior*, the upper Muſcle-vein, which is diſſeminated overthwart, through the Muſcles of the Loins, and *Abdomen*, or paunch, from whence I would call it *Muſcula lumbalis*, the Muſcle-vein of the Loins: the other [6] is named *Sacra*, or the Holy-vein, becauſe it reaches ſome little twigs to the upper holes of the Holy-bone, for the nouriſhing of the ſaid bone and the Spinall-Marrow. The diviſion of the Trunk into the two Iliacall branches. *Muſcula ſuperior.* *Sacra.*

But from both the Iliacall branches many veins iſſue, before they go out of the *Peritoneum* or Rim of the Belly toward the Legs; and from the inner branch two. The firſt [7] ariſes from the outſide called *Muſcula media*, the middle Muſcle-vein; becauſe it is ſcattered into all the Muſcles of the Buttocks, and into their skin: For it carries aliment to all thoſe Muſcles, which are of the outſide, or Back of the bone *Ilium* or Hanch-bone, as alſo to the very joint of the Hip, that for this cauſe it ought to be eſpecially taken notice of by them, who would ſomewhat curiouſly conſider the cauſe of the ach in the Hip, or the *Sciatica*. I ſhould think that this vein may not be amiſſe called *Glutea* from its inſertion, becauſe it is implanted into the Muſcles called *Glutæi*, or Muſcles of the Buttocks. The other [8] grows out of the inſide, and is a notable vein, called *Hypogaſtrica*, or the vein of the water-courſe, from its diſtribution into almoſt all the parts of the *Hypogaſtrium*, or water-courſe. From this iſſues a branch named *Hæmorrhoidalis externa*, the outer Emroid-vein, becauſe if at any time it ſwels with a more fæculent bloud, or hot, or ſalt, it makes the outward Emroids of the Fundament. This affords twigs to the holes of the *Os ſacrum*, or Holy-bone, but beſtows greater branches upon the Muſcles of the *Rectum Inteſtinum*, or the Strait-Gut, as far as to the outer skin of the Fundament. There is alſo another branch ariſing from the ſame Hypogaſtrick-vein, which we call *Cyſticus*, the Bladder-branch, and is worthy of obſervation both in men, and women; in men, becauſe it is ſpent upon the Bladder; but in women, becauſe in them being ſuſtained with a fat membrane, it goes with ſome twigs to the Bladder; but with more to the bottom of the Womb; and with more manifeſt ones to the Neck of it, by which veins alone ſome think that the monthly courſes flow in Virgins, and ſome alſo think the ſame in women. But the monthly courſes do not only flow out by theſe branches, but by thoſe alſo, which we told you were ſent from the ſpermaticall branch, and which go to the bottom of the Womb, not to the Neck. For the menſtruous bloud is uſually purged out, whether in virgins, or women, every month; not only through the Neck, but eſpecially through thoſe paſſages of the Womb, called *Cotyledones*. Which we have ſhown here at *Padua*, publiquely in the Theater, the firſt year of our being Profeſſor, in the carkaſſe of a certain woman having her monthly courſes. For we ſaw that the Hypogaſtrick branches, and the ſpermatick veſſels with the Teſticles were filled with bloud, and that the Womb itſelf did pour out a thicker bloud, the little mouths of the veins in the inner part of the Womb lying open, and manifeſtly gaping. Yet I ſaw twice in others, that the menſtruous bloud came out of the veins of the Neck only, not alſo out of the Womb, and in another on the contrary that it flowed out of the Womb only. But the ordinary way is for women to be purged at them both, and not at one only, except when beſides the intent of nature obſtructions do ſeem to hinder their flowing. Propagations of the inner Iliacall branch. *Glutæa.* *Hypogaſtrica.* *Hæmorrhoidalis externa.* *Cyſticus.*

But

But we have obſerved, and ſeen divers times, whileſt we were about the cure of Ulcers in the privie Members, and Neck of the Womb, that at what time the monthly courſes do flow, the mouth of the Womb gapes. I ſaw alſo then, that thoſe parts were dilated with a certain ſtinking moiſture, and that the Neck of the Womb appeared much larger, then it was wont to be at other times. And therefore no man need to wonder at that, which hath been obſerved by ſome Writers of our age, that in the time of their courſes theſe parts have been ſo widened in ſome, that being new married, although they were true Virgins, they have for this reaſon been accuſed, and thought to have been defloured. Wherefore if it happen, that any, who are new married, doubt of their Wifes virginity, becauſe they find the privy paſſage very wide, it will behove them to conſider, whether their flowres were not at that time upon them. Now at length the remainder of the inner Iliacall Trunk makes to the Share bone, and taking to it a propagation of the outer Iliacall, together with which it makes one vein, and ſo paſſing through the *Peritoneum*, and hole of the Share-bone, it ſpreads itſelf into the Leg, and is extended almoſt beyond the middle of the Thigh on the inſide.

Propagations of the outer Iliacall branch. *Epigaſtrica.*

From the outer branch in like manner ſome veins iſſue: and firſt of all, that which is called *Epigaſtrica*, or vein of the lower Belly [9] which ariſes from the higher part of the branch, and is ſo named, becauſe it goes to the Muſcles of the *Epigaſtrium*, to wit, the right Muſcles of the *Abdomen*. For paſſing with its chief branch out of the *Peritoneum* or Rim of the Belly, it climbs ſtraight up of both ſides under the right Muſcle, till it come near to the Navill, where it is joined by *Anaſtomoſis* with the deſcending Mammary-veins. But this *Anaſtomoſis* or Inoculation is ſeldom found in men, but in women it is very conſpicuous, from whence alſo *Galen Lib. de Diſſect. ven. & Arter. Cap.* 8. witneſſes, that that great ſympathy betwixt the Womb and the Breaſts or Dugs is cauſed by theſe two veſſels. But the moſt learned *Hippocrates* has explained this ſympathy in many Aphoriſms of the fifth Section. For in the fiftieth Aphoriſm he ſayes, If you would ſtop the courſes in a woman, apply a very great Cupping-glaſſe to her Breaſts. And in the thirty ſeventh. If the Breaſts of a great bellied woman, do of a ſodain become ſmall, the child proves Abortive. And in the thirty eight; If one of the Breaſts of a great bellyed woman become ſmall, one of the Twins, that ſhe goes with, proves Abortive; and that a Male, if the right Breaſt be ſmall; a Female, if the left: ſo the Womb being diſeaſed, the Nipples become pale; and upon a Dropſie in the Womb they ſwell up. But there is a ſympathy alſo not only by reaſon of the veins, but alſo of the Nerves, that come from the ſixth Conjugation. Whence we ſee, that if the Breaſts of a Woman, or Virgin be handled, they are provoked to luſt; ſo that for this reaſon alſo thoſe women, that have great Breaſts may be accounted more luſtfull, as *Afra* is in *Martiall*. But it is convenient to note concerning the originall of this vein, that very often it ariſes out of the Crurall branch, which we ſhall by and by deſcribe, but oftner out of the Iliacall. Another vein is the *Pudenda* [11] which ariſes from the inſide of the outer Iliacall branch, after it is come out of the *Peritoneum*, or Rim of the Belly, and it is called *Pudenda*, becauſe it is ſpent upon the privities of both Sexes. For in men it is diſtributed into the *Scrotum* or Cod, and into the skin of the Yard; but in women it is propagated to the Lips and skin of the privy paſſage, to the *Nympha* or wings, and other parts of it; but in both men and women to the Glandules, that lye about the leskes, whence ariſes that confluxe of matter into theſe Glandules, in a peſtilent or venereous *Bubo*. Laſtly, the *Muſcula inferior*, or lower Muſcle-vein [12] is that, which goes to the joint of the Hip, and is diſſeminated into the skin, and Muſcles thereabout, by reaſon whereof in my judgment by a ſtricter Appellation it might be better called *Coxendica*, or *Coxalis*, the Hip-vein.

Pudenda.

Muſcula Inferior.

CHAP. V.

Reckons up the propagations, and branches of the outer Iliacall branch diſſeminated through the crus, or great Foot, that reaches from the lower part of the Buttocks to the ends of the Toes.

THe outer branch then of the Iliacall veins [Z] when it hath ſent forth the ſaid propagations, falls out of the Rim of the belly, and is carried to the *Inguina* or leskes, through the upper and inner region of the Hip-bone, through which the firſt and ſecond bending Muſcles of the Thigh do deſcend, and makes the Crurall vein [T]. The Hiſtory whereof, that we may deliver in an eaſie method, we will divide it into Trunk, and Branches. But before the Trunk be cleft into its branches, it ſhoots out four propagations; the firſt of which is that they call *Saphena*, [13] and vein of the inner Ankle, becauſe it runs near thereunto; it is alſo commonly called by Phyſitians *vena tali*, but improperly, as we have ſaid above in our firſt Book. But it ariſes from the inner ſide of the Trunk, preſently after its departure out of the *Peritoneum*, or rim of the Belly, and having no Artery for its companion, runs ſtraight downwards under the skin

The diviſion of the Crural vein into a Trunk and branches. Four propagations of the Trunk before its diviſion, *Saphena.*

skin, through the inſides of the Thigh, & Leg; and when it is now come to the inner Ankle, it ſpreads itſelf into the upper part of the Foot, and ſcatters a branch overthwart, from which afterward many others ariſe, that are diſtributed in their order to every one of the Toes. This vein ſcatters other propagations by the way, but which are ſeldom found anſwerable one to another, either in number, or bigneſſe; as we have already more then once intimated, that nature is found to ſport in the veins, but eſpecially in thoſe of the joints. The firſt [17] of theſe propagations, not far from the originall of the vein itſelf, is dele into the upper skin of the inner Region of the Thigh, in two branches; of which the outer, which is the thicker, creeps through the fore, and outſide of the Thigh, under the skin; but the inner goes more inwardly, and ſpreads itſelf into the rim of the Belly. The ſecond [18] is propagated, when the vein has now attained to the middle of the Thigh. The third propagation [19] ariſes about the Knee, and brings forth two off-ſprings, one, which is diſſeminated into the skin of the forepart of the Knee, by the *Patella* or Whirl-bone, but the other into the skin of the Backſide, where the bending, or Ham is, about which it is rowled orbicularly. The fourth [20] is carried to the middle of the *Tibia* or Leg, with ſurcles forward, and backward. Over againſt the *Saphena*, another vein [14] is brought forth from the outſide of the Trunk, but ſhorter then the vein *Saphena* is, and reaches outward, and overthwart into the skin, that covers the forepart of the Hip-bone, as alſo into the Muſcles of the ſame place, which the later Anatomiſts call *Iſchia*. Theſe propagations being brought forth, the Trunk afterwards is drenche into the Muſcles, that compaſſe the bone of the Thigh, and ſets out a third propagation [15] which they call *Muſcula* the Muſcle-vein; and there uſe to be two of them. For the outer, which is the leſſe, ſends ſhoots to the ſecond, and fourth, extending Muſcles of the *Tibia* or Leg, together with the skin; the inner, and greater, affords twigs to the third extender of the Leg, and to almoſt all the Muſcles about the Thigh. After this the Trunk turning to the Backſide, and deſcending by degrees, ſcatters ſome other twigs into the membranes of the Muſcles, and by and by ſends out a fourth vein, which runs into the backſide of the Thigh, and is called *Poplitea*, the Ham-vein [16] much ſpoken of by writers of Phyſick, but eſpecially by *Hippocrates* the chief of them, who 6. *Epidem.* 1. 5. commends much the opening of it in diſeaſes in the Kidneys. But it is oftentimes ſeated too deep to be cut without very great difficulty. I have learnt by frequent experience, that iſſues made in the *Sura* or calf of the Leg, to which this vein ſpreads itſelf, have done a great deal of good in many diſeaſes. This vein, when it is propagated, ſometimes receives the addition of a Sprig from the inner branch of the Muſcle-vein; oftentimes alſo two propagations iſſue from the Trunk, one higher, and another lower, which afterward are united in their journey. But preſently after its riſe it ſcatters ſome branches into the skin of the Thigh, about the higher and hinder part of it; then it runs down directly through the middle of the Ham, or bending of the Leg, into the Calf, to which it diſtributes many Surcles, that run on with an uncertain courſe, ſome directly, ſome overthwart, and ſome obliquely. Theſe little branches being thus diſſeminated, the vein paſſes on as far as to the *Talus*, or Cockall-bone, and there at length determins.

Four propagations of the vein Saphena.

Iſchied.

Muſcula.

Poplitea.

And this is the progreſſe of the Crurall-Trunk, and theſe the propagations which it ſcatters, before it be divided. For lying upon the bone of the Thigh, it ſo deſcends, and runs ſide-long near to it, that, when it has attained to the Knee, it is carried betwixt the two loweſt, and hindmoſt heads of the Thigh, in which place [Δ] it is cleft aſunder into two branches, an outer, and an inner one. But they are of unequall bigneſſe, the outer being the ſmaller, and the inner the greater, but both of them [Θ Λ] are ſcattered through the Leg, and loweſt part of the Foot. The inner [Θ] in its deſcent ſends ſome propagations to the Muſcles, that are placed on the backſide of the Leg, and eſpecially thoſe which make the Calf, but moſt of all to the inner part [21] of the *Gaſteronemius externus*, or outward Calf-Muſcle, and ſo afterward continuing its courſe downward, when it is come to the lower *Appendix* of the *Tibia* or Leg, and has beſtowed ſome ſhoots upon the skin, it is reflected under the inner Ankle [22] and runs out as far as to the great Toe. The outer [Λ] is preſently cleft into two leſſer branches, that are likewiſe unequall, of which the inner [Ξ] that is the greater, and lies deep, is wholly ſpent upon the Muſcles of the Calf, running all along directly betwixt the two heads of the *Gaſteronemius externus*, or firſt moving Muſcle of the Foot, as alſo betwixt the *Gaſteronemius internus*, or inward Calf-Muſcle, and the *Tibieus anticus* or forward Leg-Muſcle, and at laſt betwixt the Muſcles, that bend the Toes, diſtributing ſome ſurcles every where by the way to the Muſcles, through which it paſſes. When it comes to the mid length of the Leg, it is again ſubdivided into an inner, and an outer branch. The inner of theſe diſtributes a twig near to the joint of the *Tibia* or greater Leg-bone, and the bone called the Cockall, deſcends with the Tendons of the Muſcles, and is divided into the great, the fore, and the middle Toes. The outer paſſes on near to the *Fibula*, or leſſer bone of the Leg, and when it comes to the Ligament, which tyes together the greater and leſſer bones of the Leg, it ſhoots forth a branch, which perforating the Ligament runs into the Foot, and is ſcattered into the Muſcles; which bend the Toes of the Foot outward.

The diviſion of the Trunk into two branches.

But

But the outer and leſſe branch [Π] of the Crurall-vein goes from that diviſion of the outer branch, which is made near the Ham, to the upper *Appendix* of the *Fibula*, as alſo to the outer, and hinder part of the *Tibia*, where ſcattering many little branches, it goes to the outer Ankle, and at laſt ends in the Foot.

And this is the univerſall Hiſtory of the Hollow and Gate-veins, wherein we have perfected the whole courſe of their diſtributions. It ſeems yet to remain, that we ſpeak of the Umbilicall, and Arterious veins. But becauſe the Umbilicall vein is nothing elſe but a more notable propagation iſſuing out of the Gate-vein; and in a man grown performs the office of a Ligament, rather then a vein; becauſe it keeps the Liver in its place; as the ſtories of them do witneſſe, who upon the cutting off, or wounding of the Navill, have ſodainly dyed, their reſpiration being hindred by the weight of the Liver falling out of its place, and putting down the *Diaphragma* or Midriffe with it; we thought it not worth our pains to make any more mention of it in this place. But if any one will obſtinately contend that it is a peculiar vein with arguments fetcht out of his own Brain, we know no better counſell, that we can give him, then to conſult better with his own ſenſe, or if he will contend further, to purge his Head with Hellebore, that that dimneſſe of his Eye-ſight may be a little taken away. But we ſhall with more convenience make mention of the *Vena Arterioſa*, or Arteriall-vein, in the following Book, when we ſhall explain the Hiſtory of the *Arteria venoſa*, or venall Artery, becauſe they are very like one another, and therefore the ſame pains may ſerve them both.

An Explanation of the Table of the Veins.

This Table delineates the Hollow-vein entire, and free from all parts. Wherein we have marked the Trunks, and larger branches, with pretty great letters: but the propagations with little ones; and when they are at an end, with figures.

AD. THe Ascendent Trunk of the *Hollow vein*, the beginning whereof is about A, which notes the place, wherein the *Liver* should stand in the proportion of this figure, the end about D. For it passes on undivided from the convex part of the *Liver*, about which it scatters little branches, a a a. as far as to the Hollow of the Neck; but it scatters some propagations, three in number. The first of these, a a. x, is called vena Phrenica the vein of the Midriffe, which is distributed of both sides into the midriffe and Pericardium, or purse of the Heart growing thereto, as also into the Mediastinum or partition of the Chest.

Another is Vena Coronaria the Crown-vein, b b, which embraces the basis of the heart in manner of a Crown, dispersing many Surcles to the point of it.

The third is the vein Azygos, or without a mate, c c, which issuing out from the right side of the Hollow-vein, about the heart, about the fifth Rack-bone of the Chest, goes down near to the right side of the Rack-bones, as far as to the second slough of the loines. There are ten propagations d d d from this, sent to as many bony distances of the ribs, which are called Intercostales inferiores, the lower veins between the ribs.

B. Shews how the Trunk A D is bowed toward the right side, because of the situation of the heart.

C. The orifice of the Hollow-vein reaching into the right ventricle of the heart.

D. The division of the Ascendent Trunk about the Hollow of the Neck, into two branches E E, which they call Subclavia, or the veins under the Collar-bone. From these arise many propagations some issuing from the lower, others from the upper part of them.

Out of the lower part issue five. The first is called Intercostalis superior the upper vein between the ribs, e, and scatters two Surcles f f, to the distances of the three upper ribs. The second is mammaria the vein of the dugs, g, which, descending under the breast-bone, as far as to the strait Muscles of the Abdomen, is inoculated 10, with the Epigastrick-vein climbing upward, 9, giving Surcles to the Gristly distances of the true ribs, as also to the Mediastinum, and Muscles, that lie upon the breast. The third called Mediastina, h, is disseminated into the Mediastinum, or partition of the Chest. The fourth, vertebralis, or the vein of the Rack-bones, i. climbs up through the holes, that are bored in the transverse processes of the Rack-bones of the Neck, distributing sprigs to the Muscles, that lie upon the Rack-bones. The fifth is called Cervicalis or the vein of the hinder part of the Neck, l, distributed into the Muscles, seated on the lower part of the back side of the neck, and on the upper part of the Chest. Out of the upper part issue three. The first is jugularis externa, the outer vein of the Hollow of the Neck, m, which bowing first over small sprigs from its outer branch to the Chops, and region of the Ear, is joined by the inner all the way to the Arteria carotis, or fleshy Artery, and is divided near to the skull into two branches called Encephalici or of the Brain, by Spigelius; of which the hindmost and greater, n, having entred into the skull through the second hole of the Nawl bone, is inserted o o, into the first 1, and second 2 sinus of the thick membrane. But the foremost and lesser, p, having entred through the seventh hole of the wedg-bone, is scattered through the sides of the thick membrane. The second is the outer Jugular vein, q, which getting up by the sides of the Neck, is divided near to the Ears, r, into two branches; of which the one called Profunda, s, is variously disseminated into the Muscles of the Larinx or Throttle, and the bone called hyoides, as also into the Tongue, the Palate, and hollowness of the Nostrils, and lastly into the skull with three propagations, of which that which passes x out of the forepart of the eye, through the second hole of the wedg-bone, is very well delineated here. The other called Subcutanea, u, first of all spreads its fore-branch x, into the Muscles and skin of the Face, which joins with its fellow about the top of the nose, and makes the Forehead vein y; then it issues out another hinder branch, which partly creeps upward along the temples, z, and partly is carryed behind the ears to the skin of the back part of the head.

a The third, Cervicalis Superior, the upper vein of the Neck, β is propagated into the Muscles behind on the back side of the Neck. There are three sinus or small channels of the thick membrane of the brain, the first or right one is marked with 1, the second or left one with 2, the third with 3. The hinder part of this, which is nearer to the Nawl of the Head, is shadowed, but the forepart, which is next the Forehead, is seen manifestly. From this sinus many little veins, which they call Ductus, are rowled forth to both sides.

F. Here the subclavian vein takes on it the name of Axillaris or the vein of the Armpit, and is divided into two branches, the Cephalick G, and the Basilick I. But before this division it scatters two twigs; the first called scapularis interna, or the inner vein of the shoulder blade, γ, the other Scapularis externa, the outer blade vein δ. The Basilick vein also, I, before it enters the Arm, propagates two; one called Thoracica superior, the upper Chest-vein, ε, which is distributed through the inside of the Pectorall Muscle, and in women, through the Dugs: the other called Thoracica inferior, the lower Chest-vein, ζ, which descending along the side of the Chest, goes to the Muscle called Aniscalptor.

The Cephalick vein, which, before its division, sends away a sprig, η, into the Muscle deltoides, and another θ into the Muscles of the Cubit.

When the Cephalick vein comes to the joint of the Cubit, at the outer bending forth of the Arm it is cut into three branches, H. The first, ι, or deep and middle one goes to the Muscles arising from the said protuberation. The second κ, or inner goes to the making of the vein called Mediana λ. The third μ, or outer is carried obliquely, by the radius or lesser bone of the Cubit, to the outside of the Arm, and so creeping on obliquely all the way, when it is come to the root of the wrist, it is joined with a little branch of the Ba-

silick-vein, τ, *and makes the vein called Salvatella.*

The Basilick-vein, *which on the right hand is called* Hepatica, *or of the Liver, on the left* Lienaris, *of the Spleen. This before its division sends out a Surcle,* ο, *to the heads of the Muscles of the Cubit; and then another notable one* π, *which being carried down obliquely, bestows its Surcles upon the Muscles, that arise from the outer protuberation of the Arm.*

K. *The division of the Basilick-vein* K *into two branches,* the one *called* Profundus *or the deep one,* the other Subcutaneus, *or branch under the skin.* The deep one

L. L, *when it comes to the bending of the cubit, is divided into two,* M, *one of which called* Radius N, *at the* Radi-

M. N. us, *or lesser bone of the Cubit; the other called* cubiteus,

O. O, *at the greater bone of the Cubit, goes to the hand.*

P. Subcutaneus, *or the branch next under the skin* P,

Q. *near to the inner protuberation of the Arm is divided,* Q,

R. *into two other, of which* the inner R *together with the inner branch of the Cephalick* κ, *makes up the vein* mediana λ, *which is likewise divided into two branches, the outer of which,* ϱ, *is called by some* Cephalica

ϱ. σ. manus; *and goes to the Thumb; the inner* σ *to the*

S. *fore and middle fingers:* The outer S *going to the wrist, is joined toward the little finger with the outer branch of the Cephalick-vein about* τ.

τ. †. *The little valves, which are found in the veins of the joints, are handsomely cut out here, as it were to be seen through.*

The Descendent Trunk *of the Hollow-vein which*

T. V. *begins about the region of the Liver* T, *and ends about the fifth Rack-bone of the loins* V. *There are*

υ *four Twigs growing from this.* The first υ *called* Adiposa *or Fattie-vein, distributed to the Membrane of*

ϱ. *the Kidneys.* The second ϱ *the Emulgent going to*

χ. *the Kidney.* The third, præparans vas, *the preparing*

ψ. *vessell; the right one* χ *arising out of the Trunk* T V.

ω. *the left* ψ *out of the left Emulgent, both afterward going into the Testicles* ω. The fourth *is the three* Lum-

444. *bares or loin-veins* 444.

The division of the Descendent Trunk V, *into the*

XX. *two Iliacall branches* X X, *both which are again divi-*

Y. *ded into two other, an inner one* Y, *and an outer* Z. *But*

Z. *before this division two propagations are issued forth,*

5. Muscula lumbalis, *or the Muscle-vein of the loins* 5,

6. *and* Sacra *or the holy-vein* 6.

Y. The inner Iliacall vein, *before it goes out of the* Peritoneum, *or rim of the belly, shoots out two propagations, the first called* Glutæa 7, *and the second* Hy-

7. 8. pogastrica 8. *The remainder of it passing through the* Peritoneum, *is spent upon the inside of the Thigh.*

Z. The outer Iliacall vein *likewise before its going forth of the* Peritoneum *scatters three propagations;*

9. *the first called* Epigastrica 9, *going into the Muscles of the* Epigastrium, *and the strait ones of the Abdomen, where they are joined by* Anastomosis, *or inoculation* 10. The second *called* Pudenda, 11, *spent*

10. 11. *upon the privy parts.* The third Coxalis, 12, *upon the*

12. *Muscles of the Hip.*

Here the outer Iliacall vein having past through the Peritoneum *or rim of the Belly enters the* Crus, *and*

r. *begins to be called* the Crurall Trunk r, *that is undivided as far as to the two lower heads of the Thigh. But it reaches forth four propagations before its division.*

13. The first, 13, *is called* Saphena, *which creeps through the inside of the Leg, under the skin as far as to the ends of the Toes.* Another 14 *called* Ischia *is spread out*

14. 15. *into the skin upon the Hip-bone.* The third 15 *named* Muscula *is sent to the Muscles, which extend the*

16. *Leg.* The fourth 16 *named* Poplitea *is distributed into the Calf of the Leg.*

13. *The vein* Saphena *also scatters from itself four*

17. 18. *surcles,* the first 17 *into the upper part of the skin of*

19. *the inside of the Thigh:* the second 18 *about the*

20. *middle of the Thigh:* the third 19 *into the Knee:* the fourth 20 *is carried forward and backward to the middle of the Leg.*

Δ. *The division of the Crurall Trunk near to the two*

Θ. *lower heads of the Thigh into an inner branch* Θ, *and an*

Θ. *The inner distributes little branches to the Muscles*

21. *of the Calf* 21, *and then runs down under the inner ankle*

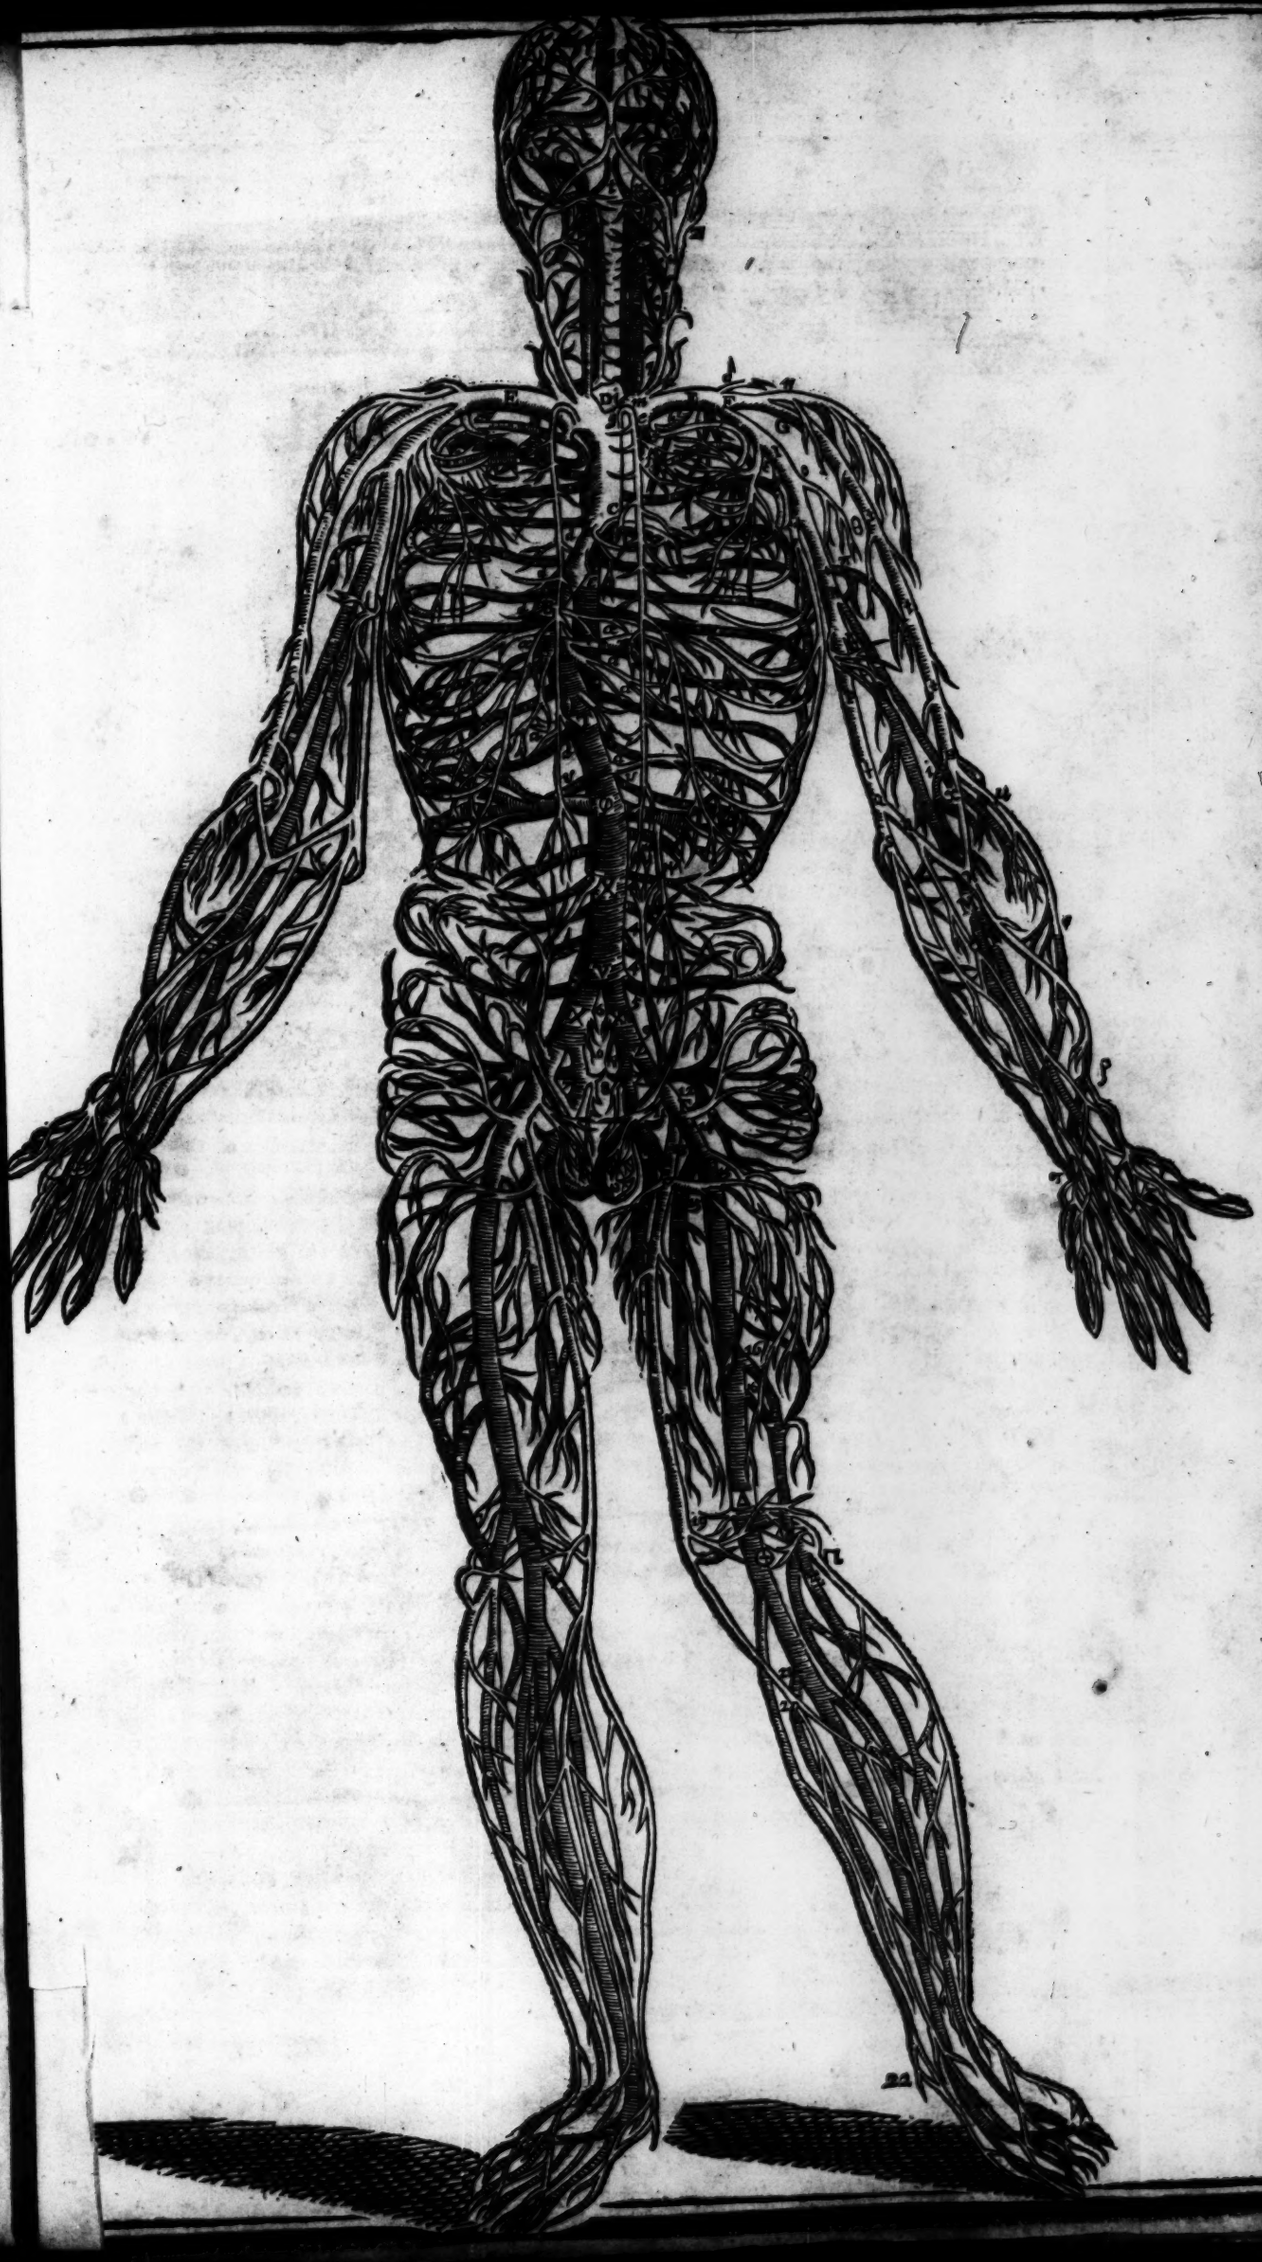
22. *to the great Toe* 22.

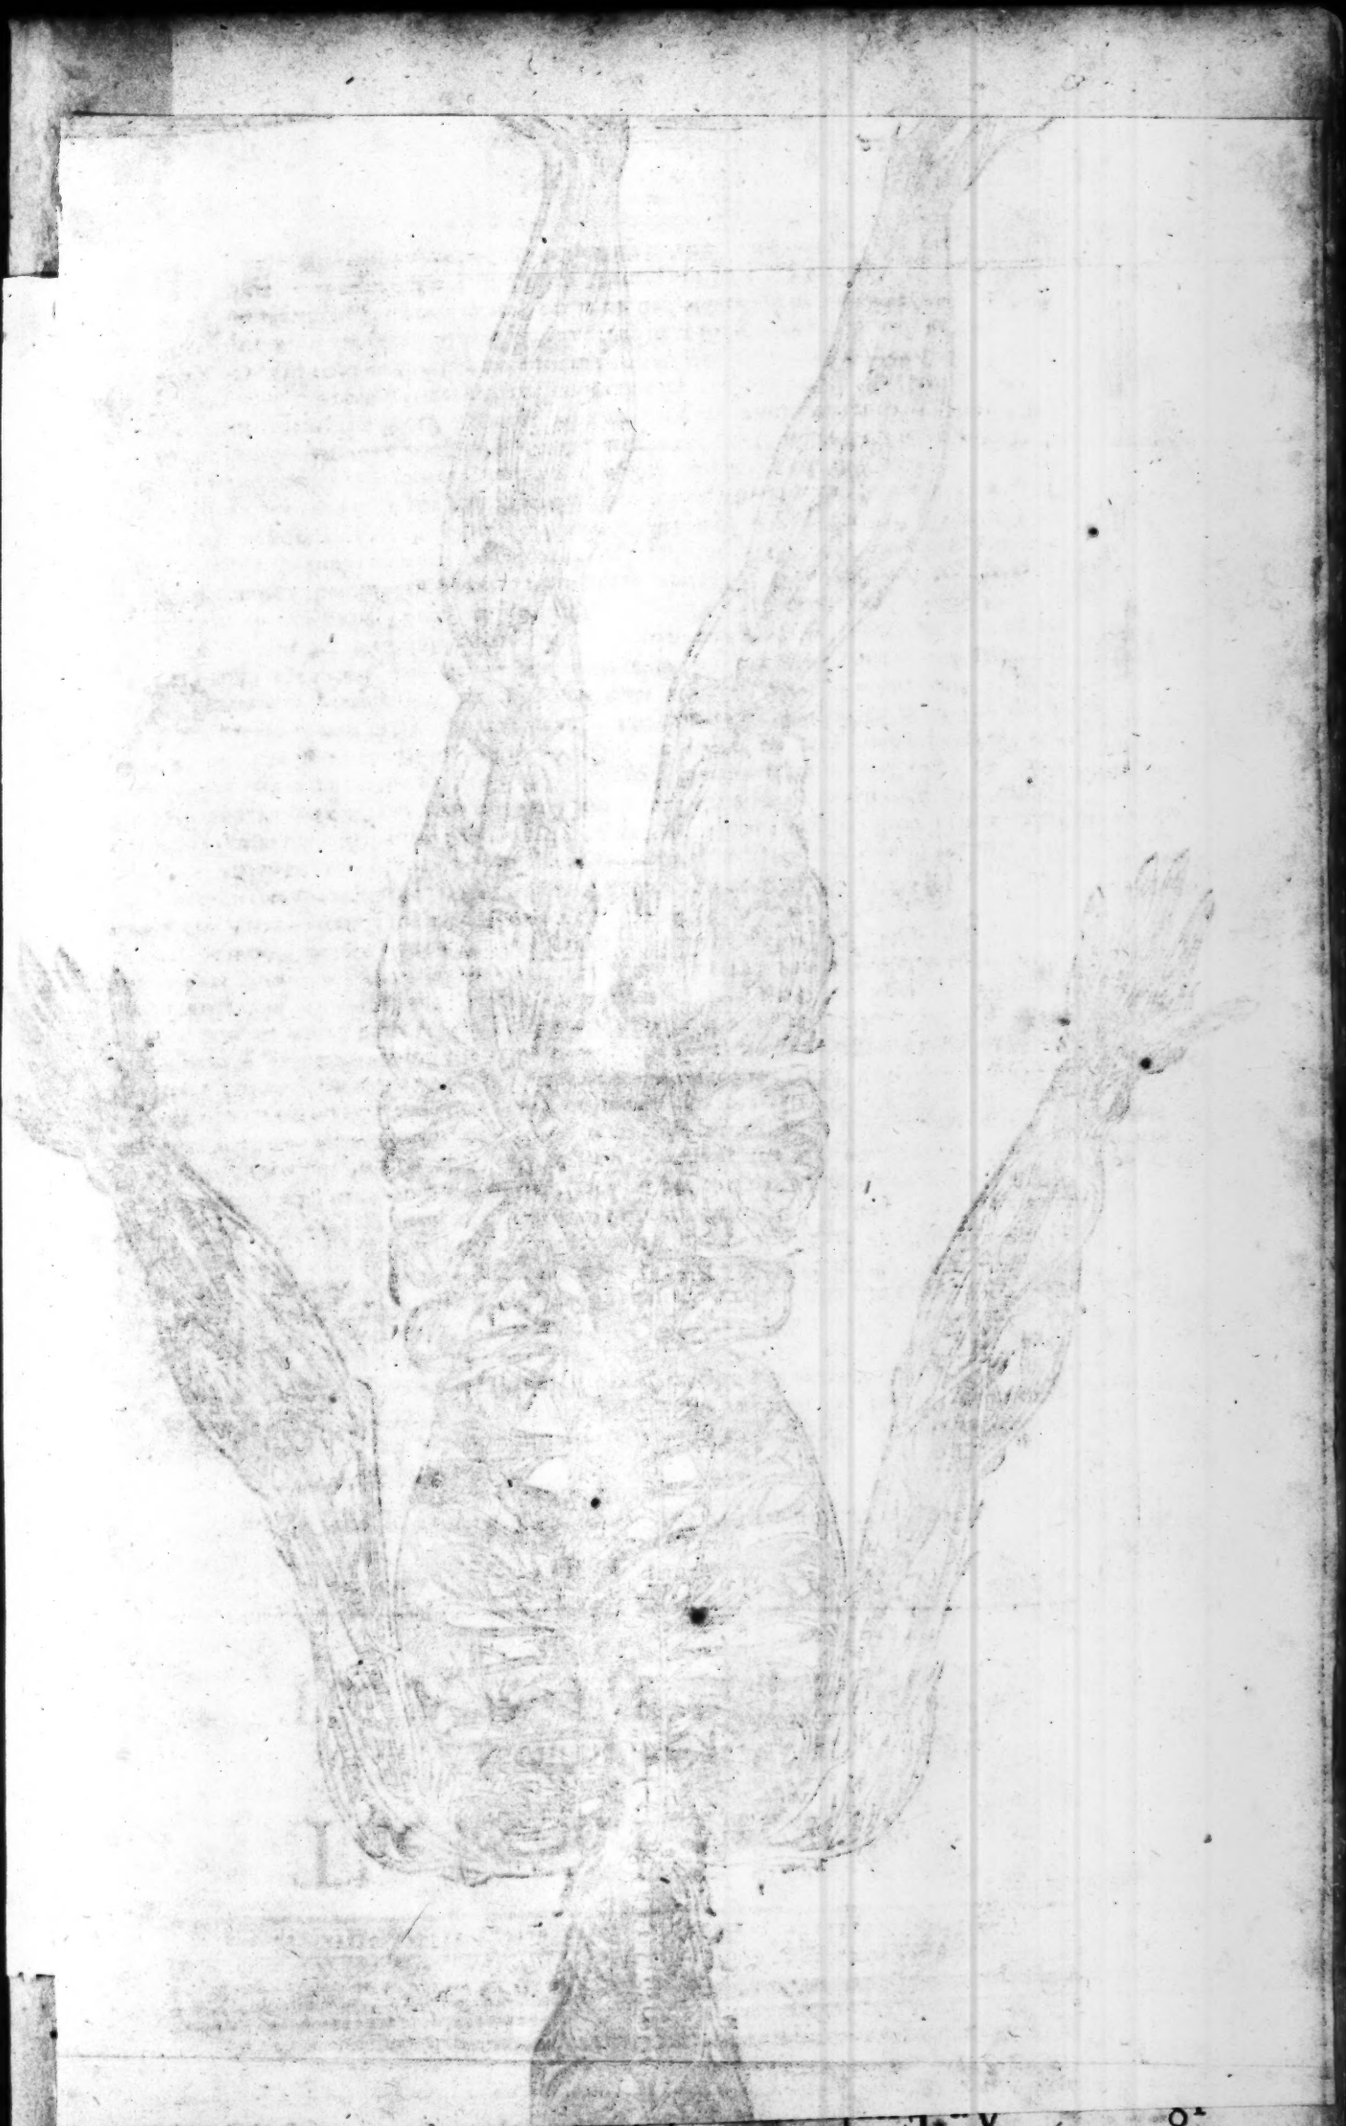
Λ. *The outer presently is cleft into two branches, an in-*

Ξ. *ner one* Ξ, *and an outer* Π. *That is spent wholly upon the*

Π. *Muscles of the Calf: this passes on near to the Fibula or lesser bone of the Leg, through the outer and back-side of the Leg.*

THE





The ſecond Treatiſe, Concerning The ARTERIES.

CHAP. I.

Shews the upper or aſcendent Trunk of the great Artery, with its propagations that are diſtributed through the Head.

THere is no controverſie among writers of Anatomy concerning the number and originall of the Arteries, but an unanimous conſent, that all the propagations, which are ſcattered throughout the body, take their riſe from one, which they call *Aorta*, and that this is derived out of the Heart. But the Heart conſiſting of two *ſinus* or cavities, a right, and a left one; thill great Artery grows out of the left *ſinus* or ventricle [A], where it is largeſt, and more hard, and griſtly, then elſewhere. But as ſoon as it is grown out, and before it fall out of the *Pericardium* or purſe of the Heart, it preſently propagates two ſmall ſprigs [a a] one of each ſide, which they call *Arteriæ Coronariæ*, the Crown-Arteries, becauſe together with the *vena Coronalis*, or Crown-vein, they compaſſe the *baſis* of the Heart in manner of a Crown, and from theſe many propagations are ſcattered downward all along the Heart. But they are more, and greater about the left, then the right ventricle, as we have alſo formerly ſaid concerning the vein, becauſe the Heart needs a greater plenty of bloud on that ſide, as which beats with a perpetuall, and more violent motion, wherein more bloud is digeſted, then the right *ſinus* or ventricle does: yet that propagation is bigger, and longer, which ariſes out of the right ſide of the Artery: ſometimes alſo there is only one, at whoſe orifice a little valve is found. Theſe propagations being thus diſſeminated, the Artery aſcends ſomewhat, under the Trunk of the *vena Arteriosa*, or Arteriall-vein, and pierces through the *Pericardium*, and, having got above it, is cleft [B] into two branches, which becauſe of their notable greatneſſe we will call Trunks, and becauſe one aſcends [C] and the other runs downward [Q.] that ſhall be the Aſcendent Trunk, this the Deſcendent. Yet the Deſcendent, and lower one is bigger by much then the upper, becauſe that ſerves more parts, then this. For the Aſcendent one goes only to ſome parts of the Cheſt, to the Head, and Arms; but the lower to very many parts of the Cheſt, to all the loweſt Belly, and the Legs. That therefore we may treat of the great Artery with more perſpicuity, we will firſt ſhew the Aſcendent Trunk, and its progreſſe through the Cheſt, and Head, and after that its branches diſtributed through the Arms. Then we will fall upon the Deſcendent one, and explain the manner of its diſtribution through the Cheſt, and loweſt belly, and laſtly through the Legs.

The originall of the great Artery.

Arteriæ Coronariæ the Crown-Arteries.

The diviſion of the great Artery into two Trunks.

VVhat parts both the Trunks nouriſh.

The order of that which is to be ſaid.

The Aſcendent therefore or upper Trunk of the *Aorta* [C], being faſtened to the *Oeſophagus*, or Gullet, climbs upward betwixt the rough Artery, and Hollow-vein, and the *mediaſtinum*, or partition of the Cheſt. Which ſituation of it they ought diligently to obſerve, who deſire to know the reaſon of that Aphoriſm, which is the four and twentieth of the fifth Section in *Hippocrates*: For, ſayes he, cold things, as ſnow, and ice, are enemies to the Breaſt, provoke coughs, and cauſe eruptions of bloud, and diſtillations. Truly they are enemies to the Breaſt, becauſe, whileſt they are ſwallowed down through the Gullet, they cool the rough Artery, that lies next to it, together with the Gullet, which part being of it ſelf cold does eaſily take harm from ſo violent a cold: hence the cough, and other diſeaſes of the Breaſt follow one another in a long row. But iſſues of bloud happen in like manner, the great Artery being cooled, whereby the vitall Spirits, and the bloud are driven back to the Heart, and from thence are ſent up forcibly to the Head, which being ſtuft, eruptions of bloud are cauſed by its dropping forth at the Noſtrills, as

alſo

alſo catarrhs and diſtillations, it being driven down undigeſted to the inferiour parts. And hence alſo a reaſon may be rendred, why ſome, upon drinking of cold water after vehement motions, and exerciſe of the body, have preſently been ſuffocated, the paſſion of the heart, and grievous ſwoundings following thereupon. For the Artery being vehemently cool'd, the blood is congealed, as well that, which was in the *Aorta*, or Great artery, as that which abides in the heart; from whence happen at firſt fearfull ſymptoms, and then ſuddain death. But we have ſeen in theſe men, that a vein being opened, the bloud hath come out thick, and cold, and with very great difficulty; whence alſo we have not found a more preſent remedy for them, then ſuch things, as by reaſon of the thinneſs of their parts have a power of diſſolving the clots of blood. Hence alſo a reaſon may be given, why in burning feavers the tongue becomes black, and the diſeaſed can hardly ſwallow. For although it be true (which is the cauſe commonly aſſign'd) that many vapors are ſent up from the whole body to the head; yet we may aſcribe a main cauſe of this blackneſſe to the nearneſſe of the artery, which being ſet on fire, and inflamed, procures much miſchief to the gullet, and conſequently to the tongue it ſelf.

The diviſion of the Aſcendent trunk into two branches.

The ſubclavian arteries.

But the Aſcendent Trunk, whilſt it paſſes thus upwards, is divided into the two ſubclavian arteries, [DD] of which one runs to the right ſide, and the other to the left. They are called *ſubclaviæ*, as long as they are in the cheſt, for the ſame reaſon as the ſubclavian veins are ſo called, becauſe they run under the *clavicule* or collar-bones: but as ſoon as ever they are faln out of the cheſt, they change their name, and are called *Axillares* [E]. From both the ſubclavian arteries, when they have attained to the firſt rib (for before that they ſend forth no propagations) many ſprigs iſſue out, as well from their upper, as lower part. From the lower iſſues the upper Intercoſtall artery, or *Intercoſtalis ſuperior* [b], which being faſtned to the roots of the ribs, beſtowes particular branches upon the diſtances of the four uppermoſt which run under the ribs, together with the veins, as far as to the griſtles, from which propagations are diſperſed into the marrow of the back, and the neighbouring muſcles. From the upper part iſſues firſt that which is commonly called *Cervicalis*, or the artery of the neck [c], but better *vertebralis*, of the rack-bones, which ariſes more backward, and toward the bodies of the rack-bones, and aſcending obliquely, near to the ſeventh rack-bone of the neck, like the neck-vein, paſſes through the holes of the tranſverſe proceſſes, and upper rack-bones of the neck, where it ſhoots out many propagations, which enter the ſpinall marrow through the common holes, at which the nerves go out. It ſends alſo a pretty company to the muſcles that are ſeated on the backſide of the neck, and aſcends to the nowle-bone together with the vein, through whoſe firſt notable hole, by which the ſpinall marrow deſcends out of the head, it enters the skull. After this it is joined with its fellow of the other ſide under the ſpinall marrow, which remains yet in the skull, and ſo runs ſtraight forwards, under the middle of the *baſis* of the brain; but when it hath now attain'd to the *ſella*, or ſaddle of the wedg-bone, upon which the phlegmatick glandule lies, it is divided into two branches, a right, and a left one, both which at the ſide of the ſaddle creep to the ſecond pair of the nerves, where being broken on both ſides into an infinite number of ſurcles, they are diſperſed betwixt the firſt and ſecond pair of the nerves, and folded together with the thin membrane make that complication of veſſels call'd *plexus Choroides*. The next is *arteria mammaria* or artery of the paps [d] which being reflected under the breſt-bone (accompanied with the mammary vein) deſcends along its ſides, and when it comes to the griſtle called *Enſi-formis*, or the breaſt-blade, about the ſides thereof goes out of the cheſt, and running under the right muſcles of the *abdomen*, deſcends directly through the lower ſide of them, and at length neer the navell, is joined by *anaſtomoſis* or inoculation [x] with the Epigaſtrick artery plying upward [i]. But before it leaves the cheſt, it ſcatters particular branches to the ſix diſtances betwixt the griſtles of the ſeven true ribs, which branches determin together with the griſtles. A third [e] is otherwiſe called *Muſcula* the muſcle artery, but might bee better, and more ſtrictly named *Cervicalis*, being it is diſſeminated into the muſcles, that are placed in the region of the neck, as far as to the *occipitium* or nowl of the head.

Intercoſtalis ſuperior, the upper artery between the ribs.

Vertebralis, the artery of the rack-bones.

Mammaria, the artery of the paps.

Cervicalis, the artery of the neck.

Arteria axillaris.

Its branches before it enters into the arm.

From its lower part.

These branches being ſent out, the ſubclavian artery goes out of the cavity of the cheſt, and getting above the firſt ribs tends obliquely to the arm-pit, and ſo makes the axillary artery [E] which afterward is ſpread into the arm. But before that it ſcatters ſome propagations, and *from its lower part* three, of which the firſt is *ſcapularis interna*, the inner-blade artery [f] which goes to the muſcles on the hollow ſide of the ſhoulder-blade. Another is *Thoracica ſuperior* the upper cheſt artery [g], which goes to the pectorall muſcle, that leads the ſhoulder forward to the breaſt, and the other muſcles that lie upon the breaſt, and is a pretty big one. The third is *Thoracica inferior* the lower artery of the cheſt, [h] which is alſo a large one, and running down all along the ſide of the cheſt, is the greateſt part of it ſcattered into the broad muſcle called *Latiſſimus*, which moves the ſhoulder backward from the breaſt. *From the upper part* of the axillary artery ariſes one called *ſcapularis externa* the outer blade-artery [i], which climbing up to the top of the ſhoulder is diſſeminated into the muſcles that cover the gibbous ſide of the ſhoulder-blade,

From its upper part one.

blade. The remaining part of the axillary artery passes on in company of the Basilick vein to the arm, upon all which it is afterward spent, of whose distribution we will speak in the following Chapter.

That which remains yet of the Ascendent Trunk [L] being sustained with the *Thymus* neer to the upper part of the breast-bone, is divided into two branches [MM] which they call *Carotides*, or *soporales* the sleepy arteries, because they being obstructed, or any way stopt, we presently fall asleep, of which *Valuerda* witnesses in *Anatom. lib. 6. c. 11.* that *Realdus Columbus* made tryall in a young man, among a great company of men. They are unequall in bigness, the right one being much thicker then the left, but they tend directly upward, being carried along by the sides of the neck, and fastned to the rough artery, and to the internall jugular veins, by the benefit of a membrane, and when they are come to the cups, are divided into two branches [N] of which one is the outer, the other the inner one: that is the lesse, this is the greater. *The outer* [O] sends propagations [+] to the cheeks and muscles of the face; then when it is come to the ear, it is divided in twain; for *one branch* [r] of it goes to the backside of the ear, from which two branches under the ear enter the neather jaw through the first hole of it, that is seated at its processes, and throughout the length thereof are disseminated into the roots of all the lower teeth; that which remains, going out at the second hole; which is placed at the chin, is scattered into the lip. The *other branch* [q] creeps through the Temples and fore-head, and is spent upon the muscles of the face. The *inner branch* [P] of the sleepy artery, or *arteria Encephalica* the brain-artery, is carried into the chops; and having scattered some propagations to the tongue and throttle, is divided about the *basis* of the skull, into two unequall branches, to wit, a greater, and a lesser one. The *lesser and hindmost* [s] is carried together with the greater Encephalick branch of the internall jugular vein to the back-side of the skull, enters through the second hole of the *occipitium* or nowl-bone, and goes into the *sinus* or canale of the thick membrane. The *greater and more forward* [t] having entred the cavity of the skull through a hole made on purpose for it in the temple-bone, and attain'd to the saddle of the wedg-bone, going every where under the hard membrane, first of all propagates a branch on both sides into the side of the thick membrane, then in beasts scattering an infinite number of surcles makes the *Rete mirabile* or wonderfull net, which indeed may be found in a man too, but it is very little, and seems but a shadow in respect of that in beasts. These surcles being thus placed it pierces through the thick membrane of the brain, and having got out of it, sends another propagation out of the skull, through the second hole of the wedg-bone to the eye, and its muscles, as also to the temple muscle, that lifts up the lower jaw; and then going straight up to the side of the phlegmatick glandule, it is divided into two branches, an outer, and an inner. The inner is joined with its fellow of the other side, and being joined they are wasted into many little arteries, which are dispersed through the thin membrane, and the very substance of the brain, to the originall of the optick nerves. The outer being reflected and sustained with the thin membrane, goes into the forward ventricle of the brain; being divided into many surcles, which are united with those little arteries, which arise from the *vertebralis*, or artery of thorack-bones; some with those which the vertebrall artery scatters through the *basis* of the head under the brain, but others with those which it disseminates through the thin membrane and substance of the brain, together with which they make the *plexus choroides*.

CHAP. II.

Declares the History of the Axillary artery being distributed through the Arm.

THE Axillary artery therefore when it is come to the arm, taking the name of the Arm-trunk [FF] is carried in one undivided stock, beyond the bent of the cubit, through the inside of the arm, dispersing some small propagations on both sides to the muscles that lie on the inside of the upper part of the arm. But it goes fast by the inner or deep branch of the Basilick vein, as an unseparable companion of it, whose conduct and steps it every where follows. But presently falling down by the back-side of the upper part of the arme, where the muscles which extend the cubit stick to it, it sends forth two propagations [l & m] the lower of which is a very notable one, and so it is writhed back toward the bent of the cubit, and having attained thereunto it reaches out two surcles [n n] one of each side, so manifest, that the pulse is there oftentimes evidently enough perceived. Then going under the bent of the cubit, through the inside of it, and sinking down betwixt the two muscles that bend the second and third bones of the four fingers, it is cut [G] into two notable branches, one of which is an outer, the other an inner one. The outer [H] is carried along

Brachialis truncus, the trunk of the arm.

The division thereof into two branches.

The outer branch.

along the *Radius*, or leſſer bone of the cubit (whence I call it *Radiem*) and goes directly to the wriſt, in which place Phyſitians feel the pulſe, it being very manifeſt, by reaſon that the artery lies next under the skin. But not far from the root of the wriſt it ſhoots out a little branch [o] which runs under the tendons of the muſcles, which extend the thumb, into the outſide of the hand, and is ſpent upon the muſcles, which are placed betwixt the firſt bone of the thumb, and that of the after-wriſt, which ſupports the fore-finger. This branch being propagated, going under the inner annular ligament of the wriſt, and the broad tendon of the palm-muſcle, it is divided into three branches [ppp] like the vein, and nerve, that are its companions. The firſt of theſe goes to the inſide of the thumb, the ſecond to the inſide of the fore-finger, and the third to that of the middle. The firſt, and ſecond are each of them parted into two branches; the third is undivided. *The inner branch* of the trunk of the arm [I] runs ſtraight along the *ulna* or greater bone of the cubit (and for that reaſon I call it *Cubitem*) and is diſperſed into the palm of the hand. But it is ſo hidden among the muſcles, that it is hardly perceived to beat, unleſſe in lean folkes; and therefore Phyſitians alwaies lay their hands upon the outer branch, when they feel the pulſe in the wriſt. But it paſſes on under the tranſverſe ligament of the wriſt, and the tendon of the palm-muſcle, in company of a vein, and nerve, and ſcatters two branches into the little finger, as many into the ring-finger, and one into the outſide of the middle.

The inner branch.

CHAP. III.

Shewes the Inferiour or Deſcendent Trunk of the great artery, and the propagation thereof through the middle and loweſt bellies.

WEE have ſaid above, that the great artery [A] as ſoon as it has gotten above the *Pericardium* or purſe of the heart, is divided [B] into two branches; of which one goes upward, the other deſcends to the parts below. We have already handled the upper branch; it remains that wee explain the other alſo.

The Deſcendent trunk.

The Deſcendent trunk therefore [Q] anſwering in proportion to the ſtock of a tree, is carried down to the fifth rack-bone of the cheſt, and declining ſomewhat to the left, cleaves to that ſide of the body of the rack-bones, and ſo deſcends leiſurely. When it has now paſt the midriffe through that diviſion reſembling a ſemi-circle, which is betwixt the productions of the *ſeptum tranſverſum* or midriffe, preſently it runs out by the rack-bones of the loins, leaning upon the middle of their body, till it come to the laſt of them, where near to the *os ſacrum* it is divided [R] into two notable branches [SS] which with other Anatomiſts we wil cal *Iliaci* the Iliacal arteries from their ſituation. In this journey it ſcatters many propagations from it ſelf, which are very worthy to be diligently obſerved, becauſe from thence we may eaſily give a reaſon of many accidents in diſeaſes. But they are in number eight, the Intercoſtal arteries, the two *Phrenikes* or arteries of the midriffe, the Cœliacall one, then the upper Meſenterick, the two Emulgents, as many ſpermaticall ones, at laſt the lower Meſenterick, and the *Lumbares*, or arteries of the loins. Of theſe the Intercoſtalls are ſcattered, whilſt the trunk is yet in the cheſt; the reſt, whilſt it paſſes on through the loweſt belly. But ſome of them accompany the branches of the gate-vein, as the Cœliacall, and both the Meſentericall arteries; others thoſe of the hollow vein, as the reſt. Now we will treat of theſe in order, beginning from the Intercoſtalls, or arteries between the ribs, which are placed uppermoſt. Preſently therefore after the Deſcendent trunk [Q] is iſſued forth, from its back-ſide it ſends over little branches on both ſides to the diſtances of the eight lower ribs, which they call *Intercoſtales inferiores*, the lower arteries between the ribs [a a u u] in reſpect of the upper Intercoſtall, of which we have ſpoke above. Theſe aſſociating themſelves with the veins and nerves of the ſame name, go ſtraight on by the lower ſide of the ribs, where peculiar *ſinus* or channells are cut out for them. But as the Intercoſtall veins reach in the true ribs only to the griſtles, but in the baſtard ones ſomewhat farther, to wit, to the ſides of the *abdomen*: ſo alſo the arteries end in them together with the bony part of the ribs, but in theſe run out a little farther. And theſe arteries ſend over ſome propagations through the holes of the nerves to the ſpinall marrow, and to the muſcles that lie upon the rack-bones of the back, juſt as we have ſaid the Intercoſtall veins were propagated. But the uſe of them is to diffuſe the vitall ſpirit, and the blood to the muſcles betwixt the ribs, beſides which they have alſo another notable office, to wit, of carrying down the water, and purulent matter, that is gathered together in the cheſt, into the great artery, and from thence by the Emulgent branches to the bladder. Although I am not ignorant that the moſt learned *Fallopius*, and others who have read before me in this moſt famous Univerſity of *Padua*, have ſhewn another way to their Auditors, by which either purulent matter, or water might be conveighed forth by help of the kidneys, to wit, the vein *ſine pari*, or without a companion, a little branch whereof in the left

Its progreſſe.

Its propagations.

Intercoſtales inferiores, the arteries between the lower ribs.

Their uſe.

eft ſide goes into the Emulgent of the left kidney. But this way which we ſhew through the Intercoſtall arteries, is by much the ſhorter; that I paſs by this, that any matter heaped together may be more eaſily diſpatcht away through the arteries then the veins. Nor needs any one here to be afraid, leſt the vital ſpirits ſhould be infected from theſe excrementitious and ill humors, whereby the heart may incurre fearfull ſymptomes; when we willingly grant (which experience alſo hath often taught us) that whilſt the corrupt matter is emptied out by the urine, the ſick parties have often falo into fits of ſwounding, and other diſeaſes; ſometimes alſo have died ſuddenly, when the peccant humor has been of too great a quantity, or too bad a quality, and has offered ſo much violence to nature, that the heat, and ſpirits have been overcome therewith. But here a certain place in *Hippocrates* calls upon me to explain it, which has long and often troubled my mind. The place is in *Coacis prænotionibus*, where he ſays; They, who together with the heart have their whole lungs inflamed, ſo that it falls to the ſide, are deprived of motion all over; and the parties ſo diſeaſed lie cold, ſenſeleſſe, and die the ſecond or third day. But if this happen to the lungs without the heart, they live not ſo long. Yet ſome alſo are preſerved. I have often thought with my ſelf, what ſhould be that ſympathy of the heart and lungs with the brain and nerves, that from the inflammation of thoſe parts, the Patient ſhould be ſo deprived of ſenſe and motion all over, when the ſame *Hippocrates* teacheth in the ſame place, that the diſeaſed ſuffer ſuch deprivation in that part, & livid ſpots appear on the outſide about the rib, where-about the *Aortæ* (ſo he ſeems to call the lobes or diviſions of the lungs) being inflamed fall to the ſide. But if they be not much inflamed, ſo that they fall not down to the ſide; he ſayes that there is a pain indeed all over, but no deprivation of ſenſe or motion, nor any ſpots appear. Having deliberated often with my ſelf, at length I came to be of this opinion; that there was no other cauſe, but the ſympathy betwixt theſe Intercoſtal arteries, and the marrow in the back-bone. This ſympathy ariſes from thoſe propagations, which we told you paſt through the holes of the rack-bones of the cheſt into the backbone. Wherefore if the lungs, and heart be ſo mightily inflamed, that great plenty of bloud ruſh into the great artery, whereupon it ſwells, as alſo theſe veſſels betwixt the ribs, and conſequently thoſe ſurcles which go to the marrow of the back-bone; truly it cannot be, but that both the marrow, and the nerves, which iſſue out of it, be compreſt; from whence what elſe can follow, but the reſolutions of thoſe parts, into which thoſe nerves are implanted, and to which they impart the faculty of motion? This opinion ſeems to mee to bee wonderfully confirmed by a certain pretty obſervation, which the learned *Cornelius Gemma* has in his book, *de hemitritæo peſtilenti*. A certain ſtudious young man, ſayes he, through the whole courſe of his diſeaſe, had his left eye leſſe then the other. He was pain'd in the left ſide, eſpecially all the time the fit raged; but about the *criſis* or change thereof, the artery of his left leg being ſwoln up was moved according to its length; that being to be ſeen by us it ſeemed to be turned upward and downward like a rope pull'd back. Who will not here willingly confeſſe, that this matter was in the arteries, when the *criſis* was made by them? But from this that hath been ſaid a reaſon may be alſo given of another obſervation of *Galen*, which is 4 *de locis affect. c.* 4. where he ſayes thus: In a certain man, who was troubled with a vehement inflammation of the lungs, as well the outer, as the inner parts of his arm, from the cubit to the very ends of his fingers labour'd with difficulty of ſenſe, and their motion alſo was ſomewhat empair'd. In the ſame man alſo the nerves, which are in the firſt, and ſecond diſtances betwixt the ribs, ſuſtained harm. *And a little after*, This man was quickly reſtor'd to his health, to wit, a medicine being applyed to the place, from whence the nerves iſſue forth, near to the firſt, and ſecond ſpaces betwixt the ribs. By reaſon of the ſame branches betwixt the ribs *John Valeriola*, the ſon of that Phyſitian, whoſe obſervations we have, being yet a boy ſuffered Convulſion-fits in a grievous Pleuriſie.

The explanation of a place in *Hippocrates*.

The arteries called *Phrenicæ* of the midriffe, [x x] are two; one of each ſide, which ariſing out of the trunk, preſently after it is come forth of the hollow of the cheſt, being divided into more branches, are ſcattered into the midriffe, but eſpecially into the lower ſide of it, near to the rack-bones of the back. They ſprinkle ſome ſmall twigs alſo into the upper part, which afterwards go to the *Pericardium* or purſe of the heart, there where it growes to the midriffe.

2. *Phrenicæ* the arteries of the midriffe.

The *Cœliaca* or Stomach-Artery is but one, ſo called, becauſe it ſends over branches to the κοιλία, that is, the Stomach. This, being moſt like to the ſpleenick branch of the Gate-vein, affords many branches to the Stomach, Liver, Bladder of Gall, Kell, the gut *Duodenum*, the beginning of the *Jejunum* or empty Gut, a part of the *Colon* or Colique-Gut, the Sweet-bread, and Spleen. But it ariſes out of the foreſide of the body of the Trunk, and being ſtayed up all the way by the upper part of the lower membrane of the Kall, is divided into two notable branches, but of unequall bigneſſe, one of which goes to the right, the other to the left: that is the leſſe, this the greater. *The right branch* therefore is joined with the deſcendent Gate-vein in the *Pancreas* or Sweet-bread, that is placed under the hinder part of the Stomach, and leaning there upon the membranes of the Kall goes to the Liver; and its ſmalneſſe is worth the taking notice of, if you look upon the largeneſs of the Liver, which the Ancients long ſince, and many at this day have made the work-

3. *Cœliaca.*

The two branches thereof. The right branch.

houſe of the bloud. But it is inſerted in the hollow part, near to the Trunk of the Gate-vein, and is ſo ſmall, becauſe that part of the Liver, which entertains the roots of the Gate-vein, needed not a greater Artery; but the other part which hath the propagations of the Hollow-vein, receives great plenty of vitall ſpirit ſent over from the Heart through the Hollow-vein. Yet before it enters into the Liver, it diſſeminates in the way many ſurcles, and thoſe partly from its upper ſide, partly from its lower: *from the upper ſide* two, firſt, that which I call *Pyloricus*, which ariſes in the mid-way, and being divided into many little branches is ſcattered into the back-ſide of the right oriſice of the Stomach. The other is called *Cyſticæ gemellæ*, the Twin-Arteries of the bladder of Gall, which are two little branches, and go into the bladder of Gall, and preſently are divided into many propagations. *From the lower ſide* likewiſe two ariſe. The firſt is *Epiploïs dextra* or the right Kall-Artery, which is implanted into the right ſide of the lower membrane of the Kall, and part of the Colique-Gut annexed thereunto. The other is cleft into two branches, of which one called *Inteſtinalis*, the Gut-Artery paſſes on to the *Duodenum*, and beginning of the *Jejunum* or empty Gut: the other, named *Gaſtro-epiploïs dextra* the right Stomach and Kall-Artery, ſomewhat larger then the former, turns down to right ſide of the bottome of the Stomach, and being ſupported by the upper membrane of the Kall, iſſues out ſome ſhoots from the upper part to the fore and back-ſides of the Stomach; but from the lower to that membrane of the Kall, upon which it leans. The *left and greater* branch is called *Arteria Splenica* the Spleen Artery, which ſticking to the lower membrane of the Kall, and the Glandules placed therein, paſſes on together with the Spleen-vein, to which it is faſtened, and in like manner diſtributes its propagations to the Spleen. But in the way likewiſe it diſtributes branches from both parts of it: *from the upper* iſſues *Gaſtrica* the Stomach-Artery, which reaches into the middle of the hinder part of the Stomach, or that, wherewith it leanes upon the back, and aſcending from thence it compaſſes the left orifice of the Stomach round about like a crown, and diſperſes little twigs, partly upward to the end of the Gullet, partly downward, and thoſe greater, and more numerous, into the Stomach, and ſo it makes the *Arteria Coronaria* or Crown-Artery, like to the Crown-vein, which ariſes from the Gate-vein, as we have ſaid in the fore-going Treatiſe. But *from its lower ſide* the Spleen-Artery ſends out the *Epiploïs ſiniſtra*, or left Kall-Artery, about that part, wherewith it now attains to the Spleen, which runs out into the left ſide of the membrane of the lower part of the Kall. This Artery preſently after its riſe is cleft into two branches, which part very far aſunder from each other, from which many other Arteries ariſe, that are all conſumed upon the ſaid membrane of the Kall, and the Colique gut, that is tyed thereto. Theſe branches being iſſued, the Spleen-Artery draws nearer to the Spleen, and juſt like the vein of the ſame name, which accompanies it all the way, is cleft into two branches like the Letter Y, one of which may be called the upper, the other the lower, which afterward entring by the hollow part of the Spleen are ſplintered into an infinite number of little ſprigs, ſo that there are five times more Arteries there, then veins. Whence it comes to paſſe, that in inflammations of the Spleen, if you lay your hand to the left *Hypochondrium*, or place under the Griſtles of the Baſtard-ribs, it ſeems to pant. But before this entry of the Artery of the lower branch makes a notable *anaſtomoſis* or inoculation with the lower branch of the vein, and propagates a twig to the lower membrane of the Kall. But from the upper branch iſſues one called *Gaſtro-epiploïs ſiniſtra*, the left Stomach and Kall-Artery, which being faſtened to the upper membrane of the Kal is derived into the left ſide of the bottom of the Stomach, beſtowing little branches upon the fore and back-ſides of it, or alſo upon the upper part of the Kall. Another iſſuing from the upper branch makes the *vas breve Arterioſum*, or ſhort Arteriall veſſell, carried, like the vein its name-ſake, to the left ſide, and orifice of the Stomach. The uſe of the right branch, which goes to the liver, beſides the common one, which it hath, is this, as often as the bladder of Gall is obſtructed, to carry down choler to the Guts, and eſpecially to the *Colon*, into which ſome of its branches are implanted. Which is the reaſon, that in bloudy Flixes the Ulcers are almoſt alwayes found in the great Guts, and eſpecially in the *Colon*, very ſeldome in the ſmall ones. For this artery, when either the Liver being over hot breeds abundance of choler, or the bladder of Gall is obſtructed, receiving into itſelf ſtore of choler carries it directly over to the *Colon*, or Colique Gut. In like manner the uſe of the left branch, or Spleen Artery, beſides the common one, is to throw down choler, melancholy and wheay humors, if at any time the Spleen abound with them, to the Guts. Moreover by this ſame way the wateriſh humors in ſuch as have the Dropſie, are ſometimes committed either to the Guts, or to the Kidneys and Bladder. This ſame branch is that by which the drink paſſes ſo ſodainly through the whole body, and by which ill humors are caſt out by vomit. This ſame is the cauſe, that upon a full Stomach we make little water; but more when the concoction therein is finiſhed. For the Stomach being much diſtended preſſes it; but that once empty, it can perform its office. This ſame branch teaches us that a ſlender diet is to be preſcribed to them, who are to take purges, that the way may be open for the medicins, as well that, by which the

VVhy ulcers are more frequent in the great guts.

The uſe of the left.

the excrements are sent over to the Stomach, as that, by which they are conveyed to the Guts. This same branch also, if you adde the two Mesentericks, is the seat of the hypochondriacall Melancholy. For this disease arising from the obstruction of the entrails, which are contained in the lowest belly, it is necessary that the arteries here should suffer very much, which the very Symptomes, that happen in this disease, may sufficiently inform us.

Mesenterica superior, the upper Artery of the Mesentery [γ] arises a little below the Cœliacall, being distributed like the Meseraick vein (which is its companion) with numerous propagations into the Guts called *Ilium* and *Jejunum*, as also that region of the *Colon*, which reaches from the Hollow of the Liver as far as the right Kidney, and so for the most part into the upper part of the Mesentery. In which place it is to be observed, that the Artery sometimes lies upon the vein, sometimes on the contrary the vein upon the Artery, and so is carried betwixt both the Membranes of the Mesentery. But these Arteries in many places in the Mesentery have Glandules, which were made for the free perspiration of the vessels, and especially of the Arteries, whereby it comes to passe, that these Glandules labouring with a hard tumor, or *Scirrhus*, the vessels are compresst, and a pining away of the whole body follows thereupon. 4. *Mesenterica superior.* An observation.

The Emulgent arteries [δ] are two, one the right, another the left one. Both issue out under the forementioned Artery, where the first, and second Rack-bones of the loins are coupled together by the Ligament. But they arise out of either side of the Trunk, although not directly over against one another, as also it is in the Emulgent veins, the right one being lower then the left. These Arteries, when they come to the Kidney, are cleft into two branches, with which they are inserted into the *sinus* or channels of the cavity of the Kidneys, and like the veins are consumed in an infinite number of little sprigs upon their substance. Their use, besides the common one, is to purge out the whey, which is found in great plenty in the Arteries. 5. *Emulgentes.* Their use.

The spermaticall, or seed-arteries [ε] are likewise two, which arise out of the forepart of the Trunk of the great Artery, their originals touching each other; for the left Artery issues not from the Emulgent, as the left spermaticall vein does. Afterward in their descent they are made fast to the veins of their own side, and in men are carried through the processes of the *Peritoneum* or Rim of the Belly to the Testicles: but in women, when they come somewhat near to the Testicles, they are divided into two parts, one of which is carried to the Testicles, the other to the bottom of the womb. But the arteries do so come to the womb, that they only water it at the sides, and pierce not at all into the inner parts of it. Which truly came to passe by the great providence of wisest nature, since it had not been so safe to have brought them down to the inner surface of the womb, by reason that in the coming forth of the child very great issuings of bloud would be caused to the no small danger of the woman in Child-bed, if the Arteries had been annexed to the Womb on the inside. Hence also it is, that in the time of delivery they flow by little and little, not rushing down with violence. 6. *Spermaticæ.*

Mesenterica inferior, the lower Artery of the Mesentery [ζ], arises near to the *Os sacrum*, or great bone, a little above the division of the Trunk into the Iliacall banches, and goes into the left side of the *Colon*, and into the strait gut, descending with the hæmorrhoidall veins to the very end of the Fundament, and making the hæmorrhoidall Arteries. It is questioned concerning the use of both the Mesentericks, whether besides the common, they have any peculiar one. For *Galen* in his 4. of the use of the parts, seems to make mention of some other when he would have some part of the *chylus* to be attracted by them. And in the book, whether bloud be contained in the Arteries, in the fifth Chapter, he sayes: If we divide the lowest belly, and the inner membrane, we shall plainly see the Arteries in the Mesentery filled with milk in Kids newly yeaned, but in living creatures that are grown, full of something else. In which words Anatomicall experience teaches us, that not onely the Meseraick veins, but Arteries also do manifestly draw the *chylus* to them. Which being so indeed, it is altogether to be beleeved, that the *chylus* is either afterward transported by them into the veins, or else turned into bloud by the Arteries themselves. Nor will this seem wonderful to any one who shall consider also that the mothers bloud is conveyed through the Umbilicall Arteries to the child, whilest it is yet shut up in the Womb. But if the bloud which is received by the veins ought yet to be better worked, as any diligent inquirer into nature will conclude it ought; truly that which is received by the Arteries will require to be so much the more exactly laboured, by how much the better it is, then that of the veins. But it is so laboured in the Arteries themselves, and in the Spleen, being haled into the Cœliacall Artery, and carried to the Spleen. And this is an excellent use of the Mesenterick Arteries, whilest a man enjoyes perfect health, besides which wee will adde another also, as often as he leaves to be in health. For these Arteries take to them the excrements of the whole body, that they may carry them down to the Guts, in like manner as the veins do, by which nature doth both attract the *chylus*, and likewise expell the noisome humors out of the body, as choler, phlegm, and melancholy. Choler is thus expelled oftentimes in continuall and intermitting cholerick feavers, a solution whereof follows by a loosnesse. Phlegm is so 7. *Mesenterica inferior.* Its use.

expell'd, as often as bloudy fluxes happen to ſuch as have the gout in the feet, which eaſe them of their pain, if the intent of nature be advanced by the help of a wiſe Phyſitian. Laſtly melancholy is conveyed out by both the Meſenterick, but eſpecially by the hæmorrhoidall branch; whence *Hippocrates* ſayes, 6. *Epidem.* He which has the Emroids naturally, ſhall neither be troubled with the pain of the ſide, or inflammation of the lungs, nor with fellons or black puſtles, called *Terminbi*, nor with the Leproſy, canker, or other diſeaſes. For there is a very great ſympathy betwixt the breaſt and the hæmorrhoidall artery, becauſe the trunk, out of which it ariſes, deſcending from the heart, preſently after it firſt iſſues from thence, propagates the Intercoſtall branches. Moreover all black cholerick humours are purg'd by this means out of the whole body, that cankers, and leproſies cannot be cauſed by them. From theſe voluntary purgings which nature it ſelf has found out, wee may now judg of ſuch as are cauſed by the help of a Phyſitian, and may be termed Artificiall. For an opinion of ſome men hath prevailed much in our age, that the body cannot be purged by clyſters, but only by thoſe medicins, which are taken at the mouth. But I will not only believe, but alſo being taught it by experience can witneſſe, that, if the clyſters contain in them purging medicins, the whole body is very commodiouſly cleanſed. For the whole colick gut receiving the matter of the clyſter, the vertue itſelf of the medicin draws down the noiſome humors by the arteries out of the *Aorta* or great artery. Which being granted, we may give a reaſon (what we have ſeen very often) why Suppoſitories made of white hellebore produce the ſome ſymptomes, as are wont to be cauſed in them, who have taken in white hellebore at the mouth. In like manner from hence we may fetch the reaſon; why the belly is ſtrongly purged, the region about the navell, being anointed with purging medicins. For the vertue of the medicin is attracted by the arteries, and by them afterward it purges. Theſe arteries are they, by which the diſeaſe of the colick is changed into the gout, and on the contrary the gout into the colick, as we have it in *Hippocrates*, 6. *Epidem. Sect.* 4. where he ſayes: One, that was vexed with the pain of the colick on the right ſide, had ſome eaſe, whileſt the gout held him; but this diſeaſe being cured, he was pained more. The reaſon hereof was this, becauſe that humor, which cauſed the gout, was carried out of the joints to the colick gut, whereby the colick diſeaſe was increaſed. *Laurentius*, inquiring into the cauſe of this, refers us to hidden and unknown paſſages, to which, it ſeems to me, that we need not fly, if we ſay, that the humors are brought out of the crurall arteries into the trunk, and out of this into the Meſenterick branches, and laſtly, out of theſe into the guts; for this is the ſhorteſt, and moſt convenient way. Nor is there any reaſon, that we ſhould be afraid of that pollution of the vitall ſpirits, which they will object to us if the excrementitious humors paſſe through the arteries; for this betrayes their great ignorance as well in Anatomy, as in ſolid phyſick; and it would be very eaſie, if I would digreſſe, to prove in this place, that a great part of the humors in our body flow down through the arteries. For in them the ſtrength of nature exceeds, and is more vigorous, that whenſoever it is provoked, it is moſt apt to expell; and the bloud being ſtirred by their continuall beating, as alſo by its own nature, makes all that is therein more fit to flow. And who will not beleeve that excrements are carried through the arteries, who conſiders the flowings down from the ſpleen, in which there being five times more arteries, then there are veins, truly it is neceſſary that that ballaſt of the ſpleen be carried out through the arteries?

How the colick is changed into the gout; and on the contrary.

8. *Lumbares.*

The four *Lumbares* or loin-arteries [γγγ] ariſe out of the backſide of the trunk of the great artery, all along as it paſſes through the region of the loins. They run through the common holes into the rack-bones of the loins, and to their marrow, and alſo into the neighbouring muſcles. And at the ſide of the marrow, after they have entred the rackbones, they climb upon both ſides to the brain together with the veins of the loins. But they are all equally big, if you except thoſe two, which iſſue out near to the *os ſacrum* or holy-bone, which are not only derived into the rack-bones to the marrow, and to the muſcles thereabout, but are alſo ſent overthwart through the *peritonæum*, and muſcles of the *Abdomen*. The two laſt are by ſome called *Muſculæ ſuperiores* the upper muſcle-arteries, and are diſtinguiſht from the *Lumbares*. And theſe are the arteries, which if we obſerve, we ſhall eaſily give the reaſons of many things, of which Phyſitians do ſtill diſpute very hotly; but eſpecially of that moſt difficult queſtion, which is controverted among Phyſitians, by what wayes, and in what manner the colick ends in a palſie or in the falling ſickneſſe. For we have the obſervation in *Paulus Ægineta lib.* 3. *c.* 43. where he ſayes: the colick, as it were by a certain peſtilent contagion, ended with many in the falling ſickneſſe, with others in a reſolution of the joints or palſie, their ſenſe remaining; and they who fell into the falling ſickneſſe, for the moſt part dyed; but they who fell into the palſie, were moſt of them preſerved; the cauſe of the diſeaſe being carried to another place in the ſolution. For the humor, that cauſed the diſeaſe, came back out of the colick gut through the meſentericall arteries, from whence being afterward tranſported into the trunk of the great artery, it came alſo to the *lumbares* or arteries of the loins, which ſwelling with bloud preſt together the neighbouring nerves, from which came the palſie in the feet. And this we have often obſerved, as well in our ſelves, as in others, eſpecially in former years, when theſe diſ-

How the colick diſeaſe ends in a palſie or Epilepſie.

eaſes

eaſes at *Padua* were Epidemiall. Yet the Palſie is not alwayes a perfect one, but often (as I am wont to call it) imperfect, becauſe the power to walk is not wholly taken away, but the diſeaſed ſtand upon their feet with a great deal of difficulty. Many at that time being deceived in the knowledge of the diſeaſe, miſtaking this for a great weakneſſe of body contracted by their ſickneſſe, endeavoured to take it away by eating and drinking largely, but in vain. This alſo is the cauſe, why the Falling-ſickneſs, and Lethargies too, as we have oft-times ſeen, follow after the Colick, becauſe the matter being ſent over from the Meſenterick arteries to thoſe of the loins, may eaſily go from them into the brain, to which thoſe very veſſells are carried.

But the trunk of the great artery, when it is come to the laſt rack-bone of the loins, having taken its journey all the way, which we have ſhewed, under the hollow vein, at the left ſide, here gets above the vein, leſt it ſhould be worn away in that continuall motion by the hardneſs of the holy-bone. But it is divided, no otherwiſe then the hollow vein is, into two notable branches [S. S.] which are called by Anatomiſts the *Iliacall* arteries from their ſituation, and being carried downward obliquely to the thigh reſemble the τ of the Greeks turned upſide down. But they alſo juſt like the Iliacall veins, to which they are exactly anſwering, before they be implanted into the thigh, ſhoot out a pretty number of branches. But from the lower ſide of the artery before the Iliacall branches be divided, iſſue forth *ſacræ* the holy arteries [ſ] which are notable ones, and carried downward, leaning upon the holy-bone, paſſe through the holes thereof, and run to the marrow and backſide of the bone. And through theſe alſo there is a way for the matter, that makes the Colick, to cauſe the Palſie of the legs. *Sacræ.*

After this a little below the diviſion of the trunk, the Iliacall arteries are ſubdivided into two branches, one of which is the inner and leſs; the other outer and greater. *The leſſe and inner* [T] iſſues out two propagations, one from its outſide, the other from its inſide. *The outer* [s] is commonly called *Muſculs*, by us more ſtrictly *Glutæa* the muſcle of the buttocks, becauſe it runs down with its name-ſake vein, betwixt the holy and hip bones, where they part one from another, and ſcatters many twigs into the muſcles, which lye upon the *Os Ilium*, or hanch-bone, called *Glutæi*, or the muſcles of the buttocks; becauſe they are the authors of them. The diviſion of the Iliacall arteries into an inner and outer branch. Propagations of the inner or leſſe branch. 1. *Glutæa.*

The inner is called *Hypogaſtrica* [ζ] which is very notable, and large, and, being carried directly down to the lower ſide of the holy-bone, it affords certain propagations in men to the bottome, and neck of the bladder, as alſo to the ſtrait gut, which alſo may bee called the Hæmorrhoidall arteries; but in women, to whom this branch is ſomewhat larger, is diſtributes a great number of propagations, beſides thoſe to the fore-named parts, into the lower region alſo of the bottome of the womb, and likewiſe into its neck. Hence we may gather the reaſon, why, if the womb reach to the middle of the hip, Convulſions are cauſed, as *Hippocrates* witneſſeth, *lib. de natura muliebri*. As alſo if the womb fal down to the hip, why the monthly flowers are ſuppreſt, and a pain is cauſed in the ſoftneſs of the ſides, and in the loweſt belly. For the blood which nature drives to the wombe, cannot bee laid in there, the arteries being preſt together by the falling down of it, ſo that neceſſarily flowing back, it fils the neighbouring veins and arteries, which ſwelling up cauſe theſe pains. For wee have oft-times ſeen in diſſections theſe veins ſo ſwoln, that they have been ſeven fold bigger then themſelves. Hence alſo a reaſon may be given of the thirty ſecond Aphoriſm of the fifth ſection in the ſame *Hippocrates*, where he witneſſes, that a woman vomiting blood is rid of her diſeaſe, upon the iſſuing forth of her tearms. Which happening by the conſent of all by revulſion or attraction of the humour to a contrary part, and that not by the benefit of the veins, becauſe the veins of the ſtomach ariſe out of the gate-vein, but they of the wombe from the Hollow one, there is no other ſympathy to bee ſought for, then that which is cauſed by the arteries, eſpecially when the Hypogaſtrick or artery of the lower part of the loweſt belly is not far diſtant from the Cœliacall, or artery of the ſtomach. Hence likewiſe a reaſon will be given of the Aphoriſm that follows this, wherein he judgeth the *Hæmorrhagia* or abundant iſſuing forth of blood at the noſtrills to bee profitable when the monthly courſes do fail. The remaining part of the leſſer Iliacall artery deſcends, and brings forth the Umbilicall or navell artery [uu], which is carried down near to the length of the great artery, and is tyed with ſtrong membranes to the ſides of the bladder of urine. But it loſes its hollowneſſe in thoſe that are once out of the wombe. After this [θ] like the Iliacall vein which is joined to it, it goes through the hole of the ſhare bone, or *os pubis*, which before it be paſt, it takes to it a propagation iſſued from the outer Iliacal branch, and ſo goes out of the hole, and being departed from it ſpends it ſelf, in like manner as the inner Iliacall vein does, upon the muſcles; partly thoſe with which the hole is ſtopt; and partly thoſe which ariſe from the ſhare bone. At length being terminated at the middle almoſt of the length of the thigh, the end of it meets [o], and is united with the ends of the branches [γ] of the inner muſcle-artery of the leg, of which we ſhall ſpeak in the next Chapter. 2. *Hypogaſtrica.* *Arteria umbilicalis.* Propagations of the outer or greater Iliacall branch.

The greater or outer Iliacall artery [V] produces likewiſe two propagations, the *firſt* of which [i] is called *Epigaſtrica*, which ariſing from the outſide of it, a little before it paſſes through the *peritonæum* or rim of the belly is reflected upward, and aſcends by the inſide of the ſtrait muſcle 1. *Epigaſtrica*, or the artery of the upper part of the lower belly.

muſcle til about the navel it be inoculated with the deſcendent Mammary artery. The other [λ] is called *Pudenda*, which is a little inner propagation, being not divided into ſo many branches, as the vein of that name is. But it ariſes preſently after the artery is gone out of the *peritonæum*, and being carried overthwart along the commiſſure or joyning together of the ſhare-bones, is ſpent at the privy parts upon the skin of the yard. That which remains of this trunk goes into the *crus* [X], whereof we ſhall now ſpeak.

Pudenda or the artery of the Privy parts.

CHAP. IV.

The propagations of the outer Iliacall branch, which are diſtributed through the Crus *or great foot, containing the thigh, leg, and foot.*

AFter that the outer branch [V] has propagated the fore-mentioned branches, it departs out of the *peritonæum* or rim of the belly, and at the groin is carried into the *crus*, by the ſame way which the crurall vein takes, under which it goes, and is joined in company therewith every where, and ſo it makes the trunk of the Crurall arterie [X], (as we will alwaies call it). But preſently after it hath got beyond the *peritonæum*, it iſſues forth a propagation from the outſide, which is called *Muſcula cruralis exterior*, the outer muſcle-artery of the *Crus*, which being carried downward is propagated into the muſcles that cover the foreſide of the bone of the thigh. Sometimes over againſt this, but oftner a little below, yet of the inſide another is brought forth, called *Muſcula cruralis interna*, the inner muſcle-artery of the *Crus*, [ν] which is diſtributed in many branches through the third bending muſcle of the thigh, called *Triceps*, and thoſe on the inſide of the thigh, as far as the knee; the ends of which branches are joined with the end of the inner Iliacall artery, which we told you deſcends through the hole of the ſhare-bones to the *Crus*. Theſe propagations being diſpatcht away, the crurall trunk deſcends from the groin, together with the crural vein; and is ſo bent backward near to the bone of the thigh, that when it is come to the ham, it ſtands betwixt the two hindmoſt heads of the thigh. For prudent nature does alwaies obſerve this, to carry down the veſſells about that ſide of the joint where the bending is, leſt if they ſhould go on that ſide whereon the joint is extended, they ſhould be compreſt. But in the very mid-way as it were, as it runs down through the thigh, it ſends out a propagation [π] which breaking into more ſurcles runs out through the muſcles that are ſeated on the backſide of the thigh, together with the ham-vein; and at length deſcending through the ham (whence it is called *Poplitea* the ham-artery) is diſtributed with many ſprigs into the calf of the leg. But whilſt it ſtayes in the ham, it ſends out a propagation [ρ ρ] on each ſide, to the ſides of the joint of the knee, which then ſinking deeper, are conſumed partly in the joint it ſelf, partly upon the muſcles called *gaſtrocnemii* that make the calf; from whence they are called *Surales*, the arteries of the calf.

The trunk of the crurall artery and its propagations ere it bee divided.

1. 2. 3. 4.

After that the Crurall trunk lyes in the ham [Y], it ſends forth a propagation from its outſide [σ] which runs down near to the *Fibula* or leſſer bone of the leg, and is hid betwixt the muſcle, that moves the foot outward, and the ſecond bending muſcle of the inſtep, and diſtributes it ſelf into the reſt, that lye on the forepart of the leg, as far as they are fleſhy, and till they begin to be contorted by the outer ankle. A little under this ſame another artery [τ] is brought forth out of the backſide of the trunk, which runs down as far to the mixing together of the tendons of the calf-muſcles. Then another [υ] iſſues out of the ſame backſide of the trunk, but under the ſecond, which deſcending and paſſing through the tranſverſe ligament, runs down by the top of the foot, and is diffuſed into the muſcles that move the toes outward. The remainder [τ] of the trunk is carryed downward by the backſide of the leg, and about the inner ankle offers a ſurcle [φ] to the foot, which goes to the muſcle of the great toe, and creeps through the top of the foot. But the trunk it ſelf lying hid among the tendons of the muſcles of the toes is cut [χ] into two branches; of which the Inner [ψ] beſtowes two ſurcles upon the great toe; two upon the fore toe, and one upon the middle; the outer [ω] two upon the little toe, and two upon the toes next to it, on the lower ſide. But although the progreſſe of the arteries be for the moſt part ſuch, as we have deſcribed, yet what we have ſaid formerly of the veins, that their diſtribution varies much, not only according to the diverſity of bodies, but alſo of ſides in the body of the ſame man, is true alſo of the arteries, which in divers men are diverſly diſtributed.

AN

An Explanation of the Table of the Arteries.

This Table comprises the delineation of the great Artery, entire and free from all the parts.

A THE large beginning of the great artery, where it issues out of the left ventricle of the heart: but presently after its rise, and before it yet falls out of the pericardium or purse of the heart, it shoots forth the two Coronary arteries,

a a a, a, which encompasse the basis of the heart in manner of a crown.

B But presently having past the pericardium it is divided B into two trunks; one of which is the Ascendent C, the other the Descendent one Q.

C The Ascendent trunk C, is by and by divided into the two subclavian arteries

D D D, D, both which when they have attained to the first rib, scatter many propagations; partly from the higher, partly from their lower side.

From the lower side issues Intercostalis superior, the upper artery

b between the ribs, b, communicating particular twigs to the distances of the four upper ribs.

From the higher side issue three. The first is vertebralis, the artery of the

c rack-bones, c, creeping on by the transverse processes of the rack-bones of the neck, as far as to the skull. The second mammaria the artery of the

d dugs, d, which descending under the breast-bone, runs out as far as to the seat of the navill, and distributes sprigs into the distances of the gristles of the true ribs, and then into the muscles that lye upon the breast; at length about the navill it joins by anastomosis or inoculation, x, with the ascending Epigastrick artery, 1. The third cervicalis or the artery of the back side of the

e neck, e, is propagated to the muscles on the back side of the neck, as far as the nowl of the head.

These branches being issued out, the subclavian artery goes to the arm-pit, and takes the name of Axillaris, about

E E, and so is diffused into the arm. Yet before it enters thereinto, it shoots out some twigs from both parts of it: from the lower three; of which the first,

f f, is called scapularis interna the inner blade artery, because it is spent upon the muscles that cover the hollow side of the shoulder-blade. The second is Thoracica superior the upper chest artery, g, dispersed into the muscles

g on the fore side of the chest. The third

h h, Thoracica inferior the lower artery of the chest, which descending along the sides of the chest, is inserted into the muscle called Anisalptor, that moves the upper part of the arm backward. Betwixt g and h a little branch is placed, one of them which here are disseminated into the glandules of the arm-pit. From the upper part

i i issues one, i, called scapularis externa the outer blade artery, being disposed of into the muscles, on the outside of the shoulder-blade.

FF In this place the axillary artery changes its name, and is called Brachialis the trunk of the arm, that is undivided as far as G, scattering two twigs

l m l and m into the muscles that cover the bone of the upper part of the arm on the

n n back side; and two other n n, one of each side about the bending of the cubit.

G The parting in twain of the Brachiall artery under the bought of the cubit into an outer H, and inner branch I.

H The outer branch of this division, or Radicus, running straight along the radius or lesser bone of the cubit to the

o wrist, and distributing a branch o into the muscles seated betwixt the first bone of the thumb, and that of the metacarpium or after-wrist, which sustains the fore-finger, and then three other,

ppp p p p, which are dispersed into the first outer fingers, the thumb, and wit, the two fingers next thereunto.

I The inner branch, or Cubiteus passing along the greater bone of the cubit, is at length consumed in a double branch upon the two inner fingers; to ring-finger and little one.

L The remaining part of the Ascendent trunk, which near to the upper part of the breast-bone is cleft into two branches

MM M M called Carotides, or the sleepy arteries. These tend directly upward by the sides of the neck, and being come to the chops are divided into two

N branches about N, one of which is the outer O, the other the inner P.

O The outer Carotis propagates twigs 4 to the Buccæ or cheek puffes, and to the muscles of the face; but about the ear it is cut into two branches,

q a formost one, q, which is caried through

r the Temples; and a hinder one, r, that is disseminated along the back side of the ear under the skin.

P The Inner Carotis, going to the skul is divided near to the basis thereof into two branches; of which the one

s and lesser, s, which goes into the sinus on the side of the thick membrane, is cut off here, whereabout it sinks into

the

t the skull: the other and greater, t, enters the skull, through a peculiar hole bored for it in the temple-bone.

Q The Descendent trunk of the great artery, reaching downward to the rack-bones of the back.

From this before its division at R, many propagations are scattered, which we will now rehearse in order.

First then are Intercostales inferiores, the lower arteries between the ribs, u u u, uuu distributed to the distances of the eight lower ribs, from which propagations are brought to the marrow of the back-bone; and to the muscles that grow to the back and chest. After this the trunk passing on distributes two more, called Phrenicæ the arteries of the midriffe x x, xx because they are disposed of into the midriffe. Then follows Cœliaca or the stomach. After that Mesenterica superior, the upper y artery of the Mesentery, y, reaching out into the guts Jejunum, and Ileum, as also into that part of the Colon, which reaches from the hollow of the liver as far as the right kidney. After this the z Emulgent arteries, z, propagated to the kidneys. Then spermaticæ, the a seed arteries, a, going to the testicles, under which is Mesenterica inferior the lower artery of the Mesenterie, β, β departing into the left side of the colick, and into the strait gut, and making the hæmorroidall arteries. Lastly Lumbares the arteries of the loins, γγγ, γγγ which going to the rack-bones o, the loins joint by joint, are distributed, into the peritonæum or rim of the belly, and the muscles growing to the rack-bones.

R These branches being issued forth, the trunk about the fift rack-bone of the SS loins, is divided into two branches S S called the Iliacall, both which are again broken into two other, an inner branch T, and an outer one V. But before this division in the very parting in twain of the Trunk, ariſes sacra the δ holy artery δ, distributed into the holes of the os sacrum or holy bone, to the marrow thereof.

T The inner Iliacall artery, before it falls out of the peritonæum, issues forth two propagations: from its ε outer side, that called glutæa, ε, distributed into the muscles of the buttocks; from its inner side, that ζ called Hypogastrica, ζ, going into the bladder and yard, and in women also to the bottome of the womb. After this it runs down, and sends forth the umbilicall arteries η η, η η that tend upward near to the length of the great artery.

θ The remainder under θ, taking to it a propagation from the outer Iliacal artery, slips down through the hole of the share-bone into the Crus, the end of it joining about ο with the inner muscle artery of the Crus ν.

V The outer Iliacall artery likewise before its going forth of the peritonæum produces two. The first is called Epigastrica, ι, digested into the ι muscles of the Epigastrium, and the straight ones of the abdomen, where κ it is joined by inoculation, κ, with the descending mammary artery d. The other called Pudenda λ, goes to the λ privy parts.

X In this place the outer Iliacall artery having past the Peritonæum, enters the Crus, and begins to be called the Crurall trunk, which issues out more propagations. The first is Muscula cruralis exterior, the outer μ muscle artery of the Crus, μ, that is propagated into the muscles, that cover the fore-side of the Thigh-bone. The second is the inner muscle-artery of ν the Crus, ν, digested through the third bending muscle of the thigh; and those muscles that are on the inside of the thigh; the endo of it are joined with the ο ends of the inner Iliacal artery about ο. The third is Poplitea, the ham-artery π, π running out into the muscles on the back-side of the thigh. The fourth ρρ is suralis the calf-artery ρ ρ, which is double, issuing out there, where the crurall trunk is hid betwixt the two lower heads of the thigh, and spreading out on both sides into the joint of the knee, and the two heads of the first extending muscle of the foot.

Y Here the great artery lyes in the ham, where it is divided into branches of unequall bigness.

σ A sprig issuing from its out side, and reacht out to the fibula or lesser bone of the leg, betwixt the muscle that moves the foot outward, and the second bending one of the instep.

Z The trunk descending by the back-side of the leg.

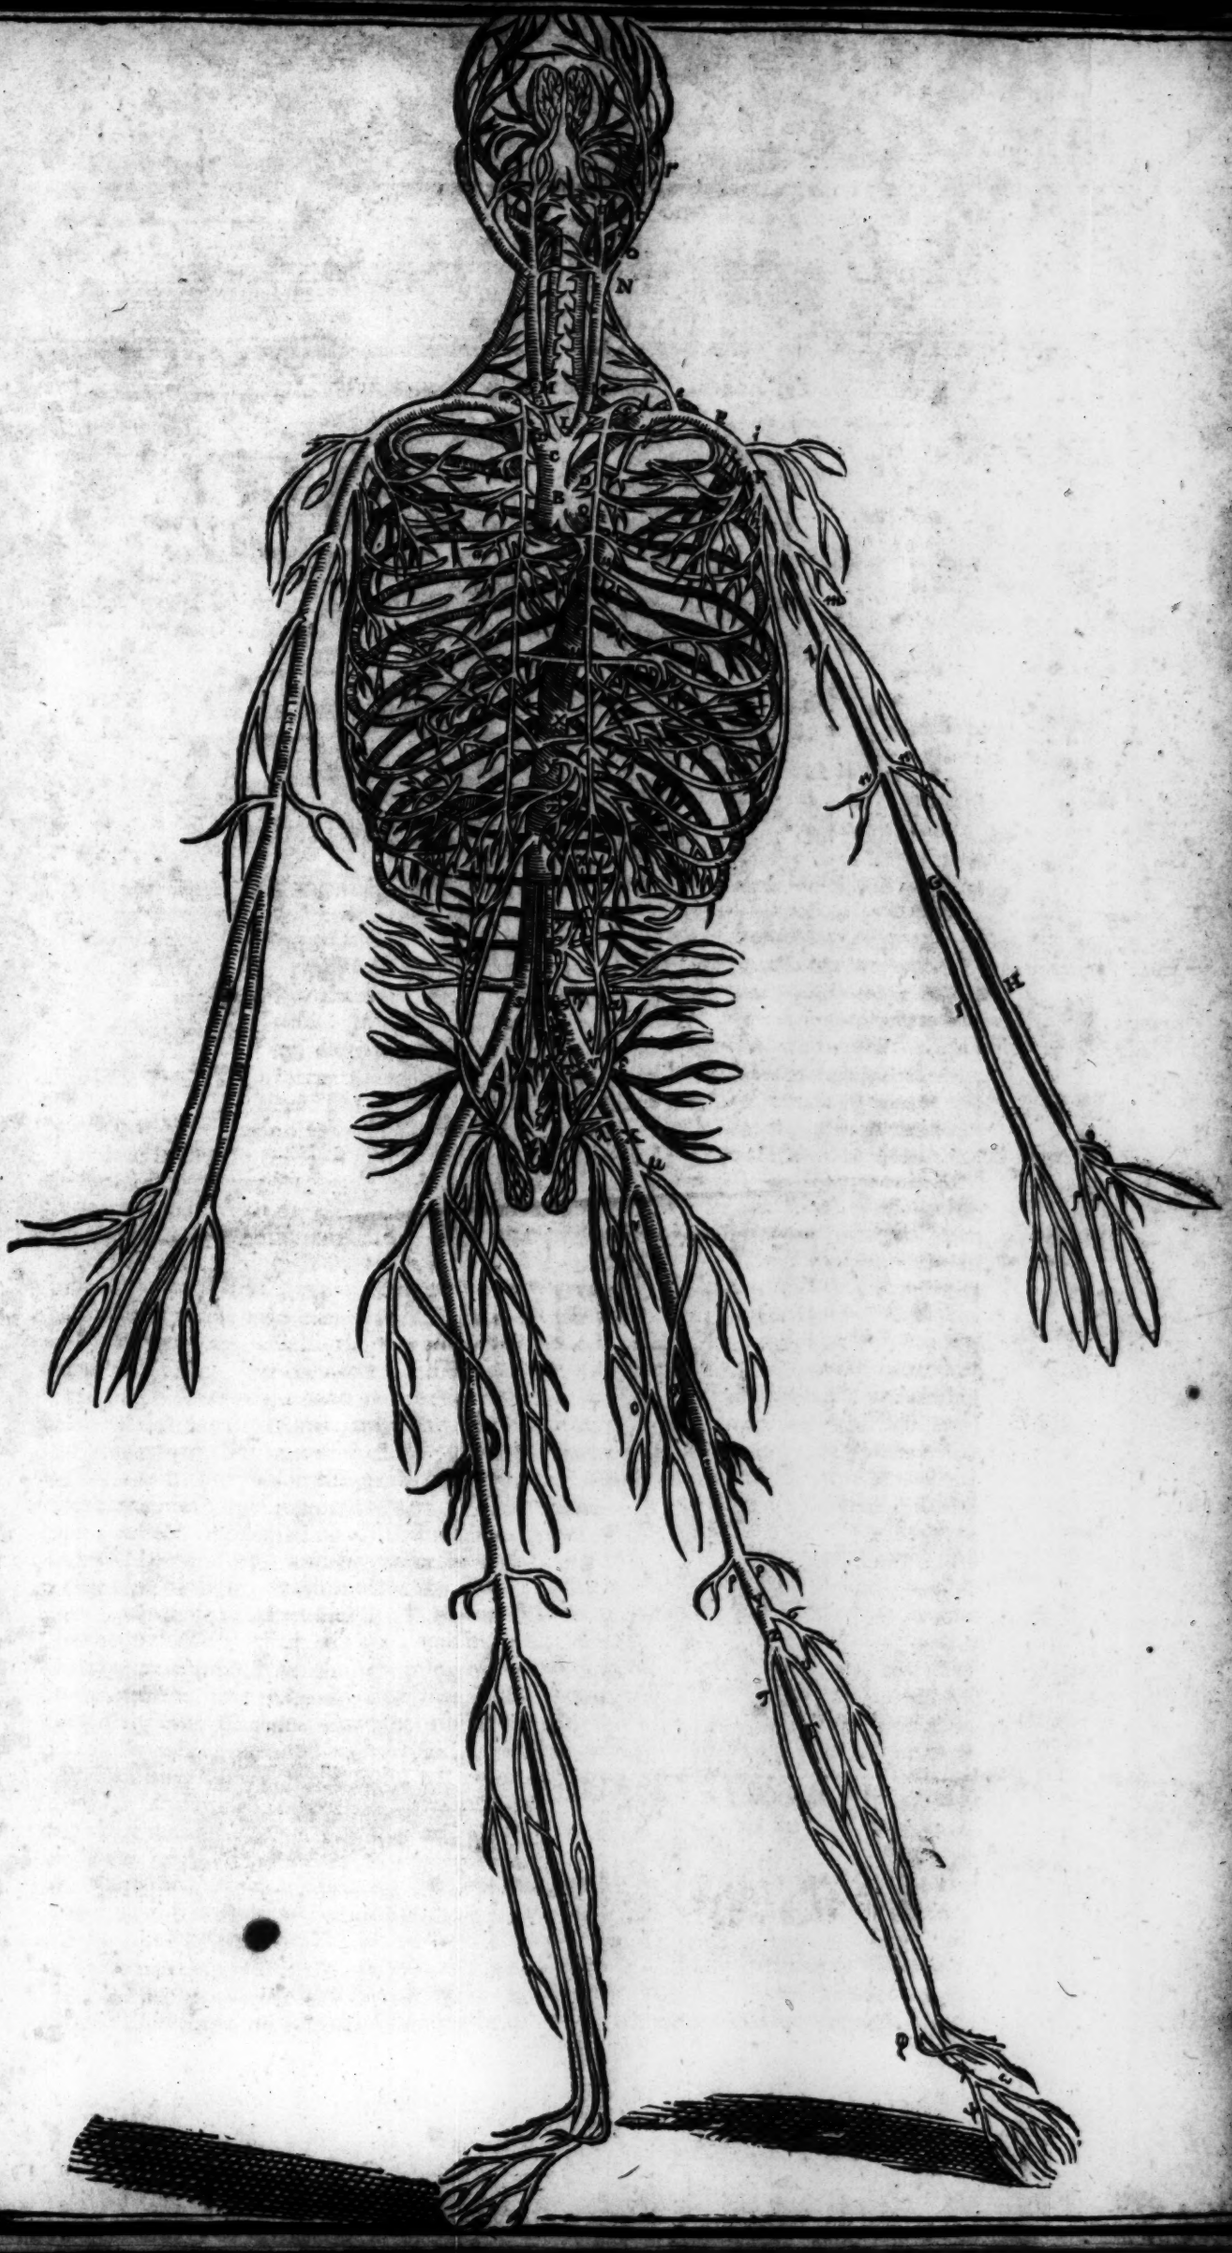
τ A higher branch issuing out of the back-side of the trunk.

υ A lower branch issuing out of the back-side of the trunk.

Γ The remainder of the trunk descending by the leg, which offers a little φ branch φ to the inner ankle.

χ The division of the trunk χ into an ψ inner branch ψ that is propagated to the great toe, and the two next; and an outer, ω propagated to the little toe, and the two next to that. ω

THE



t the skull: the other and greater, t, enters the skull, through a peculiar hole bored for it in the temple-bone.

Q The Descendent trunk of the great artery, reaching downward to the rack-bones of the back.

From this before its division at R, many propagations are scattered, which we will now rehearse in order.

First then are Intercostales inferiores, the lower arteries between the uuu ribs, u u u, distributed to the distances of the eight lower ribs, from which propagations are brought to the marrow of the back-bone; and to the muscles that grow to the back and chest. After this the trunk passing on distributes two more, called Phrenicæ the arteries of the midriffe x x, because they are disposed of into the midriffe. Then follows Cœliaca or the stomach. After that Mesenterica superior, the upper y artery of the Mesentery, y, reaching out into the guts Jejunum, and Ileum, as also into that part of the Colon, which reaches from the hollow of the liver as far as the right kidney. After this the z Emulgent arteries, z, propagated to the kidneys. Then spermaticæ, the α seed arteries, α, going to the testicles, under which is Mesenterica inferior the lower artery of the Mesenterie, β β, departing into the left side of the colick, and into the strait gut, and making the hæmorroidall arteries. Lastly Lumbares the arteries of the loins, γγγ γγγ, which going to the rack-bones o, the loins joint by joint, are distributed, into the peritonæum or rim of the belly, and the muscles growing to the rack-bones.

R These branches being issued forth, the trunk about the fift rack-bone of the SS loins, is divided into two branches S S called the Iliacall, both which are again broken into two other, an inner branch T, and an outer one V. But before this division in the very parting in twain of the Trunk, arises sacra the δ holy artery δ, distributed into the holes of the os sacrum or holy bone, to the marrow thereof.

T The inner Iliacall artery, before it falls out of the peritonæum, issues forth two propagations: from its ε outer side, that called glutæa, ε, distributed into the muscles of the buttocks; from its inner side, that ζ called Hypogastrica, ζ, going into the bladder and yard, and in women also to the bottome of the womb. After this it runs down, and sends forth the umbilicall arteries η η, that tend upward η η near to the length of the great artery.

θ The remainder under θ, taking to it a propagation from the outer Iliacal artery, slips down through the hole of the share-bone into the Crus, the end of it joining about ο with the inner muscle artery of the Crus ν.

V The outer Iliacall artery likewise before its going forth of the peritonæum produces two. The first is called Epigastrica, ι, digested into the ι muscles of the Epigastrium, and the straight ones of the abdomen, where it is joined by inoculation, κ, with the κ descending mammary artery d. The λ other called Pudenda λ, goes to the privy parts.

X In this place the outer Iliacall artery having past the Peritonæum, enters the Crus, and begins to be called the Crurall trunk, which issues out more propagations. The first is Muscula cruralis exterior, the outer μ muscle artery of the Crus, μ, that is propagated into the muscles, that cover the foreside of the Thigh-bone. The second is the inner muscle-artery of ν the Crus, ν, digested through the third bending muscle of the thigh; and those muscles that are on the inside of the thigh; the endo of it are joined with the ο ends of the inner Iliacal artery about ο. The third is Poplitea, the ham-artery, π. running out into the muscles on π the back-side of the thigh. The fourth ρρ is suralis the calf-artery ς ς, which is double, issuing out there, where the crurall trunk is hid betwixt the two lower heads of the thigh, and spreading out on both sides into the joint of the knee, and the two heads of the first extending muscle of the foot.

Y Here the great artery lyes in the ham, where it is divided into branches of unequall bigness.

σ A sprig issuing from its outside, and reacht out to the fibula or lesser bone of the leg, betwixt the muscle that moves the foot outward, and the second bending one of the instep.

Z The trunk descending by the back-side of the leg.

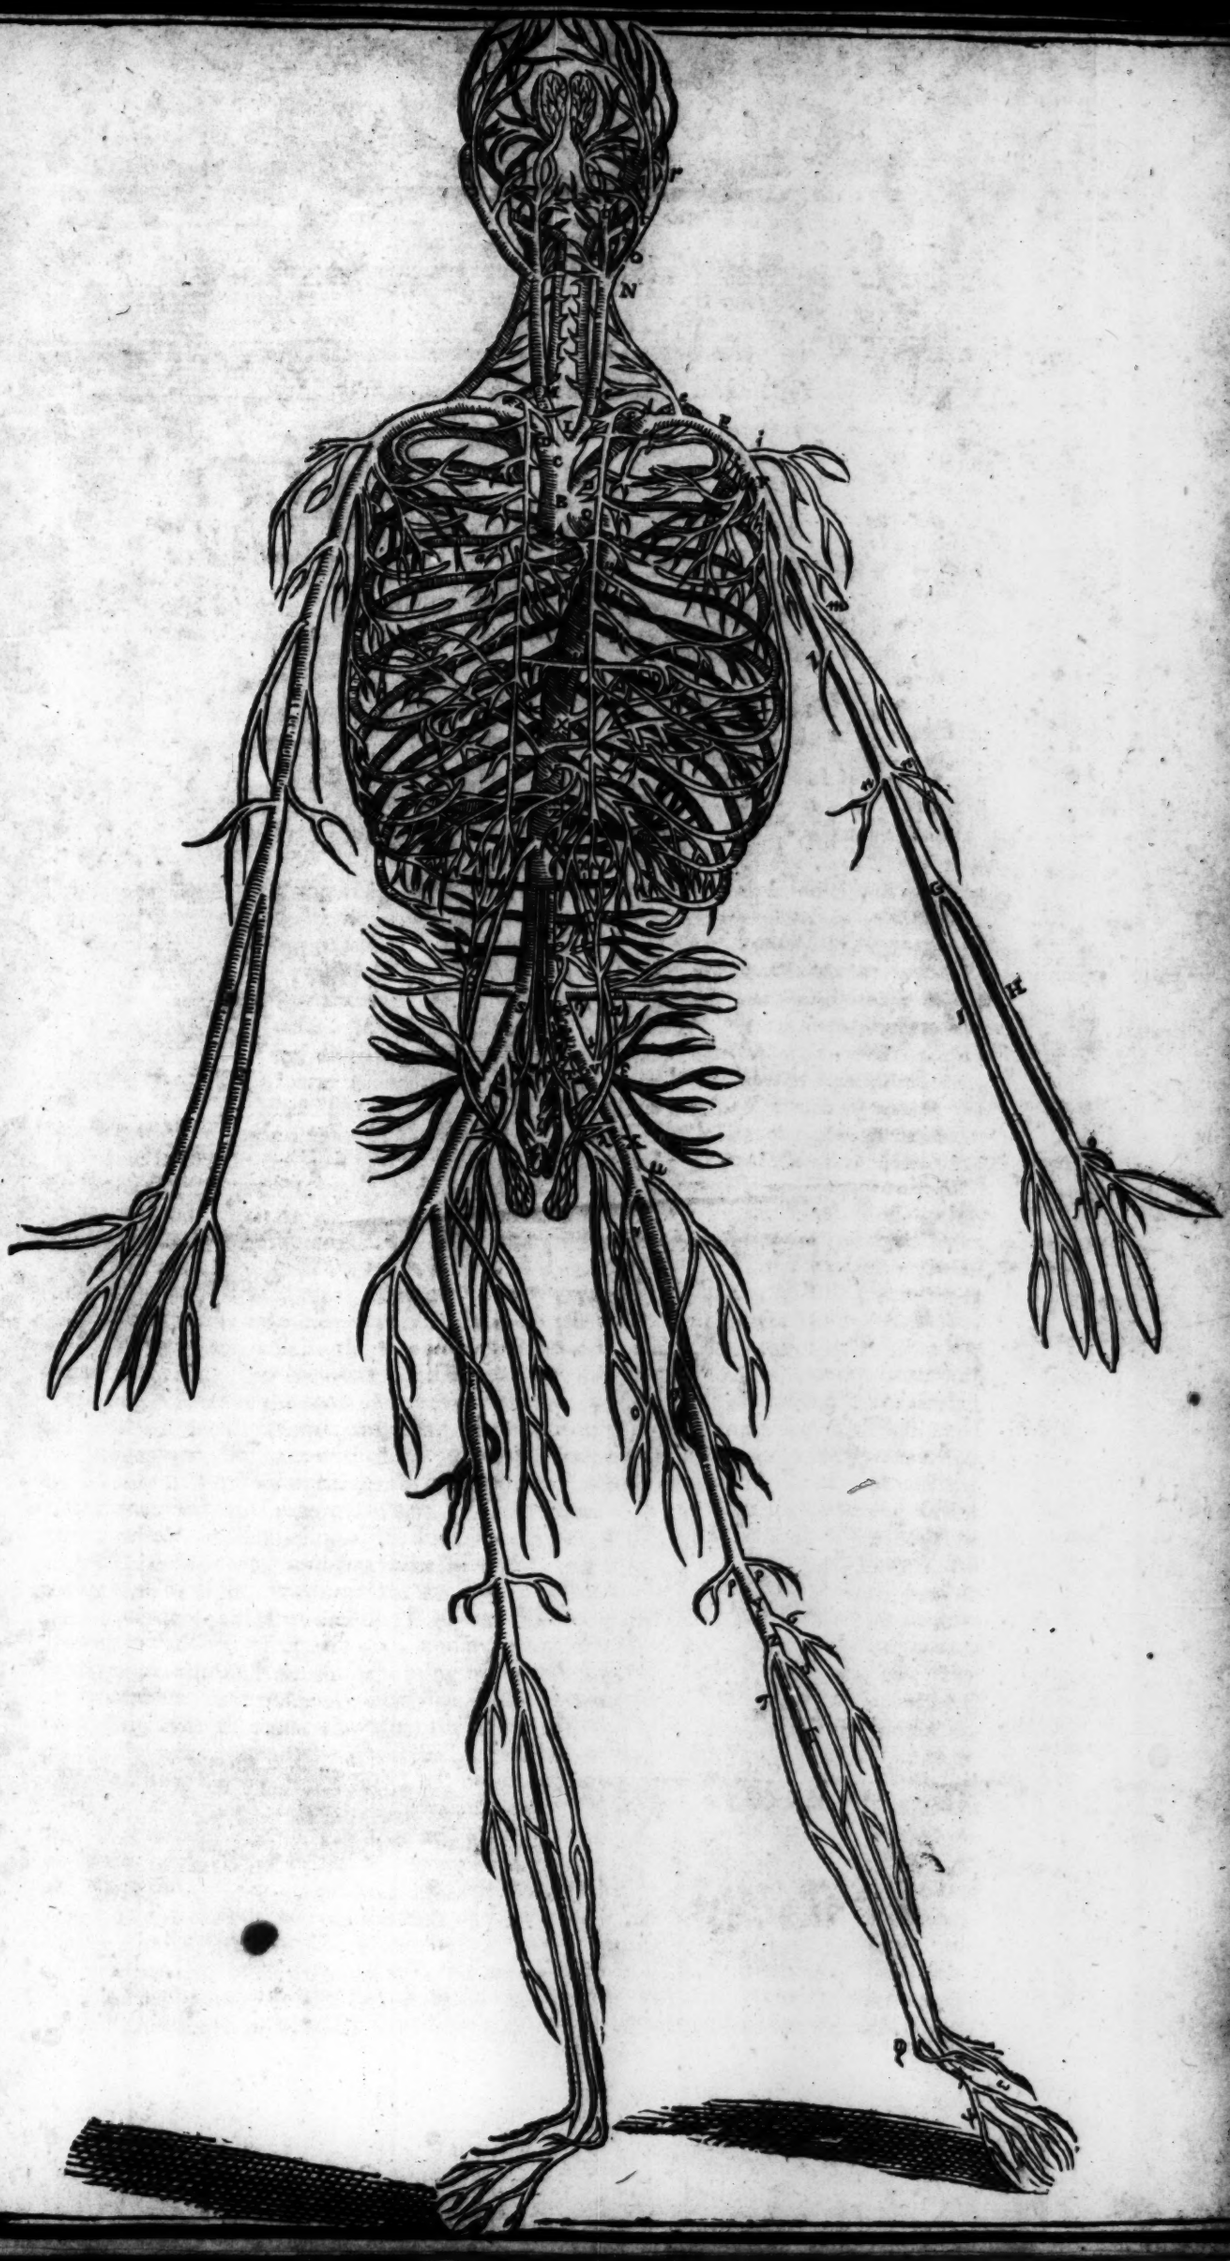
τ A higher branch issuing out of the back-side of the trunk.

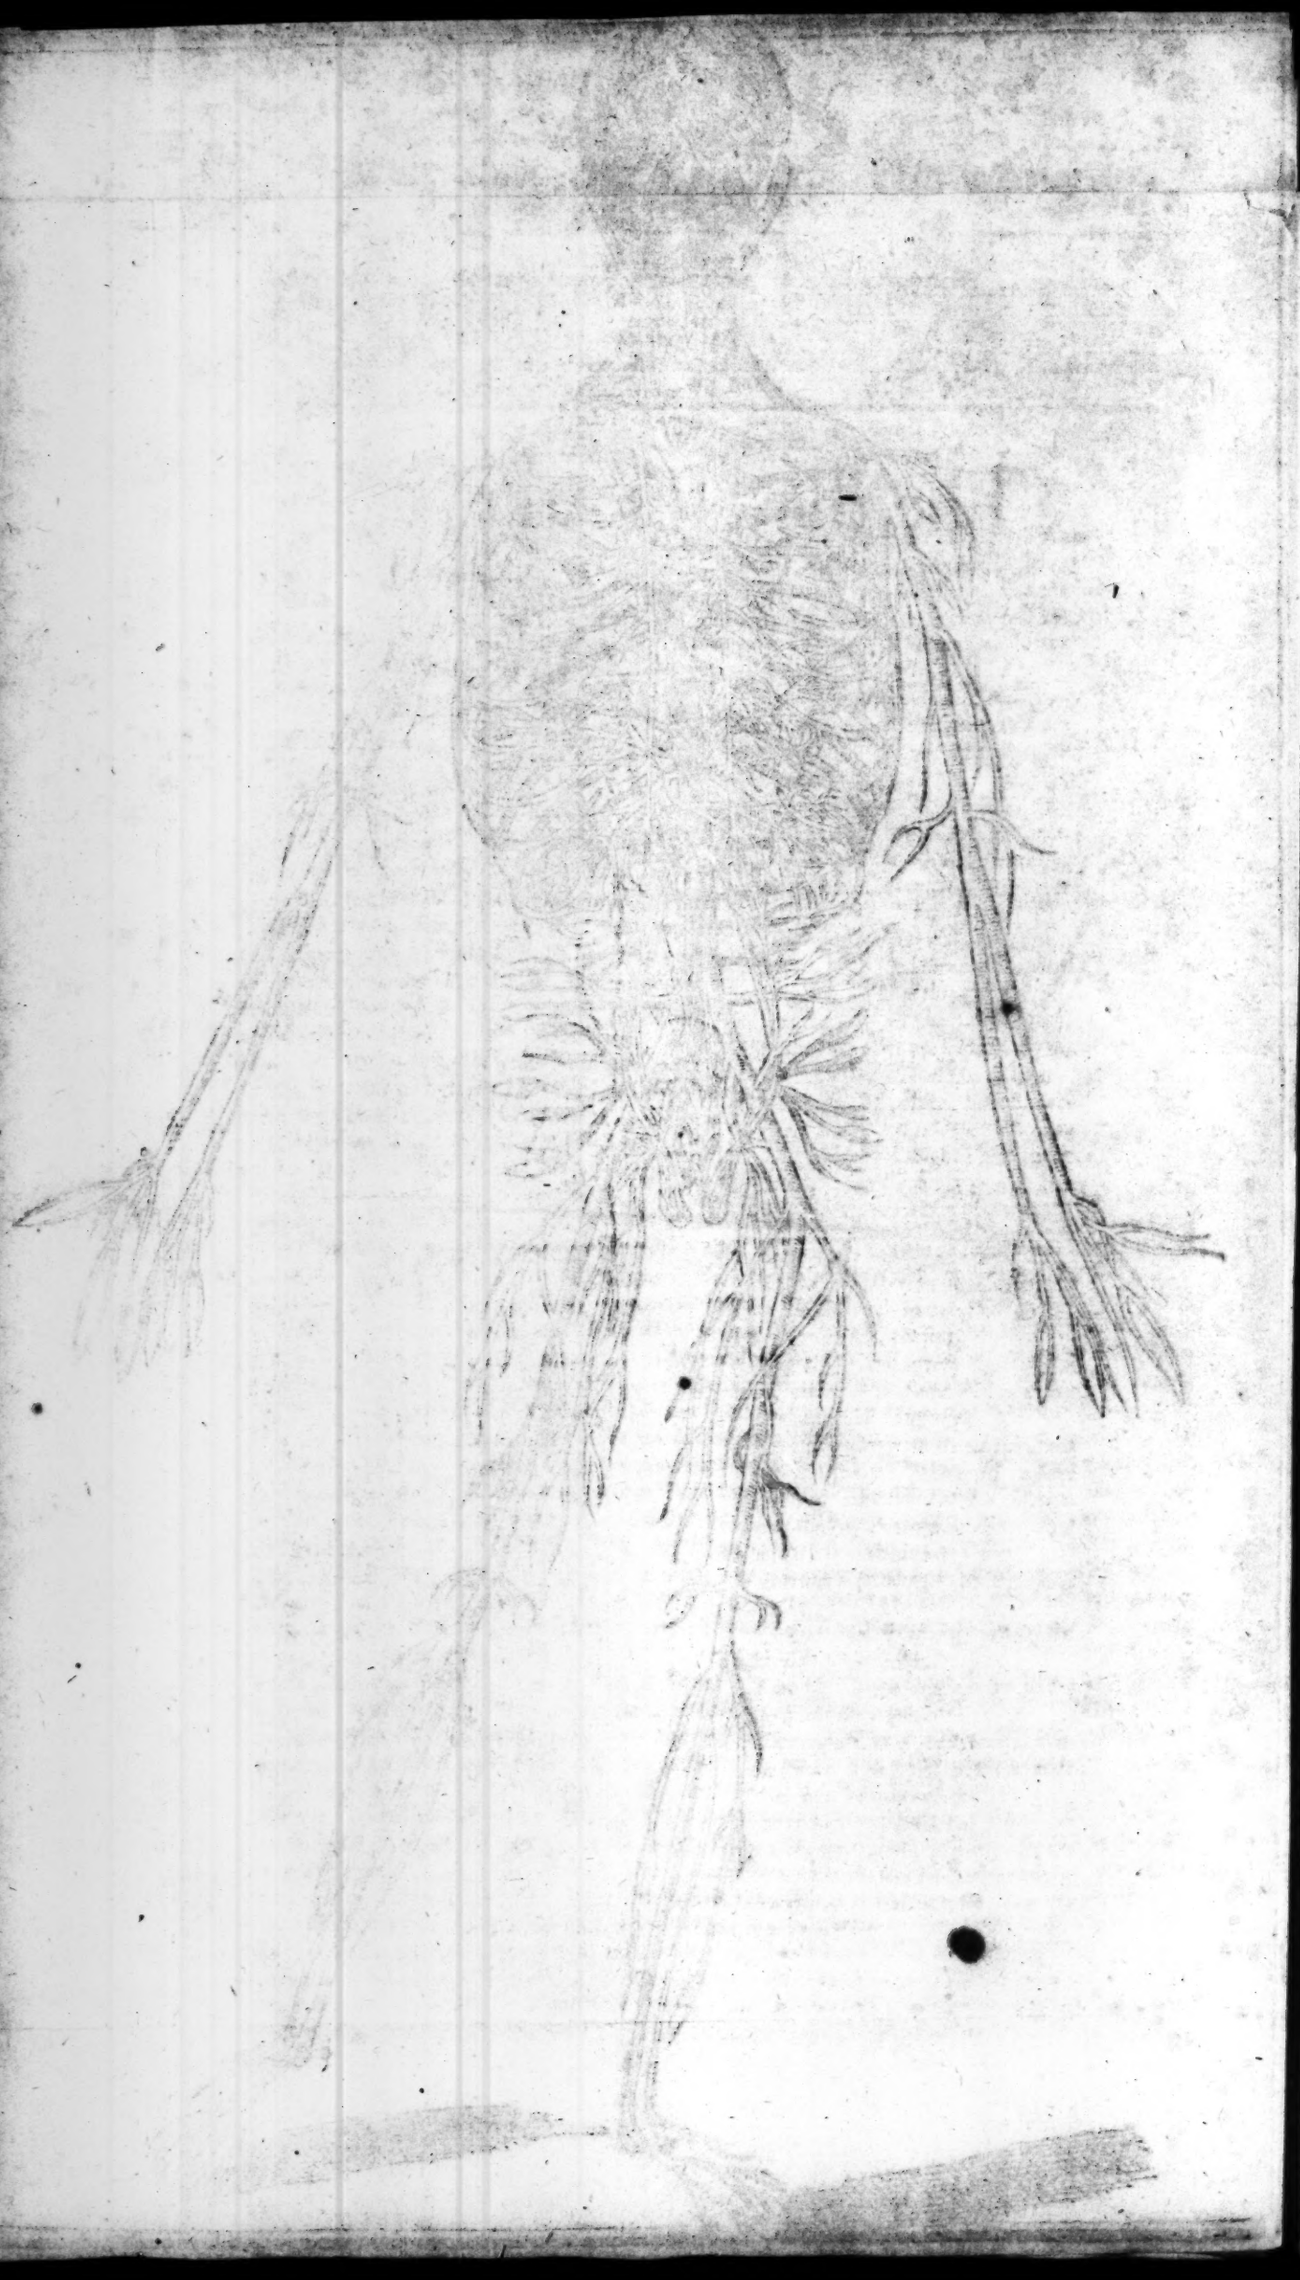
υ A lower branch issuing out of the back-side of the trunk.

Γ The remainder of the trunk descending by the leg, which offers a little φ branch φ to the inner ankle.

χ The division of the trunk χ into an ψ inner branch ψ that is propagated to the great toe, and the two next; and an outer, ω propagated to the little toe, and the two next to that.

THE





The third Treatise,
Concerning
The NERVES.

CHAP. I.
Of the nerves of the brain.

AMong those eight Conjugations, which arise from the marrow of the brain drawn out in length, whilest it is yet contained within the limits of the skull, *that* offers itself in the first place, *which makes the Optick nerves*, that are so famous among all the Masters of Anatomy. The first pair of the brain. For these are not only the biggest, if you look upon their thicknesse; but also without doubt the softest of all the nerves of the body. But they arise out of the middle of the *basis* of the brain, on the Its originall. forepart, according to the opinion of the Ancients, but indeed, if the head be turned upside down in the dissection (which is the proper way) out of the beginning of the former trunks of the spinall marrow, that their originall is as it were in the back part of the head, and presently each of them by little and Progresse. little making towards its mate, they are united (not only joyned, as some would have it) over the saddle of the wedg-bone, and make one common square body, the marrow within them being mixt together. After that presently separating again, each of them is carried obliquely into the eye of its own side, entring the orb thereof through the first Insertion. hole of the wedg-bone, and ending at the very centre of the eye. In this pair we may easily shew those two membranes, which are derived to the nerves from the two *meninges* of the brain, as also the very inner marrowy substance, which comes from the body of the brain. Yet the nerve it self is not cleft into more branches, (as the other are) but lying hid makes the coats of the eye; and out of the thick membrane it forms that coat, which is called *Cornea*, the horny one; out of the thin membrane that is called *Uvea*, the grapey one; but out of the substance of the marrow the *Retina* or coat like a net. For as soon as it is arrived at the centre of the eye, these membranes are displayed, and making a sphere contain the humors in them. These nerves convey the faculty of seeing to the *Use.* eyes; wherefore, they being obstructed, or compress, a blindnesse insues. *Galen* hath a- The holes of the optick nerves. scribed holes to them, and *Herophilus* for the same reason called them πόρους ὀπτικούς, the passages of the sight, teaching that there is a sensible hollownesse plainly to be seen in them, whom for all that almost all Anatomists do contradict. But I have heretofore shewen in the Universitie of *Padua*, and in a great assembly of men, that there are certain passages continuing from the beginning of these nerves, as far as to the place, where they meet together, and presently after that vanishing away toward the eye. And therefore I shewed that the Ancients may not only be excused, but also that they writ the truth, especially when none of them have said, that these passages were great, but only such, as did not altogether escape the sight, if one would make tryall thereof in a great living creature, and by a clear light, and presently after it is killed. For *Galen* himself requires these three conditions, 7. *placit.* 4. and *lib. de oculis*, that one may see them. But before we depart hence, I will bring in some problemes, that, besides the history itself, I may Problemes. also shew the use of that, which I say, especially when in our time they only for the most part follow the study of Anatomy, who imploy their industry in the behalf of Physick. The first therefore shall be, what is the cause, that many upon sneesing often (especially when they have provoked it for the nonce) have of a sodain falne blind. This happens, either because the branches of the sleepy arteries, which are so near to the optick nerves, that they touch, are filled, and being so, presse together those nerves; or else be- 1.

cauſe a copious, and that a phlegmatick humor has faln out of the brain into the optick nerves, and obſtructed them. I have ſeen thoſe, that have been blind through the firſt cauſe, ſometimes cured by a Seton; but I never remember, that any, in whom this aroſe from phlegmatick humors, have recovered, except one having the French pox, who being anointed with quick-ſilver, all the humors melting away, was reſtored to health. But it is not the part of a good and pious Phyſitian, to make uſe of thoſe things, which, being full of danger, may do more harm, if they prove hurtfull, then they can procure good, if they be profitable. And truly it is better not to cure blindneſſe, then to cauſe death; although oftentimes raſhneſſe helps them, whom reaſon helps not, as the moſt elegant of Phyſitians *Celſus* ſayes elegantly. In the mean time in diſeaſes of the eyes, they who practiſe Phyſick, may learn rather to adminiſter thoſe things, which bring the phlegm out by the palat, then to draw the noxious humors to the noſtrils. That I may conceal beſides the danger which they avoid, that more profit ariſes from the medicins, that void the phlegm out of the head through the mouth; which both long experience hath hitherto taught, and Anatomy perſwades, when the optick nerves in their originall are not far diſtant from the palat; but farther from the ſpondy bone, and it is a preternaturall way, by which the humors are carried, as hath been already demonſtrated by
2. the learned *Veſalius*. Then it is diſputed, by what means the eye can fall out of its orb. the optick nerve not being broke, whereof we have very many hiſtories. But it is not hard to give an anſwer, to wit, that the nerves may be very much extended in length. Whileſt therefore this nerve receives much moiſture in the inflammations of the eyes, it eaſily comes to paſſe, that it is ſlackned; but the muſcles themſelves ſwelling very much, when they can no longer be contained in the orb, leap forth out of it. For this falling forth of the eyes moſt commonly proceeds from inflammations; ſuch as are the ſtories of
3. the moſt learned *Vega*, who cured a woman in this caſe by procuring the flux of her terms, and a young man by digeſting ointments. But the queſtion is very worthy to be made mention of, and that gives me an occaſion to explain it, which I have read in ſome Authors, that ſuch as were before blind, upon receiving of a wound overthwart the fore-head, and ſome, upon a great looſneſſe of the belly ariſing on a ſodain, have received their ſight, and that preſently. The cauſe of their blindneſſe was no other, then the compreſſion of theſe nerves proceeding from the neighbour-veſſels, to wit, the veins, and arteries being ſwoln with bloud, which ſuch a wound preſently emptyed. Wherefore I alſo ſometimes, and not without ſucceſſe, in that *ſpecies* of blindneſſe, which the Barbarians call *Gutta ſerena*, open the middle vein of the fore-head, out of which I draw bloud ſo long, till it ceaſes to run of its one accord.

The ſecond pair. Its originall. *The ſecond pair* ariſes, as the ancient Anatomiſts ſay, from the ſides of the *baſis* of the forepart of the brain, near to the originall of the firſt pair. But the new diſſection ſhews, that it iſſues out at the inſide of the beginning of the ſpinall marrow, and that they are ſo united in their originall, that they make one common angle, which is the cauſe why both the eyes are moved together to the ſame ſides. It is much ſmaller, if you compare it with the firſt pair, and harder, and goes out of the skull through the ſecond hole of the wedg-bone, which is ſomewhat long, and ſo it enters the orb of the eye. By and

Branches. by it is divided into many ſprigs, which goe to the muſcles of the eye; and *the firſt* climb-
1. ing up above the firſt pair, or the optick nerves, is diſpoſed of into the two muſcles, as well
2. that, which lifts up the eye-lip, as that which lifts up the eye. *Another* very conſpicuous
3. one is diſſeminated in many ſurcles into the muſcle, which moves the eye inward. *The third*, no contemptible one neither, being divided firſt into two fibres, and by and by into more,
4. is ſent into the muſcle, that draws down the eye: *the fourth*, into the lower or leſſer of the oblique muſcles, that rowls the eye about toward the other angle. At length it iſſues out ſome thin fibres, which being joined with the firſt pair are diſtributed to the outer membranes of the eye, ſo that this ſecond pair is propagated only to four muſcles of the eye, and
Uſe. to that, which lifts up the eye-lid. The uſe of this pair is, to impart the faculty of motion to the muſcles of the eyes.

The third pair. Its originall. Banches. 1. *The third pair* ariſes with a very ſmall nerve out of the lower, and hinder part of the marrow of the brain, and runs directly forwards under the *baſis* of the brain, being tyed to the ſecond conjugation, together with which it enters into the orb of the eye through the ſaid ſecond hole of the wedg-bone. By and by it is divided into four branches, of which *the firſt* offers a little branch to the upper, and greater of the oblique muſcles of the eye, or that called the muſcle of the pulley, and then falling out through the hole of the fore-head-bone above the orb of the eye, in the skin, and muſcle of the fore-head, which ought rather to be called the muſcle of the ey-brows. This branch is diligently to be

An obſervation. taken notice of, becauſe I have long ſince obſerved, that, it being hurt with a ſlight wound the eye-lid fell down, whileſt the muſcle of the eye-brow by reaſon thereof fell into a Palſie. I have ſeen alſo the ſame palſie cauſed by cold, and narcotick medicins, ſomewhat unreaſonably applyed for the procuring of ſleep. But hence alſo a reaſon may be rendred, why *Hippocrates* 1. Prognoſtic. reckons it among the ſigns of death in acute diſeaſes to ſleep with the eyes half open. For this is an ill ſign for that reaſon, becauſe it ſignifies,

that

that the nerves are very much dryed, and ſo the brain itſelf, whence it comes to paſſe, that they, who are ſo diſeaſed, for the moſt part ſuffering convulſions afterward dye. In ſome alſo a fore-runner of the Falling-ſickneſſe is wont to ariſe from the ſame cauſe in the eye-lids, the eyes, and the whole face, when this third pair is pluckt by the humors begetting the falling-ſickneſſe, and ſo a convulſion of the eyes, and face is cauſed. *The ſecond* branch is carried downward, and falls out through the hole of the fourth bone of the upper jaw, which is under the orb of the eye, and preſently ſcattering into more propagations, on the forepart of the face, is ſpent upon the muſcles, that move the upper lip, and wing of the noſe outward, as alſo upon the lip itſelf, and the gums of the teeth, called *Inciſorii*, or ſhredders. *The third* is ſent through the hole of the ſecond bone of the upper jaw, behind the caruncle, that is placed in the inner angle of the eye, to the wide cavity of the noſtrills, being ſpread throughout its coat, whereby it comes to paſſe, that it is indued with a very ſharpe ſenſe, and being but lightly touch'd cauſes ſneezing. *The fourth* goes out through that creviſe, which is betwixt the firſt bone of the upper jaw, and the wedg-bone, in the outer angle of the eye, or through the fourth hole of the wedg-bone, and departs to the inner ſide of the temporall muſcle. The uſe of this pair is to convey the faculty of moving to the ſaid muſcles. 2. Uſe.

The fourth pair ariſes out of the marrow of the brain on the backſide, goes out of the ſkull through the ſixt hole of the wedge-bone, and running ſtraight down, propagates three branches from itſelf. *The firſt* is preſently after its going out of the ſkull, which being writhed ſometimes about in manner of the tendrells of a vine, or gourd, and united to two ſprigs of the Auditory nerve (of which we are to ſpeak next) afterward diſtributes ſurcles to the temporall muſcle, that lifts up the lower jaw, and that which moves it forward from the head, as alſo to the muſcles of the cheeks. After this the pair running farther down, iſſues forth a *ſecond* branch, which propagates ſurcles in order to the gums of the upper cheek-teeth called the grinders, and alſo to the teeth themſelves. *The third* branch iſſuing forth from the backſide of the nerve, and entring the hole of the lower jaw-bone that is bored in the inner ſurface of it, at the originall of the proceſſes, beſtows little branches in order to the roots of the teeth, and at length going forth through the foremoſt hole in the outer ſurface is terminated in the lower lip, and skin of it. The remainder of this nerve is ſpent upon the coat of the tongue near to the root, and ſo gives it the power of diſtinguiſhing ſapors or taſting. The fourth pair. Its originall branches. 1.

But note in this place, that theſe two pairs which we have now recounted, I ſay, the third and fourth, are commonly reckoned for one by Anatomiſts, and that the third; but with this diſtinction, that they ſay this very pair ariſes with a double root; the one ſmaller, and the other thicker. They call that the ſmaller root, which we ſet down for the third pair; that the thicker, which we make the fourth. But we diſtinguiſh them, becauſe indeed they are not joined together, neither in their originall, nor in their progreſſe. But that which they account for the fourth pair, ſeems not to bee diſtinguiſhed, from the third; as *Valuerda* himſelf grants, *lib. 7. Anatomiæ. cap.* 4. A note.

The fifth pair iſſues out of the marrow of the brain drawn out in length, on that ſide whereon a part of the *cerebellum* or after-brain is joined to it, ariſing out of two nerves, of which one is ſofter, the other harder. Theſe go out of the membrane together, and enter the organs of hearing, through the hole of the temple-bone, that is bored in the ſtony proceſſe thereof, being a large one and winding. After this that *harder* part goes forthwith to the foreſide, being carried through a peculiar channell, and returns backward again obliquely through the ſame bone, and departs into the firſt cavity of the inner ear. From thence being more reflected, it ſends forth two propagations, one higher, the other lower; but both paſs through their peculiar holes. *The upper* is carried through the tranſverſe hole of the ſame bone, through which alſo a little vein paſſes into the organ of hearing; and a little after it is come forth of it, is joined with that branch of the fourth pair (as we have delivered; but as other commonly count the pairs of the third) which we told you was writhed about, like the tendrell of a Vine. *The lower* goes out through the third hole of the ſame bone, which is very narrow and winding, and being carried overthwart above the muſcle of the lower jaw, that moves it ſidewards, deſcends into the chops, having diſſeminated a pretty many propagations into the noſtrills. But forthwith it is joined with the propagation of the fourth pair, that reſembles the tendrell of a Vine, or that ſprig which goes to the tongue, from which is paſſes to the roots of the teeth, and muſcles of the cheeks, as alſo to the skin that goes about the root of the outer, or little ear. Anatomiſts do beleeve, that by means of this branch it comes to paſſe, that they who are born deaf, are for the moſt part dumb alſo. But that *ſofter* part of this pair is carried together with the hard part; and when it is come to that firſt cavity of the inner ear, it is ſpread throughout it in manner of a membrane, and ſo it deſerves to bee called the Auditory nerve, as miniſtring all the ſpirits, that ſerve for hearing. The fifth pair. Its originall. Its two parts. The harder. The ſoft part. Its uſe.

The ſixth pair ariſes ſomewhat more toward the lower and hinder part, then the fifth, and The ſixth pair. Its originall.

cause a copious, and that a phlegmatick humor has faln out of the brain into the optick nerves, and obstructed them. I have seen those, that have been blind through the first cause, sometimes cured by a Seton; but I never remember, that any, in whom this arose from phlegmatick humors, have recovered, except one having the French pox, who being anointed with quick-silver, all the humors melting away, was restored to health. But it is not the part of a good and pious Physitian, to make use of those things, which, being full of danger, may do more harm, if they prove hurtfull, then they can procure good, if they be profitable. And truly it is better not to cure blindnesse, then to cause death; although oftentimes rashnesse helps them, whom reason helps not, as the most elegant of Physitians *Celsus* sayes elegantly. In the mean time in diseases of the eyes, they who practise Physick, may learn rather to administer those things, which bring the phlegm out by the palat, then to draw the noxious humors to the nostrils. That I may conceal besides the danger which they avoid, that more profit arises from the medicins, that void the phlegm out of the head through the mouth; which both long experience hath hitherto taught, and Anatomy perswades, when the optick nerves in their originall are not far distant from the palat; but farther from the spongy bone, and it is a preternaturall way, by which the humors are carried, as hath been already demonstrated by
3. the learned *Vesalius*. Then it is disputed, by what means the eye can fall out of its orb. the optick nerve not being broke, whereof we have very many histories. But it is not hard to give an answer, to wit, that the nerves may be very much extended in length. Whilest therefore this nerve receives much moisture in the inflammations of the eyes, it easily comes to passe, that it is slackned; but the muscles themselves swelling very much, when they can no longer be contained in the orb, leap forth out of it. For this falling forth of the eyes most commonly proceeds from inflammations; such as are the stories of the most learned *Vega*, who cured a woman in this case by procuring the flux of her terms,
3. and a young man by digesting ointments. But the question is very worthy to be made mention of, and that gives me an occasion to explain it, which I have read in some Authors, that such as were before blind, upon receiving of a wound overthwart the forehead, and some, upon a great loosnesse of the belly arising on a sodain, have received their sight, and that presently. The cause of their blindnesse was no other, then the compression of these nerves proceeding from the neighbour-vessels, to wit, the veins, and arteries being swoln with bloud, which such a wound presently emptyed. Wherefore I also sometimes, and not without successe, in that *species* of blindnesse, which the Barbarians call *Gutta serena*, open the middle vein of the fore-head, out of which I draw bloud so long, till it ceases to run of its one accord.

The second pair. Its originall. *The second pair* arises, as the ancient Anatomists say, from the sides of the *basis* of the forepart of the brain, near to the originall of the first pair. But the new dissection shews, that it issues out at the inside of the beginning of the spinall marrow, and that they are so united in their originall, that they make one common angle, which is the cause why both the eyes are moved together to the same sides. It is much smaller, if you compare it with the first pair, and harder, and goes out of the skull through the second hole of the wedg-bone, which is somewhat long, and so it enters the orb of the eye. By and by it is divided into many sprigs, which goe to the muscles of the eye; and the *first* climbing up above the first pair, or the optick nerves, is disposed of into the two muscles, as well
Branches. 1. that, which lifts up the eye-lip, as that which lifts up the eye. *Another* very conspicuous
2. one is disseminated in many surcles into the muscle, which moves the eye inward. *The third*,
3. no contemptible one neither, being divided first into two fibres, and by and by into more,
4. is sent into the muscle, that draws down the eye: *the fourth*, into the lower or lesser of the oblique muscles, that rowls the eye about toward the other angle. At length it issues out some thin fibres, which being joined with the first pair are distributed to the outer membranes of the eye, so that this second pair is propagated only to four muscles of the eye, and
Use. to that, which lifts up the eye-lid. The use of this pair is, to impart the faculty of motion to the muscles of the eyes.

The third pair. Its originall. Banches. 1. *The third pair* arises with a very small nerve out of the lower, and hinder part of the marrow of the brain, and runs directly forwards under the *basis* of the brain, being tyed to the second conjugation, together with which it enters into the orb of the eye through the said second hole of the wedg-bone. By and by it is divided into four branches, of which *the first* offers a little branch to the upper, and greater of the oblique muscles of the eye, or that called the muscle of the pulley, and then falling out through the hole of the fore-head-bone above the orb of the eye, in the skin, and muscle of the fore-head,

An observation. which ought rather to be called the muscle of the ey-brows. This branch is diligently to be taken notice of, because I have long since observed, that, it being hurt with a slight wound the eye-lid fell down, whilest the muscle of the eye-brow by reason thereof fell into a Palsie. I have seen also the same palsie caused by cold, and narcotick medicins, somewhat unreasonably applyed for the procuring of sleep. But hence also a reason may be rendred, why *Hippocrates* 1. Prognostic. reckons it among the signs of death in acute diseases to sleep with the eyes half open. For this is an ill sign for that reason, because it signifies,

that

that the nerves are very much dryed, and so the brain itself, whence it comes to passe, that they, who are so diseased, for the most part suffering convulsions afterward dye. In some also a fore-runner of the Falling-sickness is wont to arise from the same cause in the eye-lids, the eyes, and the whole face, when this third pair is pluckt by the humors begetting the falling-sickness, and so a convulsion of the eyes, and face is caused. *The second* branch is carried downward, and falls out through the hole of the fourth bone of the upper jaw, which is under the orb of the eye, and presently scattering into more propagations, on the forepart of the face, is spent upon the muscles, that move the upper lip, and wing of the nose outward, as also upon the lip itself, and the gums of the teeth, called *Incisorii*, or shredders. *The third* is sent through the hole of the second bone of the upper jaw, behind the caruncle, that is placed in the inner angle of the eye, to the wide cavity of the nostrills, being spread throughout its coat, whereby it comes to passe, that it is indued with a very sharpe sense, and being but lightly touch'd causes sneezing. *The fourth* goes out through that crevise, which is betwixt the first bone of the upper jaw, and the wedg-bone, in the outer angle of the eye, or through the fourth hole of the wedg-bone, and departs to the inner side of the temporall muscle. The use of this pair is to convey the faculty of moving to the said muscles.

2.

Use.

The fourth pair arises out of the marrow of the brain on the backside, goes out of the skull through the sixt hole of the wedge-bone, and running straight down, propagates three branches from itself. *The first* is presently after its going out of the skull, which being writhed sometimes about in manner of the tendrells of a vine, or gourd, and united to two sprigs of the Auditory nerve (of which we are to speak next) afterward distributes sircles to the temporall muscle, that lifts up the lower jaw, and that which moves it forward from the head, as also to the muscles of the cheeks. After this the pair running farther down, issues forth a *second* branch, which propagates sircles in order to the gums of the upper cheek-teeth called the grinders, and also to the teeth themselves. *The third* branch issuing forth from the backside of the nerve, and entring the hole of the lower jaw-bone that is bored in the inner surface of it, at the originall of the processe, bestows little branches in order to the roots of the teeth, and at length going forth through the foremost hole in the outer surface is terminated in the lower lip, and skin of it. The remainder of this nerve is spent upon the coat of the tongue near to the root, and so gives it the power of distinguishing sapors or tasting.

The fourth pair.
Its originall branches.

3.

But note in this place, that these two pairs which we have now recounted, I say, the third and fourth, are commonly reckoned for one by Anatomists, and that the third; but with this distinction, that they say this very pair arises with a double root, the one smaller, and the other thicker. They call that the smaller root, which we set down for the third pair; that the thicker, which we make the fourth. But we distinguish them, because indeed they are not joined together, neither in their originall, nor in their progresse. But that which they account for the fourth pair, seems not to bee distinguished, from the third; as *Valverda* himself grants, *lib. 7. Anatomic. cap. 4.*

A note.

The fifth pair issues out of the marrow of the brain drawn out in length, on that side whereon a part of the *cerebellum* or after-brain is joined to it, arising out of two nerves, of which one is softer, the other harder. These go out of the membrane together, and enter the organs of hearing, through the hole of the temple-bone, that is bored in the stony processe thereof, being a large one and winding. After this that *harder* part goes forthwith to the forside, being carried through a peculiar channell, and returns backward again obliquely through the same bone, and departs into the first cavity of the inner ear. From thence being more reflected, it sends forth two propagations, one higher, the other lower; but both pass through their peculiar holes. *The upper* is carried through the transverse hole of the same bone, through which also a little vein passes into the organ of hearing; and a little after it is come forth of it, is joined with that branch of the fourth pair (as we have delivered; but as other commonly count the pairs of the third) which we told you was writhed about, like the tendrell of a Vine. *The lower* goes out through the third hole of the same bone, which is very narrow and winding, and being carried overthwart above the muscle of the lower jaw, that moves it sidewards, descends into the chops, having disseminated a pretty many propagations into the nostrills. But forthwith it is joined with the propagation of the fourth pair, that resembles the tendrell of a Vine, or that sprig which goes to the tongue, from which is passes to the roots of the teeth, and muscles of the cheeks, as also to the skin that goes about the root of the outer, or little ear. Anatomists do beleeve, that by means of this branch it comes to passe, that they who are born deaf, are for the most part dumb also. But that *softer* part of this pair is carried together with the hard part; and when it is come to that first cavity of the inner ear, it is spread throughout it in manner of a membrane, and so it deserves to bee called the Auditory nerve, as ministring all the spirits, that serve for hearing.

The fifth pair.

The soft part.
Its use.

The sixth pair arises somewhat more toward the lower and hinder part, then the fifth, and

The sixth pair and its originall.

and not with one, but with many little nerves ſevered from each other, which for all that are preſently joined together, although they do not cloſe ſo, as to make one only, but two diſtinct ones alwaies, yet are they contained in one membrane, ariſing from the *Dura meninx* of the brain, which hath deceived many, ſo that they have accounted them for one. Being thus joined, they deſcend both together out of the skull, through the ſecond and third hole of the nowl bone; through which ſame the leſſer branch of the ſleepy artery, and the greater of the Jugular vein enter into the skull. There being then two nerves, the *one* in its egreſſe inclines more to the forepart of the ſaid hole, and is the leſſer of the two; the *other* to the hinder part, and is the *greater*. *That* preſently after its going forth of the skull, tends ſtraight downward to the muſcles of the tongue and chops, and to the parts placed in the mouth, upon which it is wholly conſumed.

The leſſer nerve.

The greater nerve, and its propagation.

This on the contrary ſends its firſt propagation to the muſcles ſeated on the backſide of the neck, eſpecially to the firſt muſcle of the ſhoulder-blade, called *Cucullaris* or the cowl-muſcle, and then adhering to the ſeventh pair, and the aforeſaid artery and vein, by the benefit of certain membranes, it runs down to the ſides of the throtle, to whoſe muſcles, eſpecially thoſe ſeated in the inner cavity, it diſtributes ſurcles overthwart. Here many propagations of nerves meeting together, and parting aſunder again, a certain texture is made, wherein knots are found not unlike to the glandules, that are tyed to the divarications of the veſſels; which was firſt obſerved by the moſt learned Anatomiſt *Falloppius*, who would have it reſemble the body of an olive. But the greater nerve it ſelf going in the middle betwixt thoſe ſame veſſells which I ſpake of, is carried leiſurely from the throtle to the rough artery, and running down at the ſide thereof, tends to the cheſt.

The branches of the greater nerve.

But before it enters thereinto, it is divided over the hollow of the neck into two branches, of which one is the outer and leſſe: the other the inner and greater. We ſhall now ſpeak briefly of the diſtribution and propagations of them, but ſo that being the right trunk is diſſeminated in another manner then the left, we ſet down the hiſtory of each by it ſelf; and firſt of the right, then of the left.

The propagations of the outer branch of the right nerve.

The outer branch then of the *right* nerve ſends out propagations preſently after the diviſion to the muſcle that bends the head, called *Maſtoideus*, as alſo to that of the bone *hyoides*, called *ſternohyoideus*, and that of the *Larinx* or throtle, called *ſternothyroideus*; after this it enters the cavity of the cheſt, and when it comes to the axillary artery, iſſues forth

1. from its inſide ſometimes three, ſometimes two ſurcles one under another which are returned about the ſaid axillary artery, as it were an axel-tree, or (to ſay truelyer) a kind of pulley, and cloſing together make one nerve; which being

2. faſtned to the right ſide of the rough artery, by the benefit of a membrane, runs back from the lower part thereof to the higheſt, and haſts to the right ſide of the throtle, leaning upon a glandule, which is placed at the root of the right ſide. Having paſt this, it is forthwith divided into many ſurcles, which are ſpent upon the muſcles of their own ſide, which are placed in the throtle, and have their heads downward, giving motion to them.

The right recurrent nerve.

And this nerve is called *Recurrens*, the returning one from its progreſſe, and is very famous among all, being ſo made by skilfull nature with great wiſdome, that it might be inſerted into the muſcles of the throtle, whoſe heads look downward, when all the nerves that give motion, ought to be inſerted into the heads, and to look towards the end, not on the contrary. And becauſe the throtle is an organ of the voice, but the voice cannot be uttered without motion of the muſcles, that either open the cartilages of the throtle, or ſhut them; therefore theſe nerves, which impart to the muſcles the power of moving and contracting themſelves, being either bound hard or cut off, it happens for that cauſe, that the voice is taken away. This may be very handſomely ſhewn in dogs, or in a hog, becauſe the one continually makes a noiſe with barking, the other with grunting. For one of theſe nerves being cut off, halfe the voice is taken away; but both being cut, it is wholly loſt. The recurrent propagation being thus conſtituted, the outer branch running down obliquely under the hollow of the neck, after that by the way it hath

3. diſtributed ſurcles of an indifferent bigneſſe into the *Pleura*, or membrane of the ribs, and

4. into the coat of the lungs, and given others to the *pericardium* or purſe of the heart, and to

5. the heart it ſelf; it deſcends farther within the duplication of the *mediaſtinum*, and near to the rack-bones is divided into two branches, which make *the right nerve of the left orifice of the ſtomach*, are carried obliquely, and then piercing through the midriffe, together with the gullet, to which for all that they afford never a branch, are conſumed upon the left orifice of the ſtomach, with many branches like a little net, and ſo encompaſſe it together with the left nerve, that it ſeems wholly to conſiſt of nerves. Hence there is ſo great a ſympathy of the ſtomach, not only with the brain, but with the heart alſo; that ſuch diſeaſes, as pain the upper orifice, ſeem to be of the heart, and indeed ſo they are, the ſame heart ſuffering pain, becauſe of this nerve being pained. And this is the true cauſe, to wit, the communion of this nerve, not the nearneſſe of both the entrails, as others ſay. The *inner branch* goes to the inner ſide of the root of the firſt rib of the cheſt, and cleaving to the

Whence the ſympathy is betwixt the ſtomach and heart.

Propagations of the inner branch.

the rack-bones under the *Pleura*, runs down through the roots of the reſt of the ribs, taking to it a little branch from every one of the Intercoſtall nerves, that iſſue out of the back-bone, then paſſing through the midriffe with the Deſcendent trunk of the great artery it is carried as far as to the *os ſacrum* or great bone, at the region whereof it iſſues out three propagations, which are diſtributed into the naturall inner parts. *The firſt* goes to the lower membrane of the Kall, and deſcending through it is parted into three little branches, of which *one* is diſtributed to the right ſide of the ſame membrane, and to that part of the colick gut, that is joined unto it: *another* the leaſt of them, and a very ſmall one, to the guts *duodenum*, and the *jejunum* about its beginning; *the third* to the bottom of the ſtomach on the right ſide, and to the upper membrane of the Kall, which is ſomething the larger. That which remains of this propagation is ſpent upon the hollow part of the Liver, and the bladder of gall. *The ſecond* goes into the right kidney, and 2.
the membrane thereof. *The third*, which is greater then either of the former, deſcending to the firſt rack-bone of the loins, reaches into the right ſide of the meſentery and into the guts, that are tyed thereto, entring the center of the meſentery in company of an artery, and a vein. The remainder goes into the bladder, and in women into the right ſide of the bottom of the womb. 3.

The outer branch of the left nerve.

But *the outer* branch of *the left* nerve, ſaving that in its deſcent it has offered ſprigs both to the *Pleura*, or membrane inveſting the ribs, and to the coat of the lunga, and that outwardly, as alſo to the purſe of the heart, and heart itſelf inwardly, at that part of the Deſcendent trunk of the great artery, where it firſt iſſues out of the heart, and is bowed to the back-bone, it ſends forth three ſurcles, which returning to the ſaid artery cloſe together into one nerve, which is called *ſiniſter recurrens nervus*, the left returning nerve, and in like manner as the right one, takes its progreſſe upward, and is propagated into the muſcles of the *Larinx*, or throttle. After this it iſſues out a ſmall ſprig, which is diſtributed through the *baſis* of the heart, and coat of it in manner of hairs. Afterward the remainder deſcends inclining itſelf obliquely to the right, and goes to the upper orifice of the ſtomach, into the right ſide whereof it is diffuſed, as the right branch was before into the left ſide, being divided into many little branches in manner of a net. From this a ſurcle is carried down along the upper part of the ſtomach to the *pylorus*, or lower orifice, which when it hath as it were interwoven with ſome ſprigs, it goes into the hollow of the liver.

Its propagations.

The left returrent nerves.

Propagations of the inner branch of the left nerve.

The inner branch firſt of all takes to it propagations from the intercoſtall nerves, and then paſſing through the midriffe is divided into three. *The firſt* of them goes overthwart to the Spleen, and in the way ſhoots out two ſprigs, *one*, which is likewiſe ſent into the lower membrane of the Kall, and part of the colick-gut, which is tyed thereto; *another* into the left ſide of the bottom of the ſtomach, and into the upper membrane of the Kall. 1.

The ſecond propagation goes into the left ſide of the Meſentery, and the guts of that place; ſometimes alſo it iſſues ſprigs, which run out with the ſeminary veſſels through the proceſſes of the *Peritonæum*, or rim of the belly to the teſticles. 2.

The third goes to the left Kidney, and the fat membrane thereof. The remainder of the branch paſſes to the left ſide of the bladder, and of the bottom of the womb. 3.

The uſe of this pair is manifeſt enough, as being very notorious, when the outer branch beſtows little boughs upon the middle bowels, but the inner upon all thoſe of the loweſt belly, and the right branch upon thoſe of the right ſide, the left on thoſe of the left. Beſides this uſe it conducts by the returning branches alſo to the framing of the voice, by imparting the faculty of motion to the muſcles of the throttle. Uſe.

The ſeventh pair.

The ſeventh pair ariſes in the utmoſt part of the nowl-bone, where the marrow of the brain is ready to goe out of the skull, and ſo is counted the hardeſt of all the nerves, that have their originall within the skull. But it ariſes in ſome roots ſeparated from each other, which joining together on both ſides into one, it goes out of the skull through the fourth and fifth holes of the nowl-bone (which are placed betwixt that greateſt one, which opens a way for the deſcent of the ſpinall marrow, and that, at which the ſixth pair goes out) and preſently after its egreſſe is involved in one common membrane with the ſixth pair; whence ſome, not ſo diligently obſerving it, have beleeved that they were mixt one with another; and thus they deſcend together. When it comes to the root of the tongue, it diſtributes ſurcles into all the muſcles thereof, ſending over ſome alſo to certain muſcles of the bone *hyoides*, and of the throttle, as alſo to thoſe, which take their beginning from the *appendix* called *ſtyloides*. The uſe of this conjugation is to carry down the faculty of ſenſe, & motion from the brain, to the muſcles of the tongue.

Its originall.

Its uſe.

The eighth pair.

To theſe ſeven pairs, which are commonly ſo numbred, we adde *an Eighth* which makes the nerves of ſmelling, by which a faculty is derived from the brain of apprehending the odours of things without. Theſe are commonly affirmed to ariſe out of the marrowy ſubſtance of the brain, in the *baſis* thereof, near to the firſt pair; but the new diſſection of the brain, and which is performed by turning it upſide down, hath taught us, that they ariſe at the utmoſt ſides of the brain, in that part, which is above the holes of the ears, whereby it is manifeſt, that hitherto only one half of them hath been ſhewn. They are very ſharp at their originall, and diſtant one from the other, but going forward by degrees

Its originall.

grees, betwixt the uppermoſt and middle prominence of the brain, they grow thicker, and draw nearer one to another, and ſo at length they lye down above the *ſinus* or cavities of the ſpongy bone within the skull. Theſe are thruſt into the mammillary proceſſes of the brain: but *Galen* and *Marinus*, (whom almoſt all Anatomiſts have followed) would not call them by the name of Nerves, although they altogether agree therewith in their colour, courſe, and uſe, becauſe they neither have productions like the reſt of the nerves, nor go out of the cavity of the skull: but truly they ſeem to me to commit no other a ſophiſm, then they, who have expelled the teeth out of the number of the bones becauſe they are not inveſted on the outſide with a membrane, as others are, although neither this makes any thing to the eſſence of the bones, nor that to the eſſence of the nerves.

CHAP. II.

Concerning the nerves of the Spinall marrow properly ſo called, and firſt of thoſe of the Rack-bones of the Neck.

NAture, the wiſe parent of all things, as ſhee hath framed the nerves, that they might ſerve for the carrying of the faculties, and ſpirits, that are generated in the brain, becauſe the brain itſelf could not be diffuſed through the whole body: ſo when the ſame could not conveniently beſtow nerves upon all the parts, by reaſon of their too great diſtance, ſhee made the ſpinall marrow, which is nothing elſe, but the marrow of the after-brain and brain, extended through the long conduit pipe of the rack-bones of the back. And therefore we having already viewed thoſe nerves, which take their originall from the marrow of the brain, whileſt it is yet contained in the skull; it remains now, that we take a view of them alſo, which come from the ſpondyls of the back-bone: But it is called marrow, not that it hath any affinity by reaſon of its ſubſtance with the marrow of the bones; but becauſe like marrow it is contained within the rack-bones; but the ſubſtance thereof is like that of the brain, which itſelf alſo *Plato* called marrow; and it is named the *ſpinall* marrow, or *of the back*, to diſtinguiſh it from both thoſe, that are not contained in the back-bone, but either in the skull, as the brain, or in the hollowneſſe of the bones, as that which is properly called marrow. This ſubſtance is covered with two membranes, no otherwiſe then the brain itſelf is, from whence it takes its originall, the one thick, the other thinner, which are inveſted with a certain third, ſtrong, and membranous covering, that *Galen* thought to be the ligament of the rack-bones. But it was made to that end, that it might diſtribute ſenſe, and motion to the muſcles, and membranes, to which thoſe pairs of the brain do not reach. Therefore, when there is a good number of nerves ariſing there from, yet we ſhall eaſily reduce them to ſome certain *claſſes*, or companies, if we ſay that they all make up thirty pairs, of which ſeven belong to the marrow, whileſt it is carried through the rack-bones of the neck; twelve, whileſt it is carried through thoſe of the cheſt; five, through thoſe of the loins; and laſtly ſix to that, which is contained in the holes of the *os ſacrum*, or great bone. But theſe nerves go out through the holes of the rack-bones, and either *with a double originall* on the fore and hinder part, as it happens in the two firſt conjugations of the neck, and five of the great bone, which ariſe not from the ſides, that is, from the right, or left part, but iſſue forth two branches before and behind; or elſe *with a ſingle one*, through one hole bored in both ſides of the rack-bones, as happens in all the reſt of the pairs, in which one nerve iſſues from the right ſide, the other from the left. But the firſt, and ſecond pair have a double beginning, leſt if they ſhould ariſe with a ſingle one, that being ſomewhat thicker might have been hurt by the joints of the rack-bones; or if the hole ſhould be made larger, the rack-bone (which was ſmall enough of itſelf) ſhould be liable to breaking. Therefore that both theſe evils might be avoided, the wiſe Opificer made a double beginning, one on the forepart, another on the hinder. But the right branches go every where to the right ſide, the left to the left, and they are diſtributed on both ſides after the ſame manner.

The ſpinall marrow.

VVhy it is called marrow.

It is wrapt up in two membranes.

The conjugations or pairs of the ſpinall marrow.

The firſt pair therefore [*tab.* 1 *n.* 1.] ariſes *with its firſt, and foremoſt propagation* [*tab.* 1. B] from the forepart of the ſpinall marrow, and paſſes out betwixt the nowl-bone, and the firſt rack bone of the neck, near to the ſides of that round ligament, wherewith the tooth-like proceſſe of the ſecond rack-bone is tyed to the foreſide of the nowl-bone, and ſo it is diſtributed into the muſcles over the neck, and under the gullet, that bend the neck. *With the other, and hinder propagation*, [*tab.* 2. *Fig.* 1. *C.*] it likewiſe falls out through the hole, that is common to the nowl-bone, and firſt rack-bone of the neck, toward the hinder part, but with a double ſprig, one of which being ſmall is ſpent upon the leſſer ſtrait muſcles, and the upper oblique ones, that extend the head; the other reaches out into the beginning of the muſcle, which lifts up the ſhoulder-blade.

The firſt pair of the neck.

The

The second pair [*tab.* 1. 2.] *with its fore-branch* [*tab.* 1. D.] (which is slender, then the hinder one, though both of them seem small enough) arising from the fore-part of the marrow goes forth betwixt the first, and second rack-bones at the side of the tooth-like processe, which branch is distributed into the muscles, that lie upon the neck, as well as the fore-branch of the first pair, which is wrapped together with it; and is almost wholly spent upon the skin of the face. *With its hinder branch* [*tab.* 2. *Fig.* 1. E.] it slips out through the sides of the backward processe of the second rack-bone, but presently is cleft into two branches of unequall bignesse, of which *that which is the thicker* [*tab.* 2. *fi.* 1. F.] tends from the forepart to the hinder, where the muscles seated on both sides of the hinder part of the neck do meet together, & there being mixt [*t.* 2. *f.* 1. G] with the third propagation of the third pair of the nerves, it runs out through the middle of the said muscles, returning from the hinder to the foreparts, and so is distributed into all the skin of the head, as far as to the top of the crown, [*t.* 2. *f.* 1. H] as also to the ears. *The other branch, which is the slenderer*, is inserted into the greater straight muscles, and the lower oblique ones, that extend the head. *Galen* makes mention of these branches *lib.* 4. *de locis affect.* which place we shall not think much to transcribe hither, it making very much to the illustration of the use of this kind of learning. Not long since, sayes he, they ulcerated the head of a certain man, by laying on medicins vehemently heating, thinking by this means his sense, that was greatly impaired, might be recovered. But we cured this very man, having found out the seat of the disease as well from other accidents, as from the primitive, or procatarctick causes. For we diligently examined him about every one of them, and found that this was one; when he had walked in much rain caused by a violent wind, his cloak was wet about his neck, so that he felt himself affected with a vehement cold in that part: so then if you know, that four nerves ascend from the first racks of the back-bone to the head, from which the skin about it receives its sense, you will easily find out the seat of the disease, that therefore being healed, the skin of the head was healed also, as having no primary disease. The second pair. Its fore-branch Its hinder branch.

The third pair [*tab.* 1. 3.] issues out of the common hole in the sides, which is betwixt the second and third rack-bones, and presently after it gets out, is cleft into two branches, of which the *more forward* one [*tab.* 1. I.] is subdivided into four propagations. *The first* [*t.* 1. 2. K] goes to the first bending muscle of the neck, or the long one: *the second* [*t.* 1. L.] runs down, and being united with a sprig of the fourth pair [*tab.* 1. Q.] ends in the muscles, that lye under the gullet. *The third* [*tab.* 1. M.] climbs up, and joining with the thicker branch of the second pair but now mentioned [*tab.* 2. *f.* 1. F.] is spent upon the skin of the hinder part of the head. *The fourth* [*tab.* 1. N] is imparted to the transverse muscles, or to the first pair of the extenders of the neck, and to that, which lifts up the shoulder-blade, of which two muscles that ends in the transverse processes of the neck, this begins therein; and at length it is digested into the square muscle, that draws down the cheeks, which is called by *Galen* πλατυσμα μυωδες. *The hinder branch* [*tab.* 2. *f.* 1. O] is implanted into the second pair of muscles, that extend the chest. The third pair. Its fore-branch The fourth pair. The fore-branch. Its hinder branch.

The fourth pair [*tab.* 1. *numb.* 4.] issues out of the common hole of the third, and fourth rack-bones, and like the third pair is divided into two unequall branches. *The more forward and greater* [*tab.* 1. P] is cleft into three other twigs, of which *the first* [*tab.* 1. Q.] is joined with another branch of the third pair [*tab.* 1. L.] and goes to the first long pair of muscles, that bend the neck. *Another* [*tab.* 1. R.] goes to the transverse muscle, or first of those, which extend the neck, and to the first of the shoulder-blade, called *Cucullaris*, the cowl-muscle. *The third* [*tab.* 1. S] being smaller then the other, and joyned with a surcle of the fifth pair, and another branch of the fifth pair, near to the *mediastinum* or membrane that parts the chest in the middle, and above the *Pericardium*, passes on downward, that out of these three principles the nerve of the midriffe may be made up. *The hinder branch* [*tab.* 2. *f.* 1. T.] goes toward the spine or ridge, under the muscles, which are placed thereabout, to which also it affords a good number of branches, and from thence being led downward between the muscles on both sides of the neck, it is carried to the square muscle, that draws down the cheeks. In this place it is worth our labour to inquire what may be the reason, that they who are troubled with a Resolution, or deprivation of motion in the whole body, have nevertheless the motion of their midriffe for a while free: some make answer, that this happens, because although no spirits are sent over from the brain, yet they may be diffused out of the marrow of the back. But these men beg the question, when we suppose, that no spirits come from hence, because we see that all the muscles of the whole body, to which nerves are sent from the marrow of the back, are resolved or deprived of motion. Therefore I thought fit to seek out for another answer, and to say that the midriffe has two motions, one, that is voluntary, which we use, whilst we breath strongly; another naturall one, when the fibres are extended, and contracted of themselves. A man therefore is preserved by this naturall motion, when we see that breathing is little, and weak, and as much as suffices, that the lungs may be moved a little. The third pair. 1. 2. 3. The hinder branch. A question.

The fifth pair [*tab.* 1. *numb.* 5.] goes out betwixt the fourth and fifth rack-bones, and like the two last fore-going, is cleft into two branches. *The forwarder of them* [*tab.* 1. U.] issues forth The fifth nerve. Its fore-branch.

forth some propagations. *The first* [*tab.*1.betwixt U and 6] goes to the muscles, that bend the neck. *Another* [*tab.*1.X] together with propagations of the fourth, and sixth pairs, sometimes also of the seventh, to wit, then when the branch of the fourth is wanting, descends near to the side of the gullet through the forepart of the rack-bones of the neck, and is implanted into the midriffe, & so makes the midriffe nerve. *The third* [*t.*1 Y] is carried through the upper part, and outside of the arm, to the second muscle of the arm, to wit, that which lifts it up, called *Deltoides*, from whence little branches are sent over to the first, and second, that is to the cowl-muscle, & the lifter up of the shoulder-blade. *The fourth* propagation [*tab.* 1.b] at the neck of the shoulder-blade is cleft into two, of which *the former* [*tab.*1.c] goes into the muscle *Deltoides*, at that part where it arises from the clavicles or canal-bone: *the latter* and thicker [*tab.*1.d] is inserted into the fourth pair of muscles of the bone *hyoides*, called *coracohyoideum*, and from thence imparts a small branch to the upper muscle over the shoulder-blade called *superscapularis*, and to the muscle *Deltoides*, where it arises from the spine of the shoulder-blade. *The hinder branch* [*tab.*2.*f.*1.e] is writhen toward the back-bone, and distributed in the same manner, as the hinder branch of the fourth pair is.

The hinder branch.

The sixth pair. *The sixth pair* [*tab.*1.*numb.*6] goes out under the fifth rack-bone, and in like manner as the other pairs are, is divided into two branches. *The forwarder and greater* [*tab.*1. f] after it has propagated that sprig, [*tab.*1.g] which we said is joined with the fourth, and fifth pair, [*tab.*1.S and X] to the making up of the nerve of the midriffe [*tab.*1.1] passing on farther is united with the two next following pairs, the seventh of the neck, and the first of the chest, and is again separated from them, and then again being joined with them it so weaves a certain net-like texture, from which nerves are issued forth, that go to the arm. *The hinder* [*tab.*2.*fig.*1.l] is carried to the hind muscles, which extend the head, and neck.

Its fore-branch.

Its hinder branch.

The seventh pair. *The seventh pair* [*tab.*1.*n.* 7] is derived from the marrow of the neck, and issues forth through the common hole of the sixth, and seventh rack-bones. *The forwarder, and greater* branch thereof [*tab.*1.m] is joined presently after its egresse with the sixth nerve of the neck, and the first of the chest, and for the greater part is carried with the rest to the arm. *The hinder and lesser branch* [*tab.*2.*fig.*1.n] goes to the muscles, that lye upon the neck, and to the square one, that draws down the cheeks.

The fore-branch.

The hinder.

CHAP. III.

Concerning the Nerves of the marrow of the rack-bones of the Chest.

TWelve conjugations of nerves issue forth from the spinall marrow, whilst it runs through the rack-bones of the back, as the most learned *Vesalius* has rightly opinioned, however there are but eleven holes bored in the twelve rack-bones thereof, as *Columbus* objected, because the first pair passes out between the last rack-bone of the neck, and the first of the back, wherefore it ought to be numbred rather among the pairs of the chest, then those of the neck. All these conjugations after their egresse are divided in two; and the one branch which is the greater, always bends forward; the other which is the lesse is bent to the hinder parts, and to the muscles, that lye upon the back.

The first Pair. *The first pair then* [*tab.* 1. *numb.* 8] of the nerves, which issue forth from the marrow of the chest, goes out of the common hole of the seventh rack bone of the neck, and the first of the chest, in the same manner, as the five pairs last mentioned do, and in like sort also is forthwith divided into two branches. The *forwarder*, and greater [*tab.* 1. o] is united, [*tab.* 1. p] partly with the seventh nerve of the neck, partly with the second of the chest, in that manner, which we have before explained; and so afterward is wholly consumed upon the arms, excepting one propagation [*tab.* 1. q.] which arising at the beginning of it, is joined with the said nerves, and runs into the foreparts, near the length of the first rib of the chest, to the breast bone, bestowing a sprig upon the subclavian muscle, after that being reflected upward it is spent upon the muscles, which take their originall from the top of the breast-bone: such are the muscle, that bends the head called *Mastoideus*; that which draws down the bone *hyoides*, or *sternohyoideus*; and the first of them which extend the buckler-like gristle of the throttle, called *thyroides*, or the muscle *sternothyroideus*. But to the two last sometimes branches are sent over from the sixt conjugation of the brain, and the third of the chest. The same branch also when it has past the arm-pit, being ready to go to the arm, issues forth a certain other propagation from its hinder part, which goes to the muscles seated in the hollow nesse of the shoulder-blade. *The hinder and lesse* branch [*ta.* 2. *fig.* 1. r] lies hid under the muscles, which grow to the rack-bones, and imparts some propagations to the second bending muscle of the neck, and to them which extend the head and neck; but when it has attained to the spine of the seventh rack-bone, it goes overthwart to the lower side, and distributes surcles into the first muscle of the shoulder-blade, or that like a Monk's cowl, and into the third of the same, called *Rhomboides*, as also into the upper of the hindmost saw-muscles.

Its fore-branch

Its hinder branch.

The

The ſecond pair [*ta.* 1. *num.* 9.] breaks out betwixt the firſt and ſecond rack-bones of the cheſt, and is cleft likewiſe into two branches. *The forwarder* [*t.* 1. s.] is united with the firſt pair of the cheſt; and thus the firſt and ſecond pairs of the cheſt are united by turns, with the fifth, ſixth, and ſeventh of the neck, that the one are not diſcerned from the other; but make a net not unlike to thoſe ſtrings which hang at Cardinals hats; from which afterward all the nerves that go to the arms, iſſue forth, and take their originall. This ſpreads out a branch [*t.* 1. t] which goes forward through the firſt diſtance betwixt the ribs, according to the courſe of the firſt rib, as far as to the breaſt-bone, making the firſt Intercoſtall nerve, from which ſurcles [t 1. u] are diſtributed into the muſcles that lie upon the cheſt. *The hinder* branch [*t.* 2. *f.* 1. x] has the ſame diſſemination with that of the foregoing pair. The ſecond pair. The fore-branch. The hinder one.

The other ten pairs [*tab.* 1. *numb.* 10, 11, 12. and ſo on to 19 incluſively.] of the nerves of the cheſt, obſerve the ſame manner both of their riſe, and diſtribution. For they all iſſue out of the common holes of the rack-bones at the ſides, and preſently after their egreſſe are cleft into two branches of unequal bigneſſe, one of which is the forwarder and greater; the other, the inner and leſſe. *The forward* branches [*ta.* 1. *y.*] (which make the nerves between the ribs) are carried into the fore-ſide, and each of them affords a little branch in order according to its length, to the inner branch of the ſixth pair, which deſcends under the *pleura* to the roots of the ribs. Theſe branches are joined with the Intercoſtall veins and arteries; together with which they paſſe along the rib to the forepart through the *ſinus* or chanel, which is cut out on the lower and inſide of the ribs. But they which belong to the true ribs, go on as far as to the breaſt-bone; but they which belong to the baſtard ones, are carried into the forepart of the *abdomen* above the *peritonæum* or rim of the belly. From theſe nerves many branches are diſſeminated into the muſcles between the ribs, not only in the inner, but the outer ones alſo, as wel as into the other, [*ta.* 1. *x*] which lye upon the cheſt; ſuch as are the fourth, and fifth muſcles of the ſhoulder-blade or the two formoſt ſaw-muſcles, as alſo the broad one, called *Latiſſimus* [*tab.* 1. *β*] that moves the arm backward from the breaſt. In like manner a propagation goes from the fifth Intercoſtall nerve, about the middle of the rib, paſſing through the Intercoſtall muſcle, into the firſt pair of the muſcles of the *abdomen*, [*ta.* 1. *α*] as alſo into the skin of the cheſt; and being divided in four parts is diſtributed into the pectorall muſcle that moves the arm forward to the breaſt, and alſo into the skin, from which ſome ſprigs doe afterward goe to the nipples of the breaſt [*ta.* 1. *γ*] and impart to them a very ſharp ſenſe. *The hinder branches* [*ta.* 2. *fi.* 1. *δ*] goe backward to the ſpine, or ridge, between the muſcles going to the rack-bones, which have the charge of extending the cheſt. Yet are they not wholly ſpent upon theſe muſcles, but when they have now attained to the tops of the ſpines, they fall out between the muſcles of both ſides, whereabout they are joined to one another, and ſo afterward they give nerves to all the muſcles, which ariſe out of the tops of the ſpines of the rack-bones. Such are the firſt extending muſcle of the head, called *Triangularis*, or *Spleneus*; the third muſcle of the ſhoulder-blade, or *Rhomboides*; the firſt of the ſhoulder-blade, or *Cucullaris*; the third broad muſcle that leads the arm away from the breaſt, called *Aniſcalptor*, and the hinder ſaw-muſcle. A good number alſo of ſurcles are diſtributed into the skin of the back. The ir fore-branches. Their hinder branches.

CHAP. IV.

Concerning the nerves of the marrow of the rack-bones of the loins.

FRom the ſpinall marrow, whilſt it is carried through the loins, although there be only four holes, yet five pairs iſſue forth, the firſt being between the laſt rack-bone of the cheſt, and the firſt loins. But they go forth through the common holes, and being gone forth, are diſtributed in like manner as we have ſaid of the nerves of the cheſt; when from every one of them, preſently after its gong out, one branch, and that the greater, ſpreads it ſelfe forward; the other, and leſſe backward. *The formoſt* branches run to the muſcles of the *abdomen*, or outer, and forepart of the loweſt belly; the *hindmoſt* to them, which lie upon the ſpines of the rack-bones, and the bones without a name, from whence they impart ſome little branches alſo to the skin that covers the loyns. But the fore-branches are knit together, the firſt with the ſecond, the ſecond with the third, the third with the fourth, and the fourth with the fifth in the ſame faſhion, as we ſaid the nerves of the arm were, whilſt they make the net-like complication.

The firſt pair then, [*ta.num.* 1. 20.] as the reſt do alſo; going out under the *peritonæum*, or rim of the belly, through the common hole of the rack-bones, which is betwixt the laſt rack-bone of the cheſt, and the firſt of the loins; preſently after its egreſſe is cleft into two branches. *The fore-branch*, which is greater, goes into the fleſhy parts of the midriffe, and into the beginning of the firſt bending muſcle of the thigh, called *Ileos*. The firſt paire. Its fore-branch

The binder one.

From this nerve a certain furcle [*ta.* 1. 39.] takes its beginning, reaching out for the most part with the preparing artery to the testicle. *The binder branch* [*ta.* 2. *fig.* 1. *nu.* 42.] sends propagations into the muscles that lie upon the backside of the rack-bones of the loins, such as are the first and third of them which extend the chest, that being called *Dorsi longissimus*, this *sacrolumbus*; as also the muscle which extend the loins: but when they issue out from the tops of the spines, wherabout the said muscles are joined one to another, they run to the sides, and are implanted into the broad muscle, that leads the arm outward from the breast, called *Latissimus*.

The second.

The second pair [t. 1. *n.* 21.] goes out under the first bending muscle of the thigh, called *Psoas*, betwixt the first and second rack-bones of the loins. *The fore-branch* thereof is distributed to the second bending muscle of the thigh, that fills up the cavity of *os Ilium*, or the hanch-bone, and the first bending one of the leg, called *Fascialis*, as also to the skin of the thigh. *The binder branch* going out of the *abdomen* is distributed to the three muscles that extend the thigh, or the *Glutæi*, and to that which extends the leg, called *Membranosus*, the membranous muscle.

The third.

The third pair [t. 1. *n.* 22.] issues forth likewise under the first bending muscle of the thigh, betwixt the second and third rack-bones, *The fore-branch* thereof passes over near to the hanch bones, distributing two propagations; *one* which goes to the knee, and its skin; *another* [t. 1. 51.] which accompanies the vein of the inner ancle, called *saphena*. *The binder branch* is reflected and disseminated into the muscles which lie upon the loins.

The fourth.

The fourth pair [t. 1. *n.* 23.] is the greatest of all the nerves of the loins, and being carried under the said muscle that bends the thigh, as also under the *os pubis*, or share-bone, accompanies the Crurall vein and artery.

The fifth.

The fifth and last pair [t. 1. *n.* 24.] issues out betwixt the fourth and fifth rack-bones; *the fore-branch* whereof passes through the hole which is betwixt the hip-bone, the *os pubis*, or share-bone, and the *os Ilium* or hanch-bone, and distributes some propagations to the two muscles that turn the thigh about, called *Obturatores*, others to the second and third bending ones of the thigh, and others to the muscles of the yard. *The binder branch* goes into the muscles, and skin upon the rack-bones.

CHAP. V.

Concerning the nerves of the marrow of os sacrum *or the great bone.*

The first paire.

LAst of all from the marrow which is contained in the rack-bones of the *os sacrum*, the six last pairs of the nerves of the spinall marrow do issue forth. *The first* of these [t. 1. *n.* 25.] goes out betwixt the last rack-bone of the loins, and the first of the great or holy bone, in the very same manner as the rest, that arise out of the rack-bones of the loins, and likewise after the same sort is divided into two branches. *The fore-branch* although it be mixed with the crurall nerves, sends yet a furcle [t. 1. 43.] over near to the inner region of *os Ilium*, and is dispersed into the muscles of the *abdomen*, and into the second bending one of the thigh. *The binder* [t. 2. f. 1. *n.* 44.] is disseminated into the muscles that arise from the *os Ilium* or hanch-bone, and especially into the first of them, that extend the thigh, or the greater *Glutæus*, as also into the skin of the buttocks.

The other five pairs.

The other five pairs have something proper to themselves; so that before they go out of the bone, they are every of them double on each side, and so from every one of them a double branch is carried on each side, one to the forepart, another to the hinder. The three uppermost of the fore-branches, as that of the first pair also, go to the *Crus*, or parts of the body below the buttocks: the two lowest go into the muscles of the fundament and bladder, and in women to the neck of the womb, in men to the yard; but in both sexes to the outer privy parts. The hinder branches are distributed to the muscles seated on the backside of the bones *Ilium*, and *sacrum*. Of this sort are the first and third extending muscles of the chest, or *Dorsi longissimus*, the long muscle of the back, and *sacrolumbus*, that which bends the loins, called *sacer*, and the broad muscle that leads the arm away from the breast; as also the three which extend the thigh, being the authors of the buttocks, and therefore called *glutæi* the buttock-muscles. And this is the utmost end of the spinall marrow, which reaching into the rump-bone, called *os coccygis* is in this manner terminated: And this is the history of the thirty pairs of the nerves which go out of the spinall marrow, which is diligently and accurately to be committed to the memory, that we may know to what place remedies ought to be applyed, if at any time from some externall cause, as by a fall from aloft, or a bruise, or some notable compression, any part shall have lost either motion, or sense, or both. For the remedies must be applyed alwaies to the beginning of the nerve, not to the place, in which the symptome is perceived.

CHAP.

CHAP. VI.

Concerning the Nerves which are distributed through the Arms.

THose nerves being now enumerated, which are dispersed through the muscles of the three bellyes, and the parts contained in them; it remains that we describe those also, which are propagated through the *artus*, or extream parts of the body. Here we meet with them first, which are distributed through the arms; whereof there are six pairs commonly set down by Anatomists arising from the fifth, sixth, and seventh pair of the nerves, that come out of the marrow of the neck, and from the first, and second of those, which issue out of the chest. These nerves go out through the common holes of the rack-bones, on both sides, and presently after their going out are united one among another with their forwarder, and greater branches, by and by are separated one from another again, and joined again, and finally separated, so that they seem to make out a certain net-like texture, which cannot be better likened then to those strings of Cardinals hats. This implication of nerves goes forth under the clavicle, or coller-bone, about that place, where the axillary veins and arteries go out of the hollow of the chest, and from this all the nerves of the arm take their originall. But their rise is very uncertain by reason of their being so knit together, wherefore wee in our relation of them will rather follow the footsteps of other men, then our own observations, lest wee should seem to affect new opinions rashly, and without necessity.

The first nerve then [*tab.* 1. e] which is carried to the arm, is a double propagation, namely the third, and fourth of the fore branch of the fifth pair of the neck. For *the one* branch [*tab.* 1. Y] is carried to the second muscle of the upper part of the arm called *Deltoides*, and to the skin that lies upon it; *the other* [*tab.* 1. b] goes toward the neck of the shoulder-blade, where it is cleft into two branches; *the former* of which [*tab.* 1. c] goes into the muscle *Deltoides*, where it arises from the collar-bone; *the latter* [*tab.* 1. d] is inserted into the fourth pair of the muscles of the bone *hyoides* called *coracohyoideum*, and from thence affords a little branch to the upper superscapular muscle, and the *Deltoides*, at what place it arises from the spine of the shoulder-blade. *This* nerve runs out through the higher side of the arm; but *the other five* are carried through the arm-pit into the arm, and in the same are scattered into more branches. The first nerve of the arm.

The second nerve [*tab.* 1. f] is thicker, and takes it originall from that net-like complication, of which we spake, yet, from what nerve cannot be evident enough. This is carried down through the middle, and fore-part of the arm; into which it enters under the first bender of the cubit, or the double-headed muscle, at that part, where its two heads are united one with the other, and where the tendons are inserted both of the pectorall muscle, that leads the arm forward to the breast, and of the *Deltoides*, that lifts it up. Being hid then under this muscle it sends forth two propagations [*tab.* 1. *u*] one of each side, which enters into the two heads of the muscle *biceps*; and after that about the middle of the length of the upper part of the arm, going under the same double-headed muscle, it shoots forth another sprig [*tab.* 1. *t*] by means whereof it is joined with the third nerve; and from thence descending it distributes in its progresse a surcle [*tab.* 1. *t*] from its outside to the head of the longer of the two muscles of the *radius* or wand, that turns the palm of the hand downward. When it is now come to the bending of the cubit, being led to the fleshy membrane, near to the outside of the tendon of the said double-headed muscle, it is distributed into the skin, being divided into two branches, of which one is the outer, the other the inner; that is the slenderer, this the thicker. *The outer* then [*tab.* 1. *i*] being carried down a good way with a branch of the Cephalick vein through the inside of the cubit, is distributed [*tab.* 1. *x*] to the second bone of the thumb. *The inner* branch [*tab.* 1. *x*] is subdivided under the common vein of the arm, or the middle one, called *Mediana*, into two branches, *the outer* whereof [*tab.* 1.] going on obliquely under the skin leaving the vein goes away toward the *radius* as far as to the wrest: but *the inner* [*tab.* 1. *r*] being fastened to the inner branch of the Cephalick-vein, when it goes more obliquely, in the region of the cubit is cleft into two speciall branches, of which *one* [*tab.* 1 *w*] is distributed through the region of the lesser bone of the cubit, *the other* [*tab.* 1. *o*] through the region of the greater bone to the wrist, and from thence, that being past, into the skin of the inside of the hand. The second. Its progresse. Its propagations. Its branches. The outer. The inner.

The third nerve of the arm [*tab.* 1. *g*] or the third, which is carried to the arm, lies next under the second, and in like manner with it arises from that net-like texture. This nerve, whilst it passes through the arm-pit, before it has yet attained to the arm, brings The third.

forth a propagation, [*tab.* 1, *o*] which is disperſed under the skin betwixt the Pectorall muſcle, that leads the arm to the breaſt, and the muſcle *Deltoides*, that lifts up the ſame. But when it hath firſt attained to the arm, it hides itſelf under the muſcle *Biceps*, or firſt bender of the cubit, and paſſing on downward together with the ſecond nerve, it ſends out a little branch [*tab.* 1. *r*] into the head of the ſecond bending muſcle of the cubit. After this deſcending it receives a branch [*tab.* 1. *v*] from the ſecond nerve, by means whereof they are joined one with the other; and then it goes farther through the forepart of the arm unto the bending of the cubit, being alwayes equally diſtant from the ſecond nerve, and is carried into the protuberation of the inſide of the arm, and the fore-part thereof. When it hath paſt this, it iſſues forth many propagations, [*tab.* 1. *o*] which together with the branches, that are derived from the fifth nerve, which is carried through the hinder region of the ſame protuberation, are diſtributed into the muſcles, that are ſeated on the inſide of the cubit, and ariſe from the inner protuberation of the arm: ſuch are the two, that bend the uttermoſt bones of the fore-fingers, and that, which bends the third joint of the thumb. After this it ſends out another propagation, which is carried down between the ſaid muſcles through the *radius* together with a vein, and artery, to the wriſt, and paſſing through under the the tranſverſe ligament, ſcatters ſome ſmall ſprigs into the muſcle, that moves the thumb outward from the fingers, and the two, that bend the firſt joint of the ſame. After this when it is come to the palm of the hand, it is divided [*tab.* 2. *x*] into three branches; the firſt of which ſcatters two twigs into the thumb, the ſecond as many into the fore-finger, the third ſends one to the middle finger on the inſide.

The fourth. *The fourth nerve* [*tab.* 2, *fig.* 1. *ψ*] is the biggeſt of all them, which are carried to the arm, as being almoſt thrice thicker then the reſt. This ariſes, as well as the other, from the net-like complication, and from thence is carried down through the arm, in like manner as the third is, lying deep every where among the muſcles, having the baſilick vein, and axillary artery for its companions. But preſently after it hath entred the

Its propagations. arm, it derives many, but ſmall ſprigs [*tab.* 2. *fig.* *e*] into the heads of the muſcles, that extend the cubit; and before it is come to half the length of the upper part of the arm, it is contorted obliquely downward to the bone thereof, and paſſes on betwixt that, and the muſcles, which extend the cubit. But before it be wholly reflected, it ſends forth a ſurcle [*tab.* 2. *fig.* 1. *Γ*] from its inſide, which goes betwixt the ſaid muſcles, as alſo the ſecond of them, that bend the cubit, and is ſpent upon the skin, that clothes the inſide of the arm, ſome fibres being propagated upward, and downward. Having diſſeminated this propagation it goes by degrees through the hinder part to the outſide of the arm, being carried through the cavity of the outer protuberation of the upper bone of the arm, that is cut out in the back-ſide thereof, where likewiſe it ſends out a ſurcle, [*tab.* 2. *fig.* 1. *Δ*] going to the skin, that covers the lower part of the outſide of the arm; and then another [*tab.* 2. *fig.* 1 *Θ*] which is diſtributed into the skin, as far as to the wriſt. After that near to the joint of the cubit it is divided into two branches, an outer, and an inner one, which being hid deep, and among the muſcles, as the whole trunk alſo, deſcend to the wriſt.

In two branches. The outer. *The outer branch* [*tab.* 2. *fig.* 1. *Λ*] goes along the *radius*, or wand, and when it is come to the wriſt, paſſes through the tranſverſe ligament, on the outer part, and by and by is ſubdivided [*tab.* 2. *fig.* 1. *Ξ*] into two branches, of which *one* goes with a double ſprig into the outſide of the thumb, the *other* is ſpent

The inner. partly upon the fore-finger, partly on the middle one. But *the inner branch* [*t* 2. *fi.* 1. Π] reaching along the cubit ſcatters more propagations, the *firſt* [*tab.* 2. *fig.* 1. Σ] into the firſt muſcle that extends the fingers, the *ſecond* [*ta.* 2. *fig.* 1. Φ] into the ſecond, that extends the fingers; the *third* [*t.* 2. *fi.* 1. Ψ] into the inner muſcle, that extends the wriſt. But in its progreſſe [*t.* 2. *fi.* 1. Ω] it affords propagations to the three beginnings of the muſcles, that take their original from the *ulna*, or greater bone of the cubit. The remainder of it ends in the wriſt, [*tab.* 2. *fig.* 1. 31].

The fifth nerve *The fifth nerve* [*tab.* 1, *numb.* 32] ariſing lower then any of the fore-mentioned, out of ſame net-like complication, and being joined to the fourth, deſcends through the inſide of the arm, between the muſcles, that bend, and extend the cubit. This ſcatters no propagation from itſelf, but remains intire, till it be come to the inner protuberation of the arm, at whoſe hinder cavity it is reflected, and is diſtributed afterward in the ſame manner with the third nerve, which paſſes through the foreſide of the ſame protuberation. For both of them beſtow propagations [*tab.* 1. 33] upon the muſcles, which grow out of the inner protuberation of the arm, and keep the inſide of the cubit. It iſſues forth a propagation alſo [*tab.* 1. 34.] which being carried through the *radius*, or wand, goes between the muſcles, which bend the ſecond, and third joints of the fingers, and ſo to the palm of the hand, & ſends out *the firſt branch*, which being parted in two is implanted into the inſide of the little finger; then *another*, which being alſo cut in two goes into the ring-finger, and at laſt *another* that goes to the outer part of the inſide of the middle finger. But from this ſame fifth nerve, and from the outſide near to the middle of the length of the *radius*, or wand, there grows out a certain other ſurcle, [*t.* 1. 35.] which being divided into three branches is diſſeminated into the outer part of the middle, the ring-finger, and the little one.

The

The sixth nerve [*tab. 1. numb. 36.*] issues out of the lowest part of the net-like complication, and going through the arm-pit, and inside of the upper part of the arm, & of the cubit, under the skin it makes hast to the inner protuberation of the upper-bone of the arm, dispersing many sureles in its way to the neighbouring skin. [*t. 1. 37. 37.*] But as soon as it has attained to this protuberation, it is cleft into many propagations, some of which lie under the branches of the basilick vein, some lie over, and so being carried under the skin, when they are come down to the wrist, they end [*ta. 1. 38.*] The sixth.

CHAP. VIII.

Of the nerves that are distributed through the Crura, *or thighs, legs, and feet.*

THere are four pairs of nerves, which are propagated through the *Crura*. They arise from the three lower conjugations of the loins, and the four upper ones of the *Os sacrum*, or great bone, which after they are gone through forth the common holes of the rack-bones, as wel as the nerves, which are distributed through the arm, make a certain complication like the meshing of a net, but far greater then that other. Nor are these nerves of equall bignesse, but the first [*ta. 1. 2. 46.*] and the third [*ta. 1. 56.*] are small, wherefore also they reach but to the thigh; the second [*t. 1. 50.*] is somewhat thicker, and reaches to the leg; but the fourth [*t. 1. 61.*] alone is thicker then the three other put together; and is carried down as far as to the utmost ends of the toes.

The first nerve then [*ta. 1. 46.*] growes out of the higher part of the net-like complication, where the third nerve of the loins is joined with the fourth [*ta. 1. 47.*] But it is presently carried downward under the rim of the belly, to the thigh; lying upon the outside of the tendon of the first bending muscle of the thigh, to which when it is come, it sends out a propagation [*ta. 1. 48.*] which runs out through the skin on the forepart of the thigh, as far as to the joint of the knee, and there ends, and offers sureles [*ta. 1. 49.*] to the first bending muscle of the leg, as also to the second and third, that extend the same. The first nerve.

The second nerve [*t. 1. 50.*] arises out of the same complication, and below the first, over against the connexion of the third and fourth rack-bones of the loins. This together with the crurall vein, and artery, (which are the outer Iliacall branches) descends through the groin into the thigh, which when it has attained to, presently it issues forth a notable propagation [*ta. 1. 51.*] from its inside, lying upon the *saphena* or vein of the inner ankle, on the forepart, all the way it goes under the skin through the inner parts of the *crus* to the great toe. But as the vein *saphena* it self distributes some sprigs in the way to the skin next to it, so also this nerve sends out many propagations, of which that is the chief [*t. 1. 53.*] which is gives to the forside of the knee. But the trunk is self [*t. 1. 54.*] when it has sent out this propagation, passes together with the trunk of the crurall vein and artery into the thigh, and is scattered into the muscles seated on the inside of the thigh, especially [*t. 1. 55.*] into the third bending one of the thigh, and the fourth extending one of the leg, and so afterward it is terminated above the knee. The second. The progresse of the trunk.

The third [*t. 1. n. 56.*] grows out of the complication, under the second, over against the conjunction of the fourth and fifth rack-bones of the loins. This nerve being carried down upon the second bending muscle of the thigh, called *Iliacus internus*, passes through the hole of the share-bone, and affords propagations [*t. 1. 57.*] to the two muscles, that turn the thigh about, which they cal *Obturatores*, the stoppers, to wit, of that said hole, as also to the two muscles that erect the yard, which arise out of the bone of the hip. From thence like the two foregoing nerves, it descends, and distributes little nerves into the skin, that clothes the inner part of the thigh [*t. 1. 58.*] The remaining part [*t. 1. 57.*] lies deep, the chief propagation whereof [*t. 1. 60.*] is spent partly on the second, partly on the third muscle that bend the leg. The third.

The fourth nerve [*t. 1. n. 61.*] is made up out of the fore-branches of the four upper pairs of the great bone being united together. By reason whereof it passes the rest, yea and all the nerves of the whole body, not only in thicknesse, but in hardnesse also, as being made of the last, that issue out of the spine, or ridge. This enters into the hinder part of the thigh through the cavity, that is in the hinder part of the hip-bone. But presently it sends forth a notable propagation [*t. 1. 62.*] from its back-side, which stayes a pretty while under the first extending muscle of the thigh, or *Glutæus magnus*, the great buttock-muscle, and from thence is dispersed into the skin that covers the buttocks, and the back-side of the thigh to the middle of its length. Then it sends other propagations [*ta. 1. 63.*] on both sides, three for the most part to the heads of the third, fourth, and fifth muscles that extend the leg, and to the third bending one of the thigh. After this the trunk of the nerve descends among the muscles seated on the hinder part of the thigh, near to the bone, as far as half the length thereof, and distributes another branch [*t. 1. 64.*] to that fleshy lump of the fifth bending muscle of the leg, called *Biceps*, which grows to it on the inside, The fourth. The progresse of the trunk.

inſide, after it hat gone beyond the middle of the thigh. From hence alſo other ſurcles proceed, which are diſtributed into the skin on the backſide of the thigh. But the trunk it ſelf proceeding farther on, at length attains to the knee betwixt the two heads of the bone of the thigh, and imparts a ſmall branch [t. 1. 65.] on each ſide into the firſt extending muſcle of the foot, and the ſole muſcle, called *plantaris*, and by and by is divided,

Its diviſion.

[t. 1. 66.] into the inner cavity of the knee, or in the ham into two unequall branches, which are diſtributed alone through the leg and foot. For there is not any nerve which runs out through the leg, beſides theſe two branches of the fourth; if you except only that notable propagation, which being derived from the ſecond nerve, as we have ſaid, deſcends in company of the vein *ſaphena*, through the inner part of the *crus*. *The outer* branch [t. 1. 67.] is the ſmaller, and goes toward that part where the upper *appendix* of the *fibula*, or leſſer bone of the leg is joined with the *tibia*, or greater bone thereof, ſcattering a propagation [t. 1. 68.] in the way, which goes to the outer ancle under the skin, diſtributing in the mean time, many ſprigs to the skin. But the branch it ſelf [t. 1. 69.] paſſes between the muſcles ſeated on the forepart of the leg, and going through the long ligament of the *tibia* and *fibula*, or two bones of the leg, paſſes together with the tendons of the muſcles that extend the toes, under the tranſverſe ligament, and diſperſes little branches to the ſides of the upper part of the toes. *The inner* branch [t. 1. 72.] is carried down through the backſide of the *crus*, lurking betwixt the muſcle of the ſole of the foot, and the firſt of them, that move the foot obliquely, as alſo the long bending muſcles of the toes; and being joined afterward with the branch of the outer, which paſſes through the ligament, it goes to the ſole of the foot, and diſtributes propagations in both the ſides of the lower part of the toes.

FINIS.

AN

An Explanation of the two Tables of the Nerves.

THe thirty pairs of the nerves of the marrow of the brain, whilst it is carried through the spine or ridge, are expresst in these two Tables the present & the following one. Wee have inscribed common characters on both of them; though many also bee peculiar to one; after which we have presently set the number of the Table. But the first shews the rack-bones of the spine and the nerves that issue from thence on the forside; the second on the backside.

m.1.2. 1. &c. 8 as far as 20 as far as 25 as far as — as far as to 7. The seven rack-bones of the neck. to 19. The twelve rack-bones of the chest. to 24. The five rack-bones of the loins. to 30. The six bones of the os sacrum. These same figures do stand for the pairs of the spinall marrow.

A ta. 1. & 2. — The seat of the spinall marrow, where it first enters into the rack-bones.

1. 1. — The first pair of the neck, whose forwarder propagations is B; the hinder C.

B 1. C 2. — The second pair, whose fore-propagation is D, its hinder E, from this two branches grow out; the slender one marked with the letter E, the other thick one with F, which is mixed with a branch of the third pair M, about G. But the course thereof to the skin of the crown, and backside of the head is marked with the letter H.

2. 1. D. E 2. E 2. F 2. G H

3. 1. I. 1. K. 1. M. 1. — The third pair of the neck, whose fore-branch I is divided into four propagations. The first K is implanted into the muscles, that bend the neck. The second L is mixt with a twig of the fourth pair Q. The third M is mixt with the thicker propagation of the hinder branch of the second pair F. The fourth N is inserted into the muscles that are joined to the transverse processes of the rack-bones.

N. O 2. — The hinder branch O.

4. 1. P. Q 1. R 1. S 1. T 2. — The fourth pair of the neck, whose fore-branch P is cleft into three propagations. The first Q joins with the second propagation of the third pair L. The second R goes into the transverse muscle of the neck. The third S. The hinder branch T.

5. 1. V 1. — The fifth pair of the neck, whose fore-branch V issues out some surcles. The first goes to the muscles that bend the neck, being to be seen in the first table between V, and the number 6. The second X making the greatest part of the nerve of the midriffe. The third Y goes to the muscle Deltoides, of which there is a propagation, a, which goes to the skin, that covers the muscles Deltoides, and Biceps. The fourth b, at the neck of the shoulder-blade is cleft into two branches; one of which, c, enters into the muscle Deltoides, at what part it growes out of the Collar-bone: the other, d, is implanted into the same, in the place where it grows out of the spine of the shoulder-blade.

X 1. Y. a 1. b 1. c 1. d 1.

e 2. 6. 1. f 1. g 1. h 1. i. 1. l 2. 7. 1. m 1. 2. 8. 1. o 1. p 1. q 1. r 2. 9 1. t 1. u 1. x 2. 10, 11, 12 &c. to 19 inclusively 1. y 1. z 1.

The hinder branch, e.

The sixth pair of the neck, whose fore-branch f, when it has propagated that circle g, which with the fourth and fifth pair, S and X, makes the nerve of the midriffe, is joined with the two following, h, and thus it makes up the nerve of the midriffe i, so that this arises out of three surcles S, X, and g. The hinder branch l.

The seventh pair of the neck, whose fore-branch is m, its hinder one n.

The first pair of the chest, whose fore-branch o, is united, p, with the seventh pair of the neck, and second of the chest, spreading a propagation q, through the upper side of the first rib. The hinder branch r.

The second pair of the chest, whose fore-branch sends forth a surcle t, running out through the first space betwixt the ribs, and sending surcles u to the muscles of the chest. The hinder branch x.

The paires of nerves from the ninth to the twentieth, which have the same series of propagations, and especially to the distances of the ribs. The fore-branches of these (fig. 1.) are scattered into the muscles seated on the forepart of the chest, and partly into their upper region, as y, partly into their lower z, which in women go also to the breasts; and then they send other surcles into the heads of the oblique descending muscles of the abdomen a, and into that which leads the arm from the breast β, another goes to the nipple of the breast γ. The hinder branch δ.

α 1. β 1. γ 1. δ 1. ε 1. ζ N. ϑ 1. ι. κ 1. λ 1. μ 1. ν 1. ξ 1. ο 1. π 1. ρ 1. σ 1. τ 1. υ 1. φ 1.

The first nerve that goes to the arm, which is scattered into the skin of the outside of the arm.

The second nerve that goes to the arm, whose two first propagations ϑ ϑ goe to the two heads of the muscle Biceps: then it joins with the third nerve by a surcle ι. Thirdly, it carries a propagation to the longer muscle that turns the palm of the hand downward θ. But about the bending of the cubit it is divided into two branches, an outer τ, and an inner one ϰ. That τ descending along the radius or wand, is inserted at the outside of the second joint of the thumb λ. This ϰ is by and by subdivided into an outer μ, and an inner branch ν. This ν is again cleft in the region of the cubit into an outer branch ο, and an inner one π.

The third nerve entring the arm ρ, before it attains to the arm, scatters a sprig betwixt the Pectoral muscle, and Deltoides σ. By and by having entred the arm, it distributes another, τ, into the second muscle that bends the cubit. After that descending it receives a branch from the second nerve υ; when it is past the bought of the arm, it is distributed into many surcles

ϱ.1. surcles ϱ, at length about the palm of the
χ 1. hand it is divided into three branches χ.
Ψ 2. The fourth nerve entring the arm, which is the greatest of all them that goe to the arm, is not marked with any letters in the second table, but in the third only, lest the second should be too much blurred with Letters. This sodainly after it has entred the arm, ω.1 reaches out small sprigs ω into the muscles, that extend the cubit, then another into the inner skin, upwards and downward Γ, and Γ. another into the lower part Δ, and another Δ. Θ, which goes as far as to the wrist. After Θ. this near to the bought of the arm it is divided into two branches, an outer one Λ, and Λ. an inner Π. That Λ about the transverse ligament is again divided in two Ξ. This Π Ξ. reaching all along the cubit sends forth more Π. propagations, the first Σ, the second Φ, the Σ Φ. Ψ. third Ψ. Then another in its progresse Ω. Ω. The remainder ends in the wrist 31. 31.
32.1. The fifth that enters the arm, which about the inner protuberation of the arm, is dissemenated like to the third. Its first surcle 33, its second 34, its third 35. 33. 34. 35.
36.1. The sixth nerve of the arm, which goes under the skin imparting many sprigs to it 37, 37. 37. The end of it is 38. 37. 38.
20.21. The five pairs of the nerves of the loins: the first 20, the second 21, the third 22, the fourth 23, the fifth 24. A certain 22,23, branch arising from the first pair of the loins 24. 1. 20, and descending for the most part with the 39.1. preparing artery to the testicle.

The course of the nerves through the muscles 40.1. of the Abdomen; from which branches 41 41. 1. goes to the muscle that leads the arm outward from the breast.

The hinder branches of the nerves of the 42. 2. loins.

The six pairs of the nerves of the great 25, 26, bone. Of these the first is 25, the second 26, 27, 28, the third 27, the fourth 28, the fifth 29, the 29, 30.1. sixth 30.

A Surcle reacht out from the fore-branch 43.1. of the first nerve of the great bone to the inside 44. 2. of the hanch bone, and so to the muscles of the abdomen, that arise from that bone. Then 45. 1 another spreading out from the hinder-branch to the muscles seated on the back of os Ilium, or the hanch-bone.

The termination of the spinall marrow pas- sing on without a mate, and undivided.

46. 1. The first nerve entring the crus. This a- 47. rises where the third nerve of the loins meets 48.1. with the fourth 47. A branch of this 48 goes 49. 1. to the skin; but 49 it is entangled among the muscles, that are seated on the outside of the thigh.

50.1. The second crurall nerve, a notable pro-
51.1. pagation whereof 51 runs out in the same course with the vein Saphena to the end of
52.1. the foot, and there ends about 52. In the mean time it proffers another notable surcle
53.1. 53 to the foreside of the knee. But the remain-
54.1. der of the trunk 54 enters deep into the thigh,
55.1. and gives out a small branch 55, but without question the chief.

56.1. The third crurall nerve, whose propaga-
57.1. tion 57 goes to the muscles called Obtura-
58.1. tores, and another 58 to the skin. The re-
59.1. mainder 59 lies deep intangled in the muscles
60.1. whose chief propagation is 60, which is implanted into the second and third muscles, that bend the Leg.

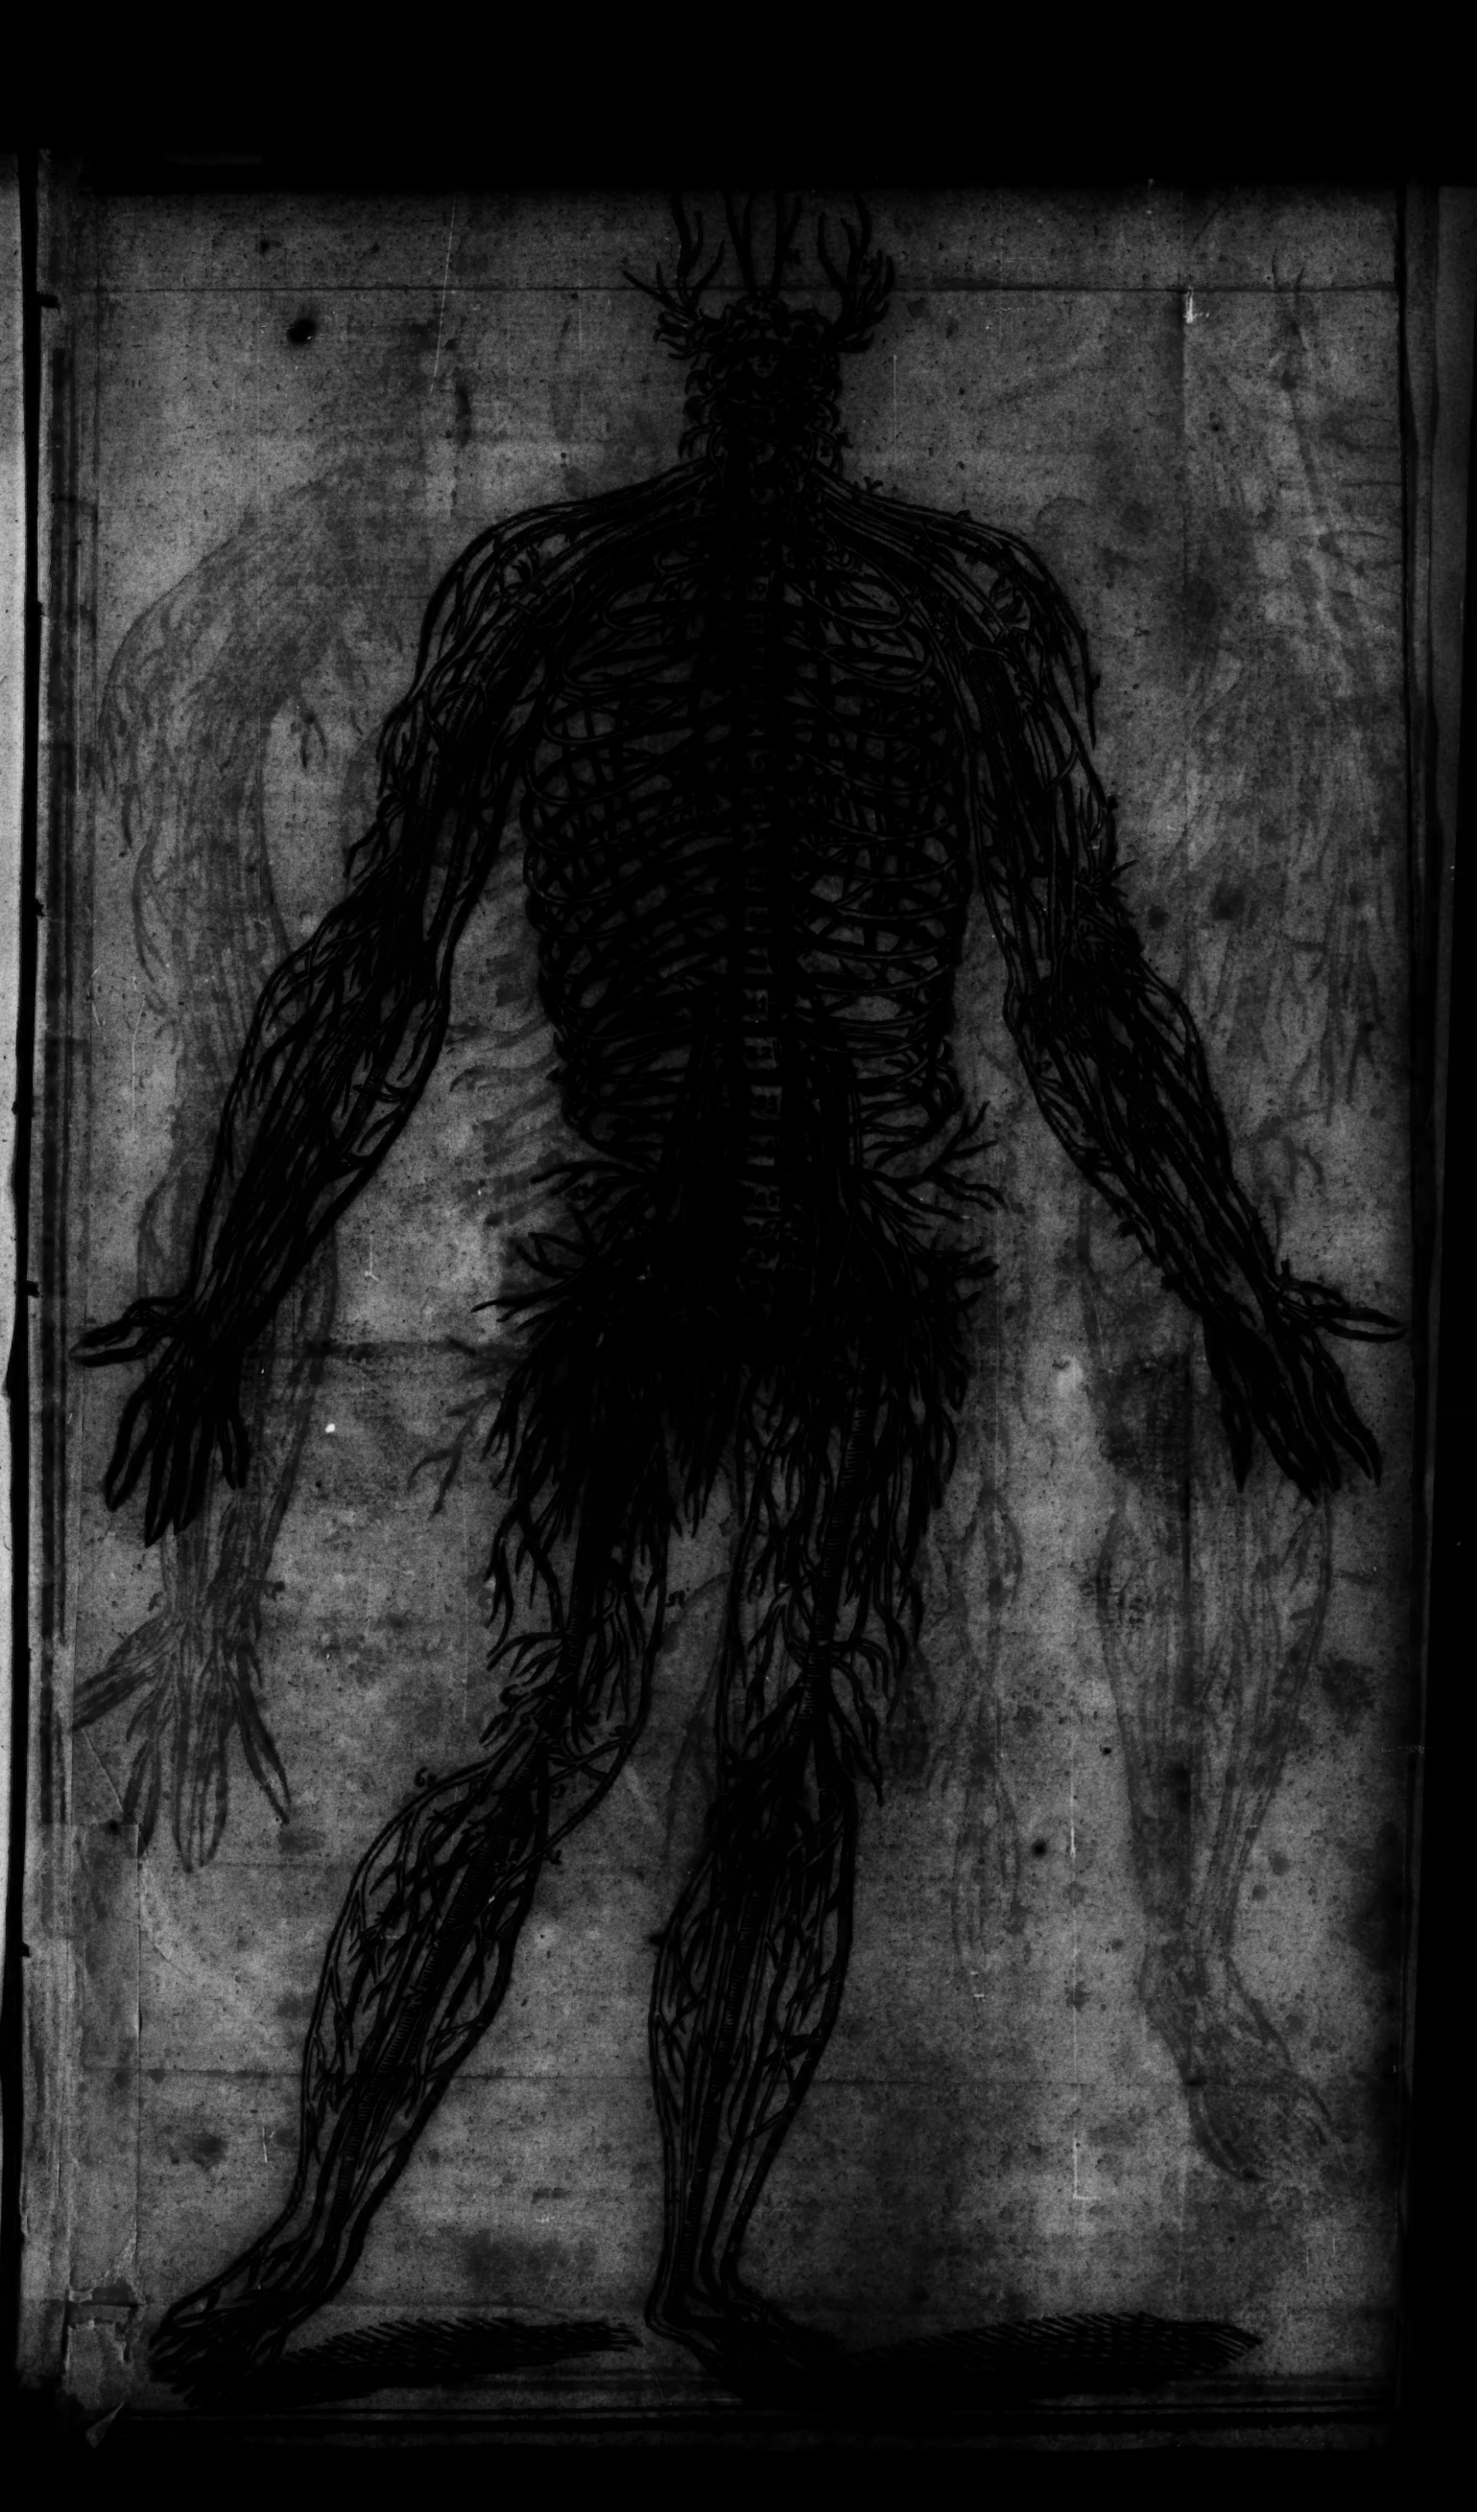
61.1. The fourth, and that the thickest of all the nerves of the crus, whose first branch is
62.1. 62, which is inserted into the skin of the but-
63.1. tocks; another 63 is distributed into the heads of the muscles that arise from the appendix of the Hip: a third 64 is given to
94.1. the fifth muscle, that bends the leg; and o-
65.1. thers 65 go into the outer calf-muscle; and that of the sole of the foot. But about the lower
66.1. heads of the thigh it is divided 66 into two branches, to wit, an outer one, 67, and an inner 72.

67.1. The outer branch, a propagation where-
68.1. of 68 is sent under the skin that covers the outer part of the leg, and the outside of the foot.
69.1. But the branch itself 69 goes to the connexion of the lesser bone of the leg with the greater;
90.1. sending forth another surcle 70 to the forepart of the leg under the skin: the remainder of it
71.1. 71 reaches along the fibula or lesser bone of leg.

72.1. The hinder branch, a propagation
73.1. whereof, 73 goes through the inside of the leg toward the calf, and inside of the foot under the
74.1. skin: and then another 74 is scattered into the skin, especially that which covers the calf.
75.75.1. Another also 75, 75 goes into the fore-part of the leg through the ligament that joins the lesser bone of the leg to the greater, and afterward is spent on the upper side of the foot. The last
76.1. propagation 76 runs out betwixt the inner
77.1. and outer calf-muscles. The remainder of the trunk goes by the inner ankle to the lower part of the foot, distributing two surcles a peice to the lower part of all the toes.

The second and third figures of the second Table. These two figures do exhibit the nerves of the arm and leg in a larger form, then the first table does, so that all, which concerns those nerves, may be shew'n more accurately herein. But they have common characters, and the same explanation of the same serves for both.

THE



THE Readers ordinary charity is desired in behalfe of the PRESSE. Such faults, as are more considerable in these three TREATISES, and from which the Translation might possibly have suffered, are here set downe. As for those petty slips, which concerne the misplacing of commas, or the like, they will be as easily observed by the Reader, as they have been committed by the Printer, and are amended even before they are taken notice of.
